Create a target source for automating the Actual value of the targets

Create a target source so that the goal user can configure it for the targets to automate the Actual value of the targets.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The context variable is required for target source types Assessment/Survey and PA Indicator. The mandatory context variables are automatically created while creating a target source with the type selected as Assessment/Surveys or PA Indicator. For more information on when the mandatory context variables are created, see [Context variable in target source](#).

Procedure

1. Navigate to **All > Enterprise Goal Management > Target Sources**.
2. Click **New**.
3. On the form, fill in the fields.
For a description of the field values, see [Target Source form](#).
4. Click **Submit**.

Create context variable for a target source

Create a context variable manually if you want to configure more context variables for a target source.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The Context variable provides information that can be used to fetch the required data and auto-update the Actual value on the target form. After a context variable is created for the target source, the goal user can configure the Actual Value Source Configuration section on the Target form so that the Actual value gets auto-updated.

Creating a context variable is similar to creating a column on a table.

To create a context variable for the target source type PA Indicator and the breakdown is of Choice list type, see [Create a context variable for the target source type PA Indicator](#).

Procedure

1. Navigate to **All > Enterprise Goal Management > Target Sources**.
2. Open the required target source that you want to create a context variable for.
3. In the Context Variables related list, click **New**.
4. On the form, fill in the fields.
For a description of the field values, see [Context Variable form](#).
5. Click **Submit**.

Create a context variable for the target source type PA Indicator

Create a context variable manually for the target source type PA Indicator if the breakdown is of Choice list type.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The context variable provides information that can be used to fetch the required data and auto-update the Actual value on the Target form. After a context variable is created for the target source, the goal user can configure the Actual Value Source Configuration section on the Target form for the Actual value to get auto-updated.

Creating a context variable is similar to creating a column on a table.

Procedure

1. Navigate to **All > Enterprise Goal Management > Target Sources**.
2. Open the required target source that you want to create a context variable for.
3. In the Context Variables related list, click **New**.
4. On the form, fill in the **Type** field as Choice and the other fields as needed.
For a description of the field values, see [Context Variable form](#).
5. Click **Submit**.

A context variable of choice type is created.

6. In the Choices related list of the context variable you created, click **New**.

Note:

If you don't see the Choices related list on the Context Variable form, add it by navigating to **Configure > Related Lists** on the form.

7. On the form, fill in the fields.

Choice form

Field	Description
Table	Name of the context variable for which the choice is created.
Element	Column name in the context variable form for which the choice is created.
Label	Name of the choice.
Value	Sys_id of the choice value for which the context variable is created. You can copy the sys_id from the Choices related list of the Dictionary Entry [sys_dictionary] table.

8. Click **Submit**.

9. **Optional:** Repeat the steps 6 through 8 to create more choices for the context variable.

What to do next

The goal user can configure these choices as context variables on the Target form for which the target source is configured.

Migrate target breakdowns

After upgrading to Goal Framework for SPM v2.3.0 or later, run the **Migrate BreakdownInterval To Checkinfrequency** scheduled job to migrate the existing values from the **Review frequency** field to the **Check-in frequency** field in the target records.

About this task

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. If the existing value in the **Review frequency** field was set to any option other than **None**, then target breakdowns will be created for such targets based on the value in the existing check-in frequency of the target. For more information on how these values are migrated for targets with different values, see [Target breakdowns migration](#).

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Search for and select the **Migrate BreakdownInterval To Checkinfrequency** scheduled job.
3. On the Scheduled Script Execution form, ensure that the frequency is selected as **On Demand** in the **Run** field.
4. Select **Execute Now**.

Target breakdowns migration

As an administrator, when you run the **Migrate BreakdownInterval To Checkinfrequency** scheduled job, the existing values in the **Review frequency** and **Breakdown interval** fields are migrated to the **Check-in frequency** field in the target records.

The value in the **Actual to date** field for the target and values in the **Planned target value** and **Actual** fields for the target breakdowns are populated based on the current actual value of the target and values in the existing target breakdowns.

Target breakdowns migration for targets with breakdown interval set to None

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. If the existing value in the **Review frequency** field was set to any option other than **None**, then target breakdowns will be created for such targets based on the existing review frequency of the target. Even though **Breakdown interval** was set to **None** for a target, target breakdowns will be created for the target based on the existing review frequency of the target.

The following table describes how the check-in frequency value is populated for targets with different values in the **Review frequency** and **Breakdown interval** fields.

Target breakdowns migration with breakdown interval set to None

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Yearly	None	Yearly
Quarterly	None	Quarterly
Monthly	None	Monthly
Fortnightly	None	Fortnightly The Fortnightly option is retained and no target breakdowns will be created because the Fortnightly option is no longer supported. After the owner or a contributor of the target updates the check-in frequency for the target, the target breakdowns will be created accordingly.
Weekly	None	Weekly
Daily	None	Daily
None	None	None In this case, no target breakdowns will be created.

For example, consider a scenario where details of a target are as follows before upgrade:

- The base value and target value of the target is 0 and 100, respectively
- The review frequency is set to **Monthly** and Breakdown interval was set to **None**
- The start date and end date of the target are 2024-01-01 and 2024-12-31, respectively
- The current actual value of the target is 60 and the current month is August

In this case, after running the scheduled job 12 monthly target breakdowns are created for the target and the current actual value as 60 is populated in the August monthly breakdown. Also, the planned target value is populated for each breakdown.

Target breakdowns migration for targets with breakdown interval set to Quarterly or Yearly

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. Then, target breakdowns are created for the targets based on the existing review frequency of the target.

The following table describes how the check-in frequency value is populated for targets with different values in the **Review frequency** and **Breakdown interval** fields.

Target breakdowns migration with breakdown interval set to Quarterly or Yearly

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Quarterly	Quarterly	Quarterly
Quarterly	Yearly	Quarterly

i Note:

For targets with breakdowns interval set to Yearly, irrespective of the target is of type cumulative or non-cumulative, after running the scheduled job quarterly target breakdowns will be created and the Target value distribution is set to **Spread linearly across the time period (cumulative)** for the target.

For example, consider a scenario where details of a target are as follows before upgrade:

- The base value and target value of the target is 0 and 80, respectively
- The review frequency is set to **Quarterly** and Breakdown interval was set to **Yearly**
- The start date and end date of the target are 2023-01-01 and 2024-12-31, respectively
- The target is of type non-cumulative
- The actual value achieved in each quarter is 10 starting from Q1-2023 till Q2-2024
- The current total actual value of the target is 60 and the current quarter is Q2-2024

In this case, after running the scheduled job 8 quarterly breakdowns are created and the Target value distribution is set to **Spread linearly across the time period (cumulative)** for the target. The current actual value for Q1-2023, Q2-2023, Q3-2023, Q4-2023, Q1-2024, and Q2-2024 quarterly target breakdowns are populated as 10, 20, 30, 40, 50, and 60, respectively. Also, the planned target value is populated for each breakdown.

Defining a custom unit of measure

Defining a custom unit of measure helps the goal users to set the unit of measure for targets as per their choice. Unit of measures are two types, quantitative and qualitative.

By default, the available unit of measures for quantitative targets are **#, \$, %, Days**. By default, the available unit of measure for qualitative targets is **Yes/No**.

As an administrator, you must create custom unit of measures so that the goal user can use them for setting a unit of measure for their targets:

- For quantitative targets, you can define a custom unit of measures from the Unit [sn_gf_unit] table.
- For qualitative targets, you must first create a choice set and then create a choice list for the choice set.

Managing goals using Goal Framework or Goal Framework for SPM

Understand the process required to define goals using Goal Framework.

Managing goals using Goal Framework or Goal Framework for SPM

Use the following steps as guidelines for defining your goals. Some of these steps require the sn_gf.strategy_planner role and some require the sn_gf.goal_user role. If you're an Goal Framework for SPM user, you need the sn_gf.goal_admin role to configure the target automation feature. All steps are the same for defining goals using either Goal Framework or Goal Framework for SPM.

1. Create a strategic plan to define the purpose - vision, mission, and values - of your organization. For more information, see [Create a strategic plan](#).

You can create strategic plans only when Strategic Planning is installed. Creating a strategic plan isn't required to define goals.

2. Create a strategic priority to orient your organization's strategic plan to your goal. For more information, see [Create a strategic priority](#).
3. Create a goal. For more information, see [Create a goal](#).
4. Create targets for goals to track and measure the progress of the goals. For more information, see [Set targets for a goal using Goal Framework](#).
5. (For Goal Framework for SPM users only) Set targets for goals and configure the target sources for the targets to auto-update the actual value of the targets. After the progress of a target is updated, the target's progress is rolled up to its goal. For more information, see [Configuring target source for target automation using Goal Framework for SPM](#).
6. Create a goal or target relationship with a work or strategic item. For more information, see [Associate work or strategy with goals or targets](#).
7. Set a goal or target as primary for the work and planning items where the items contribute to achieving the goal. For more information, see [Associating the primary goal or target for work and planning items](#).

Create a strategic plan

As a strategy planner, you can create and manage strategic plans for your organization. Create a strategic plan to define the purpose of your organization, its strategic priorities, and the associated goals.

Before you begin

Install Strategic Planning on your ServiceNow instance.

Role required: sn_gf.strategy_planner

Procedure

1. Navigate to **All > Strategy > Strategic Plans**.
2. Click **New**.
3. On the form, fill in the fields.
For field information, see [Strategic Plan form](#).
4. Click **Submit**.

What to do next

From the Values related list, capture values for your organization such as Integrity, Commitment to customers, and Trust.

Create a strategic priority for a strategic plan

As a strategy planner, you can create and manage the strategic priorities for the strategic plans for your organization. Create a strategic priority to orient your organization strategic plan toward your goal.

Before you begin

Role required: sn_gf.strategy_planner

About this task

The strategic priorities are also known as focus areas or long-term strategies.

Procedure

1. Create a strategic priority for a strategic plan using one of the following options.
2. On the form, fill in the fields.
For field information, see [Strategic Priority form](#).
3. Click **Submit**.

What to do next

Define goals and set targets for them to accomplish the strategic priorities.

Create a goal

Create goals and set targets to measure overall goal progress and evaluate them to align with the organizational strategic priorities.

Before you begin

Role required: sn_gf.goal_user or sn_gf.goal_admin

About this task

Goals are typically qualitative in nature. Goals should be ambitious and are expected to motivate and challenge the teams.

Procedure

1. Navigate to **All > Enterprise Goal Management > Goals**.
2. Click **New**.
3. On the form, fill in the fields.
For field information, see [Goal form](#).
4. Click **Submit**.

What to do next

Set targets for the goals.

Create targets for a goal using Goal Framework or Goal Framework for SPM

Create SMART targets for goals to track and measure the progress of the goals.

Before you begin

Role required: sn_gf.goal_user or sn_gf.goal_admin

About this task

A SMART target can be defined as S = Specific, M = Measurable, A = Attainable, R = Relevant, and T = Time-bound.

- Only the owner or contributors of the goal can create targets for the goal.
- You can also restrict the access for a target record to the specific users by enabling the **Confidential** field on the target form if the ESG Management application is installed.

Procedure

1. Create a target for a goal using one of the following options.
2. On the form, fill in the fields.
For field information, see [Target form](#).
3. Click **Submit**.

Result

The target progress records are automatically created when you save the target post populating the **Actuals to date** field. The target progress records specify the progress of each target for the goal.

Note:

When you delete a goal, its associated targets (if any) and their progress records are also deleted even though the **Allow the deletion of targets** property is set to **No**.

What to do next

Update the progress of the targets.

Update the progress of a manual target

Update the progress of a target when its status is changed.

Before you begin

Role required: sn_gf.goal_user or sn_gf.goal_admin

About this task**Note:**

Only the owner or contributors of the goal can update targets of the goal.

Procedure

1. Open the target record of the goal using one of the following options.
2. On the Target form, update the **Actuals to date** field and add a business justification in the **Remark** field.

For field information, see [Target form](#).

3. Click **Update**.

Result

Once the **Actuals to date** field is updated, the progress value for the target is auto-updated. For information on how the progress value is calculated, see [progress value calculation](#).

Related topics

[Update the progress of a target using Goal Framework for SPM](#)

[Update the actual value of a target breakdown](#)

Update the progress of a target using Goal Framework for SPM

Update the progress of a target using the **Update Actual value** related link on the Target form.

Before you begin

Role required: sn_gf.goal_user or sn_gf.goal_admin

About this task

Note:

Only the owner or contributors of the goal can update targets for the goal.

Procedure

1. Open the target record of the goal using one of the following options.
2. On the Target form, click the **Update Actual value** related link.
For a description of the field values, see [Target form](#).

Result

After the **Actuals to date** field is updated, the progress value for the target and its goal are auto-updated. For information on how the progress value is calculated, see [progress value calculation](#). For information on how the progress value is calculated for a target that has target breakdowns, see [Target breakdowns](#).

Related topics

[Update the progress of a manual target](#)

[Update the actual value of a target breakdown](#)

Target breakdowns

Breaking down a target into smaller periods (for example, Monthly) helps you set a target value for each month and focus on that specific monthly target. The target breakdowns are automatically created based on the Check-in frequency and Target value distribution set for the target.

The check-in frequency for a target can be set to Daily, Weekly, Monthly, Quarterly, or Yearly. Based on the Check-in frequency of the target, the corresponding target breakdowns are created. For example, if the Check-in frequency is set to Monthly for a target spanning for a year, 12 monthly target breakdowns are created. Planned target values are automatically set for each target breakdown based on the Target value distribution setting of the target.

Note:

The target breakdowns feature isn't supported for qualitative targets.

The following examples help you understand how the target progress is calculated for targets with different target distribution type.

Example 1: Acquire 1200 new customers in the calender year 2025 (Track non-cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calender year 2025 and track the progress monthly (non-cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2025-01-01 and 2025-12-31, respectively
- Set the start value and final target values to 0 and 1200, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Target value distribution to Split equally across the time period (non-cumulative)

This Target value distribution means that the final target value is divided into 12 equal values (planned target value for each target breakdown) which aggregates to the final target value. You can edit the planned target value later from the respective target breakdown record as needed.

In this case, the application creates 12 target breakdowns (January, February,, and December) for calender year 2025 and sets the Planned target value for each target breakdown to 100 (Final target value divided by the number of target breakdowns).

Because the application sums up the actual value entered in each monthly target breakdown, you must enter the actual value that is achieved in the particular month for the target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 100 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 100 as the actual value in both the March and April target breakdowns.

The application sums up the actual values entered in each monthly target breakdown and rolls up the sum value to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Example 2: Acquire 1200 new customers in the calender year 2025 (Track cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calender year 2025 and track the progress monthly (cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2025-01-01 and 2025-12-31, respectively
- Set the start value and final target values to 0 and 100, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Target value distribution to Spread linearly across the time period (cumulative)

This Target value distribution means that the final target value is divided linearly into 12 planned target values (such a way that the value for the last monthly breakdown is equal to the final target value). You can edit the planned target value later from the respective target breakdown record as needed.

In this case, the application creates 12 target breakdowns (January, February,....., and December) for calendar year 2025 and sets the Planned target value for the January, February,....., and December breakdowns to 100, 200,....., and 1200 respectively.

Because the application considers only the actual value entered in the latest monthly target breakdown, you must enter the cumulative actual value in the latest monthly target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 200 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 300 and 400 as the actual value in the March and April target breakdowns, respectively.

The application considers the actual value entered in the latest monthly target breakdown and rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Benefits of target breakdowns

The target breakdowns feature helps you when you want to set a target for a period but want to track the progress of the target in smaller periods such as daily, weekly, monthly, quarterly, and yearly. For example, you have set a target for a year with start value and final target values of 0 and 1200, respectively. Also, you want to set monthly targets of 100 for each quarter. In this case, you can break down the target into monthly targets and set a target value for each month so that you can focus on the specific monthly target and update your actuals against those monthly targets.

The target breakdowns feature has the following benefits:

- Break down the long-term targets into short-term intervals such as Daily, Weekly, Monthly, Quarterly, and Yearly for a better tracking or reporting of your progress
- Set or modify a planned target value for each target breakdown as needed
- Update the actual value for each target breakdown and track the progress of the main target
- Focus on the specific short-term target (target breakdown) rather than the whole target
- Track the progress of your short-term and long-term targets cumulatively or non-cumulatively

How the actual value is calculated when the check-in frequency set to None

When the check-in frequency is set to None for a target, the actual value must be entered in the **Actuals to date** field in the main target record. The actual value entered must be cumulative irrespective of the time period of the target. Target breakdowns aren't created when the check-in frequency is set to None.

Target breakdowns in target automation

If you've enabled the target automation feature for a target and set the check-in frequency and Target value distribution, the target automation feature automatically updates the actual value in the respective target breakdown based on the check-in due date. After the actual value of a target breakdown is updated, the value is rolled up to rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Update the actual value of a target breakdown

Update the actual value of a target breakdown when its status is changed. Updating the actual value of a target breakdown automatically updates the actual value of its target. After the **Actual** field of the target is updated, the progress value for the target and its goal is auto-updated.

Before you begin

Role required: sn_gf.goal_user

About this task

Note:

Only the owner or contributors of the goal can update the target breakdowns.

Procedure

1. Open the target record of the goal using one of the following options.
2. On the Target form, update the **Actual** field and add a business justification in the **Remark** field.
For field information, see [Target Breakdown form](#).
3. Select **Update**.

Result

After the **Actual** field is updated, the progress value for the target and its goal is auto-updated. For information on how the progress value is calculated, see [Progress value calculation](#). For information on how the actual value of the target breakdown is rolled up to its target, see [Target breakdowns](#).

Associate a work or planning item with goals or targets

Create a goal or target relationship with a work, planning, strategic, or any other item to identify and associate your current or future work and achieve your goals and targets.

Before you begin

Role required: sn_gf.goal_user

About this task

You can associate a goal or target with only one of the work items (Project, Demand, Program, Scrum Feature, Scrum/SAFe Epic), or SAFe Feature, planning items (Project, Demand, or Epic), or strategic items (Program or Initiative) at a time. To associate more than one item with a goal or target, create one goal or target relationship record for each item.

- You can associate a goal or target with the Project, Demand, and Program work items only when PPM Standard (Project Portfolio Management) is installed.
- You can associate a goal or target with the Scrum Feature and Scrum Epic work items only when Agile Development 2.0 is installed.
- You can associate a goal with the SAFe Epic and SAFe Feature work items only when Scaled Agile Framework (SAFe) is installed.
- You can associate a goal or target with the planning items (Project, Demand, and Epic) and strategic items (Program and Initiative) only when Strategic Planning is installed.

Note:

- Depending on the plugin that is installed - PPM or Strategic Planning - the respective related list appears on the Goal and Target form. If PPM is installed, the Project, Demand, and Program work item related lists appear on the Goal and Target form. If only Strategic Planning is installed or both PPM and Strategic Planning are installed, the Planning items and Other items related lists appear on the Goal and Target form respectively.
- When a goal or target relationship is created with a work item (Project, Demand, Program, Scrum Feature, Scrum/SAFe Epic, or SAFe Feature), the record appears on the respective related list on the Goal or Target form. When a goal or target relationship is created with a planning item (Project, Demand, or Epic), the record appears in the Planning items related list on the Goal or Target form. When a goal or target relationship is created with a strategic item (Program or Initiative) or any other item, the record appears in the Other items related list on the Goal or Target form respectively.

Procedure

1. Navigate to **All > Enterprise Goal Management > Goals.**
2. Open the required goal or target.
3. Create a goal or target relationship with a work or planning item using the following options.
4. Click **Submit.**

Associating the primary goal or target for work and planning items

You can associate a goal or target as the primary for the work and planning items where the items contribute to achieving the goal or target. You need different roles to set a goal or target as the primary for work and planning items.

You can associate a goal or target as primary to work and planning items by populating the **Primary goal** and **Primary target** fields on the Project, Demand, Program, Feature, Epic, and Planning item forms.

You can also associate non-primary goals or targets to work and planning items from the Goal/Target Relationships related list on the Project, Demand, Program, Feature, Epic, and Planning item forms.

Once you associate work and planning items to goals or targets, you can check these relationships directly in the goal's or target's related list or in the respective work or planning item's related list.

The following table describes how the primary goal or target can be set for each work and planning item.

Work / Planning item	Plugin required	Role required	Steps to associate the primary goal
Project	PPM Standard	project_manager	<ol style="list-style-type: none"> 1. Open the required project. 2. On the form, enter the goal or target that you want to associate to the project in the Primary goal and Primary target fields respectively.

Work / Planning item	Plugin required	Role required	Steps to associate the primary goal
Demand	PPM Standard	demand_manager	<ol style="list-style-type: none"> 1. Open the required demand. 2. On the form, enter the goal or target that you want to associate to the demand in the Primary goal and Primary target fields respectively.
Program	PPM Standard	program_manager	<ol style="list-style-type: none"> 1. Open the required program. 2. On the form, enter the goal that you want to associate to the program in the Primary goal and Primary target fields respectively.
Feature	Agile Development 2.0	rm_feature_admin	<ol style="list-style-type: none"> 1. Open the required feature. 2. On the form, enter the goal or target that you want to associate to the feature in the Primary goal and Primary target fields respectively.
SAFe Feature	Scaled Agile Framework	safe_art_user or safe_admin	<ol style="list-style-type: none"> 1. Open the required feature. 2. On the form, enter the goal or target that you want to associate to the feature in the Primary goal and Primary target fields respectively.
Scrum Epic	Agile Development 2.0	scrum_story_creator	<ol style="list-style-type: none"> 1. Open the required epic. 2. On the form, enter the goal or target that you want to associate to the epic in the Primary goal and Primary target fields respectively.
SAFe Epic	Scaled Agile Framework	safe_art_user	<ol style="list-style-type: none"> 1. Open the required epic. 2. On the form, enter the goal or target that you want to associate to the epic in the Primary goal and Primary target fields respectively.
Planning item (Project, Demand, and Scrum/SAFe Epic)	Strategic Planning	sn_align_core.apw_user	<ol style="list-style-type: none"> 1. Open the required planning item. 2. On the form, enter the goal or target that you want to associate to the planning item in the Primary goal and Primary target fields respectively.

Goal Framework and Goal Framework for SPM reference

Reference information to provide additional details about Goal Framework and Goal Framework for SPM such as the fields, user roles, and tables.

Components installed with Goal Framework and Goal Framework for SPM

Several types of components are installed with the installation of the Goal Framework and Goal Framework for Strategic Portfolio Management (SPM) applications, including user roles, scheduled jobs, tables, and scripts.

Roles installed

Role	Description	Contains roles
sn_gf.goal_user_read	Can view the goals. This role can be given to users such as the project user and demand user.	None
sn_gf.goal_user	<ul style="list-style-type: none"> Can create, view, edit, and delete goals, sub-goals, and associated targets. <p>Note:</p> <ul style="list-style-type: none"> A goal or sub-goal can be deleted only by the owner and contributors of the goal or its immediate parent goal when the sn_gf.allow_goal_deletion system property is set to Yes. An associated target can be deleted only by the owner and contributors of the target or its goal when the sn_gf.allow_goal_deletion system property is set to Yes. A goal can be edited only by the owner and contributors of the goal or its immediate parent goal. A target can be edited only by the owner and contributors of the target or its goal. <ul style="list-style-type: none"> Can remove the existing goal relationships between work item and goal, from 	sn_gf.goal_user_read

Role	Description	Contains roles
	the Goal Relationship [sn_gf_goal_m2m_relationship] table.

sn_gf.strategy_planner_read	Can view all strategic plans and strategic values.	None
sn_gf.strategy_planner	<p>Can create, view, edit, and delete strategic plans and strategic values.</p> <p>i Note:</p> <ul style="list-style-type: none"> • A strategic plan can be edited only by the owner and sponsor of the strategic plan. • A strategic value can be edited only by the sponsor of the strategic plan. 	sn_gf.strategy_planner_read
sn_gf.epmo_strategy_planner	Can create, view, edit, and delete any goal.	<ul style="list-style-type: none"> • sn_gf.goal_user_read • sn_gf.goal_user • sn_gf.goal_admin • sn_gf.strategy_planner

Scheduled jobs installed

Goal Framework scheduled jobs

Scheduled job	Description
Migrate Goal, Strategy, and Work item data to the	Migrates the existing goals data to the Goal Framework tables. For information on what data is migrated and how the data can be migrated, see goal data migration .

Goal Framework scheduled jobs (continued)

Scheduled job	Description
Goal Framework and related Planning item tables	
Migrate goal relationships for assigned entities	(For Strategic Planning users) Populates the fields, Assigned entity type and Assigned entity on the Goal form based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table if you have created m2m relationship with lens entities other than Company , Business Unit , Department , and Portfolio .

Goal Framework for SPM scheduled jobs

Scheduled job	Description
Update Actual value of the targets using Goal Framework for SPM	Updates the actual value of the targets by collecting the data from the respective target sources, so that the progress of the targets is updated and then the targets' progress is rolled up to the goals.

Tables installed

Goal Framework tables

Display name [Table name]	Description
Goal [sn_gf_goal]	Stores the goal details.
Goal Core [sn_gf_core_goal]	Stores the core (basic) details for the goal. The Goal [sn_gf_goal] table extends the Goal Core [sn_gf_core_goal] table.
Target [sn_gf_goal_target]	Stores the target details for the goal.
Units [sn_gf_units]	Stores the available units for measuring the progress of targets.
Target Progress [sn_gf_goal_target_progress]	Stores the target progress details for the goal.
Goal Relationship [sn_gf_goal_m2m_relationship]	Defines the relationship between a goal and items (Project, Demand, Program, Scrum Epic, Scrum Feature, and Planning item).
Strategic Plan [sn_gf_strategic_plan]	Stores the strategic plans defined for each planning organization hierarchy.

Goal Framework tables (continued)

Display name [Table name]	Description
	<p>Note: This table is visible only when Alignment Planner Workspace (APW) is installed.</p>
Strategic Priority [sn_gf_strategy]	Stores the strategic priorities defined for the organization.
Strategy Value [sn_gf_strategy_value]	Stores the strategic values for strategic plans. <p>Note: This table is visible only when APW is installed.</p>

Goal Framework for SPM tables

Display name [Table name]	Description
Context Variable [sn_gfa_context_variable]	Stores the context variable details for the target source.
Target Breakdown [sn_gfa_target_breakdown]	Stores the target breakdown details for the target that were created based on the breakdown intervals specified for the target.
Target Source [sn_gfa_target_source]	Stores the target source configuration details for automating the actual value of the targets.

Custom scripts installed

Goal Framework for SPM custom scripts

Name	Description
Benefit Plans A target source with predefined script.	<p>Predefined script that updates the Actual value field on the target form by fetching the required value from the Actual benefit field or Non-monetary actual benefit field from the monetary or non-monetary benefit plan records. For the script template, see Target automation script for benefit plans.</p> <p>Note: You can use the Benefit Plans custom script only when PPM Standard (Project Portfolio Management) is installed.</p>

System properties installed

Goal Framework system properties

Name	Description
glide.ui.sn_gf_goal_target_activity.field	Option to enable activity stream for fields of the targets.
sn_gf.allow_goal_deletion	Option to enable deletion of goals. The default value is true.
sn_gf.allow_target_deletion	Option to enable deletion of targets. The default value is true.
sn_gf.goal_calendar_type	Option to set calendar type for setting goals. The available calendar types are Gregorian Calendar and Fiscal Period. The default value is Gregorian Calendar.
sn_gf.weighted_average_enabled	Option to enable the weighted average logic to calculate the progress of goals from their subgoals and targets.

Goal Framework for SPM system properties

Name	Description
sn_gfa_disable_target_breakdown	Option to enable the target breakdowns feature at the instance level. The default value is false.
sn_gfa.target_breakdown_decimals	Option to define the number of decimals to show for target values while generating the target breakdowns. The default value is 2.
sn_gfa.weeklyCheckInDayToMapMonth	Option to define end day of the week for weekly target breakdowns mapping to month. The default value is Friday.

Context Variable form

Use the Context Variable form to create a context variable for a target source for calculating the actual value of the target based on the configured input values.

Context Variable form

Field	Description
Type	Context variable type. For information about the different field types, see Field types .
Application	Name of the application scope.
Label	Name of the label that the context variable type is created for.
Column name	ID of the context variable for which the context variable type is created.
Choice List Specification	Option to display the context variables on the Target form in the Actual Value Source Configuration section.
Default value	Default value to consider for updating the actual value of the target.

Goal Assigned Entity Configuration form

Use the Goal Assigned Entity Configuration form to configure a table for an assigned entity type so that the goal user can associate goals with the required assigned entity.

Goal Assigned Entity Configuration form

Field	Description
Assigned entity table	Entity table that a goal is assigned to.
Application	Name of the application scope.
Assigned entity field	Reference field on the goal form.

Goal form

Use the Goal form to create goals for your organizational strategic priorities.

Note:

For Operational Sustainability Workspace and Strategic Planning users, to view the other fields (that aren't added to the default or your custom form view) on the form in the workspace, configure the default/custom form layout. For information on how to configure the form layout, see [Configuring the form layout](#) .

Goal form

Field	Description
Name	Name of the goal.
State	State of the goal. The state can be Draft, In progress, Approved, Complete, Pending, Achieved, Not Achieved, or Cancelled.
Parent goal	Name of the parent goal that this goal contributes to.
Strategic priority	Name of the strategic priority that this goal is created for.
Start date	Start date for the goal. By default, the start date of the current quarter is populated. For a subgoal, start date of its parent goal is populated.
End date	End date for the goal. By default, the end date of the current quarter is populated. For a subgoal, the end date of its parent goal is populated.
Owner	Owner of the goal. By default, the name of the user creating the goal is populated.
Category	Category of the goal. The available options are: <ul style="list-style-type: none"> • Total Applications • Total Cost • Opex • Capex • Cloud Applications • Homegrown Applications • Support Cost • Labor Cost

Goal form (continued)

Field	Description
	<ul style="list-style-type: none"> • Standards Compliance • Strategic • Operational • Tactical • Artificial Intelligence
Status	Status of the goal. Status can be Red, Yellow, Green, or None.
Contributors	Users who contribute to the achievement of the goal.
Team	Assignment group responsible for different activities in achieving the goal.
Impact on parent goal	<p>A numerical value that represents the importance of this goal relative to sibling goals or other goals under its parent goal. By default, the value is (1) Neutral.</p> <p>The available options are:</p> <ul style="list-style-type: none"> • (0) No impact • (1) Neutral • (2) Moderate • (3) High • (4) Very high • (5) Maximum <p>Note: This field is available only when the sn_gf.weighted_average_enabled system property is set to Yes.</p>
Progress	<p>Percentage complete for the goal. The progress value is calculated automatically if the goal has sub-goals or/and targets.</p> <p>For more information on how the progress value is calculated, see Progress value calculation.</p>
Assigned entity type	Entity type to which the goal is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	Entity to which the goal is assigned.
Comments	Detailed comments for the goal to facilitate collaboration.
Classification	Goal classification type. The available options are Environmental, Social, and Governance . This field is applicable only for the Operational Sustainability Workspace users.

Goal/Target Relationship form

Use the Goal/Target Relationship form to create a relationship between a goal and planning item, strategic item, or any other item.

Note:

If Goal Framework for SPM is not installed, the form name appear as Goal Relationship.

Goal/Target Relationship form - Fields for planning and strategic item

Field	Description
Planning item type	Type of planning item.
Planning item	Planning item with which a goal relationship is created with the goal.

Goal/Target Relationship form - Fields for planning and strategic item - Fields for an item (that is of entity type, Product Model)

Field	Description
Table	Name of the reference table.
Document ID	Document ID of the column from the selected reference table. The suggested values in this field depend on the reference table selected in the Table field.

Goal Preferences form

Use the Goal Preferences form to manage goals such as the calendar type used for goal setting, weighted average calculation for goal progress, and deletion of goals and targets.

Goal Preferences form

Property	Description
Enable the weighted average logic to calculate the progress of goals from their sub-goals and targets.	When enabled, the fields, Impact on parent goal and Impact on goal appear in the Goal [sn_gf_goal] and Target [sn_gf_goal_target] tables respectively. The progress value of the parent goal is calculated by applying the Weighted Average logic. The default value is Yes . The progress value of a parent goal is calculated based on the progress value and the value defined in the Impact on parent goal and Impact on goal fields for sub-goals and targets respectively. For more information on how the progress value is calculated, see progress value calculation .
Allow deletion of goals.	Can delete the goals. The default value is Yes .
Allow deletion of targets.	Can delete the targets. The default value is Yes .

Goal Preferences form (continued)

Property	Description
	<p>Note: When you delete a goal, its associated targets (if any) are also deleted even though the Allow the deletion of targets property is set to No.</p>
Calendar type used for setting goals.	<p>Calendar type that is used for setting goals. The available calendar types are Gregorian calendar and Fiscal period.</p> <p>The default value is Gregorian calendar.</p>
Disable target breakdowns at the instance level.	<p>Can disable the target breakdowns feature. When the feature is enabled, target breakdowns are automatically created based on the breakdown interval set for the target.</p> <p>The default value is false.</p>

Progress value calculation

The progress or percentage complete value of goals is auto-calculated using different formulas. The formula depends on whether the goal has only targets, a combination of sub-goals and targets, and if it has weighted average calculation enabled.

Scenario	Formula used to calculate the progress value of the goal
<ul style="list-style-type: none"> The goal has targets. The goal doesn't have sub-goals. The Impact on goal field is defined for targets. 	$\text{Progress value of the goal} = \frac{\text{Sum of progress values of its associated targets}}{\text{number of targets}}$
<ul style="list-style-type: none"> The goal has sub-goals and targets. The Impact on parent goal and Impact on goal fields are defined for sub-goals and targets respectively. 	$\text{Progress value of the goal} = \frac{\text{Sum of progress values of its sub-goals and associated targets}}{\text{number of sub-goals and targets}}$
<ul style="list-style-type: none"> The goal has two targets (target 1 and target 2). The goal doesn't have sub-goals. The Impact on goal field is defined for targets and the sn_gf.weighted_average_enabled system property is set to Yes. 	$\text{Progress value of the goal} = \frac{[(\text{Progress of target 1} * \text{Weight scale of target 1}) + (\text{Progress of target 2} * \text{Weight scale of target 2})]}{(\text{Weight scale of target 1} + \text{Weight scale of target 2})}$

Scenario	Formula used to calculate the progress value of the goal
<ul style="list-style-type: none"> The goal has two targets (target 1 and target 2). The goal has two sub-goals (sub-goal 1 and sub-goal 2). The Impact on parent goal and Impact on goal fields are defined for sub-goals and targets respectively and the sn_gf.weighted_average_enabled system property is set to Yes. 	$\text{Progress value of the goal} = \frac{[(\text{Progress of sub-goal 1} * \text{Weight scale of sub-goal 1}) + (\text{Progress of sub-goal 2} * \text{Weight scale of sub-goal 2}) + (\text{Progress of target 1} * \text{Weight scale of target 1}) + (\text{Progress of target 2} * \text{Weight scale of target 2})]}{(\text{Weight scale of sub-goal 1} + \text{Weight scale of sub-goal 2} + \text{Weight scale of target 1} + \text{Weight scale of target 2})}$

Consider a scenario where a goal (G1) has two targets (T1 and T2) and the **Impact on goal** field for T1 and T2 is set to 2 and 3 respectively. The current Progress values of T1 and T2 are 40% and 20% respectively. In this case, the progress value for G1 is calculated as follows:

- Contribution of T1 towards G1 progress = $2/(2+3)*40 = 16\%$
- Contribution of T2 towards G1 progress = $3/(2+3)*20 = 12\%$
- Therefore, Progress of G1 = $16\% + 12\% = 28\%$

Scheduled Script Execution form

Scheduled Jobs are automated pieces of work that can be performed at a specific time or on a recurring schedule.

Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables

Use the **Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables** job to migrate the existing goals data to the Goal Framework tables.

Scheduled Script Execution form

Parameter	Description
migrateGoalData	<ul style="list-style-type: none"> Migrates all existing goal records from the Goal [goal] table to the Goal [sn_gf_goal] table. The sys_id remains the same. The corresponding target records will be created in the Target [sn_gf_goal_target] table. Creates the existing relationship between the goal and work items (Project, Demand, Program) in the Goal Relationship [sn_gf_goal_m2m_relationship] table with the first goal (from the order in the glide list) as the primary goal.
migrateStrategyData	Migrates all existing strategy records from the Enterprise Strategy [enterprise_strategy], Business Unit Strategy [business_unit_strategy], and Strategic Objective [strategic_objective] tables to the Strategic Priority [sn_gf_strategy] table. The sys_id remains the same.

Scheduled Script Execution form (continued)

Parameter	Description
migratingGoalStrategyM2Mdata	<p>In Goal Framework, a goal can be mapped to only one strategy. If an existing goal has two strategies mapped to it, a clone of the goal will be created (one as a generic goal and another as a sub-goal) with the same strategy populated for both. And, for the sub-goal, the first goal will be set as the parent goal.</p> <p>For example, consider a scenario where an existing goal (G1) is mapped to five strategies (S1, S2, S3, S4, and S5). Then, four clones of G1 will be created as sub-goals (G2, G3, G4, and G5) and the parent goal is populated as G1. For the parent goal (G1) and the sub-goals (G2, G3, G4, and G5), the Strategy field is populated respectively (S1, S2, S3, S4, and S5).</p> <p>Note: The name of the cloned sub-goal will be prefixed with <code>Cloned SubGoal :</code>, followed by the parent goal name.</p>
migrateStrategyWorkItemRelData	<ul style="list-style-type: none"> • Migrates the existing relationship of strategy and work items (Project, Demand, Program) to the Goal Relationship [sn_gf_goal_m2m_relationship] table. • If a goal doesn't have an association between the strategy (as current strategy) and the work item in the Goal Relationship [sn_gf_goal_m2m_relationship] table, a dummy goal will be created with a strategy value of current strategy. And, a goal relationship is created with the dummy goal and the work item in the Goal Relationship [sn_gf_goal_m2m_relationship] table. <p>Note: The name of the dummy goal will be prefixed with <code>Goal :</code>, followed by the strategy name.</p>

Migrate goal relationships for assigned entities

Use the **Migrate goal relationships for assigned entities** job to populate the fields, **Assigned entity type** and **Assigned entity** on the [Goal form](#) based on the existing values in the legacy fields, **Business Unit**, **Department**, **Company**, **Portfolio**, and any customized entity field.

Scheduled Script Execution form

Parameter	Description
Migrate goal relationships for assigned entities	<p>(For Strategic Planning users) Populates the fields, Assigned entity type and Assigned entity on the Goal form based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table if you've created an m2m relationship with lens entities other than Company, Business Unit, Department, and Portfolio.</p>

Scheduled Script Execution form (continued)

Parameter	Description
	<p>If users had already created m2m relationship, they may use this script to move those relationships from the m2m table to the goals table to access and manage those goals in the respective portfolio plans.</p> <p>If the goal has only one relationship with an assign entity table type, the Assign entity type and Assign entity fields are populated on the Goal [sn_gf_goal] table based on the Goal Relationship [sn_gf_goal_m2m_relationship] table.</p> <p>If the goal has multiple relationships with an assign entity table type, number of relationships (n) cloned sub-goals will be created and the Assign entity type and Assign entity fields are populated on the Goal [sn_gf_goal] table based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table for each cloned sub-goal.</p>

Strategic Plan form

Use the Strategic Plan form to define the purpose of your organization, its strategic priorities, and the associated goals.

Strategic Plan form

Field	Description
Name	Name of the strategic plan.
Sponsor	Sponsor for the strategic plan.
Start date	Start date for the strategic plan.
End date	End date for the strategic plan.
Description	A detailed description of the strategic plan.
Vision	A brief description about where your organization’s business will be at some point in the future, based on its strategies and associated goals.
Mission	A brief description about what your organization’s objectives are and its approach to reach those objectives.

Related topics

[Enterprise strategy example](#)

Strategic Priority form

Use the Strategic Priority form to orient your organization strategic plan toward your goal.

Strategic Priority form

Field	Description
Name	Name of the strategic priority.
Parent	Name of the parent strategic priority that this strategic priority contributes to.
Owner	Owner of the strategic priority. By default, the name of the user creating the strategy is populated.

Strategic Priority form (continued)

Field	Description
Start date	Start date for the strategic priority.
End date	End date for the strategic priority.
Type	<p>Strategic priority type categorizes the strategic priority by its nature and organizational intent. Classifying priorities by type helps your organization distinguish different focus areas within a strategic plan and align goals across different dimensions of your strategy.</p> <p>The available options are:</p> <ul style="list-style-type: none"> • Key Initiative • Shared Vision • Strategic Target • Operating Principle • Relationship Strategy • Environmental • Social • Governance • Artificial Intelligence
Status	Status of the strategic priority. Status can be Red, Yellow, Green, or None.
Strategic Plan	Name of the strategic plan for which this strategic priority is created.
Description	<p>A detailed description of the strategic priority.</p> <p>You can refine strategic priority description using the Refine records skill, if the Now Assist for SPM application is installed.</p>

Target automation script for benefit plans

Use the predefined Benefit Plans script as a target source to automate the actual value of your targets from the benefit plans of relevant work items.

Use the following predefined benefit plans script to configure the target source for your targets. The script fetches the required data for monetary or non-monetary benefit plans and updates the actual value for the target. You can use this script as is or you can also modify it according to your requirement. You can also create context variables and configure them for this target source (Benefit Plans).

```

result = '';
var benefitPlans = new
  GlideRecord(sn_gfa.GFAdvancedConstants.BENEFIT_PLAN_TABLE);
benefitPlans.addQuery('sys_id', 'IN', benefit_plan);
benefitPlans.query();

var nonMonetaryBenefitSum = 0;

```

```

var monetaryBenefitSum = 0;
var hasMonetary = false;
var hasNonMonetary = false;
while (benefitPlans.next() && !(hasMonetary && hasNonMonetary))
{
    if (!gs.nil(benefitPlans.getValue('currency'))) {
        monetaryBenefitSum +=
        parseInt(benefitPlans.getValue('actual_benefit'));
        hasMonetary = true;
    } else {
        nonMonetaryBenefitSum +=
        parseInt(benefitPlans.getValue('nm_actual_benefit'));
        hasNonMonetary = true;
    }
}

if (hasMonetary && hasNonMonetary)
    gs.addErrorMessage(gs.getMessage('The Benefit Plan list can
    contain either monetary or non-monetary benefit plans.'));
else
    result = hasMonetary ? monetaryBenefitSum :
    nonMonetaryBenefitSum;

```

Target Breakdown form

Use the Target Breakdown form to track and measure the progress of the target and its goal.

The form is available when the Goal Framework for SPM application is installed.

Target Breakdown form

Field	Description
Breakdown period	Period of the target breakdown.
Parent breakdown	Year of the target breakdown.
Target	Parent target of the target breakdown.
Status	Status of the target breakdown. The status can be Red , Yellow , or Green .
Breakdown	Breakdown interval specified in the parent target.
Planned target	Target value for the target breakdown.
Actual	Actual value for the target breakdown.
Remark	Remark entered by the user for business justification when updating the actuals.

Target form

Use the Target form to track and measure the progress of the goals.

Some of the fields on the form is available when the Goal Framework for SPM application is installed.

Note:

For Operational Sustainability Workspace and Strategic Planning users, to view the other fields that aren't added to the default view or your custom form view on the form in the workspace, configure the default or custom form layout. For information on how to configure the form layout, see [Configuring the form layout](#).

Target form

Field	Description
Name	Name of the target.
Goal	Name of the associated goal. This field is auto-populated when creating a target from the Targets related list on the Goal form.
Description	Brief description of the target. You can refine target description using the Refine records skill, if the Now Assist for SPM application is installed.
State	State of the target. The state can be Draft, In progress, Approved, Complete, Pending, Achieved, Not Achieved, or Cancelled.
Status	Status of the target. The status can be Red, Yellow, or Green.
Progress	Percentage of target execution that is complete. The value is calculated automatically. If the Type field is set to Maximize , the progress value is calculated using the following formula. <div style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;">$\text{Progress} = (\text{Actual value} - \text{Base value}) / (\text{Target value} - \text{Base value}) \times 100$</div> If the Type field is set to Minimize , the progress value is calculated using the following formula. <div style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;">$\text{Progress} = (\text{Base value} - \text{Actual value}) / (\text{Base value} - \text{Target value}) \times 100$</div> For more information on how the progress value is calculated when weight scale is defined, see progress value calculation .
Impact on goal	A numerical value that represents the importance of the target relative to the other targets of the goal. If there are any sub-goals present, they are also considered for relative weights and consequent progress calculation. By default, the value is (1) Neutral. The available options are: <ul style="list-style-type: none">• (0) No impact• (1) Neutral• (2) Moderate• (3) High• (4) Very high• (5) Maximum

Target form (continued)

Field	Description
	<p>Note: This field is available only when the sn_gf.weighted_average_enabled system property is set to Yes.</p>
Assigned entity type	Entity type to which the target is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	Entity to which the target is assigned.
Owner	Owner of the target. By default, the name of the user creating the target is populated.
Contributors	Users who contribute to the achievement of the target. By default, the contributors of the associated goal are populated.

Duration section of the Target form

Field	Description
Start date	Start date for the target. By default, the start date of its associated goal is populated.
End date	End date for the target. By default, the end date of its associated goal is populated.

Metrics section of the Target form

Field	Description
Unit of measure	Measure type for the specified value. Usage of the measure such as cost, time, and rate. The available measure types are stored in the Units [sn_gf_units] table. Unit of measure defines the type of the target as qualitative or quantitative. The available unit of measures for quantitative target are # , \$, % , and Days . The available unit of measure for qualitative target is Yes/No .
Type	<p>Target type that signifies the direction of achievement.</p> <ul style="list-style-type: none"> • Maximize: The direction of the progress is toward the target value from the base value where the base value must be less than the target value. • Minimize: The direction of the progress is toward the target value from the base value where the target value must be less than the base value. • Milestone: Fixed type. Only the qualitative target values are allowed (that are set in the Unit of measure field for the target)

Metrics section of the Target form (continued)

Field	Description
	<p>to capture the achievement of the target. The Milestone option is applicable only for qualitative targets.</p> <p>The Type field becomes read-only with the value populated as Milestone for qualitative targets (when the Unit of measure field is set to a qualitative target value).</p>
Start value	<p>Start value of the target. The start value can also be considered as the present or current value.</p> <p>This field becomes read-only when a value is entered in the Actual value field. Clear the Actual value field to update a value in the Base value field.</p> <p>This field is available when the Type field is set to Maximize or Minimize.</p>
Final target value	<p>Final target value of the target. The target value should be aspirational and should challenge the teams.</p> <p>This field is available when the Type field is set to Maximize or Minimize.</p>
Baseline reference	<p>Past achievement of the target to provide reference for future performance. This value is only for reference purpose and not considered for target progress calculation.</p>
Actuals to date	<p>Actual value of the target at a given time.</p> <p>This field is available when the Type field is set to Maximize or Minimize.</p>
Check-in frequency	<p>Option to specify breakdown intervals for the target and how frequently the owner or contributor should update the actual value of the target. Breaking down the target into smaller periods helps you set a target for smaller periods and focus on the specific breakdown targets. The available options are Daily, Weekly, Monthly, Quarterly, and Yearly. Target breakdowns are automatically created when you set this field to any of the available options other than None. For more details on target breakdowns, see Target breakdowns in Strategic Planning.</p>

Metrics section of the Target form (continued)

Field	Description
	<p>Note: The target breakdowns feature isn't supported for qualitative targets.</p>
Target value distribution	<p>Option to specify the target to be calculated cumulatively or non-cumulatively. The available options are Split equally across the time period (non-cumulative) and Spread linearly across the time period (cumulative).</p> <p>This field is available only when the Check-in frequency field is set to any of the available options other than None.</p>
Remark	Remark entered by the user for business justification when updating the actuals.
Check-in due date	Due date that the owner or contributor of the target must update the actual value of the target to.
Confidential	<p>Option to restrict the access for this target record to the specific users populated in the Allowed groups and Allowed users fields.</p> <p>This field is available when the ESG Management application is installed and the <i>sn_grc.enable_record_confidentiality</i> property is enabled. This field is applicable only when the Classification field in the goal form of the target is populated as Environmental, Social, or Governance. The required role to configure this field is <code>sn_esg.reader</code>.</p> <p>Note: Irrespective of the target record set to confidential or not, the target progress value rolls up to its goal for calculating the progress value of the goal.</p>
Allowed groups	<p>User groups who can access the target record. This field is applicable only for the Operational Sustainability Workspace users.</p> <p>Even though a user group is populated in this field, the users can access the confidential record only if the user group has the <code>sn_esg.reader</code> role.</p> <p>This field is available when the Confidential field is set to true.</p>

Metrics section of the Target form (continued)

Field	Description
Allowed users	<p>Users who can access the target record. This field is applicable only for the Operational Sustainability Workspace users.</p> <p>Even though a user name is populated in this field, the user can access the confidential record only if the user has the sn_esg.reader role.</p> <p>This field is available when the Confidential field is set to true.</p>
Comments	Detailed comments for the target to facilitate collaboration.

Target Automation section of the Target form

Field	Description
Automate actual value	Option to enable the target automation feature for the target.
Actual value source	<p>Target source table that the data is fetched from to auto-update the actual value of the target on the target's review due date.</p> <p>This field is available when the Automate actual value field is set to true.</p>

Variables section of the Target form

This section appears based on the context variables available in the target source that is selected in the **Actual value source** field.

When you select Actual value source as Benefit Plans ([predefined target automation script for benefit plans](#)), the **Benefit Plan** field appears in this section, from which you can select the required benefit plans for automating the actual value of the target.

Note:

You can use the Benefit Plans custom script only when PPM Standard (Project Portfolio Management) is installed. If you can't find the benefit plan that you want to select, you can find and select the same from Heisenberg UI by navigate to **Enterprise Goal Management > Targets** and opening the Target form.

Target Source form

Use the Target Source form to create and configure a source for your targets so that the actual value of the target is auto-updated.

Target Source form

Field	Description
Name	Name of the target source.
Active	Option to activate this target source for use.
Type	Type of target source. Available options: <ul style="list-style-type: none"> • Assessment/Survey • PA Indicator • Custom script
Advanced	Enables the Custom script option for the target source type Assessment/Survey with the pre-defined script. This field is available when the Type field is set to Assessment/Survey .
Assessment metric type	Assessment metric type for the target source.  Tip: A context variable is automatically created for the target source if the field is populated with a metric type of Evaluation method = Assessment. This field is available when the Type field is set to Assessment/Survey .
Assessment metric category	Assessment metric category for the assessment metric type. This field is available when the Type field is set to Assessment/Survey .
Description	Brief description of the target source.
PA Indicator	PA Indicator for the target source. This field is available when the Type field is set to PA Indicator .
Breakdown	Breakdown for the PA Indicator. This field is available when the Type field is set to PA Indicator .
Custom script	Custom script to fetch the required data from any ServiceNow AI Platform table for the target source. This field is available when the Type field is set to Custom . Or, when the Type field is set to Assessment/Survey and the Advanced field is set to true .

Domain separation and Goal Framework

Domain separation is supported for Goal Framework and Goal Framework for SPM. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#) .

How domain separation works in Goal Framework and Goal Framework for SPM

After you enable domain separation on your ServiceNow instance, the Goal Framework and Goal Framework for SPM data is automatically domain separated. The goals and targets data of portfolio plans for different domains are visible to only those users who have access to these domains.

Data Separation

The ServiceNow[®] Data Separation application helps organizations restrict access to sensitive data based on a lens hierarchy and its leaf node.

Note:

This application is no longer deployed, enhanced, or supported. For details, see the [Deprecation Process \[KB0867184\]](#)  article in the Now Support Knowledge Base.

Alternatively, you can use Data Filters and access control lists (ACLs) to configure data separation for your use cases. For details on how to enable data separation for different use cases using data filters and ACLs, see the [Managing data separation using data filters and ACLs \[KB0558290\]](#)  article in the Now Support Knowledge Base.

Data separation supports records, related items, planning consoles, workbenches, and reports.

Note:

Currently, data separation is supported only for ServiceNow[®] Project Portfolio Management.

Alternatively, you can define data filters along with other configurations to restrict access to sensitive data (enable data separation). For details on how to enable data separation for different use cases using data filters and ACLs, see the [Managing data separation using data filters and ACLs \[KB1772519\]](#)  article in the Now Support Knowledge Base.

Exploring Data Separation

Learn about the features, configuration, and benefits that Data Separation provides.

Data Separation overview

Data Separation helps you restrict data in ServiceNow[®] Strategic Portfolio Management based on a lens hierarchy and its leaf node. The leaf node is the bottom-level entity in a lens hierarchy. For example, if the Organization lens is used for data separation, the leaf node would be Department for the base system lens.

You can enable Data Separation on select Demand, Project, Resource Plan, and Cost Plan entities, as needed. Also, you can enable Data Separation on select Cost Plan Breakdown and Project Task related entities.

Data Separation supports records, related items, planning consoles, workbenches, and reports.

Note:

Access control list (ACL) and query Business Rule (BR) limitations apply even when Data Separation is enabled. For example, reports with aggregate numbers may not be data separated.

Data Separation applies even on child projects and sub-tasks based on the Data Separation that is configured for the parent project or task.

Data Separation key components

- **Hierarchy:** Defines the hierarchy for enabling Data Separation using a lens and its leaf node.
- **Supported Entities:** Enables Data Separation on select entities and related entities, as needed.
- **Entity-Group Mapping:** Defines entity-group mappings between a business area and user group.

Features

You can use the Data Separation features to do the following:

- Configure a data separation hierarchy using a lens hierarchy and its leaf node.
- Enable data separation on select entities and related entities, as needed.
- Create as many entity group mappings as required to restrict data to specified user groups.
- Grant access for the users who always need access to sensitive data by assigning the data separation privileged user (sn_ds.ds_privileged_user) role.

How Data Separation works

The following is the process flow for restricting access to the sensitive data in Strategic Portfolio Management using Data Separation.

- A lens is selected for defining a hierarchy for Data Separation. The Data Separation admin can modify the hierarchy of the lens for data separation as needed.
- The required entities and related entities are enabled for Data Separation.
- An entity group mapping is created for each business group (where the business group could be a business unit, department, or company) that defines the set of users that the access is restricted to.
- The data of the business group is then restricted for the enabled entities only to the users that are part of the user group populated in the entity-group mapping record.

Examples data separation**Example 1**

Consider a scenario where:

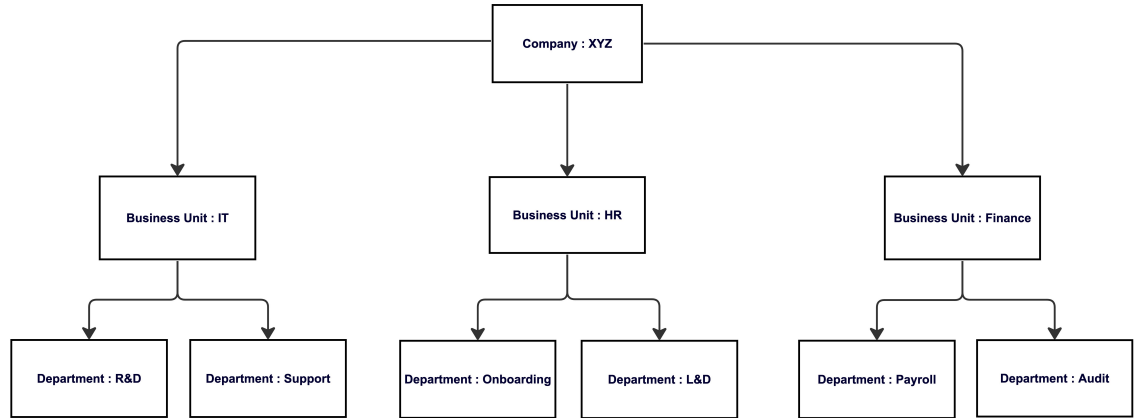

- The Data Separation hierarchy is defined using the Organization lens and the lens structure is Company, Business Unit, and Department (from top-to-bottom).
- The entity mapping is created for the HR department (Department : HR) with the group HR leads.
- Data Separation is enabled for the Demand and Project entities.

In this case, no user can access the project and demand records of the HR department except the users that are part of the HR leads group. However, all users

(based on the ACLs that the user currently has) can access other records (for example, the resource plan and cost plan) of the HR department.

Example 2

The Company XYZ has a data separation-enabled lens structure as shown in the following image and wants to restrict data to specific groups based on different use cases. Also, all the supported entities are enabled for Data Separation. The following use cases help you understand how Data Separation works and how to configure Data Separation for different use

cases.

- **Case 1: Restrict data of the Payroll department to the Payroll managers**
 You can restrict data for this case by configuring Data Separation as follows:
 - Create a Payroll managers user group.
 - Create an entity-group mapping for the Payroll department with the lens entity record (Department : Payroll) and the Payroll managers user group.
- **Case 2: Restrict data of the HR business unit (both the Onboarding and L&D departments) to the HR leads**
 You can restrict data for this case by configuring Data Separation as follows:
 - Create an HR leads user group.
 - Create an entity-group mapping for the HR business unit with the lens entity record (Business Unit : HR) and the HR leads user group.
- **Case 3: Restrict data of the entire organization to the Organization leads**
 You can restrict data for this case by configuring Data Separation as follows:
 - Create an Organization leads user group.
 - Create an entity-group mapping for the Company XYZ with the lens entity record (Company : XYZ) and the Organization leads user group.

Configuring Data Separation

As an administrator, you can install Data Separation and assign the Data Separation roles to the required users.

Configuration workflow

A Data Separation administrator can define Data Separation hierarchy, enable entities, and map user groups for Data Separation.

Guided setup to configure Data Separation

Guided setup provides a sequence of tasks to help you with the required configuration on your ServiceNow instances. After installing Data Separation, navigate to **All > Data Separation > Guided Setup** to configure Data Separation.

Install Data Separation

You can install the Data Separation application (sn_ds) if you have the admin role.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .
- Data Separation requires the following plugin and store application. Ensure that the following plugin and application is activated before you install Data Separation.

Required ServiceNow plugin

PPM Standard plugin (com.snc.financial_planning_pmo)

Activate the PPM Standard plugin (com.snc.financial_planning_pmo) in your ServiceNow instance before you install Data Separation.

For more information see, [Activate PPM Standard \(Project Portfolio Management\)](#).

Required ServiceNow Store application

Portfolio Planning (sn_align_ws)

Install the Portfolio Planning (sn_align_ws) application in your ServiceNow instance before you install Data Separation. For more information see, [Install Portfolio Planning](#).

Role required: admin

About this task

The following items are installed with Data Separation:

- Plugins
- Roles
- Tables

For more information, see [Components installed with Data Separation](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Data Separation application (sn_ds) using the filter criteria and search bar.

You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. In the Application installation dialog box, review the application dependencies.

Dependent plugins and applications are listed if they'll be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Data Separation.

4. Select **Install**.

Assign roles for managing Data Separation

Assign Data Separation roles to user groups and to individual users based on user activities and responsibilities.

Before you begin

Role required: admin

About this task

You can assign roles to individual users or groups. Applying roles to a group gives access to all the members of the group. For more information on roles installed with Data Separation, see the Roles installed table in [Components installed with Data Separation](#).

Procedure

1. Navigate to **All > Data Separation > Guided Setup**.
2. Select **Get Started**.
3. Select **Assign roles** from the tasks list.
4. Select the required role (sn_ds.ds_admin or sn_ds.ds_privileged_user), select **Configure**, and assign the role to a user or user group.

What to do next

Configure a data separation hierarchy for enabling Data Separation. For more information, see [Configure a lens for enabling Data Separation](#).

Configure a lens for enabling Data Separation

Configure a data separation hierarchy for enabling Data Separation using a lens hierarchy and its leaf node.

Before you begin

Role required: sn_ds.ds_admin

About this task

Note:

Only one lens can be enabled for Data Separation at a time.

Procedure

1. Navigate to **All > Data Separation > Hierarchy**.
The Lenses list view opens with the available lenses for data separation.
2. Open the lens record that you want to use as a hierarchy for configuring Data Separation.

3. On the Lens form, select **Data separation enabled**.
For a description of the field values, see [Lens form](#).
4. Select **Update** to save the configuration.
5. Navigate to **All > Data Separation > Hierarchy**.
6. From the Lenses list view, select **Sync data separation** to synchronize the lens configuration for Data Separation.

What to do next

Enable Data Separation on select entities as needed. For more information, see [Enable entities for Data Separation](#).

Enable entities for Data Separation

Enable Data Separation on select entities as needed.

Before you begin

Role required: sn_ds.ds_admin

About this task

You can enable Data Separation on the following entities and related entities.

- Entities:
 - Demand [dmn_demand]
 - Project [pm_project]
 - Resource Plan [resource_plan]
 - Cost Plan [cost_plan]
- Related entities:
 - Cost Plan Breakdown [cost_plan_breakdown]
 - Project Task [pm_project_task]

Procedure

1. Navigate to **All > Data Separation > Supported Entities**.
The list opens the entities supported for Data Separation.
2. Open each Supported Entity record that you want to enable Data Separation for.
3. On the form, fill in the fields.

Supported Entity form

Field	Description
Entity	Name of the entity table.
Enable data separation	Option to enable Data Separation for the entity.

4. Select **Update** to save the configuration.
5. Navigate to **All > Data Separation > Supported Entities**.

- From the Supported Entities list view, select **Sync data separation** to synchronize the entity configuration for Data Separation.

Note:

The related Cost Plan Breakdown and Project Task entities can be enabled only if the Cost Plan and Project parent entities are enabled respectively.

What to do next

Map a user group for Data Separation. For more information, see [Map a user group for Data Separation](#).

Map a user group for Data Separation

Map a user group for Data Separation to restrict data only to the specified users of a group and sub-groups.

Before you begin

Role required: sn_ds.ds_admin

About this task

You can create only one entity-group mapping per lens entity record.

For example, the following image shows that the leaf node is a Department and that IT is one of the departments. You want to restrict the data of the IT department to a specific group. Then, create an entity-group mapping for the IT department with the required user group.

Lens entity record	Group	Active	Is data synced
Search	Search	Search	Search
Department: HR	HR Group	true	true
Department: IT	IT Group	true	true

If you want to grant access to the data of the IT department for more than one group, create a parent user group and add all the other groups as sub-groups under the parent group. Then you can map the parent group in the entity-group mapping record of the IT department.

Note:

If you want to grant access to the data of all departments for a user group, create an entity-group mapping with the parent entity of the department entity. Alternatively, you can also create one entity-group mapping per department for the user group.

Procedure

- Navigate to **All > Data Separation > Entity-Group Mappings**.
- Select **New**.
- On the Entity-Group Mapping form, fill in the fields.
For a description of the field values, see [Entity Group Mapping form](#).
- Select **Submit** to save the record.

5. Navigate to **All > Data Separation > Entity-Group Mappings**.

6. From the Entity-Group Mappings list view, select **Sync data separation** to synchronize the entity-group mappings for Data Separation.

Result

The data is restricted to the user group populated in the entity-group mapping record for the enabled entities.

Synchronize Data Separation

Synchronize Data Separation when the configuration is changed in the lens, supported entities, or entity-group mappings tables.

Before you begin

Role required: sn_ds.ds_admin

About this task

The **Is data synced** field value must be **true** for all records of the Data Separation configuration (lens, entities, entity-group mappings) to restrict the data according to the Data Separation configuration. If the **Is data synced** field value for any part of the configuration record is **false**, the data separation isn't synchronized.

The **Is data synced** field value is **false** only when any of the configurations for Data Separation are changed.

Procedure

Perform the following steps to synchronize data separation depending on the type of configuration change made in Data Separation.

For this configuration change	Perform these steps
<ul style="list-style-type: none"> • Data Separation is turned off on the existing lens and then enabled again on the same lens • Data separation is turned off on the existing lens and then enabled again on another lens 	<ol style="list-style-type: none"> a. Navigate to All > Data Separation > Hierarchy. b. From the Lenses list view, select Sync data separation to synchronize the lens configuration for Data Separation.
<p>Data Separation is enabled or turned off for an entity</p>	<ol style="list-style-type: none"> a. Navigate to All > Data Separation > Supported Entities. b. From the Supported Entities list view, select Sync data separation to synchronize the entity configuration for Data Separation.

For this configuration change	Perform these steps
A group is added, removed, or updated for an entity-group mapping record	<p>a. Navigate to All > Data Separation > Entity-Group Mappings.</p> <p>b. From the Entity-Group Mappings list view, select Sync data separation to synchronize the entity-group mappings for Data Separation.</p>

Data Separation reference

Reference information to provide additional details about Data Separation such as the fields, user roles, tables, guidelines, and Data Separation information.

Components installed with Data Separation

Several types of components are installed with activation of the Data Separation plugin, including user roles and tables.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Roles installed

Role	Description	Contains roles
sn_ds.ds_admin	Can create/update/delete records in the tables required to configure the Data Separation feature.	sn_align_core.ap_read_only
sn_ds.ds_privileged_user	Can create/update/delete records of any business function in Strategic Portfolio Management, even when Data Separation is enabled.	None

Tables installed

Display name [Table name]	Description
Supported Entity [sn_ds_data_separation_config]	Stores the entity details (Demand, Project, Resource Plan, Cost Plan, Cost Plan Breakdown, and Project Task) for enabling Data Separation.
Entity-Group Mapping [sn_ds_entity_group_mapping]	Stores the lens entity and user group details for Data Separation.

Data Separation limitations

There are some types of data that Data Separation doesn't work for even when Data Separation is enabled.

The Data Separation limitations are as follows:

- Data Separation supports only Project Portfolio Management and a subset of the Project Portfolio Management tables.
- Access control list (ACL) and query business rules (BR) apply even when Data Separation is enabled. For example, reports with aggregate numbers may not be data separated.
- Data Separation may have performance impacts to some extent.

Entity Group Mapping form

Learn about the fields of the Entity Group Mapping form. Use this form to define an entity group mapping that enables Data Separation for the selected entity group and user group.

Entity-Group Mapping form

Field	Description
Lens entity table	Name of the lens entity table. For example, Business Unit, Department, or Company.
Active	Indicates if the entity-group mapping is active.
Lens entity record	Brief description of the lens. Entity group on which Data Separation is enabled.
Group	User group that the data of the selected entity is restricted to.

Lens form

Learn about the fields of the Lens form. Use this form to enable data separation based on the lens hierarchy and its leaf node.

Lens form

Field	Description
Name	Name of the lens.
Active	Indicates if the lens is active.
Description	Brief description of the lens. You can indicate the business purpose of this lens and the planning managers that would use this lens.
Planning items	Type of work that can be planned using this lens. Move the desired planning item types from the Available list to the Selected list.
Bottom entity on planning item	Bottom entity in the lens hierarchy.
Data separation enabled	Option to enable data separation using the lens hierarchy.

Supported tables for Data Separation

Several types of tables are supported for Data Separation, including direct and indirect related tables for each entity.

You can enable data separation on the following entities and related entities.

- Entities:
 - Demand [dmn_demand]
 - Project [pm_project]
 - Resource Plan [resource_plan]
 - Cost Plan [cost_plan]
- Related entities:
 - Cost Plan Breakdown [cost_plan_breakdown]
 - Project Task [pm_project_task]

Domain separation and Data Separation

Domain separation is supported for Data Separation. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#) .

Project Portfolio Management

ServiceNow® Project Portfolio Management (PPM) provides a simplified, team-oriented approach to managing projects, portfolios, their resources and financials by combining several individual applications.

Customers who already have Project Portfolio Management can upgrade to [PPM Standard](#). New customers must purchase PPM Standard.

Get started

 <p>Innovation Management</p>	 <p>Demand Management</p>	 <p>Project Management</p>
 <p>Resource Management</p>	 <p>Portfolio Management</p>	 <p>Program Management</p>
 <p>Timecard Management</p>	 <p>PPM Analytics and Reporting</p>	 <p>PPM reference</p>

Troubleshoot and get help

- Ask or answer questions in the [Strategic Portfolio Management forum on the ServiceNow Community](#) 
- [Search the Known Error Portal for known error articles](#) 
- [Contact Customer Service and Support](#) 

Explore Project Portfolio Management

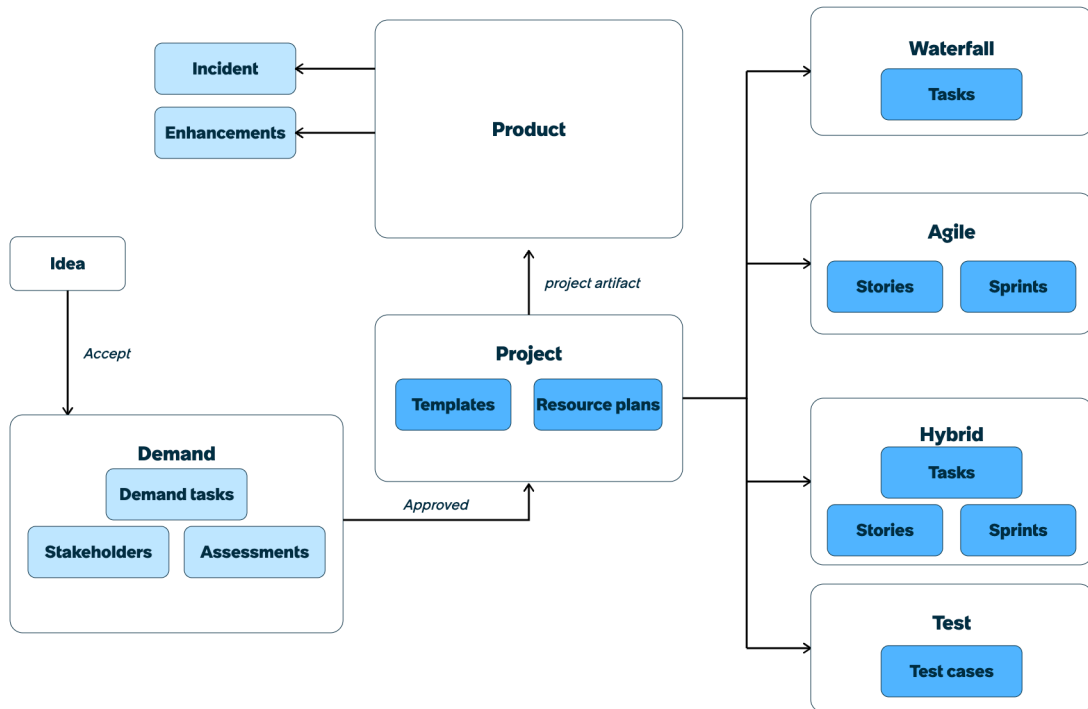

Learn more about Project Portfolio Management (PPM) with a sample workflow and review the benefits it can provide for different users in your organization.

Project Portfolio Management overview

PPM is a collection of multiple applications that help you analyze and approve ideas and demands, convert them to projects and manage them through completion. You can manage resources and financials of individual projects or the ones that are rolled up to a program or portfolio. PPM enables your teams to plan and execute work in traditional waterfall methodology or combine an Agile approach to execute using a hybrid methodology.

Project Portfolio Management workflow

Project execution in a Waterfall, Agile, or Hybrid approach using PPM

The project manager (project_manager role) includes all the manager roles for the applications included in the PPM suite.

Project Portfolio Management benefits

Benefit	Feature	Users
Gather and evaluate of ideas and promote accepted ideas to demand, story, epic, or project.	Innovation Management	Project Teams, Demand Manager
Assessing, approve, and promote demands to strategic and operational demands.	Demand Management	Demand Manager
Manage projects, tasks, and resources.	Project Management	Project Manager, Project Team
Manage programs, the projects under a program and its tasks.	Program Management	Program Manager
Manage your projects and programs of different portfolios.	Portfolio Management	Portfolio Manager
Create resource plans and request resources.	Resource Management classic	Resource Manager
Track time on a daily basis against tasks	Time Card Management	
Gain visibility into the status and health of programs, projects, and demands.	Project Portfolio Management Platform Analytics Solutions	Project, Program, or Portfolio Manager or Business stakeholder

Integration with Digital Portfolio Management

Digital Portfolio Management (DPM) provides a unified workspace for owners to view and collectively manage their services and applications through the full life cycle. Installing DPM and Project Portfolio Management enables the integration with Project Management and Demand Management. With this integration, DPM managers can view project data that may impact a business application and create demands on a business application in DPM.

For more information, see [Exploring Digital Portfolio Management](#) .

Domain separation

Domain separation provides complete data isolation for domain-specific users. Project Portfolio Management supports domain separation with a few limitations. For more information, see [Domain separation and Project Portfolio Management](#).

PPM Standard (Project Portfolio Management)

The ServiceNow[®] PPM Standard, earlier known as Project Portfolio Suite with Financials, application integrates Financial Management and Project Portfolio Management.

PPM Standard automatically activates Financial Management if it is not already active.

The integration enables project and portfolio managers to perform the following activities:

- Determine overall cost requirements for all demands and projects in portfolios
- Establish resource requirements and track costs for demands and projects
- Track actual amounts spent compared to an approved budget

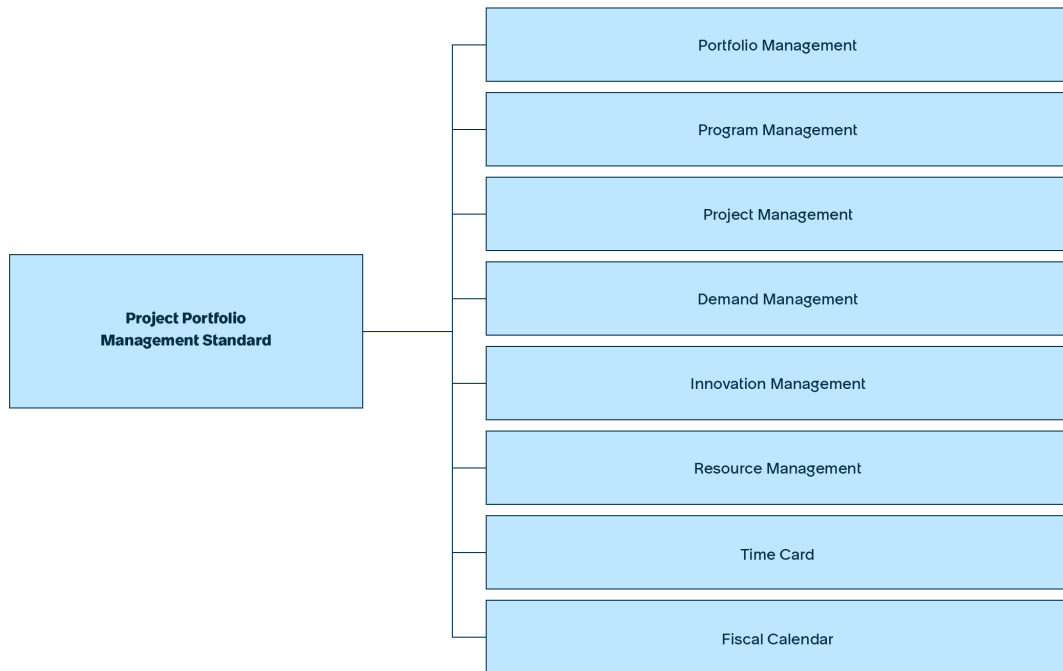

Upgrades and new customers

Customers who already have Project Portfolio Suite with Financials can upgrade to PPM Standard. New customers must purchase PPM Standard.

PPM Standard applications

The PPM Standard plugin installs Financial Management and Project Portfolio Suite. The following diagram illustrates the applications that are available.

Applications installed with PPM Standard

PPM Standard additions

PPM Standard adds the portfolio workbench, that you can use to perform all aspects of financial planning. You can also perform financial planning and budgeting using UI actions on related lists.

Get started with project management

PPM Standard provides comprehensive capabilities for project planning and execution. Use the following topics to get started:

- **Project creation and planning:** Create projects, define work breakdown structures, set milestones, and plan timelines. See the Project Management documentation.
- **Resource management:** Allocate resources to projects, manage capacity, and track utilization. See [Resource Management Workspace](#).
- **Financial planning:** Create cost plans, track budgets, and manage investment funding.
- **Portfolio management:** Prioritize demands, manage portfolios, and track portfolio performance. See [Portfolio Management](#).
- **Installed components:** Review the roles, tables, and configurations installed with PPM Standard. See [Roles installed with PPM Standard](#).

Activate Investment Funding for projects and demands

Activate the Investment Funding (com.snc.investment_funding) plugin if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Ensure that the PPM Standard (com.snc.financial_planning_pmo) plugin is installed.

Role required: admin

About this task

The Investment Funding (com.snc.investment_funding) plugin enables you to request or allocate funds for your projects and demands.

The plugin activates the related plugins if they are not already active. It also adds the sn_invst_pln_investment_user role to the following roles:

- project_manager
- demand_manager
- portfolio_manager
- program_manager

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#).

Currencies and budget reference rates

The support for use of multiple currencies provides conversions for budget items in different currencies.

Currency support

The application can use a base currency, also called the reporting currency that you [specify with system properties](#). You can also specify other currencies for budgets and budget items.

Currency usage

Item	Currency used
Budget plan	A currency that you specify on the Budget Plan form. When the plan is converted to a forecast, the application converts the currency to the reporting currency.

Currency usage (continued)

Item	Currency used
Budget plan items	A currency that you specify on the Budget Item form. If the budget plan item has currency different from the budget plan currency, the budget plan item amount is converted to the budget plan currency.
Budget forecast	The reporting currency.

Budget reference rates

Budget reference rates are exchange rates between currencies. Each reference rate is valid for a specified time period. The application uses budget reference rates when budget items are in a different currency from the budget plan and forecast. The application automatically converts budget item currency values to a global system currency value when it calculates the Budget Amount on a Budget Plan, and when it shows values on budget forecasts.

Note:

Currency support is for budgets only. You cannot create allocations in multiple currencies.

Test Management 2.0 integration with Project Portfolio Management

Test Management 2.0 integration with Project Portfolio Management enables you to carry out testing activities on projects.

After activating both the Test Management 2.0 and Project Portfolio Management applications, you can:

- Add a test phase to a project.
- Assign a test execution suite to the test phase.
- View the tests associated with the test execution suite.
- Assign tests to testers.
- Perform tests and record results.
- Track the progress using the **Percentage complete** field in the timeline.

As testers perform tests and record results, the information is updated to the test, test phase, and then to the project.

Note:

If you're an existing user, the integration between Project Portfolio Management and Test Management 1.0 continues to work the same. You can still create test phases, associate test phases to a test plan, and perform testing activities.

Agile Development 2.0 integration with Project Portfolio Management

Project Portfolio Management leverages the Agile Development 2.0 application to combine the Scrum methodology with project-based IT development.

IT organizations typically work on multiple projects with shorter time schedules. The project planning and tracking is done using waterfall, but the group prefers scrum methodologies to carry out their work. It then becomes a challenge to track project status when there is an agile development phase. This integration between Agile Development 2.0 with Project Portfolio

Management facilitates a combination of waterfall and agile methods for project management and development.

The flow described below is applicable when Agile Development 2.0 is activated along with Project Portfolio Management.

- Create a group to represent a Scrum team.
- Add members to the group.
- Create sprints.
- Assign groups to projects from the Project Workbench.
- Maintain group and project backlogs. Multiple projects can be under development and groups can be assigned to multiple projects. Each project and each group has its own backlog. The project backlog includes all stories related to a project. The group backlog includes stories from multiple projects that have been assigned to the group.
- Perform group sprint planning. The group refines the combined backlog, ranks the stories and assigns points, and adds stories to sprints based on priority.
- Create stories, including one-off stories that are not related to projects.
- Track progress in stories, phases, and projects.

Create and manage agile projects

An overview of the tasks involved in creating an agile project.

The following tables, arranged by task group, list the tasks involved in creating an agile project.

Set up a development group

Task	How do I do this?
Define an Agile group	Navigate to Agile Development > Create Agile Group and click New .
Add group members	Navigate to the Group members related list on the Group form and click Edit .
Decide the capacity of a group	Navigate to Agile Development > Groups , select the desired group, and enter a number in the Group capacity (points) field.

Create sprints

Task	How do I do this?
Create a sprint	Use the Create Sprints related link on the Group form to create multiple sprints or use the Sprints related list to create individual sprints.
View the created sprints	Use the Sprints related list on the Group form.

Create a new project

Task	How do I do this?
Create a project	<ul style="list-style-type: none"> • Navigate to Project > Projects > Create New. • Navigate to Project > Projects > Project Workspace and click New Project.

Open an existing project

Task	How do I do this?
Open an existing project	<ul style="list-style-type: none"> • Click the Project Workspace related link on the Project form. • Navigate to Project > Projects > Project Workspace and select the project from the Select Projects choice list in the workspace header.

Add phases to a project from the project workbench

Task	How do I do this?
Create an agile phase for a project	<p>Click the Add phase icon () and select Agile from the Phase Type choice list.</p> <p>Note: This option appears only when both the Project Portfolio Management and Agile Development 2.0 applications are installed.</p>
Create a test phase for a project	<p>Click the Add phase icon () and select Test from the Phase Type choice list.</p> <p>Note: This option appears only when both the Project Portfolio Management and Test Management 2.0 applications are installed.</p>

Add details to a project phase from the project workbench

Task	How do I do this?
View phase details in list view or VTB	Click the List or VTB button in the project workbench header.
Assign a group to an agile phase	Edit the Agile phase and select a group in the Group field.
Select sprints for an agile phase	Edit the Agile phase, ensure that a group has been assigned, and select a Start Sprint and End Sprint .

Add details to a project phase from the project workbench (continued)

Task	How do I do this?
Create stories for an agile phase	Click the Agile phase in the project workbench and click New in the detail view header.
Refine stories for one project	Click the Manage Stories button to open the Manage Stories dialog box. Note: You can also use the Agile Planning & Tracking related link on the Project form to view your backlog, assign stories to the projects, or create new stories for the project.
Refine stories across multiple projects	Click the Manage Stories related link on Group form.
Assign a group to an agile phase	Click the Agile phase edit icon and select the group from the Group choice list.

Add milestones to a project from the project workbench

Task	How do I do this?
Add milestones to a project	Click the Add phase icon () and then click Milestone at the top of the Add Phase pop-up window.

Plan sprints

Task	How do I do this?
Start sprint planning	Navigate to Agile Development > Groups , open the desired group, and click the Sprint Planning related link.
Add stories to the sprint	Navigate to Agile Development > Groups , open the desired group, click the Sprint Planning related link, and click Create story .

Testing process (Only when Test Management 1.0 is activated)

Task	How do I do this?
Create a test plan	Navigate to Test Management > Test Execution > Test Plans > New .
Add test cases to a test plan	Click the Add Test Cases from Test Suite related link on the Test Plan form.
Assign test cases to testers	Select a user in the Assigned to field on the Test Case form.
Notify testers to start testing	Click the Notify testers to start testing related link on the Test Plan form.
Tester performs tests and submits results	Navigate to Self-Service > My Tests or Self-Service > My Assessments .

Testing process (Only when Test Management 1.0 is activated) (continued)

Task	How do I do this?
Monitor the testing progress	The Test Plans list, Test Plan form, and Test Case form all display results for test cases and individual tests.
Testing sign-off	Click the Sign-off Test Plan related link on Test Plan form.

Testing process (Only when Test Management 2.0 is activated)

Task	How do I do this?
Create a test execution suite	Navigate to Test Management 2.0 > Test Execution Suites , and click New .
Add tests to a test execution suite	Open a test execution suite, and click Add tests . From the Tests list, select the required tests and click Add to Execution Suite .
Assign tests to testers	Open a test execution suite. In the Test execution assignments related list, assign tests to testers. Note: Only the tests in the Ready state can be assigned.
Tester performs tests and submits results	Navigate to Test Management 2.0 > Tests Assigned to me . Select the required tests and click Run .

Define an Agile group

Create an agile assignment group to later assign the work of an agile project.

Before you begin

Role required: admin

About this task

[Assignment groups in Agile Development 2.0](#)

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Click **New**.
3. On the form, fill in the fields:

Group form

Field	Description
Name	Enter the name of the group.
Manager	Select the manager of the group.
Group capacity (points)	Enter the projected capacity of the group in story points for each sprint.
Group email	Email address of the group.
Description	A brief description of the group.

Related links of the Group form

Field	Description
Create Sprints	Access the Create Sprints for Team dialog box. Fill in the fields and then click OK to create multiple sprints for the current group. The new sprints are added to the Sprints related list.
Sprint Planning	Access the Sprint Planning tab on the Agile Board.
Group Velocity	Access a chart which shows how the story points in a project are allotted across sprints.

4. Click **Submit**.

Add group members

Add members to the group who are later assigned tasks of an agile project.

Before you begin

Role required: none

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Open the desired group.
3. Click **New** in the **Group Members** related list.
4. Add the name of the group member in the **Name** field.
5. Select a **Scrum Role** for the group member.
6. Click **Submit**.

Decide the capacity of a group

Decide the capacity of a group based on the historical velocity of the group for each sprint.

Before you begin

Role required: scrum_master

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Open the desired group.
3. Decide the group capacity in points and enter the number in the **Group capacity (points)** field.
4. Click **Update**.

Convert a release team to an agile group

Convert a release team to an agile group to later assign the work of an agile project.

Before you begin

Role required: project_manager

About this task

This section is applicable only if you have upgraded from Agile Development 1.0 to Agile Development 2.0.

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Click the **Convert Release Teams to Groups** related link.
3. Select the team that you want to convert to an agile group.
4. Click **Convert to Group**.

Create a sprint

Create a sprint to plan the work for an agile phase of a project.

Before you begin

Role required: none.

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Open the desired group.
3. Click **New** in the Sprints related list.
4. Fill in the following fields on the Sprint form:
 - **Short description:** Name or a brief description of the sprint
 - **Planned start date:** Start date for this sprint
 - **Planned end date:** End date for this sprint
 - **Group capacity (points):** Projected capacity of the group in story points
5. Click **Submit**.

Create multiple sprints

Create multiple sprints to plan the work for an assignment group.

Before you begin

Role required: none.

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Open the desired team.
3. Click the **Create Sprints** related link to open the Create Sprints for Team dialog box.
4. In the Sprint form, fill in the fields:
 - **Name:** the name of the sprint.
 - **Starting Number:** the number of the first sprint to be created.
 - **Start date:** the start date for the first sprint to be created.
 - **Duration:** the number of days in a sprint.
 - **Number of sprints:** the number of sprints to be created.

5. Click **OK**.

The new sprints are added to the **Sprints** related list on the Team form.

Assign a group to a project

Assign a group to a project so that the group later works on the tasks of the assigned project.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Select your project to open its form.
3. From the **Assignment group** field, select a group to assign this project.
If you don't see the group that you need, work with your admin to create it. See [Define an Agile group](#).
4. Save the project form.

Add stories to a project

Create stories and associate them to a project or add existing stories to your project.

Before you begin

Role required: it_project_manager

About this task

- The stories list displays current active stories. You can create a story from this list or view the story form for a current story. You can also add scrum tasks from the story form and view the story and task progress boards.
- Stories can be associated to projects, but is not mandatory. While creating a story, if a project has only one phase then the story automatically gets tagged to the only phase.
- One-off stories can be created without a link to a product or a project. One-off stories are created with only a short description, and can be assigned to a group.
- Stories can be added to only those projects that have the **Execution type** field set to **Hybrid** or **Agile**.

Procedure

1. Navigate to **All > Projects**.
2. Open a project that you want to add stories.
3. From the Stories related list, select one of the following:
 - **Add Existing** to add existing stories to this project.
 - **New** to create a story and add it to this project.

For information on the form fields, see the descriptions in [Story form](#).

4. Save the project form.

What to do next

- Create scrum tasks for this story. See [Create a scrum task for Agile Development 2.0 stories](#).
- Use the related links and lists of the story for more actions that you can perform. See [Related links and lists for a Story in Agile Development 2.0](#).
- [Add dependencies for Agile Development 2.0 stories](#)
- You can create a story with the same details as this story by using the **Insert** or **Insert and Stay** options from the story additional actions ()

When you use **Insert and Stay**, the form of the newly created story stays open. You can modify the details of the story or create more stories with these details. On the Agile board, the new story is positioned right below the original story. The global rank of the new story is set accordingly.

Note:

Set the `glide.ui.task.insert` and `glide.ui.advance` properties to **true** to access these actions. These actions are not allowed on stories added from the triage board.

Plan sprints

Streamline your sprint planning and completion activities using the **Sprint Planning** tab.

Before you begin

Role required: `scrum_admin`, `scrum_master`, or `scrum_sprint_planner`

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Open the desired group.
3. Click the **Plan Sprints** related link.
The Agile Board, **Sprint Planning** tab appears.
4. Use either of options to view all the active stories assigned to the team, but not assigned to any sprint in the Backlog section.

Note:

- If the backlog contains more than 50 stories, then pagination control appears at the bottom of the list enabling you to navigate to the previous, next, first, or last pages in the list.
 - Rearranging stories in the backlog changes the ranking of stories. Ranks are stored in the `global_rank` column in the Story `[rm_story]` table. When you move a story within a backlog, its rank changes relative to the stories within the same backlog. Thus, if the story exists in some other backlog, its ranking might change but position in the backlog would remain the same.
5. To start a sprint, click **Start** that appears at right-corner of the first or top sprint.
The **Sprint Tracking** tab appears.
 6. To complete a sprint, click **Complete Sprint** that appears at right-corner of the first or top sprint.

- a. Move incomplete stories, if any, to the backlog or a future sprint.
- b. Click **Complete**.
The sprint disappears from the **Sprint Planning** tab and appears in the Sprint list as complete.

Track progress

Track the progress of an agile phase from the Project Workbench timeline.

Before you begin

Role required: none

About this task

Stories are assigned to a project and are tied to an agile development phase in the Project Workbench. As stories are completed, the story points and the story status get rolled up to the sprint and project phase. In turn, the phase gets rolled up to the project.

Procedure

1. Navigate to the Project Workbench timeline.
2. The color in the phase bar increases to show progress and the **Percentage complete** field is updated.

Activate PPM Standard (Project Portfolio Management)

Activate the PPM Standard plugin (com.snc.financial_planning_pmo) if you have the admin role. This plugin installs the Project Portfolio Management applications.

Before you begin

Role required: admin

About this task

The PPM Standard is the basic plugin for the PPM (Project Portfolio Management) applications.

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

i Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears:
Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#) .

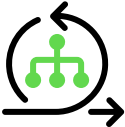

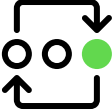

Result

All PPM applications are installed in your ServiceNow instance, along with their user roles and tables. For more information, see [Components installed with Project Portfolio Management \(PPM\) Standard](#).

Innovation Management

The Innovation Management enables you to gather and evaluate ideas efficiently, and to quickly identify and process the ideas with the greatest potential for implementation.

Get started

<p>Explore</p> 	<p>Configure</p> 	<p>Use</p> 
<p>Integrate</p> 	<p>Reference</p> 	

The Idea Portal accelerates and organizes idea gathering, evaluation, selection, and execution. The idea manager or demand manager evaluates submitted ideas and promotes accepted ideas to demands, epics, features, or stories.

Exploring Innovation Management

The Innovation Management application is a central repository to gather and evaluate ideas to determine which ideas are most likely to be implemented.

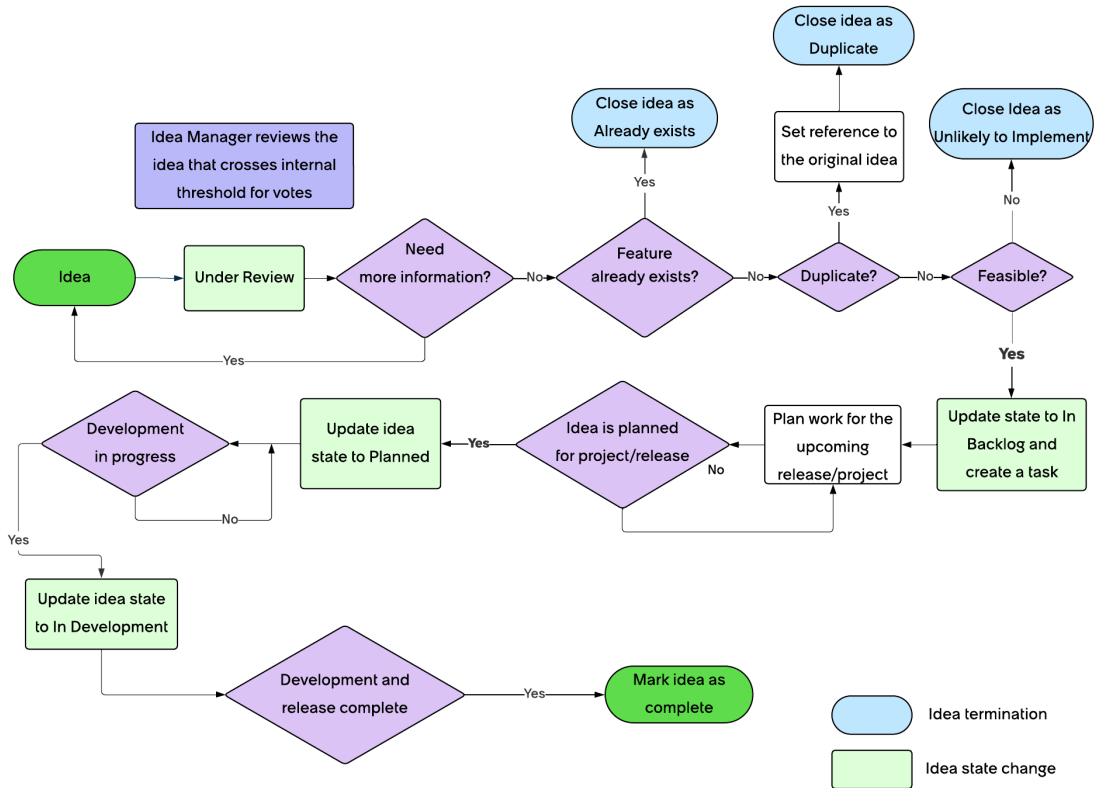

Innovation Management overview

The process of innovation management includes managing an organization's innovation from the initial ideation phase to the final implementation. It includes the decisions, activities, and practices involved in devising and implementing an innovation strategy. The Innovation Management application enables you to submit, track, view, discuss, filter, and vote on ideas.

Innovation Management workflow

The image explains the idea workflow from submitting the idea to completing it.

Idea workflow

Innovation Management benefits

Innovation Management benefits

Benefit	Feature	Users
Collect new ideas for a product, feature in Idea Portal to vote on.	Submit an idea	Users with access to the application.
View, filter, and organize ideas to work upon.	View, filter, and sort ideas	Users with access to the application.
Collaborate through interactive comment boards to exchange information about ideas in a central location.	Collaborate on ideas	idea_manager
Create a task to plan and develop an accepted idea.	Create a task for an idea	idea_manager or idea_manager_professional
Create an Idea module to store and group ideas.	Create an Idea module	idea_admin
Create new idea categories to associate with a submitted idea.	Define new idea categories	idea_admin
Use the Idea Dashboard manager to analyze and review your ideas.	Analyzing idea metrics using Idea Manager dashboard	idea_manager or idea_manager_professional
Create an idea from a universal request and manage your ideas.	Create an Idea from Universal Request	idea_admin

Innovation Management benefits (continued)

Benefit	Feature	Users
Transfer an idea to another department if the idea is rejected or can't be implemented.	Transfer an Idea to another department	Agent to whom the idea is assigned or is a part of the assigned work group.

What to explore next

- [Integrating Innovation Management with Universal Request](#)
- [Innovation Management reference](#)

Predictive Intelligence for Innovation Management

The Predictive Intelligence for Innovation Management capability uses machine-learning algorithms to search and display similar ideas while submitting a new idea.

The PPM Predictive Intelligence Workbench includes a prebuilt use case template that systematically guides you through the process of creating and training new predictive models, evaluating and testing them, and finally adding them to your business process to add value to your Idea, Demand, and Project Management.

Once you train your custom use cases, they are usable immediately. No prior knowledge or experience with artificial intelligence or machine learning is required when you use the PPM Predictive Intelligence Workbench.

The application includes templates with prebuilt guidance to assist you in creating, training, evaluating, testing, and producing your unique predictive models.

Predictive Intelligence for Innovation Management has the following benefits:

- Improves the quality of your idea database by avoiding duplicate ideas.
- Suggests related ideas to help you identify similar ideas and merge duplicate ideas.

Activation information

Activate the following plugins before using the Predictive Intelligence Workbench:

- Predictive Intelligence for PPM (com.snc.ppm_ml) plugin
- Predictive Intelligence for Ideation (com.snc.innovation_management_ml) plugin

Solution definitions for Predictive Intelligence for Innovation Management

The solution definitions for Predictive Intelligence for Innovation Management capability are available in the Predictive Intelligence for Ideation plugin (com.snc.innovation_management_ml). For more information about Predictive Intelligence, see [Predictive Intelligence](#) .

Solution Definition for Innovation Management

Solution Definition	Solution Type	Description
<p>Similar Ideas</p> <p>i Note: This solution definition is available as a template on instances where the following plugins are active:</p> <ul style="list-style-type: none"> • Predictive Intelligence • PPM Standard (com.snc.financial_planning_pmo) • Predictive Intelligence for Ideation (com.snc.innovation_management_ml) 	Similarity	<p>Suggests related ideas based on the Title and Description fields. You can see the results in the following places:</p> <ul style="list-style-type: none"> • The Related Ideas section on the Create an Idea form when creating an idea in the Idea Portal. • The Related Ideas section on the Ideas page in the Idea Portal.

Configuring Innovation Management

Configure Innovation Management application to analyze, track, and promote ideas to a task, demand, or project. This application is available with Strategic Portfolio Management.

Install Idea Manager dashboard

You can install the Idea Manager dashboard application from ServiceNow Store if you have the admin role. This application includes demo data and installs the related plugins if they are not already installed.

Before you begin

i Note:

Starting with version 2.0.0, the Idea Manager dashboard is available in the Next experience UI Framework which can be accessed from Analytics Idea Manager.

- Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .
- If the application requires plugins or other store applications, install them first if they are not already installed. For the Idea Manager dashboard application, the following plugins are required:
 - PPM Standard plugin (com.snc.financial_planning_pmo)

For information on activation steps, see [Activate PPM Standard \(Project Portfolio Management\)](#).

Role required: admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the application using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find an application, you may have to request it from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Result

You can access the Idea Manager dashboard by navigating to **Ideas > Idea Manager Dashboard**.

What to do next

Run the following Performance Analytics data collector jobs before using the Idea Manager dashboard.

- *[PA PPM IMD] Historic Data Collection*: Collects historical data related to ideas and runs on demand to update data for dashboard.
- *[PA PPM IMD] Daily Data Collection*: Collects data for daily indicators and runs daily to update data for dashboard.

[List of plugins \(Zurich\)](#)

Configure idea categories

Map an idea category table with an Idea module to specify the category options listed on the Idea Portal and the create an idea form.

Before you begin

- Role required: `idea_admin`
- Identify the Idea module and idea category table that you want to use.

About this task

Configuring idea category with the Idea module is required to fetch the list of categories in the Idea Portal. If you have created static categories, use the Idea Category `[im_category]` table to configure the mapping between the idea module and idea category table.

Use your existing product or department table to define dynamic idea categories. The dynamic categories are derived from specific columns and fields of the parent table.

Note:

You can map only one category table with an Idea module.

Procedure

1. Navigate to **All > Ideas > Idea Category Config > New.**
2. On the form, fill in the fields.
For more information, see [Idea Category Configuration form.](#)
3. **Optional:** Create filter conditions to determine the idea categories to be listed on the Idea Portal.
4. Select **Submit.**

Configure idea categories for transferring a request as an Idea

Configure idea states to use when directly transferring an HR case, incident, or a custom task from your department as an idea.

Before you begin

Role required: admin

About this task

When an idea is created in the Idea Portal, it must be associated with at least one or multiple categories. Create mapping between your department-specific primary ticket and idea category to be used when a service ticket is transferred as an idea to another department.

Procedure

1. Navigate to **All > Universal Request > Administration > Direct Transfer Configuration.**
2. Follow the steps as described in [Direct transfer mapping](#).
3. Select **Submit.**

Migrating from the legacy Ideas application to Idea Portal

If you are upgrading to the Zurich release, complete the migration tasks after the upgrade to start using the new Idea Portal.

Review the following information and make any necessary changes to your configuration:

Idea States

The new Idea Portal provides new idea states such as Completed, Under Review, and In Backlog, which are mapped with your existing idea states. The following tables provide a comparison to the existing idea states and the equivalent new states with their values.

Legacy Ideas application

Idea State	Value
Draft	-5
Submitted	1
NA	NA
NA	NA
Accepted	2

Legacy Ideas application (continued)

Idea State	Value
NA	NA
NA	NA
Closed complete	3
Closed skipped	7
NA	NA
NA	NA

Idea Portal

Idea State	Value
Draft	-5
Submitted	1
Under Review	-1
Need more information	-2
In Backlog	2
Planned	4
In Development	5
Completed	3
Unlikely to Implement	7
Duplicate	8
Already Exists	9

Starting with the Zurich release, idea states are stored in and retrieved from the Idea [im_idea_core] table. You can continue to use your existing idea states along with the new idea states. However, if you want to use only these new states for managing your ideas, navigate to the Choice [sys_choice] table and delete the old idea states.

Idea categories

Organize your ideas using categories, for example, to group ideas that are relevant to a particular product, department, or business unit. If your existing ideas are not associated with any category, [create new categories](#) or select an existing table to [define categories](#) to which you can map your ideas. The Ideas application also installs a set of default new categories to which you can associate your existing ideas.

If your ideas are already associated with categories and you want to use the new categories, you can map your existing idea categories to the default new categories. You then write and use a script to create m2m mapping between existing ideas and categories.

Note:

You must map an existing idea with appropriate categories for your ideas to appear in the Idea Portal.

Converting ideas to demands or project, stories, initiatives, and epics

You can convert an idea into work entities other than demands. The **Create Task** button enables you to convert an idea into a project, epic, or story as well as a demand becomes available in the Idea form.

You must have the required Agile plugins Agile Development 2.0 and Scaled Agile Framework (SAFe) and Continual Improvement Management installed to view these options.

If you want to allow conversion of ideas only to a demand, disable the **Create Task** button and continue using the **Accept** button or disable the **Accept** and **Defer** buttons to use other options. For more information see, [Using the form designer](#).

Business rules

Review the existing business rules in the idea table. Set the business rules that you don't want to apply as False.

Navigation for legacy Idea application

To encourage your users to submit ideas through the new Idea Portal, remove navigation for old Idea application from the application menu and deactivate the Submit an Idea option from the Service Catalog. For more information see, [Enable or disable an application menu or module](#).

Managing ideas using Innovation Management

Use the features and capabilities of Innovation Management to capture, analyze, and manage your ideas. As an idea manager, manage submitted ideas by reviewing them, making modifications, or deleting outdated ones, identifying duplicates, and updating and tracking their state.

Related topics

[Innovation Management reference](#)

Submit an idea

Submit an idea for a product, feature, enhancement, or change in the Idea Portal for others to vote on. Select categories relevant to the idea and, if useful, attach files to add details.

Before you begin

Role required: None

About this task

The Idea Portal is where you share your product, feature, change, or enhancement ideas. Submit your ideas, view, and subscribe to the ideas of other users, and track the progress of a subscribed idea. For more information, see [View, filter, and sort ideas](#) and [Collaborate on ideas](#). New ideas are created in the **Submitted** state. You can edit your submitted idea in the Idea Portal after it has been submitted until the state is changed to **Completed**.

Procedure

1. Navigate to **All > Ideas > Idea Portal > Create an Idea**.
2. On the form, fill in the fields.
For more information on fields and description, see [Create an Idea form](#).
3. **Optional:** If you have attachments related to the idea, select **Add attachments** and attach them.
4. Select **Create**.

What to do next

- [View, filter, and sort ideas](#)
- [Collaborate on ideas](#)
- [Manage ideas](#)
- [Evaluate an idea](#)
- [Create a task for an idea](#)

View, filter, and sort ideas

View ideas submitted by you or all submitted ideas. Filter and sort the ideas based on idea state, category, or date.

Before you begin

Role required: None

About this task

You can view the following information for an idea:

- Title
- Number of votes
- Name of the submitter
- Age
- Current state
- Category to which the idea belongs.

Procedure

1. Navigate to **All > Ideas > Idea Portal**.
2. Perform the following tasks on My Ideas and All Ideas tab.

My Ideas and All Ideas tab

Task	Steps
View your own submitted ideas.	Navigate to Idea Portal > My Ideas .
View all submitted ideas.	Navigate to Idea Portal > All Ideas .
View details of an idea.	Select the title of the idea.
Filter the ideas based on the idea state.	Select a state from the State list.
Filter the ideas based on idea categories.	Select a category from the Category list.
Sort the ideas based on the most recent ideas, the number of votes, or the date of creation.	Select an option from the Sort by list.

Collaborate on ideas

Use the comment option to discuss ideas and exchange information about ideas. Up-vote or down-vote an idea to register your level of interest and support for an idea. Subscribe to an idea to track its progress.

Before you begin

Role required: None

About this task

You cannot comment and vote for ideas that are in the **Completed**, **Unlikely to implement**, **Duplicate**, or **Already exists** state.

Procedure

1. Navigate to **All > Ideas > Idea Portal**.
2. Select the title of an idea to view its details.
3. Review the idea details and then choose which action to perform on the idea.
For more information on actions and steps, see [Collaborate on idea](#).

Manage ideas

As an idea manager, manage submitted ideas by reviewing them, making modifications, or deleting outdated ones, identifying duplicates, and updating and tracking their state.

Before you begin

Role required: idea_manager

About this task

The idea manager reviews submitted ideas and, if necessary, requests more information, and then chooses to accept or reject the idea. The number of votes on an idea helps in assessing the popularity and demand for the idea. Change the state of the idea to reflect its status. Changing the state helps in notifying the idea submitter and subscribers about the progress of the idea.

Note:

The idea submitter and all the subscribers receive a notification email whenever there is a change in the state of an idea. A notification email is also sent whenever a user comments on an idea or replies to a comment.

Procedure

1. Navigate to **All > Ideas > Idea Portal**.
2. Select the title of an idea to view its details.
3. Select the more options icon (), and then select the **Open in platform** option to open the idea in the form view.
4. Review the idea details and then choose which action to perform on the idea.
For more information on actions and steps, see [Manage ideas](#).
5. Select **Update**.

What to do next

Convert selected ideas into tasks such as [demand](#), [project](#), [stories](#), and [epics](#).

Evaluate an idea

Review submitted ideas and then accept or reject them.

Before you begin

Role required: idea_manager

About this task

As an idea manager, evaluate an idea and then decide whether to accept or reject an idea. If an idea cannot be implemented right away, move the idea to the backlog and pick it up later. Accept the ideas that are feasible for implementation and create a task such as a demand, project, or story from it. Plan and work on these tasks to develop an idea into a new feature, product, or enhancement.

Procedure

1. Navigate to **All > Ideas > Idea Portal**.
2. Select the title of an idea to view its details.
3. Open the idea in form view by selecting the more options () icon, and selecting the **Open in platform** option.
4. Review the idea details and then choose which action to perform on the idea.
For more information, see [Evaluate ideas](#).
5. Select **Update**.
Convert the accepted ideas to a demand, epic, story, or feature based on how you would like to execute your idea. Use relevant options such as Epic, SAFe epic, or Improvement initiative based on the plugins installed such as PPM Standard, Agile Development 2.0 and Scaled Agile Framework (SAFe). After creating a demand or a project, change the state of the idea to track its status during different stages of development.

Create a task for an idea

Create a task for planning and developing an accepted idea.

Before you begin

Role required: idea_manager or idea_manager_professional

About this task

Create a task such as a demand, project, story, SAFe epic, SAFe feature, or SAFe story for an accepted idea. Plan and work on these tasks to develop an idea into a new feature, product, or enhancement.

Procedure

1. Navigate to **All > Ideas > Idea Portal**.
2. Select the title of an idea that you want to create a task for.
3. Open the idea in form view by clicking the more options () icon, and selecting the **Open in platform** option.
4. Select an appropriate state for the idea from the State list based on the priority of the idea.
For more information about different idea states, see [Manage ideas](#).
5. Select **Create Task**.
6. In the **Convert Idea to task** dialog box, select a task type from the Select task type list.
The available task types are:
 - Demand
 - Project
 - Epic
 - Story
 - SAFe epic
 - SAFe feature
 - SAFe story

These task options are based on the installed plugins such as PPM Standard, Agile Development 2.0, and Scaled Agile Framework (SAFe).

Note:

You must also have the appropriate role based on the plugins to create these task types.

Train the similarity solution for Innovation Management to find similar ideas

Train the Similar Ideas solution definition included within the Predictive Intelligence for Ideation capability to find related ideas when submitting an idea or viewing ideas in the Idea Portal.

Before you begin

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml), PPM Standard plugin (com.snc.financial_planning_pmo), and Predictive Intelligence for Ideation plugin (com.snc.innovation_management_ml) are activated. For more information about Predictive Intelligence, see [Predictive Intelligence](#).

Role required: admin

Procedure

1. Navigate to **All > Predictive Intelligence > Similarity > Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Similar Ideas solution definition (ml_sn_global_similar_ideas).
3. On the Similarity Definition form, verify the default field values for ideas. For more information about the Similarity Definition form fields, see [Create and train a similarity solution](#).
4. Click **Update & Retrain**.
5. Open the Similarity Definition form for the Similar Ideas solution definition (ml_sn_global_similar_ideas).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column.

Note:

Alternatively, you can click the link for the solution in the **Active** column. On the ML Solution form, click the **Show training progress** related link to check the training solution progress.

Result

When the solution is complete, the similar ideas appear in the Related Ideas section on the Create an Idea form and Related Ideas section on the Ideas page in the Idea Portal.

What to do next

- Review similarity examples: On the Similarity Definition form, in the ML Solutions related list, when **Progress** is 100%, in the **Active** column, click the link for the solution. On the ML Solution form, click the **Similarity Examples** related link to view the Similarity Examples list.
- Update the similarity score threshold: On the ML Solution form, on the **Solution Statistics** tab, enter the required value in the **Similarity Score Threshold** field. Right-click the ML Solution form and click **Save**.
- Test the prediction output for the records: On the ML Solution form, on the **Test solution** tab, enter your text in the **Short description** field and the maximum number of expected results in the **Top N** field, and then click **Run test**. The results above the similarity score threshold value are displayed.

Managing Idea Portal

The Idea Portal is your central location to collect, curate, and promote ideas into demand, project, epic, or story. It enables integration of key feedback and requests into your product planning and development process.

The Idea Portal enables you to do the following:

- View, submit, vote, and subscribe to ideas.
- Collaborate using comments to discuss and exchange information on ideas.
- Users who submit, comment, or subscribe to an idea receive a notification for any state change, comment, or reply to that idea keeping them informed about its status and progress.
- View the details of an idea and ask or answer questions and exchange information about an idea using comments. Comments maintain a trail of discussion and help to identify key contributors for an idea or reasons for its success and failure.

Idea and demand managers use the Idea Portal to do the following:

- Manage submitted ideas.
- Review and evaluate the submitted ideas and select the ideas that meet their requirements.
- Assess the popularity and demand of an idea from the number of votes.

The selected ideas are converted into tasks for planning and then developed into a new product, feature, or enhancement.

Maintain separate data storage and control access

You can use the Idea module to do the following:

- Store ideas and categories belonging to different departments, products, or business units separately.
- Store and organize ideas, enable voting, and, if your organization is large, you can configure different portal pages with unique sets of categories, for example, for HR, IT, and Support.
- Control access, allowing only the users of a specific business unit or department to submit and view ideas belonging to a specific category through the Idea Portal by creating access-control lists in the table that you want to use for categories. For example, if you do not want users outside the Payroll department to view the ideas associated with the category Salary, create ACLs with read access, at least, to the employees of Payroll department in the parent table that is used to derive the category Salary. The ACLs restrict the employees outside the Payroll department from viewing the ideas associated with the category Salary. For more information, see [Create an Idea module](#).

Note:

Innovation Management supports basic level of domain separation. For more information about domain separation, see [Application support for domain separation](#)  and [Domain separation and Project Portfolio Management](#).

Idea Portal administration

Idea Portal enables end users to view, submit, filter, sort, comment, and vote on ideas. Idea managers use the Idea Portal to review, evaluate, collaborate on, and manage ideas. An idea admin configures an Idea module, maps idea categories to the Idea module, and adds navigation for the Idea Portal page.

The [Managing Idea Portal](#) retrieves data from the Idea module, therefore, you must configure an Idea module first. Consider configuring separate Idea modules for your product, department, or business unit. Review, plan, and identify the following items before configuring an Idea Portal:

- Idea table
- Idea module
- Idea categories
- Navigation to the Idea Portal page

Complete the following tasks to set up and configure an Idea Portal for your product, department, or business unit:

Idea Portal navigation

Configure the Idea Portal URL to enable access to the Idea Portal from the application navigator.

Before you begin

Role required: idea_admin

About this task

Enable access to the Idea Portal module using the Application Menus module.

Procedure

1. Open the **Ideas** application menu record and add the Idea Portal to the navigation menu.
For information about how to add Idea Portal to the navigation menu, see [Create a module](#) .
2. In the Module form, set the value of the **Link type** field as **URL (from arguments)**.

Use the Module Id as a parameter in the URL to specify the Idea module that you want to associate with the Idea Portal.

For example, if you created an Idea module for your HR department and used **hr** as the **Module Id**, the URL to access the Idea Portal would be as follows: `/idea/?id=ideas_list&sysparm_module_id=hr`.

Create an Idea module

An Idea module defines the ideas and categories that are displayed in the Idea Portal. Create an Idea module to store and group ideas, and define categories based on product, department, or business unit.

Before you begin

- Identify an idea table to store your ideas. Use an existing table or create a new table to extend the Idea [im_idea_core] table.

Use a different idea table for each Idea module. Separate idea tables ensure that ideas for different modules are stored separately.

- Role required: idea_admin

Procedure

1. Navigate to **All > Ideas > Settings > Idea Module > New.**
2. On the form, fill in the fields.
For more information on fields and description, see [Idea module form](#).
3. Select **Submit**.

What to do next

Define new idea categories or use an existing table to derive the categories from specified columns and map it with your idea module. For more information, see [Configure idea categories](#).

Define new idea categories

Create new idea categories that a user can select to associate with a submitted idea. You can also add custom idea categories.

Before you begin

Role required: idea_admin

About this task

The default Idea Category [im_category] table stores the user-defined idea categories. Define new idea categories if you do not want to use an existing table or if you want to use custom idea categories. Create nested idea categories for defining a hierarchy of the idea categories.

You can use multiple idea categories with an Idea module, however, you can map only one category table with an Idea module.

Procedure

1. Navigate to **All > Ideas > Idea Category > New.**
2. On the form, fill in the fields.
For more information, see [Idea category form](#).
3. Select **Submit**.
An idea category represents a theme for organizing idea submissions. All ideas submitted through the Idea Portal must be associated with at least one idea category. You can use values from an existing table or create new idea categories for organizing your idea. Users select one or more idea categories, configured by an admin, to associate with their idea when they submit it. For more information, see [Create an Idea module](#), and [Idea category configuration](#).

What to do next

Map idea categories with your idea module. For more information see, [Configure idea categories](#).

Adding Idea Portal to Employee Center

Improve engagement experience for your employees by enabling navigation to Idea Portal from Employee Center.

On the Employee Center portal, add the following links to Idea Portal so that employees can easily navigate to it.

Header menu item on the Employee Center portal

Configure a menu item for the Idea Portal page on the Employee Center portal header. Follow steps 1 through 5 in [Create employee forum menu item in the Employee Center menu](#) .

Quick link on the Employee Center portal

Create a quick link to the Idea Portal page using the quick links module in Employee Center. Follow the procedure in [Create a quick link](#).

Analyzing idea metrics using Idea Manager dashboard

Review, analyze, and manage your ideas effectively by using the Idea Dashboard manager.

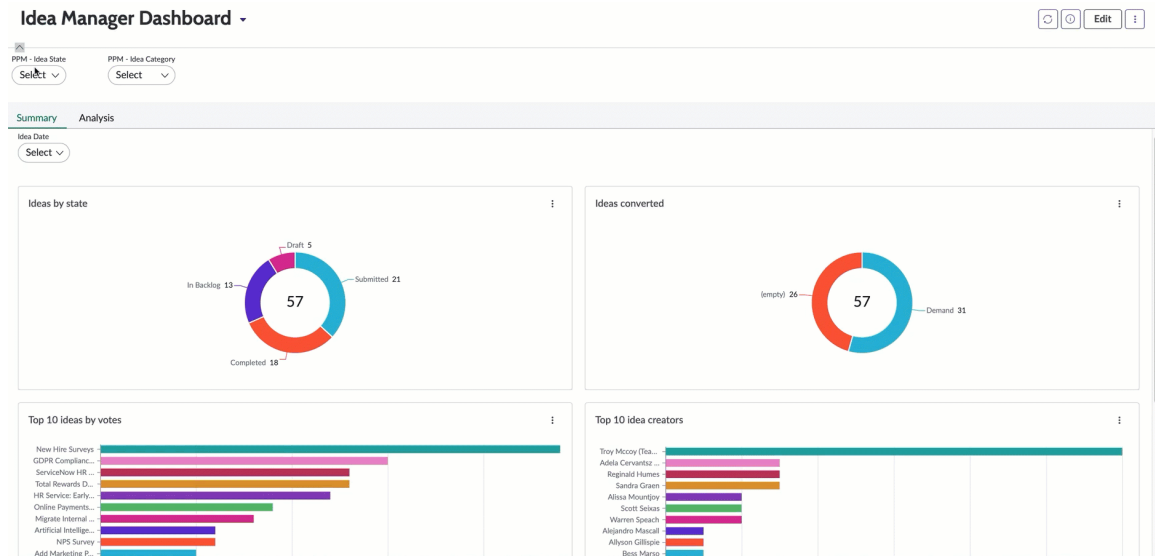

The Idea Manager dashboard provides summary of idea metrics and trends such as ideas in different states, age of ideas, categories, and ideas converted to different work entities.

Note:

Starting with version 2.0.0, the Idea Manager dashboard is available in the Next experience UI Framework which can be accessed from Analytics Idea Manager. The Ideas pane in **Analysis** tab is not supported in the Next experience.

Idea Manager dashboard in Next experience UI

The Idea Manager dashboard provides comprehensive reports to the idea manager and users with read-only roles for ppm (sn_ppm_read). The dashboard uses Performance Analytics to provide a trend of historical data as well as regular reports. It provides you an overview of ideas, number of ideas converted into work entities, and trends based on categories, idea submitters, and votes. It helps you to review and analyze ideas and enables you to take required actions for managing your ideas effectively.

End user and roles

End user and goal	Required role
Idea Manager - Needs visibility into ideas in different states, number of ideas created, and age of ideas.	idea_manager

End user and goal	Required role
Read only roles for PPM - Needs visibility into ideas in different states, number of ideas created, and age of ideas.	sn_ppm_read

Use case

The dashboard displays ideas related to Project Portfolio Management.

Only ideas associated with categories are displayed in the dashboard. Ideas marked for deletion are not displayed. By default, the dashboard displays one-year data. Use the interactive date filter to view monthly, quarterly, or yearly data.

You can drill down within an idea indicator data for further analysis by navigating to Idea Portal from the dashboard. For example, to view individual records of Open ideas in the Idea Portal, click the **Open ideas** indicator value to open the Analytics Hub. In the Analytics Hub, click **Show Records** to view the list of open ideas, open an idea in the form view, and then click the **Idea Portal** related link to view the idea record in the Idea Portal.

Indicators

The Summary and Analysis tabs in the dashboard contain the following indicators. The data for ideas is collected from the [idea] table.

Open Ideas

Count of the ideas that are in Submitted, Need more information, or Under Review state for the current month.

Average Age of Open Ideas

The average age of ideas that are in Submitted, Need more information, or Under Review state since their creation, in days, as calculated by the formula $[[PPM:Total\ Age\ of\ Open\ Ideas]] / [[PPM:Open\ Ideas]] / 24$.

Ideas Converted

Count of ideas converted into different work entities such as demand, project, story, or epic based on other plugins.

% of Ideas Converted

The percentage of ideas converted into different work entities such as demand, project, story, or epic based on other plugins, as calculated by the formula $[[PPM:Ideas\ Converted]] / [[PPM:Active\ Ideas]] * 100$.

Ideas

Count of ideas that are in different states. You can view the count of ideas, in different states, created in week, month, quarter, and year.

Active Ideas

Count of ideas in Submitted, Need more information, Under review, in backlog, planned and in development state. This indicator is not displayed in dashboard but is used in formula.

Total Age of Open Ideas

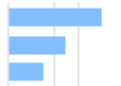

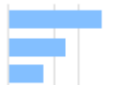

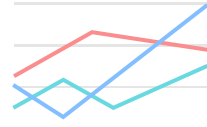

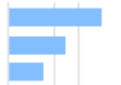

Total number of days an idea is in state Submitted, Need more information, and Under review before conversion to a work entity. This indicator is not displayed in dashboard but is used in formula.

Breakdowns

- PPM - Idea Category
- PPM - Idea State

Data visualizations

The dashboard includes the following visualizations:

Title	Type	Description
Ideas by state	 Pie chart	Breakdown of the number of ideas in each of the different states.
Ideas converted	 Pie chart	Breakdown of the number of ideas converted into work entities such as demand and project.
Top 10 ideas by votes	 Horizontal bar chart	Top 10 ideas based on the total number of up-votes.
Top 10 idea creators	 Horizontal bar chart	Top 10 users based on the number of ideas submitted.
Ideas trended by categories	 Line chart	Trend of the total number of ideas submitted under various categories. The trend is displayed on a monthly basis.
Top 10 categories by ideas	 Horizontal bar chart	Top 10 categories based on the number of ideas submitted under each category.

Integrating Innovation Management with Universal Request

Integration of Innovation Management with Universal Request extends the capabilities of Universal Request and enables your employees and agents to create an idea from a universal request.

Integrate Innovation Management with the Universal Request application to provide a consistent ticketing experience and facilitate inter-department request transfers.

A Universal Request is created from an Interaction Record or New Call record when an agent determines that a new task record must be created for any of the following reasons:

- Resolve the Universal Request immediately without assigning it to a specific department.
- Transfer the Universal Request to a different department by assigning it to a Tier 1 assignment group.

Universal Request serves as a parent record for other records created as child records, such as INC, HRC, and custom task types. It is also used for all cross-departmental reporting. For more information about universal request, see [Exploring Universal Request](#).

Features

The integration provides the following functionalities:

- Create an idea from a universal request: When a universal request is created, an agent analyses the request. If the request can result in a new product, feature, or change, the agent creates an idea from that universal request.

The idea manager then reviews submitted ideas and, if necessary, requests more information, and then chooses to accept or reject the idea. Accepted ideas are then converted to a demand, epic, story, or feature.

The relevant information of the universal request such as details from the **Short description** and **Description** fields are copied to the **Title** and **Idea Description** fields of the idea.

Also, the idea created from the universal request becomes the primary ticket for the universal request and the **Primary Ticket** field is populated with the idea number.

- Transfer the idea to another department with or without resolution: If the idea is rejected or cannot be implemented, the routing agent can transfer the idea to another department.

When an idea is transferred to another department, the idea is closed and a new record is created. For example, a universal request related to HR process improvement can be converted to an idea and then transferred to the HR department as an HRC when the idea is deemed not feasible.

i Note:

When the idea created from a universal request is transferred to another department, the resulting INC, HRC, or custom task becomes the primary ticket for the parent universal request.

Plugin requirements

Activate the following plugins if you have the admin role. These plugins are not active by default, and you must install them to integrate Innovation Management with Universal Request applications.

- PPM Standard plugin (com.snc.financial_planning_pmo).
- Universal Request plugin (com.snc.universal_request). For activation information, see [Activate Universal Request](#).

Activate other related plugins such as Human Resources Scoped App: Core (com.sn_hr_core), and Employee Center (com.snc.employee_center) plugins to facilitate inter-department transfers of ideas.

Create an Idea from Universal Request

Create an idea from a universal request after initial evaluation for a new product, feature, enhancement, or change.

Before you begin

Role required: sn_uni_req.request_write or ITIL

- Activate the Universal Request (com.snc.universal_request) and PPM Standard (com.snc.financial_planning_pmo) plugins

About this task

New idea is created in the **Submitted** state. You can edit your submitted idea in the Idea Portal after it has been submitted until the state is changed to **Completed**.

Procedure

1. Navigate to **Universal Requests > All**.
2. Open the universal request record from which you want to create an idea.
3. Select **Create Idea**.
4. On the form, fill in the fields.
For more information, see [Create an Idea form](#).
5. **Optional:** If you have attachments related to the idea, select **Add attachments** and attach them.
6. Select **Create**.
The universal request number from which the idea is created appears in the header of the Idea form. The idea number appears in the **Primary Ticket** field on the Universal Request form.

What to do next

[Evaluate an idea](#) and [create a task from an idea](#), if selected for execution. If the idea cannot be implemented, transfer the idea to the relevant department as an INC, HRC, or custom task.

Idea state mapping

Map your idea states to the Universal Request states to provide a better user experience during the idea state transition and to track the progress of the idea.

Before you begin

Role required: admin

About this task

Mapping the states of the idea to the universal request state ensures that the status of idea is also reflected on the state of universal request. As the idea moves through different stages of the life cycle, the state of the universal request also gets updated to reflect the change.

For example, consider a universal request that has an idea attached to it as a primary ticket. When the state of idea changes from **Submitted** to **Need more information**, the state of the universal ticket state is also updated to **Awaiting Response**.

The following image is an example of a default state mapping. The **Submitted, Under Review, In Backlog, Planned** and **In Development** states of an idea are mapped to **In Progress** state of a Universal Request.

The following table lists the default mapping of different idea states with the universal request states.

Default mapping of Idea states with universal request states

Idea state	Universal Request state
Submitted	In Progress

Default mapping of Idea states with universal request states (continued)

Idea state	Universal Request state
Under Review	In Progress
In Backlog	In Progress
Planned	In Progress
In Development	In Progress
Unlikely to implement	Closed
Duplicate	Closed
Already exists	Closed
Completed	Closed
Need more information	Awaiting Response

Procedure

1. Navigate to **All > Universal Request > Administration > State Mapping**.
2. Select **New**.
3. On the form, fill in the fields.
For more information, see [State mapping form](#) .

Transfer an Idea to another department

Transfer an idea to another department with or without resolution if the idea is rejected or cannot be implemented.

Before you begin

Confirm that the following requirements are met:

- The idea is created from a universal request.
- The idea is associated with a category.
- Personalize the Create an Idea form to add the **Assigned to** field.
- The idea is assigned to an agent.
- Additional plugins required for transfer are active. For example, if the idea is being transferred as an HR case (HRC), activate the Human Resources Scoped App: Core (com.sn_hr_core), and Employee Center (com.snc.employee_center) plugins.

Role required: Agent to whom the idea is assigned or is a part of the assigned work group.

About this task

If the idea is rejected or cannot be implemented, transfer the idea to another department as an HRC, incident, or a custom task.

When an idea is transferred to another department, the idea is closed and a new record is created. For example, a universal request related to HR process improvement can be converted to an idea and then transferred to the HR department as an HRC when the idea is deemed not feasible.

Procedure

1. Navigate to **All > Ideas > Idea Portal**.
2. Select the title of an idea to view its details.
3. Select the more options icon (⋮), and then select the **Open in platform** option to open the idea in the form view.
4. Select **Transfer**.
5. In the **Transfer Ticket** dialog box, provide the following details.
 - **Department:** Select the department from the list.
 - **Transfer reason:** Select the reason from the list.
 - **Transfer notes:** A brief description for transferring the idea that you want to pass to the UR Routing agent.
 - **Copy additional comments and attachments:** Clear the check box if you do not want to transfer the idea with additional comments and attachments.
6. Select **Transfer**.
The idea is transferred to the selected department and the state of the idea is changed to **Unlikely to implement**.
7. Provide information about why the idea was rejected or closed in the **Close notes** field.
8. Select **Update**.

Result

The idea is transferred to the selected department. The **Primary Ticket** field of the parent universal request is updated with the INC, HRC, or custom task number created as a result of the transfer.

Demand Management

The Demand Management application consists of tools for capturing, centralizing, and assessing strategic and operational demands. It also provides a single location for managing all the demand information.

Demand Management overview

i Important:

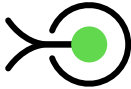

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Get started

<p style="text-align: center;">Explore</p>  <p style="text-align: center;">Learn the features and business value of Demand Management</p>	<p style="text-align: center;">Configure</p>  <p style="text-align: center;">Learn how to configure Demand Management</p>
<p style="text-align: center;">Use</p>  <p style="text-align: center;">Create and manage demands with Demand Management</p>	<p style="text-align: center;">Reference</p>  <p style="text-align: center;">Learn about the forms and fields of Demand Management</p>

Troubleshoot and get help

- [Search the Known Error Portal for known error articles](#) 
- [Contact Customer Service and Support](#) 

A typical workflow for you as the demand manager is as follows:

- Work on a demand to assess the feasibility, effort, and cost of the demand and create a business case for approval of the demand.
- Create demand tasks, such as an initial feasibility review, cost estimate, and effort estimate, to delegate activities to specialized resources or groups. For example, a demand manager

can create demand tasks for assessing the cost associated with a software upgrade and the resources required.

- Assign demand tasks to a business analyst, resource user, or an appropriate group. The assigned resource or group then creates a cost plan and resource assignment to help the demand manager assess and qualify the demand. For more information, see [Demand tasks](#).

Basics of Demand Management

- Set up the application: Plan, create stakeholders and assessment categories, and create bubble charts.
- Assess ideas: Review and analyze submitted ideas before promoting ideas to demands.
- Create and add details to the demands: Create demands and add demand tasks, stakeholders and assessments, and evaluate and qualify demands.
- Use the Demand Management application or the demand workbench to compare and assess demands, and promote demands to projects, enhancements, changes, or defects.

Exploring Demand Management

Learn more about Demand Management and its process flow, and reviewing its benefits to your organization.

Demand Management overview

In Demand Management assess the ideas submitted through the Idea Portal or ideation module and promote the feasible ideas to demands. Track the progress of an accepted idea as it moves through the demand life cycle (idea to a demand, to a project, enhancement, change, or defect).

Important:

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Demand Management workflow

In demand management, a demand can be in any of the following

The demand states are Draft, Submitted, Screening, Approved, and Completed. For more information, see [Use Demand Management](#).

Demand Management benefits

Benefit	Feature	Users
View and assess ideas that have been approved to be demands in a central location.	Demand workbench	Demand Manager
Track the progress of an accepted idea as it moves through the demand life cycle (idea to a demand, to a project, enhancement, change, or defect).		
Manage and track the financials of your demands in corporate, regional currency, or the same currency that you want to use for managing the project	Multicurrency in Demand Management	Demand Manager
Add users to the stakeholder registry so that demand and project management can automatically populate the stakeholder list when a user creates a demand or project.	Populate the stakeholder registry	Demand Manager

Demand Management process flow

The Demand Management process flow consists of the following tasks.

***i* Important:**

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Demand Management Process Flow

Task	Description
Submitting ideas	Any user can submit ideas from the following locations: <ul style="list-style-type: none"> • Service Catalog > Can We Help You > Submit Idea. • Self-Service > Ideas > Create New.

Demand Management Process Flow (continued)

Task	Description
	<p>Note: Submitters or collaborators can edit their ideas as long the idea is in the Submitted state.</p>
Creating demands	<p>Demand managers and demand users can create demands using the Demand Management application.</p> <p>Alternatively, any user can create demands from the following locations:</p> <ul style="list-style-type: none"> • Service Catalog > Can We Help You > Create a new demand. • Self-Service > Demands > Create New. <p>Note: Requesters or collaborators can edit their demands as long as the demand is in the Draft state.</p>
Adding details to demands	<p>Demand managers can add details to a demand request by adding demand tasks, stakeholders, requirements, risks, decisions, and resource assignments.</p>
Assessing demands	<p>Decision makers can use assessment results and the demand backlog when determining which demands to approve or reject.</p> <p>Demand managers can decide if the assessment should be triggered for the demand using the Assessment Required field on the demand form.</p>
Completing demands	<p>Demand managers can set a demand to Completed when work on the demand is complete.</p>

Demand workbench

The demand workbench provides a central location for viewing and assessing business demands.

The demand workbench makes it easy to manage demands by presenting multiple interactive views of demand information on one page. The workbench is split into two panes: the top pane presents an interactive bubble chart for assessing demands and the bottom pane displays the demand details in a list view.

The demand workbench provides real-time interaction between the two panes. Modifying a demand in the bubble chart automatically updates the values in the demand record. Similarly, changes made to a demand record are automatically reflected in the bubble chart.

By default, the workbench displays demands screened by stakeholders or qualified by the demand manager. With the demand manager role, you can use the workbench to:

- View, evaluate, and update demands
- Create demands
- Create artifacts from demands, including projects, enhancements, changes, and defects

With the demand manager role, you can view and evaluate demands.

Demand Workbench

The demand workbench includes the following components:

- The top pane displays demands in a bubble chart.
- The bottom pane displays demands in a list view.
- The header includes a back button (<) that opens the Demands list.

Demand workbench bubble chart

The interactive bubble chart on the demand workbench is a dynamically updated graph that plots metrics for multiple demand records.

Demand managers can use bubble charts to visualize, compare, and evaluate the relative standing of demands in three categories: risk, value, and size. The X-axis represents the risk of a demand, the Y-axis represents the value, and the Z-axis represents the size. Demands are plotted as circles, or bubbles, which vary in size according to the size of the demand. All three measurements are based on values between 0 through 10. This scale enables demand managers to see how one demand compares to other demands in the chart.

The bubble chart contains four quadrants, with each quadrant representing the value versus risk tradeoff for the demand. The quadrants are labeled along the edges of the bubble chart to represent this combination of value versus risk. The color of the bubbles displayed in each quadrant also represents the value versus risk tradeoff.

- The upper left quadrant, labeled **Resource**, contains demands with high value and low risk. Green bubbles represent demands in this quadrant.
- The lower left and upper right quadrants, labeled **Consider**, contain demands that require further evaluation. The lower left quadrant contains demands with low risk but low value while the upper right quadrant contains demands with high value but high risk. Orange bubbles represent demands in these quadrants.
- The lower right quadrant, labeled **Re-evaluate**, contains demands with low value and high risk. Red bubbles represent demands in this quadrant.

Each bubble also includes a label with the name of the demand.

From the demand workbench bubble chart, you can perform the following actions:

- Hover over a bubble to [view a summary of the demand](#), including the demand name and the risk, value, and size.
- Select a bubble to open a sizing window and [change the size of the demand](#).

- Select and drag a bubble to increase or decrease the risk or value of the demand.
- Right-click a bubble to view the demand, [create an artifact](#), or [view an artifact](#) that has been created from a demand.

Note:

If Agile Development 2.0 isn't activated, you won't find the options to create an enhancement or a defect

Changes made to a demand in the bubble chart are automatically updated in the demand record.

Demand workbench list view

The lower pane of the demand workbench displays a list of the demands shown in the bubble chart.

The bubble chart list view displays up to 20 demands at a time. Page forward and back through the list to display additional demands.

The **Demand** column displays the demand number, which provides a link to the Demand form. The **Stage** column displays the status or progress of the demand. For more information, see [Stage Fields](#).

The interactive bubble chart is updated whenever you change a demand in the list view. If you create a demand from the demand workbench, it's created in a qualified state and appears on the bubble chart. When a demand is promoted to a project, enhancement, change request, defect, or Enterprise Agile Planning (EAP) entity, it's removed from the bubble chart.

Performing the following tasks in the list view affects the demands displayed in the bubble chart:

- Searching or filtering the records in the list view displays the bubbles for those demands that meet the search or filter criteria.
- Adding or deleting records in the list view adds or deletes the corresponding bubbles.
- Paginating the list view by selecting any of the page arrow icons displays the bubbles for the demands that appear on the current page.

Predictive Intelligence for Demand Management

The Predictive Intelligence for Demand Management capability uses machine-learning algorithms to search and display similar demands while creating a demand in the Demand form.

The PPM Predictive Intelligence Workbench includes a prebuilt use case template that systematically guides you through the process of creating and training new predictive models, evaluating and testing them, and finally adding them to your business process to add value to your Idea, Demand, and Project Management.

Once you train your custom use cases, they're usable immediately. No prior knowledge or experience with artificial intelligence or machine learning is required when you use the PPM Predictive Intelligence Workbench.

The application includes templates with prebuilt guidance to assist you in creating, training, evaluating, testing, and producing your unique predictive models.

Predictive Intelligence for Demand Management has the following benefits:

- Improves the quality of your database by avoiding duplicate demands.
- Helps you in planning your demand. You can view details of similar demands that were submitted and executed in the past.

Activation information

Activate the following plugins before using the Predictive Intelligence Workbench:

- Predictive Intelligence for PPM (com.snc.ppm_ml) plugin
- Predictive Intelligence for Ideation (com.snc.innovation_management_ml) plugin

Solution definition for Predictive Intelligence for Demand Management

The solution definition for Predictive Intelligence for Demand Management capability is available in the Predictive Intelligence for PPM plugin (com.snc.ppm_ml). For more information about Predictive Intelligence, see [Predictive Intelligence](#) and [Contextual search](#).

Solution Definition for Demand Management

Solution Definition	Solution Type	Description
<p>Similar Demands</p> <p>i Note: This solution definition is available as a template on instances where the following plugins are active:</p> <ul style="list-style-type: none"> • Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) • PPM Standard plugin (com.snc.financial_planning_pmo) • Predictive Intelligence for PPM plugin (com.snc.ppm_ml) 	Similarity	View similar demands based on the Demand Name and Description fields. You can see the results in the Similar demands section on the Demand form.

Now Assist skills for Demand Management

Now Assist for Strategic Portfolio Management (SPM) provides AI-powered skills for demand records that help you quickly understand demand details and identify related records. These skills improve planning efficiency and support informed decision-making.

Similar record identification

The identify similar records skill enables you to find demand records that are contextually similar to your demand. This skill helps reduce duplicate demands and improves planning efficiency.

This skill uses the name, description, and business case content of a demand to look for contextual similarity with other demand records using AI search. The skill identifies demands with a minimum 85% similarity threshold, excluding outdated and irrelevant records.

The similar demand records are displayed in a top banner and in the Similar Demands related list. This skill improves visibility into related initiatives, and enhances decision-making for demand users.

For more information, see [Identify similar records using Now Assist for Strategic Portfolio Management \(SPM\)](#).

Demand summarization

The demand summarization skill reviews the fields and related lists of a demand record and helps generate a clear summary. Use this skill to quickly understand the key details of a demand without reviewing individual fields, comments, and work notes.

The generated summary is displayed in a summary card on the demand record. You can copy the summary for further use.

For more information on, see [Summarize demands with demand summarization skill](#).

Configuring Demand Management

Configure your Demand Management application to assess and promote demands to projects, enhancements, changes, defects, or Enterprise Agile Planning (EAP) entities.

Configuration overview

Important:

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Multicurrency in Demand Management

Manage and track the financials of your demands in the corporate currency, regional currency, or the same currency that you want to use for managing the project using the multicurrency feature. The corporate policy typically governs the choice of this preference.

i Important:

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

In global or multinational organizations, demands are often managed and tracked at one geographic location and executed at a different geographic location. As each location might use a different currency to spend the budget, this difference in geographic location makes it difficult to monitor and track financials for such demands.

The multicurrency feature in Demand Management makes it easier for you to manage and track your demands from any geographical location in any currency. You can monitor and track the financials of your demands in one currency and spend the budget in a different currency such as the functional currency, regional currency, or the currency that you want to later use to manage your projects. You can also choose to manage your demands in one currency and specify a different currency for managing your future projects.

Activation information

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin to enable the multicurrency features in Demand Management. Activating the plugin enables the demand currency view in demand, cost plans, and benefit plans forms. With the demand currency view, you can manage your simple demand financials, cost plans, benefit plans, and budgets in the demand currency.

i Note:

Activating this plugin automatically activates the PPM Standard (com.snc.financial_planning_pmo) plugin and therefore you get the option to switch between the default view and the demand currency view.

Currency Preferences

After activating the multicurrency plugin, specify your currency preference for managing your demand financials. You can select your functional currency, a regional currency, or a local currency. For more information, see [Select demand currency preference](#).

Demand currency view

In addition to the default view in the Demand form, the Demand Currency view enables you to view the multicurrency fields. You can enable this view from the form context menu.

You can designate a currency other than the functional currency as the processing Demand Currency for a demand. The **Financials** tab of the Demand form has the **Demand currency** field. You can select an active currency from the Currencies [fx_currency] table.

Note:

The **Demand currency** field of a demand becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown for the demand.

Multicurrency in Demand Tasks

Track the expenses incurred while performing the demand tasks in demand currency. When the time card for a demand task is submitted and processed, the actual cost is calculated based on the rate model, the default labor rate, or the rate defined in the system property. You can view this actual cost in the Demand Task form in the **Demand currency** and **Actual cost in demand currency** fields. For more information, see [Demand tasks](#).

Multicurrency in Demand Baseline

Compare the financial baselines of your demands to track the performance of a demand over time. Baseline comparison enables you to identify and review the financial changes made to the demand at various stages of the demand life cycle. With the multicurrency feature, you can view the financial information in the demand currency when you compare the baselines. You can also configure the baseline view to add additional fields and view details in demand currency. For more information, see [Compare financial baselines of a demand](#).

Select demand currency preference

Set your currency preference to use for managing and tracking the financials of your demands from the functional currency, regional currency, or local currency.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

Procedure

1. Navigate to **All > Project Administration > Settings > Preferences-Project**.
2. Select a currency option for managing your demands from the Demand currency setup list.
3. Select **Save**.

What to do next

Enable the multicurrency view in the Demand and other demand-related forms. For more information, see [Enable demand currency view](#).

Enable demand currency view

Switch to the demand currency view to track the planned costs of a demand in the selected currency.

i Important:

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin or it_demand_manager

About this task

To manage your demands in a currency different than the functional currency, the demand currency fields are added in the following tables that have the cost details and financials tab:

Tables with demand currency fields

Table name	Description
Demand [dmn_demand] table	Track a demand in a different currency. Create a demand and select another currency by navigating to the Financial tab and selecting a currency in the Demand Currency field. To create a demand, see Create a demand .
Demand Task [dmn_demand_task] table	Demand tasks are used to delegate the cost, effort, risk, and benefit assessment activities. To create a demand task, see Create a demand task .
Cost Plans [cost_plan] table	Cost plans capture the costs of demands. To navigate to the Cost Plan form, see Create a demand cost plan .
Cost Plan Breakdown [cost_plan_breakdown] table	Cost plan breakdowns specify the estimated cost and actual cost at a granular level for a fiscal period. To navigate to the Cost Plan Breakdown form, see Create a demand cost plan .
Benefit Plan [benefit_plan] table	If you open the demand form in Demand Currency view, then by default the fields related to the demand currency appear in the Benefit Plans related list. To create a demand benefit plan, see Create a monetary benefit plan for a demand .
Benefit Plan Breakdowns [benefit_plan_breakdown] table	Benefit plans capture the potential benefits accrued by the demand when the demand is

Tables with demand currency fields (continued)

Table name	Description
	executed. To update a benefit plan breakdown, see Create a monetary benefit plan for a demand .
Expense Line [fm_expense_line] table	Expense lines are part of the demand cost plans and stores cost associated with a specific resource. To navigate to the Expense line form, see Create an expense line for a demand .
Project Funding [project_funding] table	Stores the demand target and budget expense values for both capital and operating expenses for a single fiscal period. To allocate the budget for a demand, see Allocate budget to a demand .

Procedure

1. Navigate to the respective form.
2. Right-click the context menu of the form.
3. Select **View**.
4. Select **Demand Currency** from the list.

What to do next

Refer to the form fields that are exclusive to the **Demand Currency** view that you have selected. All the other form tabs and fields remain the same both for the default view and the demand currency view. Continue to enter values in the fields as you would for the default view.

Multicurrency fields in demand-related forms

When you enable the **Demand Currency** view in a Demand, Cost Plan, and Cost Plan Breakdown forms, you can observe the multicurrency fields in the Financials section of the forms.

Financials tab of the demand form

Demand form

Field	Description
Demand currency	Currency in which you want to manage and track the demand.

Demand form (continued)

Field	Description
	<p>Note:</p> <p>The ability to select a demand currency depends on the currency option you selected in Preferences-Project under Project Administration. For more information, see Select demand currency preference.</p> <p>The Demand currency field of a demand becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown.</p>
Project currency	<p>Currency in which you want to implement the project when this demand is converted to a project.</p> <p>Note:</p> <p>The Project currency field in the Project form of Project Management is carried over from the demand when it's converted.</p>
Capital expense in demand currency	Capital expenditure (Capex) for the demand.
Capital budget in demand currency	<p>Total capital budget allocated to the demand across all fiscal years.</p> <p>The value is rolled up from the capital expenditure (Capex) budget of the demand.</p>
Operating expense in demand currency	Operational expenditure (Opex) for the demand in the selected demand currency.
Operating budget in demand currency	<p>Total operational budget allocated to the demand across all fiscal years in the selected demand currency.</p> <p>The value is rolled up from the Opex budget of the demand.</p>
Total planned cost in demand currency	Estimated cost of the demand in demand currency.
Financial return in demand currency	Estimate of the revenue based on the Total planned costs in demand currency and Financial benefit in demand currency fields.
Financial benefit in demand currency	Estimate of revenue if the demand is approved in the selected demand currency.

Demand form (continued)

Field	Description
	This value is rolled up from the benefit breakdown of the demand.
Net present value in demand currency	<p>Present value of future cash based on the given annual interest rate in the selected demand currency.</p> <p>It's a measure for comparing money spent today against future expected financial benefits. It helps when evaluating the overall investment performance.</p>
Actual cost in demand currency	Total cost incurred while working on a demand and demand tasks in the selected demand currency.

Multicurrency fields of the Demand Task form

Demand Task form

Field	Description
Demand currency	Currency that you specified in the Demand currency field of the Demand form.
Actual cost in demand currency	<p>Total cost incurred while working on a demand tasks in the selected demand currency.</p> <p>Actual cost comes after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, derived from the rate card, labor rate, or system properties, is used to populate this field.</p>

Financials section of the Cost Plan form

Cost Plan form

Field	Description
Demand currency	Currency that you specified in the Demand currency field of the Demand form.
Cost in demand currency	Value that is rolled up from the Entered cost field of all cost plan breakdowns.

Note:

Any change that you make to the unit cost, quantity, or fiscal period of a cost plan has the amounts recalculated in demand currency. See [Cost plan updates and cost recalculation in demand currency](#).

Multicurrency fields in the Cost Plan Breakdown form

Cost Plan Breakdown form

Field	Description
Demand currency	Currency that you specified in the Demand currency field of the Demand form.
Cost in demand currency	Breakdown amount in demand currency.
Demand currency exchange rate	Rate in effect for the period corresponding to the cost plan breakdown in the demand currency.
Demand currency exchange rate date	The reference date on which the currency exchange rate is applied for conversion.

Financials section of the Benefit Plan form

Benefit Plan form

Field	Description
Demand currency	Currency that you specified in the Demand currency field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.
Actual benefit in demand currency	Actual benefit value rolled up from the actual benefit in the benefit breakdown.

Multicurrency fields in the Benefit Plan Breakdowns form

Benefit Plan Breakdowns form

Field	Description
Demand currency	Currency that you specified in the Demand currency field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.
Demand currency exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown in demand currency.
Demand currency exchange rate date	The reference date on which the currency exchange rate is applied for conversion.

Multicurrency fields in the Expense Line form

Expense Line form

Field	Description
Demand currency	Currency that you specified in the Demand currency field of the Demand form.
Amount in demand currency	Expense cost in demand currency. Amount entered in the Amount field is converted to demand currency.

Multicurrency fields in the Demand Budget form

Demand Budget form

Field	Description
Capex budget in Demand Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex budget in Demand Currency	Operating expense amount in the selected currency in the selected currency.
Total Budget in Demand Currency	Sum of Capex and Opex amounts in the selected currency.

Allocate demand budget in demand currency

Set the capital expense (Capex) and operating expense (Opex) budgets in demand or functional currency according to the fiscal years. The sum of the Capex and Opex budgets is calculated as the total budget in demand currency.

Before you begin

Role required: it_demand_manager

About this task

Allocate the budget in a similar manner as you do with functional currency. For more information, see [Allocate budget to a demand](#).

Enable the **Demand Currency** view in the Demand form to allocate the budget in demand currency.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand to which you want to allocate the budget.
3. Select the **Create Demand Budget** related link of the Demand form.

The **Demand Budget** dialog box opens.

4. On the Demand Budget dialog box, fill in the fields.
For detailed description of the field names, see [Demand Budget form](#).
5. Select **OK**.

Result

The demand budget for the selected year appears in the Demand Budget related list. Select the amounts in the list to revise them.

Cost plan updates and cost recalculation in demand currency

Updating the unit cost, quantity, or fiscal period of a cost plan updates all the related amount fields in the cost plan and its breakdowns. Also, the amounts in the related fields of the demand, to which the cost plan is rolling up, are recalculated and reflected in the demand currency.

Changes in Unit cost, Quantity, and Recurring check box of a cost plan

When you change the values of any of these fields in the Cost Plan form with multicurrency view enabled, the following values are recalculated:

- When you modify the **Unit cost** field, **Quantity** field, or **Recurring** check box of the Cost Plan form, the total planned cost is recalculated in demand currency.
- The **Cost in demand currency** in the Cost Plan Breakdown is also recalculated.
- The values in the **Capital expense in demand currency**, **Operating expense in demand currency**, and the **Total planned cost in demand currency** fields of the demand are recalculated.

Changes in the fiscal period of a cost plan

When you change the fiscal period, either the start date or end date in the Cost Plan form, the following values are recalculated:

- The **Total planned cost** and the **Cost in demand currency** of the cost plan are recalculated. Therefore, the Cost Plan Breakdown records may be added or removed.
- If the **Recurring** check box isn't selected, then the **Cost in demand currency** of each Cost Plan Breakdown record is recalculated.
- The values in the **Capital expense in demand currency**, **Operating expense in demand currency**, and the **Total planned cost in demand currency** fields of the demand are recalculated.

Changes in the entered cost of a cost plan breakdown or manual addition of a breakdown

When you change the entered cost in an individual Cost Plan Breakdown record or manually add cost plan breakdowns to a cost plan, the following values are recalculated:

- The **Total planned cost** of the cost plan is recalculated in demand currency.
- The values in the **Capital expense in demand currency**, **Operating expense in demand currency**, and the **Total planned cost in demand currency** fields of the demand are recalculated.

Benefit plan updates and recalculation in demand currency

Updating the entered currency, entered benefit, offset type, or the fiscal period of a benefit plan also updates all related amount fields in the benefit plan and its breakdowns. Also, the amounts in the related fields of the demand, to which the benefit plan is rolling up, are recalculated and reflected in demand currency.

Changes in entered currency, entered benefit, and recurring check box of a benefit plan

When you change the values of any of these fields in the Benefit Plan form with multicurrency view enabled, the following values are recalculated:

- When you modify the **Entered currency** field, **Entered benefit** field, or **Recurring** check box of the Benefit Plan form, the total planned benefit is recalculated in demand currency.
- The **Benefit in demand currency** in the Benefit Plan Breakdown is recalculated.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Changes in the offset type of a benefit plan

When you change the offset type for the benefit plan, either the start date or end date and specify the offset period and duration of such periods in the Benefit Plan form, the following values are recalculated:

- The **Total planned benefit** and the **Benefit in demand currency** of the benefit plan are recalculated. Therefore, the Benefit Plan Breakdown records may be added or removed.
- If the **Recurring** check box isn't selected, then the **Benefit in demand currency** of each Benefit Plan Breakdown record is recalculated.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Changes in the fiscal period of a benefit plan

When you change the fiscal period, either the start date or end date in the Benefit Plan form, the following values are recalculated:

- The **Benefit in demand currency** and the **Total planned benefit** of the benefit plan are recalculated. Therefore, the Benefit Plan Breakdown records may be added or removed.
- If the **Recurring** check box isn't selected, then the **Benefit in demand currency** of each Benefit Plan Breakdown record is recalculated.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Changes in the entered benefit of a benefit plan breakdown

When you change the entered benefit in an individual Benefit Plan Breakdown record, the following values are recalculated:

- The **Benefit in demand currency** of the benefit plan is recalculated in demand currency.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Quick start tests for Multicurrency in Demand Management

Validate that the multicurrency in Demand Management still works after you make any configuration change such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Danger:

By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See [Enable or disable executing Automated Test Framework tests](#).

Demand currency quick start tests require activating the PPM Standard Multicurrency – ATF Tests plugin (com.snc.ppm_multicurrency.atf).

Demand currency test suite tests

Test	Description	Release version
Verify cost in demand currency on cost plan	Validate the calculation of cost plan breakdown with budget reference rate and verify the roll up to cost plan in demand currency.	Quebec
Verify benefit in demand currency on benefit plan	Validate the calculation of benefit plan breakdown with budget reference rate and verify the roll up to benefit plan in demand currency.	Quebec

Upgrade existing demands

Execute scheduled jobs to upgrade your existing active and inactive demands, respectively, after activating the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

About this task

Run these scheduled jobs on demand to upgrade your existing active and inactive demands in demand currency only when necessary.

Note:

The jobs may have a performance impact depending on the number of demands and cost plans, therefore run the jobs only when necessary.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs.**
2. Execute a scheduled job to upgrade your existing active and inactive demands.

Set up Demand Management

Perform these tasks to set up Demand Management.

i Important:

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Before using Demand Management, PPS admin performs several setup tasks.

Planning for Demand Management

Plan the listed items before setting up Demand Management.

i Important:

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Demand Management Planning

Name	Description
Roles	Determine who has the demand manager [it_demand_manager] and demand user [it_demand_user] roles.
Portfolios	Determine how you want to group or categorize demands, and then have a user with the project manager [it_project_manager] role create portfolios based on those groupings.
Stakeholders	Identify individuals who have the appropriate domain knowledge to evaluate demands related to each portfolio. Then make them stakeholders for that portfolio.
Assessments	Consider using assessments to facilitate the information gathering process.

Demand Management Planning (continued)

Name	Description
	Define metric categories and assessment metrics to develop and distribute assessments to the appropriate audience.
Bubble chart definitions	<p>Identify metrics that are important to stakeholders, departments, and the organization.</p> <p>Use these metrics to create bubble charts that visually compare demands.</p> <p>For example, when considering which projects to undertake many organizations compare metrics such as risk rating, return on investment, and cost.</p>
Resource assignments	<p>Consider creating resource assignments to help the organization understand the time and resource costs associated with the demand. Any resource assignment attached to the demand propagates to the project.</p> <p>Resource assignments require that the Resource Management Workspace application is active.</p>
Enhancement and defect requests	<p>Determine if you need the ability to manage enhancement and defect requests as demands.</p> <p>This functionality requires that the Agile Development application is active.</p>

Populate the stakeholder registry

Add users to the stakeholder registry so that demand and project management can automatically populate the stakeholder list when a user creates a demand or project.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All > Project Administration > Settings > Stakeholders**.
You can also scroll to the **Stakeholders** related list on the Demand or Project form and select **New** to create a record.
2. Select **New** to create a record.
3. On the stakeholder register form, fill in the fields.

For a description of the field names, see [Stakeholder Register Form](#).

i Note:

When adding a user to the stakeholder registry, the combination of the user and the assigned portfolio must be unique. However, there can be more records for the same user but with a different portfolio.

View an assessment metric category

View assessment metric categories that are used with assessment metric types and assessment metrics in generating the bubble charts on the Demand Workbench. The bubble charts help the demand managers to assess the demands visually.

Before you begin

Role required: it_pps_admin

About this task

The Demand Management application comes with an assessment metric type named **Demand**, five default assessment metric categories, and assessment metrics.

Procedure

1. Navigate to **All > Project Administration > Settings > Assessments Metric Categories**.
2. Open an assessment metric category to review it.
The following default assessment metric categories are available with the Demand Management.

Demand assessment metric categories

Assessment metric category	Data source	Description
Size	T-Shirt size field on the Demand form.	Assesses demand size relative to the size of other demands.
Strategic Alignment	View an assessment category result  field in the assessment category result for the Strategic Alignment metric category.	Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.
Risk	Rating field in the assessment category result for the Risk metric category.	Assesses demand risks compared to other demands.
ROI	Impact and Financial return fields on the Demand form.	Assesses demand return on investment compared to other demands.
Cost	Labor costs , Capital expense , and Operating expense fields on the Demand form.	Assesses demand cost compared to other demands.

Configure a widget for the financial metrics of a demand

Configure a widget to view and track the financial metrics of a demand on the Demand Financials page.

Before you begin

Role required: pps_admin

Procedure

1. Navigate to **All > Project Administration > Widgets**.
2. Select **New**.
3. On the Widget form, fill in the fields.
For a description of the field names, see [Widget form](#).

What to do next

[Associate the widget to the Demand table](#).

Associate a widget to the Demand table

After you configure a widget, associate it with the Demand table to show the financial data of a demand.

Before you begin

You must [configure a widget](#) before you can associate it with the Demand [dmn_demand] table.

Role required: pps_admin

Procedure

1. Navigate to **All > Project Administration > Widgets**.
2. Open a widget to associate with the Demand table.
3. In the Widget associations related list, select **New**.
4. On the Widget Association form, fill in the fields.
For a description of the field names, see [Widget Association form](#).

Configure demand workbench

Update the demand workbench to configure parameters such as bubble chart.

Before you begin

Role required: it_pps_admin

About this task

You can configure the parameters of the demand workbench provided with the base system. Bubble charts are useful for comparing demands based on common metrics such as risk rating, return on investment, and cost. Decision makers can use bubble charts when considering which demands to approve or reject.

Procedure

1. Navigate to **All > Project Administration > Settings > Workbench Config - Demand**.
2. Open the **Demand Workbench** record.
3. Update the required settings and select **Update**.

Use Demand Management

Users with the demand manager role can create, view, and modify demands using the Demand Management application.

i Important:

Demands are available in the Next Experience for Demand Management. For more information, see [Next Experience for Demand Management](#).

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- **New customers:** Use Next Experience for Demand Management to create and manage your demands.
- **Existing customers:** If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

You can also approve demands and create the following artifacts from the approved demands:

- Project
- Change
- Enhancement
- Defect
- Enterprise Agile Planning (EAP) entities (epic, feature, and capability)

The type of artifact created from a demand depends on the selections in the **Category** and **Type** fields on the Demand form.

i Note:

- Enhancements and defects can be created when the administrator has activated the SDLC-SCRUM plugin.
- EAP entities can be created when the Strategic Planning plugin is activated.

Demand Management Life Cycle

The demand management life cycle can be simplified as follows:

- **Creating a demand:** The user submits an idea and the demand manager approves the idea, automatically creating a demand from that idea.
- **Viewing a list of demands:** The demand manager views demands on the [demand workbench](#) or from a list view.
- **Enhancing a demand:** The demand manager can send the demand to screening, which sends assessments to stakeholders.
- **Assessing a demand:**
 - The demand manager can screen the demand and send surveys to stakeholders to complete assessments.
 - The demand manager can set the state of the demand to qualify, defer, or incomplete.
 - Demands can be analyzed and approved using the demand workbench.
- **Creating an artifact:** The demand manager creates a project, enhancement, change, defect, or EAP entities.

The demand management application uses the following simplified demand states.

Demand States

State	Description
Draft	<p>The demand manager accepts a submitted idea.</p> <p>After reviewing or editing the record, select one of these buttons:</p> <ul style="list-style-type: none"> • Update: The demand record is updated, but the demand remains in the current state. • Submit demand: The demand is moved to the submitted state. • Delete: The demand record is deleted.
Submitted	<p>An accepted idea creates a demand record and the demand manager submits the demand.</p> <p>After reviewing or editing the record, select one of these buttons:</p> <ul style="list-style-type: none"> • Update: The demand record is updated, but the demand remains in the current state. • Screen: The demand is moved to the screening state. • Qualify The demand is moved to the qualified state. • Defer: The demand is moved to the deferred state. • Incomplete: The demand is moved to the incomplete state. • Reset to Draft: The demand is moved back to the draft state. • Delete: The demand record is deleted.
Screening	<p>Stakeholder assessments are initiated for the demand.</p> <p>After reviewing or editing the record, select one of these buttons:</p> <ul style="list-style-type: none"> • Update: The demand record is updated, but the demand remains in the current state. • Qualify The demand is moved to the qualified state. • Defer: The demand is moved to the deferred state. • Reset to Draft: The demand is moved back to the draft state. • Delete: The demand record is deleted.
Qualified	<p>The demand has been qualified and is ready for review.</p> <p>After reviewing the record, select one of these buttons:</p> <ul style="list-style-type: none"> • Update: The demand record is updated, but the demand remains in the current state. • Approve: The demand is moved to the approved state. • Defer: The demand is moved to the deferred state. • Delete: The demand record is deleted.
Deferred	<p>The demand has been put on hold. The demand can be revisited in future and reviewed.</p> <p>After reviewing the record, select one of these buttons:</p>

Demand States (continued)

State	Description
	<ul style="list-style-type: none"> • Update: The demand record is updated, but the demand remains in the current state. • Approve: The demand is moved to the approved state. • Delete: The demand record is deleted.
Approved	<p>The demand is approved</p> <p>After reviewing or editing the record, select one of these buttons:</p> <ul style="list-style-type: none"> • Update: The demand record is updated, but the demand remains in the current state. • Close: The demand is moved to the closed state. • Reset to Draft: The demand is moved back to the draft state. • Delete: The demand record is deleted.
Completed	<p>The demand is moved to the completed state.</p> <p>After reviewing the record, select one of these buttons:</p> <ul style="list-style-type: none"> • Update: The demand record is updated, but the demand remains in the current state. • Reset to Draft: The demand is moved back to the draft state. • Delete: The demand record is deleted.

These states appear in the process flow indicator at the top of the Demand form. The process flow indicator:

- Highlights the current state of the demand.
- Checks off the states that a demand has passed through.
- Leaves empty the states that have been skipped.

Assess demands

The Demand Management application comes with two demand visualization tools that can aid decision makers with demand assessment.

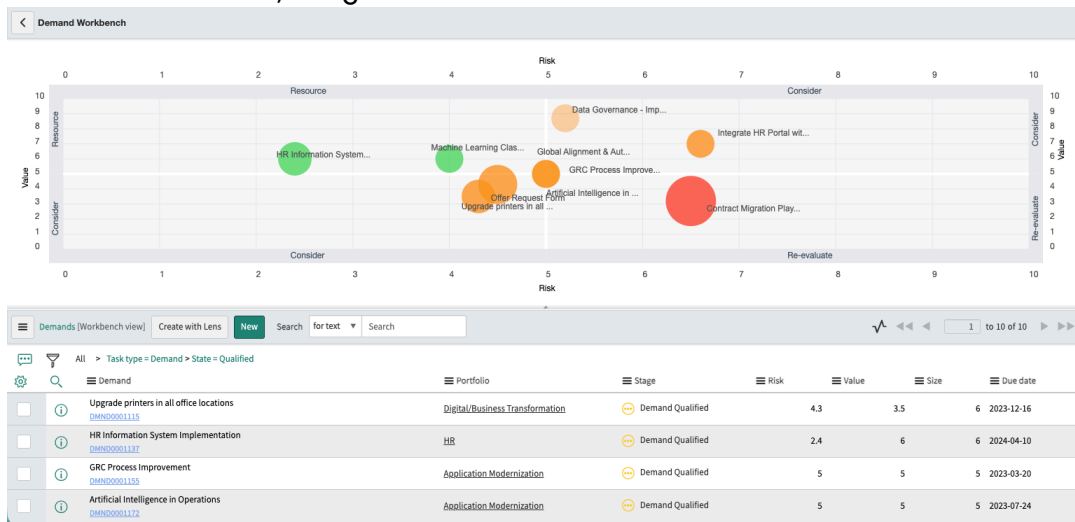

The [demand workbench](#) provides a single point of engagement for assessing and approving demands and creating projects, enhancements, changes, or defects. This page combines multiple views of demand information, including an interactive bubble chart and a detail area that displays the list of current demands. The demand roadmap is a visual representation of demands over time for an organization.

Using the Demand Workbench

A bubble chart is a graph that plots multiple demands based on three categories: risk, value, and size. Each demand is represented on the bubble chart by a circle, which varies in size and color depending on the average of the scores for these categories. The bubble chart in the demand workbench displays all qualified demands and is dynamically updated as demands are created and assessed. This chart makes a useful tool for demand managers, stakeholders, and decision makers to assess visually and compare demands.

The list view on the demand workbench displays a list of the qualified demands that appear in the bubble chart. Selecting a demand from this list highlights the demand in the bubble chart and displays the demand form. The list view is also integrated with Live Feed so users can see current activity for a demand.

To access the demand workbench, navigate to **All > Demand > Demands >**

Workbench.

Using the Roadmap

The roadmap is an interactive visualization tool that shows all demands that are currently in an active state. You can modify the look of the backlog using the Settings pane. The Settings pane enables you to change between the two-dimensional (2D) and three-dimensional (3D) view, filter demands by portfolio, or open the demands in a list view. While in list view, you can reassign panel colors, create filters to limit the records that are used for lanes and panels, and apply sorting. To use the roadmap, navigate to **All > Demand > Roadmap**.

Create a demand

Create demands to capture your strategic and operational requirements and centralize information for stakeholder assessment and prioritization.

Before you begin

Role required: snc_internal

Procedure

1. Access the Demand New record form in one of the following ways.

- Navigate to **All > Demand > Demands > Create New**.
- Navigate to **Self-Service > Demands > Create New**.
- If you have the it_demand_manager role, navigate to **All > Demand > Demands > Workbench > New**.

Note:

Demands created from the Demand Workbench are in the Qualified state.

2. On the Demand New record form, fill in the fields.

For a description of the field values, see [Demand form](#).

3. Select **Save**.

Note:

Requesters or collaborators can edit their demand as long as the demand is in the Draft state.

What to do next

- Review and refine the demand details.
- When all required information is complete, move the demand to the Submitted state by selecting **Submit demand**. The demand then enters the formal evaluation workflow involving the demand manager and stakeholders.

Create a qualified demand

The demand manager can create a qualified demand from the demand workbench list view.

Before you begin

Role required: it_demand_manager

About this task

Saving the demand adds it to the Demands list and adds a bubble representing the demand in the bubble chart.

Procedure

1. Navigate to **All > Demand > Demands > Workbench**.
2. Select **New** at the top of the list view.
3. Fill in the fields on the Demand form.
For information about the fields, see [Creating Demands](#).

Create a demand task

Create tasks for a demand to delegate cost, effort, risk, and benefit assessment activities. Assign a resource or group to the demand task to track the actual time and effort spent on performing the specified activities.

Before you begin

Role required: it_demand_manager

About this task

You create demand tasks to plan the work for demands rather than for the target work entity such as a project, change, defect, or enhancement. For more information, see [Demand tasks](#).

- Planned dates, actual dates, and original dates are part of project tasks not demand tasks.
- The due date indicates the date on which the task is targeted for completion and doesn't affect the demand workflow. Project tasks, however, affect the project completion dates if the planned dates and actual dates are changed.
- Don't support the creation of nested demand tasks.
- Don't support task constraints such as the settings Start ASAP and Start on a specific date.
- Don't support an execution type such as Agile, Waterfall, or Hybrid.
- You assign resources for a demand task use the **Assigned to** field, **Additional Assignee** list, and **Assignment Group** fields.

Resources assigned to a demand task can submit the time spent on it using a time card.

If you're creating a demand task with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, additional fields become available in addition to the Default view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency in Demand Management](#) and [Multicurrency fields in demand-related forms](#).

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand to which you want to add tasks.
3. Add or edit a demand task from the **Demand Tasks** related list:
 - To add a demand task, select **New**.
 - To update the details of an existing demand task, select the record and then select **Edit**.
4. On the Demand Task form, fill in the fields.
For a description of the field names, see [Demand task form](#).
5. Select **Save**.
After completing your work on the demand task, select **Update** to return to the demand page.

Note: Team members can access demand tasks assigned to them from Collaborative Work Management. For more information, see [Managing SPM work in Collaborative Work Management](#).

What to do next

Create resource assignments and add cost plans, benefit plans, and risks to the demand depending on your role. Use the following related links to access these tasks.

Demand Task form related links

Related Links	Description
Add Cost Plan to Demand	Add a cost plan to capture the costs of demands. Create a cost plan to specify the unit cost of a cost type for a fiscal period. This link appears if the Category value is set to Cost estimate and the user has the <code>it_project_manager</code> or <code>it_demand_manager</code> role. Select the link to open the cost plan form and fill in the details. For more information, see create a cost plan .
Add Resource Plan to Demand	Create a resource plan to find the availability of resources and add the resource plan to the demand. This link appears if the Category value is set to Effort estimate and the user has the <code>it_resource_user</code> role. Select the link to navigate to the Resource Plans page and request resources. For more information, see Create and manage resource assignments for a demand .
Add Benefit Plan to Demand	Create a benefit plan to capture the potential benefits accrued by the demand when the demand is executed. This link appears if the

Demand Task form related links (continued)

Related Links	Description
	<p>Category value is set to Benefit estimate and the user has <code>it_project_manager</code> or <code>it_demand_manager</code> role. Select the link to open the benefit plan form and fill in the details. For more information, see Create a monetary benefit plan for a demand.</p>
<p>Add Risk to Demand</p>	<p>Add risks that can potentially impact the success or outcome of the execution of the demand. This link appears if the Category value is set to Risk estimate and the user has <code>it_project_manager</code> or <code>it_demand_manager</code> role. Select the link to open the risk form and fill in the details. For more information see, add a risk.</p>

Submit a time card for a demand task

The resources assigned to a demand task create and submit a time card or time sheet to record the time spent on a demand task. The reported hours are used to calculate the actual cost and effort for a demand task.

Before you begin

Role required: `timecard_user`

About this task

The resource submits the time card or time sheet to record and track the work performed on a demand task. An appropriate approver then has to approve the submitted time card or time sheet.

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.
2. Create a time card.
3. Fill in the hours for each day spent working on the demand task.
4. Select **Submit**.

Create an artifact from a demand

Create an artifact, such as a work item, from a demand so that you can track work on the demand.

Before you begin

A demand must have been created. For more information, see [Create a demand](#).

The category and type of a demand and the applications you have installed determine the artifact you can create from it. The available artifact types and the applications you must have installed to be able to create them are listed in the following table.

Artifact	Required application
Enhancement, change, or defect	Project Portfolio Suite
Agile Development entities (story or epic)	Agile Development 2.0
Scaled Agile Framework (SAFe)SAFe entities (story, feature, or epic)	Essential SAFe or Portfolio SAFe
Enterprise Agile Planning (EAP) entities (epic, feature, or capability)	Strategic Planning

Role required: it_demand_manager

Note:

- The sn_apw_advanced.eap_user role is required to convert a demand to EAP entities.
- The safe_art_user role is required to create a SAFe story.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the demand for which you want to create an artifact.
3. Verify that the values in the **Category** and **Type** fields are appropriate for the artifact you want to create.
The options in the Type list change according to the category that you select. For more information, see [Demand form](#).

Note:

The **Category** and **Type** fields are set to read only when an artifact is created from a demand. If you delete the created artifact, these fields become editable again.

4. Select **Update**.
5. Create the artifact by selecting the appropriate related link.
Depending on the category and type of the demand, links related to the artifact you can create become available.

Create an Enterprise Agile Planning (EAP) entity from a demand

Create an Enterprise Agile Planning (EAP) entity, such as an epic, feature, or capability, from a demand so that you can start to work on these entities in Enterprise Agile Planning.

Before you begin

The [Strategic Planning](#) application must be installed.

Role required: sn_apw_advanced.eap_user

Note:

A demand manager requires the sn_apw_advanced.eap_user role to convert a demand to an EAP entity.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the demand that you want to convert into an artifact.

3. Set the demand category and type for EAP entities.
 - a. From the Category list, select **Strategic**.
 - b. From the Type list, select **EAP Epic**, **EAP Feature**, or **EAP Capability**.
4. **Optional:** In the EAP Details section, select the team that you want the EAP entity to be assigned to in the **Team** field.
This field becomes read-only once the entity is created.
5. Save the demand by selecting **Save**.
6. Create an entity that will be associated with this demand by selecting the appropriate related link.

Note:

The related links aren't available once the demand is converted to the selected entity.

The available related links are:

- Create EAP Epic
- Create EAP Feature
- Create EAP Capability

Result

The EAP entity is created successfully and the demand is moved to the Completed state. A message with a link to the created entity in Strategic Planning Workspace that enables you to immediately view or work on the entity is displayed.

For information about the data migrated from the demand to the EAP entity, see [Data migrated from demands to Enterprise Agile Planning \(EAP\) entities](#).

What to do next

View and work on the new entity in Strategic Planning Workspace right away by selecting the link to the entity in the message that is displayed when the entity creation is successful.

Note:

To access the entity at a later time, in the demand form, select the entity name in the **Converted to** field in the EAP Details section.

For more information, see [Strategic Planning](#) and [Enterprise Agile Planning in Strategic Planning](#).

Create a monetary benefit plan for a demand

Demand benefit plans capture the potential benefits accrued by the demand when the demand is executed. Create a monetary benefit plan to specify the estimated benefit in a category for a fiscal period.

Before you begin

Role required: it_demand_manager

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan. The monetary benefit plan breakdown records specify the estimated and actual benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The Monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual benefits for each fiscal period for the demand.

Note:

Converting a demand to a project or EAP entity transfers the benefit plan from the demand to the target project or EAP entity.

If you're creating benefit plan for a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, the fields in the **Financials** section differ from the Default view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency fields in demand-related forms](#).

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand form.
3. Select the Monetary Benefit Plans related list.
4. To create a monetary benefit plan, select **New**.

Note:

To create a monetary benefit plan from the **Financials Summary** page, select **Manage**.

5. On the Monetary Benefit Plan form, fill in the fields.

For a description of the field names, see [Monetary Benefit Plan form](#).

Note:

When you move the demand dates, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the demand start date, or end date. The [project property Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change](#) controls the behavior for demand date changes.

6. Select **Submit**.

What to do next

On the Benefit Plan form, view the benefit breakdown by fiscal period in the Monetary Benefit Plan Breakdowns related list.

Update a monetary benefit plan breakdown for a demand

Update a monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand.
3. Select the Monetary Benefit Plans related list.
4. Open the required monetary benefit plan.
5. In the Monetary Benefit Plan Breakdowns related list, select the information icon  for a monetary benefit plan breakdown.
6. Select **Open Record**.

7. On the Monetary Benefit Plan Breakdown form, view and update the enabled fields.

For a description of the field names, see [Monetary Benefit Breakdown form](#).

8. Select **Update**.

Create a non-monetary benefit plan for a demand

Create a non-monetary benefit plan to specify the estimated benefit in a category for a fiscal period. Demand benefit plans capture the potential non-financial benefits accrued by the demand when the demand is executed.

Before you begin

Role required: it_demand_manager

About this task

The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The Non-monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period for the demand.

Note:

Converting a demand to a project or EAP entity transfers the benefit plans from the demand to the target project or EAP entity.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand form.
3. Select the Non-Monetary Benefit Plans related list.
4. To create a non-monetary benefit plan, select **New**.
5. On the form, fill in the fields.

For a description of the field names, see [Non-monetary Benefit Plan form](#).

Note:

When you move the demand dates, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the demand start date, or end date. The [project property Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change](#) controls the behavior for demand date changes.

6. Select **Submit**.

What to do next

- On the Benefit Plan form, view the benefit breakdown by fiscal period in the Non-monetary Benefit Plan Breakdowns related list.
- [Associate monetary and non-monetary benefit plans](#), so that you can capture the potential benefits (financial and non-financial) accrued by the demand for the hybrid benefit plans.

Update a non-monetary benefit plan breakdown for a demand

Update a non-monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand.
3. Select the Non-monetary Benefit Plans related list.
4. Open the required non-monetary benefit plan.
5. In the Non-monetary Benefit Plan Breakdowns related list, select the information icon () against a non-monetary benefit plan breakdown.
6. Select **Open Record**.
7. On the Non-monetary Benefit Plan Breakdown form, view and update the enabled fields.
For a detailed description of the field names, see [Non-monetary Benefit Plan Breakdown form](#).
8. Select **Update**.

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the demand.

Before you begin

Role required: it_demand_manager

About this task

You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

Note:

When you delete a benefit plan, its relationship with the associated benefit plan (if any) is also removed.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand form.
3. Select the Monetary Benefit Plans or Non-monetary Benefit Plans related list.
4. Select the name of a benefit plan that you want to associate.
5. Associate a monetary or non-monetary benefit plan.
6. Select **Save**.

Result

The selected benefit plan is associated with another plan.

What to do next

Select the **View Associated benefit plan** related link to view the associated benefit plan.

Create a demand cost plan

Demand cost plans capture the costs of demands. Create a cost plan to specify the unit cost of a cost type for a fiscal period.

Before you begin

Role required: it_demand_manager

About this task

The application automatically creates cost plan breakdown records when you save the cost plan. The cost plan breakdowns are records that specify the estimated and actual costs and the budget at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The demand cost plans are added to the parent program and portfolio.

The cost plan breakdowns that specify the estimated cost and actual cost at a granular level for a fiscal period of the demand cost plan are recalculated in the project currency. Similarly, the estimated breakdown amounts of the planned benefit and actual benefit of the demand benefit plans are recalculated in the project currency. The project currency amounts are then rolled up to the cost plan, benefit plan, and the project records.

If you want to use multiple currencies, create a cost plan for another currency.

If you're creating benefit plan for a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, the fields in the **Financials** section differ from the Default view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency fields in demand-related forms](#).

Procedure

1. Navigate to **All > Demand > Demands > All** and open the required demand form.
2. In the related links, select **Cost Plans**.
3. To view the Financials Summary page in a grid, select **Manage**.
4. Add or edit a cost plan from the Cost Plans related list:
 - To add a cost plan, select **New**.
 - To update the details of an existing cost plan, select the record and then select **Manage**.
5. In the cost plan form, fill in the fields.

For a description of the field names, see [Cost plan form](#).

Note:

When you change the planned start date of a demand, the associated cost plans and resource assignments also change. The [project property Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change](#) controls the behavior for demand date change.

6. Select **Submit**.

What to do next

- On the Demand form, view the breakdowns by fiscal period in the **Cost Breakdown** related list.
- To recalculate the value in the **Forecast** field, use the **Calculate Forecast Amount** related link.

View financial summary of cost and monetary benefit plans

View a breakdown of the cost and benefit components of a demand to track the financials of your demands. The financial summary enables you to assess the progress of the demand and track financial changes and their impact on the demand over a period.

Before you begin

Role required: it_demand_manager

About this task

View a detailed breakdown of the cost components of a demand using the **Financial Summary** tab. The total planned cost, budget cost, actual cost, and planned returns with their breakdowns are displayed in the form of read-only cards. The cost plans, benefit plans, and their breakdowns are provided in an editable grid view.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open a demand.
3. On the Demand form, select the **Cost Plans** or **Monetary Benefit Plans** related list.
4. Select **Manage**.
5. **Optional:** Add additional fields, view plan details, or reorganize the financial data.

Create an expense line for a demand

A demand expense line is the cost associated with a specific source, such as a user or a fixed asset. Expense lines are part of demand cost plans.

Before you begin

Role required: it_demand_manager

Application required: Project Portfolio Management with Financials

About this task

Only processed expense lines are considered for demands. You can create multiple expense lines for a project or demand.

Expense lines on the demands are used to record any expense incurred during demand evaluation only. You can't associate expense lines to cost plans on demands. The actual cost incurred from the expense lines tied to the demand rolls up to the **Demand actual costs** field.

When a demand is converted to a project, the expense lines remain with the demand, while the cost plans and budget are moved over to the project.

Procedure

1. Navigate to **All > Demand > Demands > All** and open the demand form.
2. In the Expense Lines related list, select **New**.
3. On the expense line form, fill in the fields.
For a description of the field names, see [Expense line form](#).
4. Select **Submit**

Create and manage resource assignments for a demand

As a resource requester, find the availability of the resources, and create and manage the resource assignments for a demand.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand form.

3. Select the **Resource assignments** related list and select **New**.
4. On the Resource assignment new record form, fill in the fields.
For a description of the field names, see [New Resource Assignment form](#).
5. Select **Submit**.

Recalculate costs of resource assignments of a demand

Recalculate the costs of all active resource assignments of a demand whenever the hourly rates change in the associated rate model so that the plan costs are up to date.

Before you begin

Confirm the following setup:

- The demand must be active.
- The demand must have an active rate model assigned.

Role required: demand_manager

About this task

This option recalculates the costs of all resource assignments of the demand at once. You can also open a resource assignment from the **Resource assignments** related list to [recalculate the resource costs of an individual resource assignment](#).

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open a demand.
3. On the Demand form, right-click on the header bar and select the **Recalculate Resource Costs**.
4. In the Recalculate Resource Cost form, fill in the fields.
For a description of the field names, see [Recalculate resource costs form](#).
5. Select **OK**.

Result

- Recalculates the selected resource costs of all the applicable resource assignments in the demand based on the latest hourly rates. The hourly rates are derived from the rate model associated with the demand.
- Updates the recalculated resource costs on the respective cost fields on the resource assignment form and the Resource assignments related list.
- Reflects the revised values in the respective cost fields of the demand.

Generate labor costs

Generate labor costs to view the expenses of resources using resource assignments and cost plans.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Open the **Generate labor costs for demands and projects** scheduled job.

3. Select **Active**.

4. On the Scheduled Script Execution form, fill the fields.

For a description of the field names, see [Scheduled Script Execution Form](#).

5. Select **Update**.

 **Tip:**

Alternatively, as an admin, you can activate and define a scheduled job to generate labor costs at the required frequency. For more information, see [Activate a scheduled job to generate labor costs](#).

Migrate budget of active demands to Next Experience

Migrate your demand budget to Next Experience to manage the financials using Project Workspace.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Migrate baselines using one of the following options.

 **Note:**

After migration, you won't be able to view the budget on Classic UI. You're encouraged to manage budget using the Financials in Next Experience.

Migrate financial baselines of demands to Next Experience

Migrate the financial baselines of demands to Next Experience to manage the financial using Project Workspace.

About this task

Next Experience uses new data model that has two new tables Investment Baselines (`sn_invst_pln_invst_investment_baseline`) and Investment Baseline Header (`sn_invst_pln_invst_investment_baseline_header`) which are used to capture financial baselines. The financial baselines created for demands in classic experience aren't visible in Next Experience. You can migrate the existing baselines from classic to Next Experience as an on-demand activity for the required demands, or as bulk by activating and running a scheduled job.

Baselines view in the Next Experience provides better insights to view and analyze the financial performance of your demands.

Unlike the financial baselines created using Next Experience, the financial baselines created in the Classic UI don't capture the actual expenses along with planned costs as a default behavior. To have relevant information for baselines comparison, the actual costs are captured as part of the baseline migration using the processed expense lines as of the baseline creation date of the financial baseline.

For detailed information and use cases on using financials in Next Experience, see [Managing financials for planning items in Portfolio Planning](#).

Note:

Starting March 2026 release, for customers using multicurrency, migration of financial baselines updates the baseline data in project currency to investment currency.

- Existing demands that have only financial baselines but no investment baselines. With the migration, financial baseline will be migrated to investment baseline and you can view the migrated baseline from the `sn_invst_pln_invst_investment_baseline` table list view.
- Existing demands that have both project and investment baselines, you need to run the scheduled job to populate the fields for investment currency in the baselines with the values from project currency. For more information, see [Activate scheduled job to populate to multicurrency fields](#).

Before you begin

The data in project currency fields will be migrated to investment currency fields on migrating baselines for customers using multicurrency.

Role required: `it_demand_manager`

Procedure

- Navigate to **All > Demand > Demands > All**.
- Migrate baselines using one of the following options.

Tip:

After migration, you're encouraged to create financial baselines using the Financials in Next Experience.

Result

Financial baselines for the selected demands are migrated to Next Experience and you can view them in the [Baselines view](#).

What to do next

[View and compare the migrated baselines](#) with any existing baselines or current baseline ().

Allocate budget to a demand

Set the budget of a demand according to the fiscal years.

Before you begin

Role required: `it_portfolio_manager`

Procedure

- Navigate to **All > Demand > Demands > All** and open the demand form.
- In the related links, select **Demand Budget**.
The **Demand Budget** dialog box opens.
- Select the fiscal year for which you want to set the budget for the demand.

Tip:

You can work on allocating lean budgets at the fiscal period level using the Investment Budget. For more information, see [Enable lean budgeting for demands](#).

- Enter the amounts for **Capex Budget** and **Opex Budget**.
The **Total Budget** is updated with the sum of capex and opex amounts.

5. Select **OK**.

Note:

- If the demand doesn't have a cost plan, start date, and due date, then demand budget is distributed from the current month until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a due date but has a start date, then the demand budget is distributed from either:
 - Start date (if the start date falls in the given budget fiscal year) until the end of the demand budget fiscal year.
 - Start of the demand budget fiscal year until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a start date but has a due date, then the demand budget is distributed from either:
 - Current month until due date (if the due date falls in the given budget fiscal year).
 - Current month until the end of demand budget fiscal year.

If the demand has a cost plan associated, then demand budget is distributed by honoring the cost plan fiscal periods.

Result

The demand budget for the selected year appears in the **Demand Budget** related list. You can select the amounts in the list to revise them.

Enable lean budgeting for demands

Enable the Investment Budget option to allocate budgeting for demands at fiscal period.

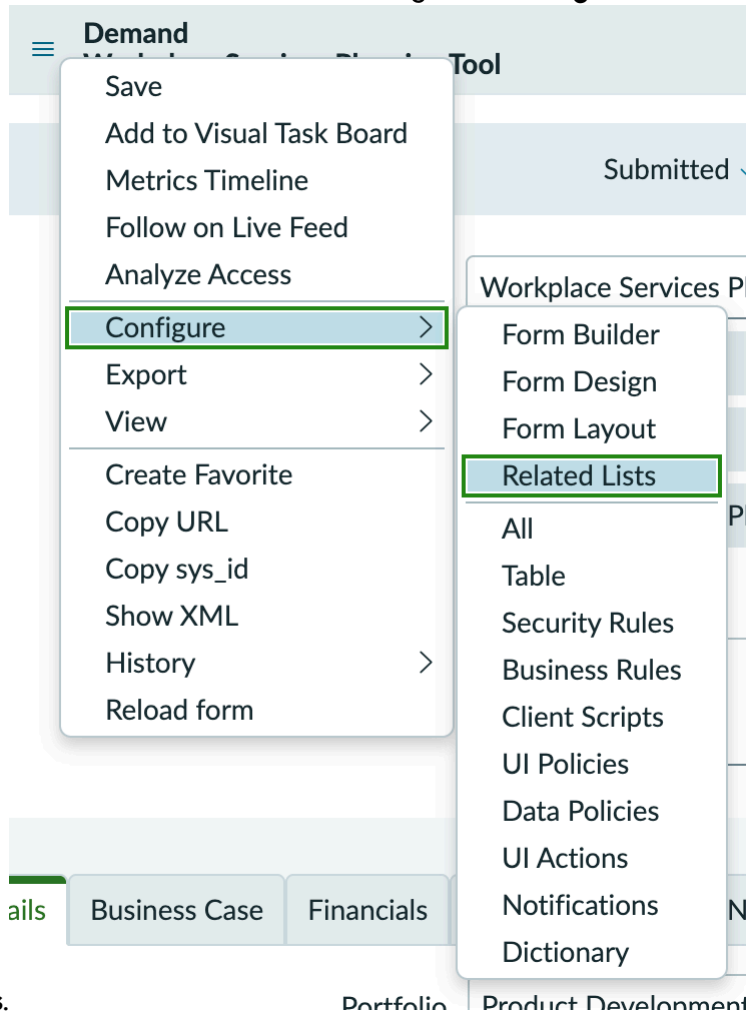

Before you begin

Role required: admin

Procedure

- 1.** Navigate to **All > Demands > Demand > All**.
- 2.** Open the required demand.

3. Select the Additional actions and navigate to **Configure > Related**

Lists.

4. Select **Investment Budget** from the Available column and add it to Selected column.

5. Select **Save**.

Manage lean budgeting for demand

Allocate budget for demands at each fiscal period instead of the entire fiscal year to reduce the overhead costs associated with traditional approach.

Before you begin

- [Enable lean budgeting for demands](#)
- Role required: sn_invst_pln.sn_spm_funding_user

Any user role with this specific role attached can add or manage the investment budgets.

Procedure

1. Navigate to **All > Demands > Demand > All**.
2. Open the required demand.
3. In the Investment Budget related list, select **New**.
4. On the Investment Budget form, fill in the fields.
For more information about the fields and their description, see [Investment Budget form](#).
5. Select **Submit**.

Result

The allocated budget for a fiscal period is displayed in the Investment Budget related list.

Create a baseline of a demand

Create a financial baseline of a demand, which captures benefit and financial metric information (snapshot of cost plan, benefit plan, and demand-level financial metrics) at a particular moment in time.

Before you begin

You can create as many financial baselines as necessary and review the financials changes that have been made to the demand since the previous baseline. Any financial baseline doesn't capture the actual cost component of the demand.

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the required demand.
3. To create a financial baseline of a demand, use either of the options.

Compare financial baselines of a demand

You can compare baselines to review the variances in the financial data of a demand and see what changed.

Before you begin

Role required: it_demand_manager

About this task

You can [create](#) multiple baselines at various stages of a demand's life cycle. For example, at the end of each phase or after every calendar month or quarter. Each baseline captures the financial data of the demand at a particular moment, providing a basis from which you can identify and review the changes made to the demand. Having multiple baselines and comparing them helps you track the performance of your demand.

If you're creating demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, you can view and compare the financial details of the demand in baselines in the demand currency. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency in Demand Management](#).

Procedure

1. To compare financial baselines of a demand, perform one of the following options.
2. On the Financial Baseline form, select the baselines you want to compare from the two lists. By default, the current and the most recent baselines are selected.
3. Select **Compare**.
The comparative data of the baselines are displayed in the following two sections:

- The **Financial Baseline Summary** section displays three widgets: the first two widgets contain the financial data of the two baselines, and the third widget contains their variance.
- The **Financial Baseline Details** section displays the cost plans and benefit plans of the two baselines in two different grids. Each plan type has two rows corresponding to each baseline data.

Note:

To see the color code of rows representing each baseline, select the baseline legend icon ().

4. Optional: Add additional fields or reorganize the comparative data on the **Financial Baseline Summary** section of the form.

- To toggle viewing the **Financial Baseline Summary** section, select the **Collapse** icon  or **Expand** icon .
- To show or hide additional fields on the widgets in the **Financial Baseline Summary** section, select the configuration icon  and select the field names.

Note:

If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated, you can add additional fields to the baseline such as Total planned cost in demand currency, Operating budget in demand currency, and Financial return in demand currency.

(Optional) The selected field preferences are saved and are available when you reopen the Financial Baseline form.

- To reset to the default widget layout, select **Reset to defaults**.
- To view the financial information of the baselines in demand currency, toggle the **Show Widgets in Demand Currency** button.

Note:

This button is available only when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated.

5. Optional: View details of financial data of the cost and benefit plans on the **Financial Baseline Details** section of the form.

- To view a cost plan or benefit plan comparative data in yearly, quarterly, or monthly format, select the **Year** or **Quarter** or **Month** views respectively.
- To view details of a fiscal year, select the **Expand** icon  or **Collapse** icon .

Realign resource assignments with demand

Planning and execution of your roadmap involves change in priority or timelines of your work. In such cases, you can adjust the resource assignment dates to match with the latest dates of your demands.

Before you begin

[Migrate resource plans to resource assignments](#)

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand.
3. Change the **Approved start date** and **Planned start date** to meet your organizational priorities.
4. Select **Save**.
5. Select the **Realign assignments to demand** related link.

Result

In the Resource assignments related list, you can see the Start date of the resource assignments aligned with the demand start dates.

View demands

You can view existing demands at any time.

Before you begin

Role required: it_demand_manager

About this task

The **Project** field displays the project name after the demand manager creates a project from the demand. The **Risk**, **Value**, and **Size** fields display assessment metrics for the demand. This information appears on the Demands list.

Procedure

1. View demands using one of the following options.
 - a. **All > Demand > Workbench.**
The bubble chart and the list view on the demand workbench display all qualified demands.
 - b. **All > Demand > Demands > All.**
Displays the Demands list.
2. Select the **Number** field on the Demands list to view the Demand form.
3. View the status of the demand using the **Stage** field.

This field is updated as the demand moves through the life cycle, from an idea to a demand to the resulting project, enhancement, change, defect, or planning item. At a glance, users can use this field to track the progress of a demand.
4. Hover over the **Stage** field on the Demands list to view the progression of the idea along with the value of the **State** field for each step in the progression:

- **Idea:** If an idea is being evaluated, the pop-up window displays the current state of the idea.
- **Demand:** if an idea is promoted to a demand, the pop-up window displays the current state of the demand as well as the idea.
- **Project, Enhancement, Change, or Defect:** If a demand is accepted, the pop-up window displays the current state of the resulting artifact in addition to the demand and

View an artifact created from a demand

As the demand manager, you can view an artifact created from a demand.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > Workbench**.
2. Right-click a bubble that has an associated artifact.
3. Select **View <artifact>**.
This action displays the artifact form for the selected demand in a new tab.

View a demand summary

Hover over a bubble in the demand workbench bubble chart to display a summary of the demand information.

Before you begin

Role required: it_demand_manager

Procedure

1. Hover over a demand in the bubble chart to highlight the bubble and its label.

A bubble summary window also shows the demand name and the risk, value, and size data. Hovering over the bubble also highlights the corresponding demand row in the list view. Hovering over a demand in the list view highlights the corresponding bubble in the bubble chart.

Note:

When hovering over a bubble, scroll down in the list view to see the corresponding highlighted demand row. If necessary, adjust the height of the list view or the bubble chart.

2. For multiple demands, some bubbles or labels overlap and are difficult to see.

Hover over a label to highlight the corresponding bubble.

Use when:

- Two or more bubbles have the same metrics and overlap directly.
- Several bubbles intersect and overlap.
- A bubble is only partially visible on the edge of the bubble chart.

Add details to demands

The demand manager typically works with a business relationship manager to identify stakeholders and elicit requirements, risks, and other important information.

The Demand Management application streamlines the stakeholder identification process. Auto-populating the list of stakeholders from the portfolio the user selects when filling out the demand form in the service catalog or in the Demand Management application. The Demand Management application also enables you to use assessments to automate some of the information gathering process.

Add demand tasks

Demand managers analyze business demands, approve demands, and create projects and enhancements. Many times activities such as effort, cost, risk, and benefit estimates are required to analyze a demand and create a business case for approval of the demand. A demand manager can create demand tasks and assign these tasks to individual resources or a group to perform these activities.

The resources assigned to the demand tasks then post time spent while working on a demand or demand task using a time card. The time card data is used to calculate actual effort and cost incurred on the demand task as well as demand.

To [create demand tasks](#), scroll to the **Demand Tasks** related list on the Demand form and select **New** to create a record.

Add stakeholders

When a demand is submitted, the demand stakeholder list is populated automatically from the associated portfolio. You can also add stakeholders. To add a person to the stakeholder list, scroll to the *Stakeholders* related list on the Demand form, select **Create new** to create a record, and fill in the form. To add existing stakeholders to the demand, select **Add existing**.

When adding a stakeholder from the demand form, the **Portfolio** field displays the portfolio that was selected on the Demand form.

A demand can have multiple stakeholders and a stakeholder can be associated with multiple demands.

The newly added stakeholder is automatically associated with the current demand and any other demands that use the same portfolio.

Add requirements

Demand managers can create as many requirements as needed, but requirements aren't required. Typically, the stakeholders associated with a demand request have insights into what the requirements are for a demand request to be completed.

Demand managers use the Requirement form to describe the requirement and assign an owner who is responsible for making sure that the requirement is met. When a requirement is complex, demand managers can associate planned tasks, such as project tasks, with the requirement. The demand manager assigns and tracks the tasks until they're complete.

To add a requirement to a demand, follow these steps:

1. Open a Demand form and select **New** from the Requirements related list.
2. On the Requirement form, fill in the fields. For a description of the field names, see [Requirement form](#).

Add resource assignments

Resource assignments are another source of information that decision makers can use when evaluating demands. You can create resource assignments for a demand from the **Resource assignments** related list, which appears only if the Resource Management Workspace application is activated.

To [add a resource assignment to the demand](#), scroll to the *Resource assignments* related list on the Demand form and select **New** to create a record.

Add and recalculate strategy and goal allocations

The Strategy Allocations related list displays the percentage of the demand's total cost and benefits allocated toward the achievement of the associated strategies. The Goal Allocations related list displays the percentage of demand's total cost and benefits allocated toward achievement of goals associated with the demand. For more information, see [Allocate or modify the strategy and goal percentage for a demand](#).

Recalculate and update cost field values in the Strategy and Goal Allocation tabs. Use the Recalculate Strategy and Goal Allocation related link to update the demand's total cost and benefits when strategy and goal allocations for the demand are changed. For more information, see [Strategic Spend Tracking for PPM](#).

Note:

These related lists and related links appears only when [Strategic Spend Tracking for PPM](#) is installed. This application is available on ServiceNow Store. You must switch to the **Strategic Alignment** view to see them. If these lists and links aren't available on the form view that you're using, ask your administrator to configure the demand form to add them. For more information, see [Install Strategic Spend Tracking for PPM](#).

Add goal/target relationships

The Goal/Target Relationships related list displays the relationship between a goal and a planning item, strategic item, or any other item such as a demand.

Allocate funds

If your demand represents a significant, multi-year investment and you must distribute funding across related work, you can allocate funds from your demand. By allocating funds, you can directly support one or more projects, epics, or programs linked to the approved demand.

This link appears only if you have the [Investment Funding](#) plugin activated, an existing corresponding investment record for this demand, and the investment_user role.

RIDAC (Risk, Issue, Decision, Action, and Request Changes) records for a demand

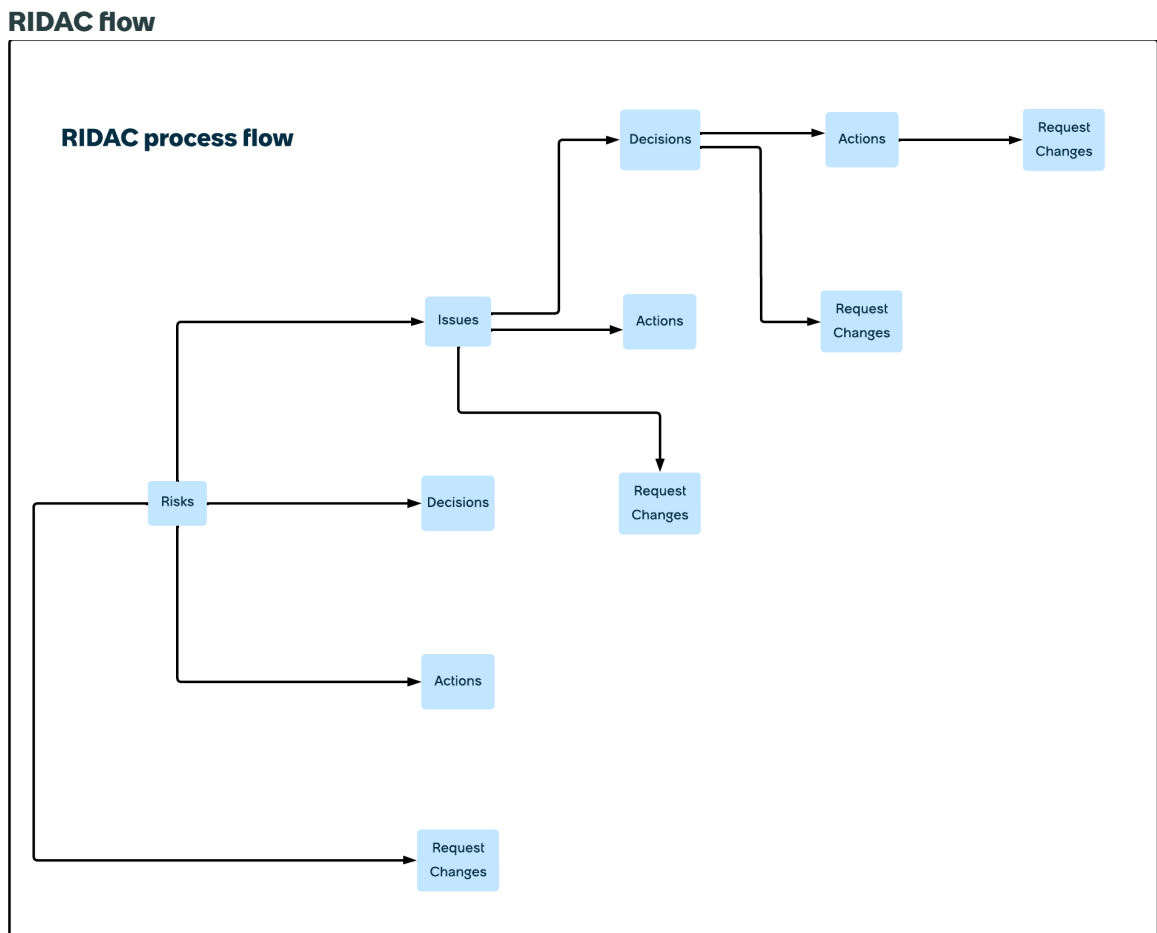

RIDAC is an acronym for Risk, Issue, Decision, Action, and Request Changes records. Create a risk for your demand that you can convert to other records during the demand life cycle. Track issues and avoid manual copying of relevant details in related records.

As a demand progresses through the demand life cycle, a risk might result in an issue or a new issue might occur. Once you have a risk record, you convert that record into related records such as issues, actions, or decisions. This conversion and association of records helps you analyze and identify patterns, trends, and probable resolution for planning future demands. The ability to convert records provides you with the following advantages:

- Ability to create related records without having to enter the relevant information manually.
- Helps you analyze and identify patterns, trends, and probable resolution for planning future demands.
- Enables you to view a consolidated list of all converted RIDAC records using the **View RIDAC** related link on the Demand form.

Consider the following points before converting or associating RIDAC records:

- You can convert one record to another only in the RIDAC sequence. For example, you can convert a risk to an issue, decision, action, or request change but you can't convert an issue to a risk or a decision to an issue. The following diagram illustrates the RIDAC process flow.

- You can convert one record into multiple RIDAC records. For example, you can create multiple issue records from one risk record.
- You can associate one record with multiple different records. For example, you can link one issue record to multiple different risk, decision, action, or request change records. For more information, see [Associate existing RIDAC \(risks, issues, actions, decisions, and request changes\) records for a demand](#).

Add risks for a demand

Add a risk to a demand to identify, analyze, prioritize, plan, and track a risk during any phase of the demand life cycle. Assess potential problems and the severity of their impact to take informed decisions about the demand.

Before you begin

Role required: it_demand_manager

About this task

A risk is any uncertain event that can potentially impact the success or outcome of a demand. For example, an incorrect estimate of factors like financial outlay or resource assignments can cause schedule slippage. Another example of a risk is a change in demand requirements. Recording risks ensures that decision makers have all relevant information when assessing a demand's progress. The demand risks are added to the parent program and portfolio.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand to which you want to add risks.
3. From the Risks related list, select **New**.
4. On the Risk form, fill in the fields.
For a description of the field names, see [Risk form](#).
5. Select **Submit**.

What to do next

- Convert an existing risk to an issue, decision, action, or request change and close the risk. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Change\) record to another for a demand](#).
- Associate the risk with existing issues so you can track dependencies and recognize trends for the future. For more information, see [Associate existing RIDAC \(risks, issues, actions, decisions, and request changes\) records for a demand](#).

Configure a custom Risk rank and Risk value for a demand

Configure custom risk rank and value scores (such as High-Medium, Medium-Low, or Absolute-Low) to rate the impact and probability factors for a risk.

Before you begin

Role required: pps_admin

About this task

Use the Risk Value Lookup module to set up the risk rank and risk value for a specific combination of risk impact and probability. The system uses these values to determine the degree of risk (Absolute, High, Medium, Low) based on the impact and probability factors of a risk.

The value in the **Probability** field is multiplied by the value of the **Impact** field to generate the values for the **Risk rank** and corresponding **Risk value** in the Risk form.

By default, you can use the following impact, value, and probability scores for a risk to create a risk rank and risk value score:

- Absolute
- Low
- Medium or Moderate
- High

For example, a risk might have high probability and medium impact but you might want to consider it as an overall low risk for the demand. In that case, you would configure the Risk Value Matcher form with the following values:

- Impact = 2 Medium
- Risk Rank Color = Green
- Probability = High
- Probability Number = 1
- Risk Value = 3 Low

The following image illustrates a Risk

The image shows a form with the following fields and values:

Number	RSK0001002
Probability	Low
Impact	3 - Low
Risk rank	9
Risk value	3 - Low

Procedure

1. Navigate to **All > Project Administration > Settings > Risk Value Lookup**.
2. Select **New**.
3. On the risk value matcher form, fill in the fields.
For a description of the field names, see [Risk value matcher form](#).
4. Select **Submit**.

Add issues for a demand

Add an issue to a demand to escalate a risk or to track an unexpected problem. For example, a technical malfunction or resource unavailability that occurs during any phase of the demand life cycle. If the issue remains unresolved, unnecessary conflicts, delays, or even a failure can occur.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand to which you want to add an issue.
3. From the Issues related list, select **New**.
4. On the Issue form, fill in the fields.
For a description of the field names, see [Issue form](#).
5. **Optional:** Search in the knowledge base for any article related to the issue.
 - a. Select the search knowledge icon .
 - b. If you find relevant articles, select the title of an article to view its content.
 - c. If you want to include the content of the article in the issue, select **Attach to Issue**.
The article content is copied in to the **Description** field of the Issue form. You can modify the text if necessary.
6. Select **Submit**.

What to do next

- Convert an existing issue to a decision, action, or request change and close the issue. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Change\) record to another for a demand](#).
- Associate the issue with your existing risks so you can track dependencies and recognize trends for the future. For more information, see [Associate existing RIDAC \(risks, issues, actions, decisions, and request changes\) records for a demand](#).

Add decisions for a demand

As a demand manager, develop a plan to manage risks and issues proactively with solutions. Add the solution for a risk or issue to a demand in the form of a decision. You can also convert a risk or an issue to a decision or a decision to an action or a request change.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand to which you want to add a decision.
3. From the Decisions related list, select **New**.
4. On the Decision form, fill in the fields.
For a description of the field names, see [Decision form](#).
5. **Optional:** Search in the knowledge base for any article related to the decision.
 - a. Select the search knowledge icon .
 - b. If you find relevant articles, select the title of an article to view its content.

- c. If you want to include the content of the article in the issue, select **Attach to Decision**. The article content is copied in to the **Description** field of the Decision form. You can modify the text if necessary.

6. Select **Submit**.

What to do next

- Convert a decision to an action or request change and close the decision. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Change\) record to another for a demand](#).
- Associate the decision with your existing issues and risks so you can track dependencies and recognize trends for the future. For more information, see [Associate existing RIDAC \(risks, issues, actions, decisions, and request changes\) records for a demand](#).

Add actions for a demand

Add actions that are required for resolving an issue or risk for a demand. You can also convert a risk, issue, or decision to an action based on your analysis and plan for resolution of a risk or issue.

Before you begin

Role required: it_demand_manager

About this task

After analyzing the risks and issues and taking a decision on how to manage those risks and issues, add an action for resolving the risk or issue.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand to which you want to add an action.
3. From the Actions related list, select **New**.
4. On the Action form, fill in the fields.
For a description of the field names, see [Action form](#).
5. **Optional:** If the action requires approval from other stakeholders, request approval with a due date using the **Approval** and **Due date** fields.
6. Select **Submit**.

What to do next

- Convert an action to a request change and close the action. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Change\) record to another for a demand](#).
- Associate the action with your existing risk, issue, and decision records so you can track dependencies and recognize trends for the future. For more information, see [Associate existing RIDAC \(risks, issues, actions, decisions, and request changes\) records for a demand](#).

Add Request Changes to a demand

As a demand manager, you might create a request change as the outcome of the action taken to resolve an issue or mitigate a risk. The request change might result in changing the demand's scope, resource requirement, cost, or schedule to minimize the impact of a risk or issue.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand to which you want to add a request change.
3. From the Request Changes related list, select **New**.
4. On the Request Change form, fill in the fields.
For a description of the field names, see [Request change form](#).
5. Select **Submit**.

What to do next

Associate the request change with your existing risk, issue, decision, and action records so you can track dependencies and recognize trends for future. For more information, see [Associate existing RIDAC \(risks, issues, actions, decisions, and request changes\) records for a demand](#).

Convert one RIDAC (Risk, Issue, Decision, Action, and Request Change) record to another for a demand

Convert one RIDAC record (risk, issue, action, decision, and request changes) to another, in that order to retain the record information instead of having to create a record manually and to track the issue more easily.

Before you begin

Role required: it_demand_manager

About this task

When you convert a RIDAC record to another record, the values for the **Short description**, **Requester**, and **Assigned to** fields are carried forward.

You can also specify to close the parent record on creation of the new record instead of manually closing the parent record.

You can also view the consolidated list of all the converted RIDAC records using the **View RIDAC** related link on the Demand form and **View RIDAC** in the application navigator of the Demand module.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand for which you want to convert a risk, issue, decision, action, or request change record to another RIDAC record.
3. From the Demand form related list, select the risk, issue, decision, action, or request change record to open the form view.
4. Select the **Convert to RIDAC** related link on the form.
5. **Optional:** On the Convert dialog box, from the select task type list, select the RIDAC record to which you want to convert the selected record.
For example, if you wanted to convert a risk to an issue, you would select **Issue**.
6. **Optional:** Modify the text in the **Short description** field, which is copied from the parent record.
7. **Optional:** Change the default assignment copied from the parent record in the **Assigned to** field by selecting the lookup icon  and selecting a different user.

8. Optional: If you want to close the parent RIDAC record on creation of the new record, select the close parent record option.

The label of the close parent record option changes depending on the parent record type.

For example, if the parent record is Risk and you're converting it to an issue record, the close record option would appear as **Close Risk**.

9. Select **OK**.

Associate existing RIDAC (risks, issues, actions, decisions, and request changes) records for a demand

Link existing RIDAC records (risks, issues, actions, decisions, and request changes) to one another for your demand. Associating RIDAC records with each other enables you to keep a record of risks or issues and their outcome for analysis at demand closure and planning. It also helps to track the risks and issues throughout the demand life cycle.

Before you begin

Role required: it_demand_manager

About this task

You can associate one record with multiple different records. For example, you can link one issue record to multiple risk, decision, action, or request change records. Additionally, you can view the converted RIDAC records such as risks converted to issues, decisions, actions, and changes, using the View RIDAC related link.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select the demand for which you want to associate one RIDAC entry to another.
3. In the Demand form related list, select the RIDAC record.
4. On the form, select the **Associate RIDAC** related link.
5. In the Associate dialog box, from the Select type list, select the RIDAC record to which you want to associate the selected record.
For example, if you wanted to associate a risk to an issue, you would select **Issue**.
6. Select the record number to which you want to associate the selected record from the Associate to list.
For example, if you wanted to associate the selected risk to issue (ISU0010003), you would select **ISU0010003**.
7. Select **OK**.

Reset a demand to Draft state

A demand can be moved back to the Draft state, if necessary.

Before you begin

Role required: it_demand_manager

About this task

A demand can be reset to Draft from the Completed, Approved, Screening, or Submitted states, or until an artifact such as a project or enhancement is created from it. The **Reset to Draft** option is unavailable if the demand is in the Qualified state.

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Open the required demand form.
3. Select **Reset to Draft**.
 - A confirmation message appears if there are:
 - Active assessments pending with stakeholders, or
 - Resource assignments are created for the demand
4. Select the check box to replan the allocated resource plans that have no actual hours reported.
5. Select **OK**.

Result

- The demand is moved to the Draft state.
- All the score values in **Assessment Data** tab are reset to default.
- All active assessments for the demand are canceled. New assessments are triggered when the demand moves to the Screening state and if the **Assessment Required** field on the demand form is set to true.

Delete demands

Demands can be deleted only while in the *Pending* state.

Before you begin

Role required: it_demand_manager or it_demand_user

About this task

When you delete a demand, all data related to the demand, such as risks, demand tasks, requirements, and decisions are deleted. However, the stakeholders aren't deleted from the Stakeholder Register [dmn_stakeholders_register] table.

If a project is already created from a demand, its reference is removed from the project along with the data related to the demand. However, the project isn't deleted from the database.

To delete a demand:

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Do:
 - Select the demand to open the demand form and then select **Delete**.
 - Select the check box next to the demand and then select **Delete** from the **Actions** list.

Move and resize a demand

As the demand manager, you can move and resize bubbles in the bubble chart.

Before you begin

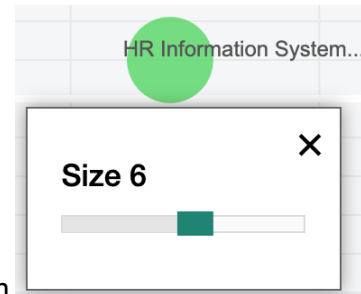

Role required: it_demand_manager

About this task

Moving and resizing bubbles in the bubble chart updates the corresponding values for the demands in the list view.

Procedure

1. Select and drag a bubble left or right along the horizontal axis to decrease or increase the risk of the demand.
The new risk for the demand is updated in the **Risk** column.
2. Select and drag a bubble up or down along the vertical or Y axis to increase or decrease the value of the demand.
The new value for the demand is updated in the **Value** column.
3. Select a bubble to open a sizing window where you can increase or decrease the size of the bubble.

The new size of the demand is updated in the **Size** column.

Train the similarity solution for Demand Management to find similar demands

Train the Similar Demands solution definition is included within the Predictive Intelligence for PPM capability to find related demands when creating a demand.

Before you begin

Confirm that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml), PPM Standard plugin (com.snc.financial_planning_pmo), and Predictive Intelligence for PPM plugin (com.snc.ppm_ml) are activated. For more information about Predictive Intelligence, see [Predictive Intelligence](#).

Role required: admin

Procedure

1. Navigate to **All > Predictive Intelligence > Similarity > Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Similar Demands solution definition (ml_sn_global_global_similar_demands).
3. On the Similarity Definition form, verify the default field values for demands.
For more information about the Similarity Definition form fields, see [Create and train a similarity solution](#).
4. Select **Update & Retrain**.
5. Open the Similarity Definition form for the Similar Demands solution definition (ml_sn_global_global_similar_demands).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column.

Note:

Alternatively, you can select the link for the solution in the **Active** column. On the ML Solution form, select the **Show training progress** related link to check the training solution progress.

Result

When the solution is complete, the similar demands appear in the Similar demands section on the Demand form.

What to do next

- Review similarity examples: On the Similarity Definition form, in the ML Solutions related list, when **Progress** is 100%, in the **Active** column, select the link for the solution. On the ML Solution form, select the **Similarity Examples** related link to view the Similarity Examples list.
- Update the similarity score threshold: On the ML Solution form, on the **Solution Statistics** tab, enter the required value in the **Similarity Score Threshold** field. Right-click the ML Solution form and select **Save**.
- Test the prediction output for the records: On the ML Solution form, on the **Test solution** tab, enter your text in the **Short description** field and the maximum number of expected results in the **Top N** field, and then select **Run test**. The results above the similarity score threshold value are displayed.

[Create a demand](#)

Identify similar records using Now Assist for Strategic Portfolio Management (SPM)

Detect similar demand records using the identify similar records Now Assist skill. This skill detects similar demand records based on contextual similarity in the name, description, and business case content.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#) .

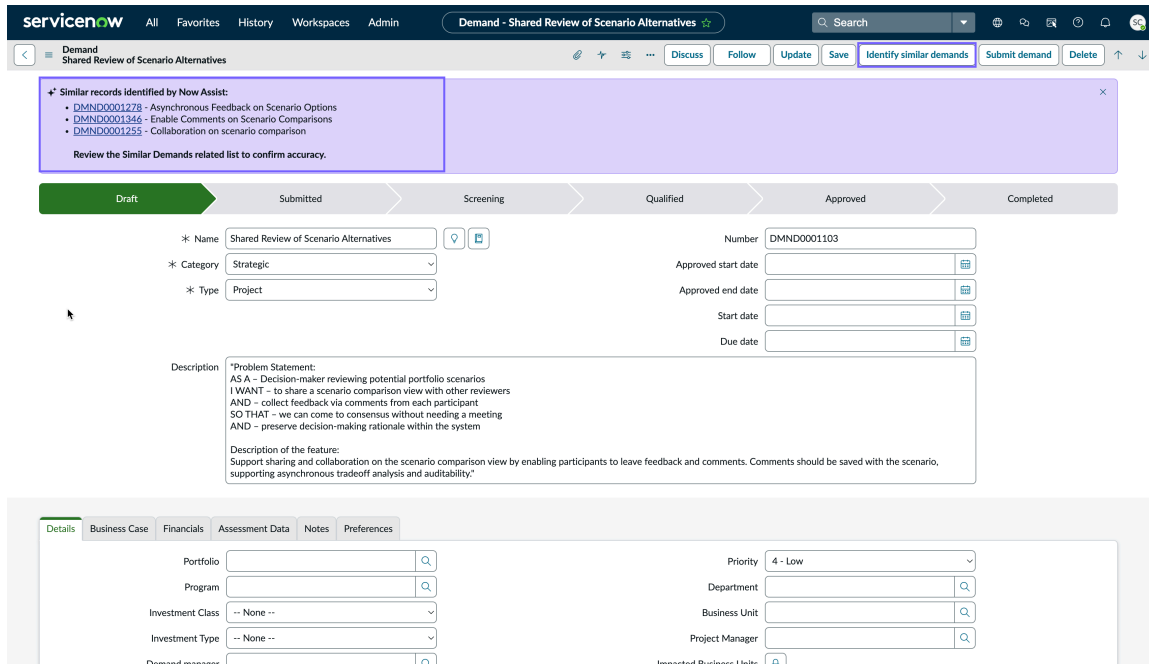

Role required: it_demand_user

Procedure

1. Navigate to **All > Demand > Demands > Create New**.
Alternatively, you can create a demand from **Self-Service > Demands > Create New**.
2. On the Demand form, fill in the **Name**, **Description**, and **Business case** fields.
For a description of the field names, see [Demand form](#).
3. Select **Save**.
4. Select the **Identify similar demands** button to detect similar demand records.

Result

The similar demands identified by Now Assist are displayed in the top banner and the Similar Demands related list.

Note:

- If any similar records are present on the demand record, the related list is updated to display the list of identified similar records.
- If there are no identified similar records for a demand, a message is displayed to convey the same and the related list remains empty.

What to do next

View the full details of the identified similar demand records by selecting the demand number link from the Similar Demands related list.

Associate AI systems with demands

Add and manage AI system associations directly from the **AI Associations** tab in Demand Management.

Before you begin

- The AI Control Tower plugin must be installed. For more information, see [Activation and installation of AI Control Tower](#).
- The investment type of the demand is set to artificial intelligence.
- Role required: it_demand_user, it_demand_manager

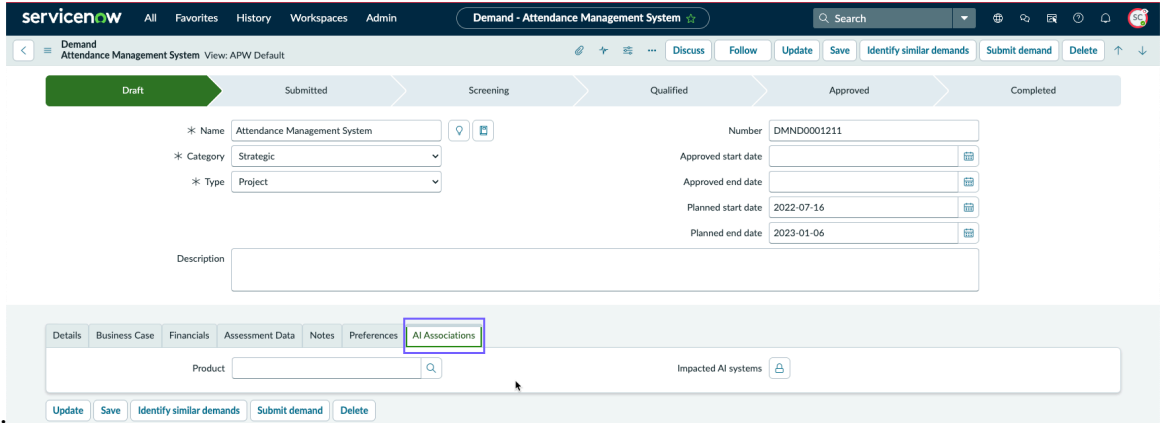

About this task

Add and manage AI system associations directly from the AI Associations tab in a demand form.

You can select the impacted AI systems for the demand. If the required AI systems aren't available, you can create AI systems using the **Create AI System** related link directly within the demand workflow. You're navigated to the AI Control Tower to create the AI system. The created AI system is then available for selection in the **Impacted AI Systems** list on the demand form.

Procedure

1. Access the demand form in one of the following ways.
 - Navigate to **All > Demand > Demands > Create New**.
 - Navigate to **All > Demand > Demands > All** and select a demand.
2. Navigate to the **AI Associations** section of the demand form and fill in the

fields.

AI Associations section

Field	Description
Product	Product or system that the demand relates to.
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

3. Save the demand by selecting **Save**.
4. **Optional:** Select the **Create AI System** related link to create an AI system in the AI Control Tower.

Note:

This related link is available for users with the sn_ai_steward role.

For more information on creating AI systems, see [Create AI system assets](#).

Summarize demands with demand summarization skill

Summarize demand records using the demand summarization skill. The skill reviews the demand fields and helps create a clear summary of the demand.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Role required: it_demand_user, it_demand_manager

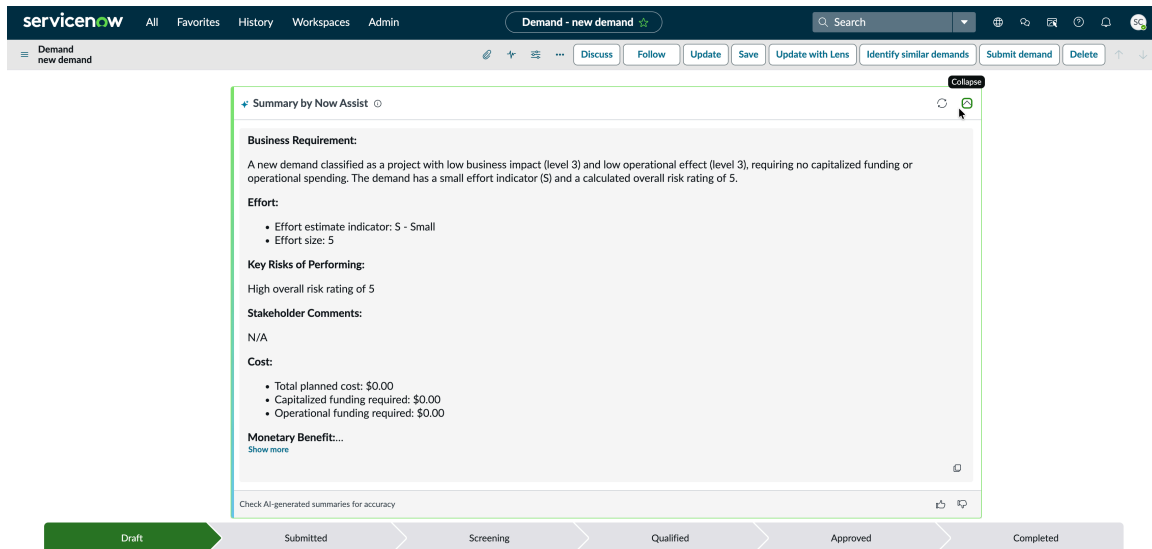

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#).

Procedure

1. Navigate to **All > Demand > Demands > All**.
2. Select a demand from the **All Demands** list.
3. Select the **Summarize** button on the demand form to generate a summary of the demand.

Result

The summary generated by Now Assist is displayed in the summary card.

i Note:

Select the copy icon to copy the generated summary for further use.

Demand Management reference

Reference information to provide additional details about Demand Management such as the fields, user roles, tables, guidelines, and domain separation information.

Demand tasks

A demand task is a unit of work, created within a demand, to break down initial planning activities before converting the demand into a project, change, enhancement, or defect.

You can [create a demand task](#) from the **Demand Tasks** related list to delegate activities that are helpful for assessing demand feasibility. Demand tasks differ from project tasks in the following aspects:

- Planned dates, actual dates, and original dates are part of project tasks not demand tasks.
- The due date indicates the date on which the task is targeted for completion and doesn't affect the demand workflow. Project tasks, however, affect the project completion dates if the planned dates and actual dates are changed.
- Don't support the creation of nested demand tasks.
- Don't support task constraints such as the settings Start ASAP and Start on a specific date.
- Don't support an execution type such as Agile, Waterfall, or Hybrid.

Resource assignment

Assign resources for a demand task using the **Assigned to**, **Additional Assignee list**, and **Assignment Group** fields. Don't create and use resource assignments to allocate resources or groups to a demand task or submit the time spent on the demand. If you associate a resource assignment with a demand task, the associated resource plan isn't transferred to the work entity created from that demand.

The resource assignments aren't associated with the demand by default. Make sure that you don't use the resource assignments that you created for the future work entity created from the demand to submit the time spent on a demand.

When you submit a time card for a demand, the time and cost incurred aren't transferred to the work entity created from the demand. The time and cost remain within the demand as the demand cost and effort.

Resources assigned to a demand task can submit the time spent on it using a time card. For more information, see [Submit a time card for a demand task](#).

Actual cost and effort for a demand task

The actual effort of the work performed on the demand task is derived from the time card. The actual cost is derived from the hourly resource rate defined in the rate model, default labor rate, or default system property. The actual cost and effort for a demand task are then rolled up to derive the actual cost and effort for the associated demand. For more information, see [Actual cost and effort calculation for a demand and demand task](#).

Add work items to a Demand

Based on the selected demand task category and role assigned to you, you can use the demand task form to:

- [Add a cost plan to a Demand](#)
- [Add a resource assignment to a Demand](#)
- [Add a benefit plan to a Demand](#)
- [Add risks to a Demand](#)

Actual cost and effort calculation for a demand and demand task

The actual cost and effort are realized cost incurred and time spent for the work performed on a demand and demand task during a specific time period. Actual cost and effort are calculated based on the approved time cards and hourly rate for the resources and vary based on how the hourly rate for the resource is derived.

Working on a demand task and demand involves cost and time, which add to the overall expenditure of converting a demand to a product, feature, or enhancement. Demand managers must therefore know the actual cost and effort incurred in assessing and planning activities for a demand. The calculation for actual cost is derived by multiplying the hours reported in the time card by the hourly rate of the resource. The actual effort for a demand task is calculated based on the hours reported in the time card.

The actual effort and cost for the demand tasks are then rolled up for calculating the actual effort and cost for the demand. The calculation of the actual cost and hourly rate for a resource is derived as follows:

- If a rate model is associated with the demand, the actual cost is calculated based on the hourly rate defined in the rate model.
- If a rate model is absent or if an hourly rate isn't found in the rate model, then the hourly rate is derived from the default labor rate.
- If an hourly rate isn't found in the default labor rate, then the hourly rate is derived from the default system property.

Don't create and use resource assignments for allocating resources or groups to a demand task. The resource assignments that you create in the demand are used for the resource estimation of the work entity that would be created from the demand. These resource assignments are automatically moved to the resulting work entity when a demand is qualified and converted.

When you submit a time card for a demand the actual effort and cost aren't reflected in the resource assignment, as the resource assignments aren't associated with the demand by default. The actual cost and actual effort for the demand remains with the demand and aren't transferred to the project created from the demand even if you manually associate a resource assignment with the demand.

If a resource spends extra hours working on a demand that aren't associated with demand tasks, then this time must also be recorded. The resource submits the time card for recording the extra hours spent on the demand using the Time Sheet Portal. This extra cost and effort is added to the demand but isn't reflected in the actual cost and effort for the demand tasks.

The actual cost and actual effort for the demand as derived from the time card data is added to the total actual cost and effort for the demand tasks. The values in the **Demand Actual Cost** and **Demand Actual Effort** fields are calculated as follows:

- Demand Actual Cost: actual cost of all the demand tasks + actual cost of extra activities
- Demand Actual Effort: actual effort of all the demand tasks + actual effort of extra activities

If a demand has no task or assigned resource, you can capture the actual cost by submitting a time card against the demand. Once the time card is approved, an expense line is created on the demand. The expense line is then processed and the actual cost of work for that time card is rolled up to the demand into the Demand Actual Cost column.

The following example demonstrates the actual cost and effort calculation for a demand task and its rollup to the demand.

Example: Actual cost and effort calculation based on the demand tasks

For a demand (D1), the demand manager delegates activities such as initial assessment, cost estimate, and effort estimate. To delegate these activities, the demand manager creates three demand tasks (DT1, DT2, and DT3) and assigns resources R1, R2, and R3 to each demand task respectively.

The hourly rate defined for the resources in the rate model, default labor rate, and default system property are listed in the following table.

Hourly resource rate

Resource	Hourly rate in the rate model	Hourly rate in the default labor rate	Hourly rate in the system property
R1	\$200	\$150	\$50
R2	\$250	\$200	\$50

Hourly resource rate (continued)

Resource	Hourly rate in the rate model	Hourly rate in the default labor rate	Hourly rate in the system property
R3	\$150	\$100	\$50

Each resource spends a total of eight hours while working on the assigned demand task and submits a time card.

Actual cost and effort calculation for demand task: The demand task actual cost and effort are calculated and displayed on the **Demand Task** form. The totals differ depending on the method used to derive them.

Scenario 1 shows how the total is calculated if the resource hourly rate is derived from the rate model.

Rate derived from the rate model

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$200 * 8 = \$1600$	$250 * 8 = \$2000$	$150 * 8 = \$1200$

Scenario 2 shows how the total is calculated if the rate model isn't associated with the demand and the resource hourly rate is derived from the default labor rate.

Rate derived from the default labor rate

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$150 * 8 = \$1200$	$200 * 8 = \$1600$	$100 * 8 = \$800$

Scenario 3 shows how the total is calculated if the rate model isn't associated with the demand and the resource hourly rate is derived from the default system property.

Rate derived from the default system property

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$50 * 8 = \$400$	$50 * 8 = \$400$	$50 * 8 = \$400$

Example: Actual cost and effort roll up to a demand

The **Demand Actual Cost** and **Demand Actual Effort** fields on the Financials tab of the Demand form are populated with the sum of actual costs and actual effort of all the demand tasks.

1. If the resource rate for the demand task is derived from the rate model (Scenario 1), the value in the Demand Actual Cost field is displayed as \$4800. The value in the Demand Actual Effort field is displayed as 24 hours.
2. If the resource rate for the demand task is derived from the default labor rate (Scenario 2), the value in the Demand Actual Cost field is displayed as \$3600. The value in the Demand Actual Effort field is displayed as 24 hours.
3. If the resource rate for demand task is derived from the default system property (Scenario 3), the value in the Demand Actual Cost field is displayed as \$1200. The value in the Demand Actual Effort field is displayed as 24 hours.

Demand Management key terms

Important terms in Demand Management are listed in the table.

Demand Management Key Terms

Term	Description
Portfolio	A collection of demands managed as a group to achieve strategic and operational objectives.
Assessable record	A demand record that you want to evaluate for metric type demand. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess.
Metric	A trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire or gather objective values in a database query run by a script. Examples of metrics include perceived value of demands and return on investment for a demand.
Metric type	A characteristic that defines a set of records you want to evaluate. Demand management comes with the metric type demand, which uses records from the Demand [dmn_demand] table.
Metric category	A theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include return on investment and cost. Set filter conditions to control which assessable records to evaluate for the metrics in a category.
Stakeholder	A person affected by the demand or who has interest in the demand.
Scorecard	A visual breakdown on performance of an assessable record based on assessment results. Use scorecards to view various data summaries for one assessable record and to compare the ratings with other assessable records.
Requirement	An extra item that must be present or an extra action item that must be finished before a demand request closes.

Demand Management Key Terms (continued)

Term	Description
Demand Task	A unit of work, created within a demand, to break down initial planning activities before converting the demand into a project. A demand task isn't a planned task like a project task.

Stage fields

The Stage field on the Ideas list displays the current state of an idea as it moves through the demand life cycle. The current state includes from an idea to a demand and then to the resulting project, enhancement, change, or defect.

The result of an idea depends on the initial settings in the **Category** and **Type** fields on the Demand form. The **Stage** field also appears on the Demands list. The **Stage** field is a display only field and can't be searched or sorted.

i Important:

The **Stage** fields are no longer available starting from the New York release. Any instance provisioned in New York or later won't have a Stage field on the Idea table. However, the **Stage** fields are available if you're upgrading from an older release to New York or later.

A new idea is created in the **Submitted** state. An accepted idea is updated to the **Accepted** state and a deferred idea is updated to the **Skipped** state. When a demand is closed, the associated idea is marked as **Complete**.

Hovering over the **Stage** field displays a pop-up window that shows the progression of the idea along with the value of the **State** field for each step in the progression.

- **Idea:** if an idea is being evaluated, the pop-up window displays the current state of the idea.
- **Demand:** if an idea is promoted to a demand, the pop-up window displays the current state of the demand as well as the idea.
- **Project, Enhancement, Change, or Defect:** if a demand is accepted, the pop-up window displays the current state of the resulting project, enhancement, change, or defect in addition to the demand and idea.

Stage	Project	Score
		
Demand Draft	(empty)	0

Composite Fields

A composite field combines information from two fields in a table to form a single field.

For example, the **Task** field on the Project Tasks list displays the short description and the project task number. The short description appears above the project task number. The project task number appears and is a link to the Project Task form.

Composite field

Use a composite field

- Editing a composite field changes the short description. Editing the short description changes the composite field.
- Sorting on a composite field is based only on the short description and not the number.
- Searching on a composite field is enabled for both the short description and the number:
 - To search by the number using the list header, enter an asterisk (*) before the search term. For example, *PRJTASK0010016.
 - To search by the number using the filter, create a condition similar to: [Task] [contains] [PRJTASK0010016].

Domain separation and Demand Management

Domain separation is supported in Demand Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#) .

[Domain separation for service providers](#) 

Data migrated from demands to artifacts

Data fields that are migrated from a demand to an artifact when the artifact is created from the demand.

Data migrated from a demand to a created project

Data fields are migrated from a demand to a project when the project is created from the demand.

Field type	Description
Demand	<p>The following demand fields are migrated to a project:</p> <ul style="list-style-type: none"> • Description • Business case • Investment Class • Investment Type • Risk of performing • Risk of not performing • Enablers • Barriers • In scope • Out of scope • Assumptions • Business Unit • Department • Impacted Business Units • Business Capabilities • Priority • Impact • Rate Model • Approved start date • Approved end date • Short description • Program • Domain • Goals • Strategies • Impacted Business Applications • Configuration item • Company • Urgency • Project Manager • Project currency • Project calculation

Field type	Description
Resource assignments	Resource assignments are migrated to a project by updating the task reference from the demand to project.
Requirements	Demand requirements.
Financial records	Financial records such as cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and demand budgets are migrated to a project. This process updates the task reference from demand to project.
RIDAC	RIDAC entities are migrated to a project by updating the task reference from demand to project. The migrated entities include the risks, issues, decisions, project actions, request changes, and RIDAC_m2m records.
Assessment	The following assessment data fields are migrated to a project: <ul style="list-style-type: none"> • Risk • Value • Score • T-Shirt size
Stakeholders	Stakeholder records.
Project Currency Financial	If the multicurrency feature is active, the project financial fields are calculated according to the project currency and reference rate.

Data migrated from demands to Enterprise Agile Planning (EAP) entities

Data fields are migrated from a demand to an EAP entity when the entity is created from the demand.

Data fields migrated from demand to EAP entity

Field type	Description
Demand	The following demand fields are migrated to the created entity: <ul style="list-style-type: none"> • Business Capabilities • Product • Primary target • Team • Demand manager • Description • Department

Data fields migrated from demand to EAP entity (continued)

Field type	Description
	<ul style="list-style-type: none"> • Priority • Approved start date • Approved end date • Short description • Primary goal • Strategic program • Service offering • Business service • Business applications • Score • Requested by • Capital expense • Operating expense • Start date • Program • Total planned cost • Investment Class • Portfolio • Investment Type • ROI % • Rate Model • Model ID • Expense type • Financial benefit
Resource assignments	The resource assignments of a demand are migrated to the created entity.
Financial records	Cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and investment budgets are migrated to the created entity.
Attachments	Demand attachments.
Goal/target relationships	Goal/target relationships of the demand.

Demand Management forms

Field information for forms used in the Demand Management application.

Action form

Use an action form to add an action to a demand.

Action form

Field	Description
Number	System-generated number with a configurable prefix.
State	Current state of the action. All new action records are created with the state set to Open. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency for implementing or approving the action based on impact.
Estimated Cost	Estimated cost the action generates.
Impact	The impact on the outcome of the demand if you don't implement the action.
Approval	Status of approval from the stakeholders for the action. The available options are: Not Yet Requested, Requested, Approved, and Rejected.
Assigned to	Primary resource assigned to implement the action.
Due date	Requested date on which the action must be approved or implemented.
Parent	The demand to which this action belongs.
Short description	Brief description of the action such as what the action entails, how to implement the action, who it affects, and the action outcome. Select the Suggestion icon  to select a description from the list of predefined actions.
Description	Details of the action and its potential impact.
Work notes	Information about the action. Add work notes to communicate about the status of action approval, rejection, or implementation with other users.

Cost plan form

Use the cost plan form to capture the costs of demands.

Cost plan form

Field	Description
Name	Descriptive name for the cost plan.
Project/ Demand	Demand number to which the cost plan belongs.
Start fiscal period	Starting fiscal period. When you change the start fiscal period, the associated cost breakdown values also change.
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated cost breakdown values also change.

Cost plan form (continued)

Field	Description
Group	This field is a read-only field.

Financials section of the Cost plan form

Field	Description
Entered currency	<p>Currency for the cost plan.</p> <p>If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the cost of the demand.</p>
Unit cost	Cost of single unit of the resource.
Quantity	Quantity of resource required.
Recurring	<p>Indicates if the cost is recurring for each fiscal period.</p> <p>Quantity x Unit cost value is incurred for every fiscal period.</p>
Cost type	Cost type of the plan. See Create a cost type definition .
Investment	<p>Name of the investment created for the project.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>
Source type	<p>Funding entity to associated with the project investment for funding.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>
Source	<p>Funding entity value from which you request fund.</p> <p>The field is available when you select a value in the Source type field.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin</p>

Financials section of the Cost plan form (continued)

Field	Description
	is activated or the Investment Funding (sn_invst_pln) application is installed.
Total planned cost	Total planned costs of the cost plan. If the cost is recurring, the calculation is Quantity x Unit cost x number of fiscal periods . If the cost is non-recurring, the calculation is Quantity x Unit cost . This value is rolled up from cost breakdown.
Functional currency	The default currency configured in the Financial Management application and used for managing the demand or project.
Cost in functional currency	The total planned cost for the demand in functional currency. The value in this field changes if the Entered currency is different from the functional currency.
Total actual cost	Total actual costs of the cost plan. This value is rolled up from cost breakdown.

Decision form

Use a decision form to add a decision to a demand.

Decision form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the decision. All new decision records are created with Open state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency of approving or implementing the decision based on possible impact.
Decision status	Status of the decision. The available options are: Pending, Approved, and Rejected.
Impact	Impact on the outcome of the demand if you don't implement the decision.
Approval required	Option for determining whether approval of the decision is required.
Estimated Cost	Estimated cost of implementing the decision.
Due date	Requested date on which the decision must be approved or implemented.
Assigned to	Primary resource assigned to work on the decision. The default value is the name of the user creating the decision record.
Parent	Demand number to which this decision belongs.

Decision form (continued)

Field	Description
Short description	<p>Brief description of the decision such as what the decision is about, who made it, what it affects, and the decision outcome.</p> <p>As you start entering the title for your decision, related decisions that potentially match your decision are displayed.</p> <p>Select the Suggestion icon () to select a description from the list of predefined decision descriptions.</p>
Description	Details of the decision and its potential impact.
Work notes	Information to record and track the status of decision implementation or approvals.

Demand Budget form

Use the Demand Budget form to allocate a budget to your demand.

Demand Budget form

Field	Description
Fiscal Year	The fiscal year for which you want to set the budget for the demand.
Currency	<p>Currency in which you want to allocate the budget for the demand.</p> <p>If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is active, then you can allocate the budget in demand currency or functional currency.</p>
Capex Budget in Demand Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex Budget in Demand Currency	Operating expense amount in the selected currency.
Total Budget in Demand Currency	Sum of Capex and Opex amounts.

Demand form

The demand form information is used to create a demand.

Demand form fields

Field	Description
Name	Name of the demand.
Category	Category of the demand:

Demand form fields (continued)

Field	Description
	<ul style="list-style-type: none"> • Strategic: For demands for plans, such as projects or stories. • Operational: For demands for operational work, such as changes or defects.
Type	<p>The Category field selection determines the selections available in the Type field.</p> <ul style="list-style-type: none"> • The following demand types are available if the demand category is Strategic: <ul style="list-style-type: none"> ○ Continual Improvement Management ○ Enhancement ○ Project ○ Epic ○ Story ○ EAP Epic ○ EAP Feature ○ EAP Capability ○ SAFe Epic ○ SAFe Story ○ SAFe Feature ○ No Conversion • The following demand types are available if the category is Operational: <ul style="list-style-type: none"> ○ Change ○ Defect ○ No Conversion <p>If the Agile Development 2.0 application is active, the Story, Epic, Enhancement, and Defect options are available.</p> <p>If the Strategic Planning application is active, the EAP Epic, EAP Feature, and EAP Capability options are available.</p> <p>If the Essential SAFe or Portfolio SAFe features are active, the SAFe Story, SAFe Feature, and SAFe Epic options are available.</p> <p>The No Conversion option enables you to use your demand to fund a large project that includes one or more projects, epic, or programs.</p> <p>The selections in the Category and Type field also determine the fields that are displayed in the Assessment Data section.</p>
Project	<p>Name of the project created from this demand.</p> <p>This read-only field is visible only when you convert the demand into a project.</p>
Enhancement	<p>Number of the enhancement created from this demand.</p>

Demand form fields (continued)

Field	Description
	<p>This read-only field is visible only when you convert the demand into an enhancement.</p>
Epic	<p>Name of the epic created from this demand.</p> <p>This read-only field is visible only when you convert the demand into an epic.</p>
Story	<p>Name of the story created from this demand.</p> <p>This read-only field is visible only when you convert the demand into a story.</p>
Number	<p>Unique, auto-generated identification number for the demand.</p>
Approved start date	<p>The formal date approved by stakeholders for starting the demand. This date is set after prioritization and stakeholder approval and represents the committed and authorized timeline for execution. It's used for governance and traceability.</p> <p>For example, the approved date to start the database upgrade is 2026-01-10.</p> <p>This field is carried forward to the Approved start date field of the Project form if the demand is converted to a project and remains unchanged, even if the project starts later.</p> <p>This field is highlighted in red if the date is different than the value in the Start date field.</p> <p>i Note: If this field is empty while creating a demand, the date from the Start date field is inserted.</p>
Approved end date	<p>The formal date approved by stakeholders for completing the demand. This date is set after prioritization and stakeholder approval and defines the approved execution window and supports historical tracking.</p> <p>For example, the approved end date to complete the demand is 2026-02-15.</p> <p>This field is carried forward to the Approved end date field of the Project form if the demand is converted to a project and remains unchanged, even if the project ends later.</p> <p>This field is highlighted in red if the date in this field is different than the value in the Due date field.</p> <p>i Note: If this field is empty while creating a demand, the date from the Due date field is inserted.</p>
Start date	<p>The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved.</p> <p>For example, you're planning for a database upgrade to start on 2025-11-01.</p>

Demand form fields (continued)

Field	Description
	<p>This date is changed to Planned start date when the demand is converted to a project.</p> <p>Note: When you change the planned start date of a demand or project, the associated cost plans and resource assignments also change. The Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change property controls the behavior for a demand date change. This property isn't enabled by default. For more information, see Properties installed with Project Management.</p>
Due Date	<p>The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved.</p> <p>For example, you're planning to complete the database upgrade by 2025-12-31.</p> <p>Note: This date is changed to Planned end date when the demand is converted to a project.</p>
Description	Description of the demand.
Similar demands	Demands that have similar values for the Short description fields using predictive intelligence and machine-learning algorithms. For more information, see Predictive Intelligence for Demand Management .
Related Search	Search results matching the specified term. The default is the value in the Name field.

Details section of the Demand form

Field	Description
Portfolio	Portfolio indicating the business focus of the demand.
Program	Name of the program to which the demand belongs.
Investment Class	<p>Type of investment class category assigned to the demand:</p> <ul style="list-style-type: none"> • Run: Investment made to sustain the existing business. • Change: Investment made to implement a change in the business.
Investment Type	Investment type of the demand:

Details section of the Demand form (continued)

Field	Description
	<ul style="list-style-type: none"> • Cost Reduction • End User Experience • Legal and Regulatory • Revenue Generating • Service Sustaining • Strategic Enabler • Artificial Intelligence
Demand Manager	Name of the demand manager.
Collaborators	Users who can edit or contribute to the demand. A demand requester can select any user as a collaborator.
Expense type	The type of the expense, either capex (capital expense) or opex (operational expense).
Priority	The priority of the demand.
Department	<p>Department in a business unit to which the demand submitter belongs.</p> <p>Note: If you don't select a department, the default value is the name of the department to which the submitter belongs.</p>
Project Manager	Project manager that would be assigned to the project created from this demand. When a project is created, this field becomes read only. This field appears if the Category field is set to Strategic and the Type field is set to Project. If you delete the project created from this demand, this field becomes editable.
Business Unit	Business unit to which the demand submitter belongs.
Impacted Business Units	<p>Business units affected by the submitted demand. The selected units could experience operational impact, process changes, technology adoption, and so on.</p> <p>For example, if a demand is submitted by the procurement business unit, it can impact the finance, legal, and IT business units.</p>
Idea	Unique identification number of the idea from which the demand was created.
Business Capabilities	Business capabilities associated with the demand that links the demand to

Details section of the Demand form (continued)

Field	Description
	organizational goals and value. Business capabilities are defined in the Enterprise Architecture (formerly Application Portfolio Management) module.
Impacted Business Applications	<p>If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications.</p> <p>You can select any business application in your enterprise regardless of whether it's related to a capability selected in the Business Capabilities field.</p>
Business Applications	<p>If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications.</p> <p>You can select any business application in your enterprise regardless of whether it's related to a capability selected in the Business Capabilities field.</p>

Business Case section of the Demand form

Field	Description
Strategic priority	<p>Strategic objectives of the organization that the demand fulfills. A demand can fulfill multiple strategic objectives.</p> <p>If a business unit has been selected in the Details tab, the business strategies for the selected business unit along with other enterprise strategies are available for selection.</p>
Primary goal	<p>The primary goal associated with the strategy selected in the Strategic priority field.</p> <p>If a strategy hasn't been selected, all goals are available for selection.</p>

Business Case section of the Demand form (continued)

Field	Description
Business case	Business arguments that support the demand.
Risk of performing	Risks if the demand is approved and implemented.
Risk of not performing	Risks if the demand isn't approved, for example, risk of loss of opportunity.
Enablers	Key enablers for the demand that would aid the demand to be completed. For example, clearly defined resource and cost plans.
Barriers	Major barriers to the demand that would obstruct the demand's completion. For example, incomplete or unclear demand details.
In scope	Scope of the demand, which is the set of boundaries that define the extent of a demand.
Out of scope	Activities or deliverables not in the scope of the demand. Anything not defined in the scope is out of scope.
Assumptions	Assumptions made for the demand. Assumptions help to define the scope and risks, and fine-tune the estimates for time and cost.

Financials section of the Demand form

Field	Description
Rate Model	<p>Rate model assigned to the demand. This setting is used to derive hourly rates for the associated resource assignments and time cards. For more information, see Rate Models.</p> <p>Note: If the rate model assigned to the demand is changed or removed, the cost fields on the associated resource assignments aren't recalculated.</p>
Project Currency	<p>Currency used to execute the project once the project is created from this demand.</p> <p>You can select any active currency from the values listed in the Currency [fx_currency] table.</p> <p>After you create a project in the selected project currency, you can't change the project currency in the Project form if the demand</p>

Financials section of the Demand form (continued)

Field	Description
	<p>contains a cost plan, a benefit plan, or a project budget. If the demand has no attached plan or budget, you can change the project currency in the Project form.</p> <p>Note: The value of this field defaults to the Project currency field of the Financials tab in the project currency view of the Project form as well. This field is available only when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) feature is activated and the Demand Currency view is enabled.</p>
Capital expense	Capital expenditure (capex) for the demand.
Operating expense	Operational expenditure (opex) for the demand.
Total planned costs	Result calculated based on the values in the Capital expense and Operating expense fields.
Financial return	Result calculated based on the values in the Total costs and Financial benefit fields.
Financial benefit	<p>Estimate of revenue if the demand is approved.</p> <p>This value is rolled up from the benefit breakdown of the demand.</p> <p>You can also enter the value manually by selecting a currency icon and entering a value.</p>
ROI %	<p>ROI calculated based on the values in the Total costs and Financial return fields.</p> <p>The value in this field is updated when a cost plan, benefit plan, or resource assignment is created or updated for the demand in the Qualified or Approved state.</p>
Capital budget	<p>Total capital budget allocated to the demand across all fiscal years.</p> <p>The value is rolled up from the capex budget of the demand.</p>
Operating budget	Total operational budget allocated to the demand across all fiscal years.

Financials section of the Demand form (continued)

Field	Description
	The value is rolled up from the opex budget of the demand.
Discount Rate %	Demand discount rate, which is the interest rate to determine the present value of future cash flows.
Net present value	<p>Present value of future cash based on the given annual interest rate, a measure for comparing money spent today against future expected financial benefits. This value is useful when evaluating the overall investment performance.</p> <p>For example, at a 12% discount rate, \$1.00 today is worth \$0.80 in two years. Therefore, receiving \$1.00 in two years is the same as receiving \$0.80 today.</p> <p>Net present value (NPV) is calculated from total costs according to year, financial benefit per year, and the discount rate for the demand.</p>
Internal rate of return %	<p>Annual interest rate required to achieve an NPV of zero.</p> <p>Internal rate of return (IRR) helps to determine which demands can deliver a higher rate of return in terms of revenue.</p>
Demand Actual Cost	Total cost incurred while working on a demand and demand tasks. Demand actual cost is calculated after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, which is derived from the rate card, labor rate, or system properties, is used to populate this field.
Demand Actual Effort	Time accrued or spent by a resource while working on a demand or a demand task as derived from the submitted and approved time cards. This field isn't available on the Demand form by default.

Note:

If you're creating a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and the **Demand Currency** view enabled, then the fields in the **Financials** tab differ from the **Default** view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency in Demand Management](#).

Assessment Data section of the Demand form

Field	Description
Impact	Level of business impact created by the demand.
Risk	Risk value calculated from the demand assessment.
Value	Business value of the demand calculated from the Impact and Financial return fields.
T-Shirt size	<p>Size of the demand.</p> <p>Before using this value as an indicator of demand size, consider creating and publishing definitions for each option outside the application. That process ensures that the values are interpreted correctly and consistently across the organization or department.</p>
Score	<p>The demand score is calculated based on the <i>risk</i>, <i>value</i>, and <i>size</i> attributes in the base system.</p> <p>The value of the <i>risk</i>, <i>value</i>, and <i>size</i> attributes are derived from the assessment metric category results. For more information, see assessment categories and assessment category results .</p> <ul style="list-style-type: none"> • When the <i>risk</i> and <i>size</i> values are high, the score of the demand is low. • When the <i>value</i> setting is high, the score of the demand is high.
Assessment Required	<p>Option for enabling the assessments for the demand. This option is active by default.</p> <p>Only a demand manager can update this value when the demand is in the Draft or Submitted state.</p> <p> Note: If this option isn't selected and you reset the demand to the Draft state, the option remains unselected.</p>

 **Note:**

The values in the **Value** and **Score** fields are updated when a cost plan, benefit plan, or resource assignment is created or updated for the demand in the Qualified or Approved state. The values in the fields are updated only until an artifact such as project, enhancement, defect, or change is created from the demand.

Notes section of the Demand form

Field	Description
Watch list	The groups and users subscribed to the demand who can view the information in the Additional comments field.
Work notes list	The groups and users subscribed to the demand who can view the information in the Work notes field.
Work notes	Information about the demand. This information isn't visible to customers. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Preferences section of the Demand form

Field	Description
Close Demand	<p>Determines when to close the demand automatically if it's converted to a project.</p> <ul style="list-style-type: none"> • None: Keeps the demand in the Open state after it's converted to a project. • On creation of project: Closes the demand when the demand is converted to a project. • On closure of project: Closes the demand when the project created from the demand is closed. <p>Note: The On creation of project and On closure of project options appear when the value for the Type field is set to Project. If the Type field is set to Enhancement, the default setting is None.</p>
Project Calculation	<p>Determines the calculation to use for task dependencies for the project when the demand is converted to a project. The default value is Automatic.</p> <ul style="list-style-type: none"> • Manual: Task dates don't reflect any changes made to dependencies. • Automatic: Task dates are automatically updated to reflect any changes made to dependent or child tasks.

EAP Details section of the demand form

This section appears only if the selected type is an EAP entity.

Field	Description
Team	The planning team to which the created EAP entity is assigned. This field becomes read only once the EAP entity is created. This value is an optional value.
Converted to	The name of the created EAP entity. This field is read-only.

AI Associations section of the demand form

This section appears only if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Field	Description
Product	Product or system that the demand relates to.
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

Demand task form

Use the demand task form to create tasks for a demand.

Demand Task form

Field	Description
Short description	Name of the demand task.
Assignment group	Group assigned to the demand task.
Assigned to	Primary resource assigned to the demand task. The following conditions apply: <ul style="list-style-type: none"> • If an assignment group is defined, only users in the assignment group are listed. • If skills are defined, only users with those skills are listed. • If no assignment groups or skills are defined, only users with one of the Project Management application user roles are listed. • Users with <code>timecard_user</code> role are also listed.

Demand Task form (continued)

Field	Description
Additional assignee list	Users assigned to the demand task in addition to the single primary resource defined in the Assigned to field.
Category	<p>Category of the demand task:</p> <ul style="list-style-type: none"> • Initial review • Effort estimate • Cost estimate • Benefit estimate • Risk assessment <p>The Category field selection determines the links available in the related links. For example, the Add Resource Plan to Demand related link appears when you set the Category value to Effort estimate. Users must have the appropriate role to use these related links.</p>
Actual effort	<p>The actual time spent working on the demand task, which is derived from the approved time card for this demand task.</p> <p>Because this field doesn't appear by default on the Demand Task form, you must add it by personalizing the form.</p>
Description	Brief description of the demand task.
Number	System-generated ID number with a configurable prefix.
Priority	Sequence in which the task must be completed based on impact and urgency.
State	Current state of the demand task. The states include Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped.
Due date	The date by which the task is targeted for completion.
Actual cost	The actual cost of the demand task derived from the number of hours worked and hourly rate of the resource as defined in the rate card. In the absence of a rate card, the hourly rate is derived from the default labor rate card or default system property.
Work notes	Information about the demand task. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Demand Task form (continued)

Field	Description
	<p>Note: Users with the business stakeholder role for PPM can view this field. For more information, see Business stakeholder role for PPM.</p>

Expense line form

Use the expense line form to associate specific costs to a demand.

Expense line form

Field	Description
Number	Auto-generated number.
Amount	Select a currency type and enter the expense cost.
Date	Date of the expense generated.
Process date	Date on which the expense line was processed.
Source ID	Record that generated the associated cost.
State	State of the expense line. The state can be Pending or Processed. The cost roll-up happens only if the expense line is processed.
Cost plan	Name of the cost plan against which you want to create the expense line.
Summary type	Select the category that you want to group the expense under.
Cost type	Select the cost type .
Expense type	Select Capex for a capital expense or Opex for an operating expense.
Short description	Enter a short description of the expense type.
Sources	Select the records for the sources of the expense line. These sources include: <ul style="list-style-type: none"> • Assets • Fixed assets • Contracts • Users • Configuration items • Tasks • Cost centers

Investment Budget form

Use the Investment Budget form to allocate budget for a demand for each fiscal period.

Investment Budget form details

Field	Description
Amount	Enter the budget amount.
Fiscal period	Select the fiscal period to allocate the budget.
Investment	Select the planning item to allocate this budget. The existing budget is selected by default.
Expense type	Select expense type from the list. <ul style="list-style-type: none"> • Select Capex to allocate your budget to capital expenses. • Select <i>Opex</i> to allocate your budget to operational expenses.

Issue form

Use the issue form to add an issue to a demand.

Issue form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the issue. All new issue records are created in the Open state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency of resolving or managing the issue based on possible impact.
Estimated cost	Estimated cost the issue generates.
Impact	Impact on the outcome of the demand if the issue remains unresolved.
Due date	Requested date for the assigned resource to resolve the issue or the date on which the issue must be closed or addressed if not assigned to any resource.
Assigned to	Primary resource assigned to work on the issue resolution.
Parent	Demand to which this issue belongs.
Short description	Brief description of the issue and its potential impact on the success of the demand. As you start entering the title for your issue, related issues that potentially match your issue are displayed. Select the suggestion icon () to select from the list of predefined issue descriptions.

Issue form (continued)

Field	Description
Description	Details of the issue and its potential impact.
Work notes	Information to record and track the work accomplished for resolving the issue.

Monetary Benefit Breakdown form

Use the Monetary Benefit Breakdown form to update the estimated and actual financial benefits for a specific fiscal year.

Monetary Benefit Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Entered currency	Currency specified in the benefit plan.
Exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown. When the period corresponding to the benefit plan breakdown has multiple rates, the rate in effect on the first date of that period is used. Exchange rate is used to convert the entered benefit into the functional benefit. It's obtained from the itfm_fx_rate [budget_reference_rates] table.
Actual benefit	Actual benefit that is incurred from the project or demand.
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars .
Entered benefit	Benefit in entered currency.
Functional benefit	Functional benefit obtained by multiplying the exchange rate with the entered benefit.
Exchange rate date	First date of the fiscal period corresponding to the benefit plan breakdown.

Monetary Benefit Plan form

Use the Monetary Benefit Plan form to specify the estimated benefit accrued by a demand for a fiscal period.

Monetary Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit: <ul style="list-style-type: none"> • Hard: Benefits that can be measured in terms of revenue. • Soft: Benefits that are measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in Category field determines the selections available in this field.
Benefit type	Type of benefit. Select Monetary benefits .
Offset type	Offset type field indicates when the benefits start realizing. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the due date of the demand changes, the benefit plan start date shifts to align with the new due date of the demand.
Work start date	Start date of the demand. The field appears if you select Start Date in the Offset type field.
Work end date	End date of the demand. The field appears if you select End Date in the Offset type field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is set to End Date and the offset is -2, the benefit plan is two periods before the demand end date. If the demand end date shifts, the benefit plan start date shifts to two periods before the new demand due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. Populated based on values in the Offset field relative to the selected Project or Demand start date or Project or Demand end date, and the Duration in period values. The field is editable if you select None in the Offset type field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Non-monetary benefit that is associated with this monetary benefit plan.
Description	Description of the monetary benefit plan.

Financials section of the Monetary Benefit Plan form

Field	Description
Entered benefit	Estimated amount of the potential benefit. Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods.
Entered currency	Currency for the benefit plan. If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the financial benefit of the demand.
Functional currency	The default currency configured in the Financial Management application and used for managing the demand or project.
Total planned benefit	Total benefit value that is rolled up from the benefit breakdown.
Benefit in functional currency	Benefit incurred from demand in functional currency. The value in this field changes if the Entered currency is different from the functional currency.
Actual benefit	Actual benefit value that is rolled up from the actual benefit in the benefit breakdown.
Recurring	Check box to indicate if the benefit is recurring for each fiscal period in the benefit breakdown.

Non-monetary Benefit Plan Breakdown form

Use the Non-monetary Benefit Breakdown form to update the estimated and actual non-financial benefits for a specific fiscal year.

Non-monetary Benefit Plan Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Measure	Measure type specified in the benefit plan.
Actual benefit	Actual benefit that is incurred from the project or demand.
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.

Non-monetary Benefit Plan Breakdown form (continued)

Field	Description
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars  .
Entered benefit	Benefit in entered value.
Variance	The difference between the estimated and actual benefit.

Non-monetary Benefit Plan form

Use the Non-monetary Benefit Plan form to specify the potential non-financial benefits accrued by the demand, when it's executed.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit: <ul style="list-style-type: none"> • Hard: Benefits that can be measured in terms of revenue. • Soft: Benefits that are measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in the Category field determines the selections available in this field.
Benefit type	Type of benefit. Select Non-monetary benefits .
Offset type	Field to indicate when the benefits start to be realized. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the due date of the demand changes, the benefit plan start date shifts to align with the new due date of the demand.
Work start date	Start date of the demand. This field appears only when Start Date is selected from the Offset type field.
Work end date	End date of the demand. This field appears only when End Date is selected from the Offset type field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is set to End Date and the offset is -2, the benefit plan is two periods before the demand end date. If the demand end date shifts, the benefit plan start date shifts to two periods before the new demand due date.
Duration in periods	The length, in periods, of the benefit plan.

Benefit Plan form (continued)

Field	Description
Start fiscal period	<p>Starting fiscal period. Populated based on the value in the Offset field relative to the selected Project/Demand start date or Project/Demand end date, and the Duration in periods field values.</p> <p>The field is editable if you select None in the Offset type field.</p> <p>When you change the start fiscal period, the associated benefit breakdown values also change.</p>
End fiscal period	<p>Ending fiscal period.</p> <p>When you change the end fiscal period, the associated benefit breakdown values also change.</p>
Associated benefit	Monetary benefit that is associated with this non-monetary benefit plan.
Description	Description of the non-monetary benefit plan.

Non-monetary Details section of the Benefit Plan form

Field	Description
Measure	<p>Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score.</p> <p>Select the option Yes/No to track the benefits that aren't quantifiable. When this option is selected, the only field available is Benefits achieved. You can select the check box to indicate that the benefits have been achieved.</p>
Non-monetary entered benefit	<p>Estimated value of the potential benefit.</p> <p>Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods only.</p>
Non-monetary planned benefit	Benefit value that is rolled up from the benefit breakdown.
Benefits achieved	Option to indicate if the benefit is achieved.
Breakdown type	<p>Type of breakdown creation when you save the benefit plan.</p> <ul style="list-style-type: none"> • None: No breakdowns are created. • Automatic: A Non-monetary Benefit Plan Breakdown record is created automatically with data. The breakdown is calculated linearly.

Non-monetary Details section of the Benefit Plan form (continued)

Field	Description
	<ul style="list-style-type: none"> • Manual: A Non-monetary Benefit Plan Breakdown record is created automatically but without data in the entered benefit column.
Aggregation mode	<p>Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the Non-monetary planned benefit and Non-monetary actual benefit fields.</p> <ul style="list-style-type: none"> • Sum: Aggregates data from all breakdowns. • Average: Average value from all breakdowns. • Most recent: Recent breakdown value. • Max: Maximum value among the breakdowns. • Min: Minimum value among the breakdown
Non-monetary actual benefit	Actual benefit value that is rolled up from the actual benefit in the non-monetary benefit plan breakdown.

Recalculate resource costs form

Use the recalculate resource costs form to make sure that the resource assignment costs are up to date.

Recalculate Resource Costs dialog box

Field	Description
Start date	<p>Start date of the time period for which the costs are recalculated.</p> <p>By default, the field shows the current date.</p>
End date	<p>End date of the time period for which the costs are recalculated.</p> <p>By default, the field shows the due date of the demand. If the due date isn't specified for the demand, the field is empty.</p>
Planned costs for Requested Resource plans	Option for recalculating the planned cost of Requested resource plans.
Confirmed/Allocated costs for Confirmed/ Allocated resource plans	Option for recalculating the confirmed or allocated cost of confirmed or allocated resource plans.

Recalculate Resource Costs dialog box (continued)

Field	Description
Planned costs for Confirmed/Allocated resource plans	<p>Option for including the planned cost of a confirmed or allocated plan.</p> <p>The option is enabled if the Confirmed/Allocated costs for Confirmed/Allocated resource plans option is selected.</p> <p>By default, the option isn't selected.</p>

Request change form

Use the request change form to change the metrics of a demand, such as demand scope, resource requirement, cost, or schedule.

Request Change form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the request change. All new request change records are created in the Open state.</p> <p>The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped</p>
Priority	Urgency for approving the requested changes based on impact.
Estimated Cost	Estimated cost the requested changes generate.
Impact	Impact on the outcome of the demand if you don't approve the requested changes.
Approval	Status of approval from the stakeholders for the requested changes.
Assigned to	Primary resource assigned to work on the request change.
Due date	Requested date to complete the request change.
Category	Entity for which you're creating the request change. The options are: Resource, Scope, Cost, and Schedule.
Parent	Demand to which this request change belongs.
Title	Title for the change request.
Description	Details of the request change and its potential impact.
Business Justification	Reason for requesting the proposed change in the demand and its impact on the business.
Work notes	Additional information to indicate progress on the demand request change.

Requirement form

Use the requirement form to add a new requirement to a demand.

Requirement form

Field	Description
Number	Unique identification number for the requirement. This number is automatically generated when a new requirement record is created.
Source	User requesting the requirement. This field is automatically populated with the name of the person filling out the form, but the source could be a different person who identified the requirement.
Owner	User who is responsible for managing the requirement or making sure that the requirement is met.
Estimated effort	Approximate amount of time to complete the requirement and any associated tasks.
Priority	Importance of the requirement as it applies to the overall demand.
State	Status of the requirement can be Pending, Approved, or Rejected . i Note: The request state is independent of the demand request state and of the states of any planned tasks associated with the requirement. The request can be closed without the requirement state being closed. Likewise, closing the request doesn't change the state of the requirement.
Type	Type of requirement can be: Business, Solution (Functional), Solution (Non-Functional), Quality, Stakeholder, or Transition .
Short description	Brief description of the requirement.
Description	Detailed description of the requirement and any associated tasks. For example, you can use this field to describe an expected outcome or result.

Risk form

Use the risk form to add a risk to a demand.

Risk form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the risk. All new risks are created in the Pending state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Risk status	Status of the risk. The available options are: Pending, Achieved, Not Achieved, Avoid, Mitigate, Transfer, and Accept.
Probability	The likelihood that the event described in the risk occurs. The available options are: Absolute, High, Moderate, and Low
Impact	Impact of the risk event on the outcome of the demand.
Estimated cost	Estimated cost the risk event generates.

Risk form (continued)

Field	Description
Risk rank	A value and color assigned to the risk. This value is calculated using risk probability and impact. You can configure the color and value using Risk Value Lookup. For more information, see Configure a custom Risk rank and Risk value for a demand .
Risk owner	Primary resource who is responsible for monitoring and managing the risk.
Assigned to	Primary resource assigned to work on the risk.
Risk value	A value calculated from Risk Value Lookup. For more information see, Configure a custom Risk rank and Risk value for a demand .
Due date	Requested date for the assigned resource to resolve the risk or the date on which the risk must be closed or addressed if not assigned to any resource.
Task	Demand to which this risk belongs.
Short description	Brief description of the event and its potential impact on the success of the demand.
Description	Details of the event and its potential impact.
Mitigation plan	Brief description of the efforts taken to mitigate the risk.
Work notes	Information to record and track the work accomplished for resolving the risk.

Risk value matcher form

Use the risk value matcher form to rate the impact and probability of a risk.

Risk Value Matcher form

Field	Description
Impact	Impact value of the risk. The default values are: <ul style="list-style-type: none"> • 1 = High • 2 = Medium • 3 = Low
Application	The application to which these risk values belong.
Risk Rank Color	Color to indicate the severity of the risk.  Tip: You can enter variations of a color to differentiate between risks with similar impact and probability values. For example, you could enter lightgreen to indicate a low-severity risk.

Risk Value Matcher form (continued)

Field	Description
Risk Value	<p>The value for the specified risk impact and probability combination.</p> <p>The options are: High, Medium, and Low.</p> <p>This value is displayed in the Risk value field of the Risk form.</p>
Probability	<p>Risk probability value is associated with the impact value of the risk. The options are: Absolute, High, Moderate, and Low.</p>
Probability Number	<p>Numerical value to indicate the probability. This value is multiplied by the value of the Impact field for calculating risk rank.</p> <p>The default values are:</p> <ul style="list-style-type: none"> • 1 = Absolute • 1 = High • 2 = Moderate • 3 = Low <p>The calculated risk rank and the risk rank color are displayed in the Risk rank field of the Risk form.</p>

Stakeholder Register Form

Use the Stakeholder Register form to add users to the Stakeholder Registry.

Stakeholder Register Form fields

Field	Description
Number	Unique identification number for the stakeholder. This number is automatically generated when a new entry is created.
User	Name of user being added to the stakeholder registry.
Portfolio	A group of activities managed to align to business or operational objectives. Typically, portfolios are named according to the business units of an organization.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand or project.
Assessment recipient	Indication of whether the user is authorized to receive assessment questionnaires for a demand.
Approver	Indication of whether the user has authority to approve demands or change requests in projects.
Influence	Level of influence the user has over the group assessing the demand or project.
Engagement	Indication of the way the user is engaged with the demand or project.

Stakeholder Register Form fields (continued)

Field	Description
Function	Function of user in the demand or project process.

Widget Association form

Use the Widget Association form to associate your widget to a demand.

Widget association form

Field	Description
Association ID	Record to associate with the widget. To access the relevant records, you must select the Tables [sys_db_objects] table in the Table name list and the Demand [dmn_demand] table in the Document list.
Association table	Table to associate with the widget. You must select the Tables [sys_db_objects] table from the list.
Widget	Unique name of the widget.
Order	Position of the widget in relation to other widgets on the Demand Financials page. Widgets appear in numeric order, with the smallest number listed first.
Display on card	Option to display the widget on the Demand Financials page.
Include by default	Option to show the widget by default on the Demand Financials page.

Widget form

Use the widget form to configure a new widget.

Widget form

Field	Description
Name	Unique name for the widget.
Scripted	Option for indicating the value on the widget is from a code script. By default, this option is selected and is read-only.
Show Label	Option for displaying either the label or the color indicator. If you clear the check box, the Color field appears and you can set the color.
Active	Option for indicating the status of the widget. Only active widgets are shown on the Demand Financials page.
Parent widget	Widget that is the parent of the current widget. The current widget displays in the Child widgets related list of the selected widget.

Widget form (continued)

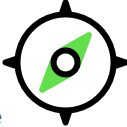

Field	Description
	You can add a maximum of three child widgets for a parent widget.
Formatter required	Option for specifying whether a currency formatter is required for the widget.
Script	<p>Code script that returns a requested metric value that is displayed on the widget.</p> <p>In the script, use the context and filter objects. The context object contains all the demand financial fields, such as total_costs, irr_value, and capital_budget.</p> <p>The following sample script returns the capital budget metric value of a demand to appear on the widget.</p> <pre> var context = JSON.parse(context); var filter = context.filters; var now_GR = new GlideRecord('dmn_demand'); gr.addEncodedQuery(filter['dmn_demand']); gr.query(); if(gr.next()) gr.getValue('capital_budget'); Collapse </pre>
Short description	Description of the widget.

Project Management

The ServiceNow® Project Management application is a suite of tools that aids in managing projects, tasks, and resources. You can create and manage small projects with a few tasks to large portfolios that contain complex tasks with various relationships and dependencies.

Introduction to Project and Program Management including the purpose of Project Management, the project workspace and template, baseline, project considerations, and viewing the project.

Exploring Project Management

Create, view, and manage projects using Project Management (PM) application.

Project Management overview

A project is any planned, collaborative effort that is designed to achieve an objective. The Project Management application not only helps you plan and track projects, it integrates with other applications.

There are several paths available to manage a project. The best path usually depends on business needs. The phases in the graphic are designed to get a project up and running with the minimum amount of effort.

Project phases

Project Management benefits

Project Management benefits

Benefit	Feature	Users
Starting a project	Start a project after setting up the project, populating it with tasks, and assigning resources.	it_project_manager
Create a project task from a project	Create project tasks from project form.	it_project_manager
Create baseline of a project	Capture planned dates of all tasks and milestones of a project using baseline.	pps_admin
Create a milestone	Use milestones to mark key dates in your project, such as key decision points, approvals, and holidays.	it_project_manager
Create a monetary benefit plan for a project	Capture the benefits accrued by the project when the project is executed by creating monetary benefit plan.	it_project_manager
Create a non-monetary benefit plan for a project	Capture the non-financial benefits accrued by the project when the project is executed by creating non-monetary benefit plan.	it_project_manager

Project Management benefits (continued)

Benefit	Feature	Users
Create a project cost plan	Create a cost plan to specify the unit cost of a cost type for a fiscal period.	it_project_manager
Adding RIDAC (Risks, Issues, Actions, Decisions, and Request Changes) records for a project	Create Risk, Issue, Decision, Action, and Request Change records (RIDAC) and identify issues or risks for your project.	it_project_manager
Applying templates to projects	Create, save, and reuse project structure using project templates.	it_project_manager
Adding external dependencies for projects	Use an external dependency to set up a dependency from a task in one project to a task in another project.	it_project_manager
Importing and exporting projects	Import or export projects from Microsoft Project to Project Management.	it_project_manager
Project Diagnostics	Detect corrupt data in a project such as task validity, dependencies, and relationships using Project Diagnostics.	it_pps_admin, adt_admin
Investment Portal	Create an investment board and share it with other stakeholders using Investment Portal.	it_project_manager or it_project_user
Manage status of your projects using Project Status application	Track the status of your projects, collaborate with stakeholders to resolve exceptions, and take timely actions regardless of your location using project status application.	portfolio_manager or project_manager or program_manager
Using Project workbench - Legacy	The Project Workbench supports hybrid project models by combining waterfall, agile, and test phases in a single project framework.	it_project_manager
Using Teamspaces in Project Management	Use teamspaces to centralize key PPM modules in one location and to improve accessibility and team productivity.	it_pps_admin, admin
Collaborate with your project teams using PPM Collaboration application	Enhance team collaboration on Slack or Microsoft Teams	it_project_manager

Project Management benefits (continued)

Benefit	Feature	Users
	with the PPM Collaboration application.	
Virtual Agent for PPM	Obtain business-related information by interacting with a virtual agent via messaging platforms using Virtual Agent for PPM.	admin, virtual_agent_admin

Integration with Project Portfolio Management

You can use Project Management as a separate application or it can be activated as part of the PPM.

This application provides a simplified, team-oriented approach to IT development by combining several individual applications and integrating the different components of the project development life cycle.

Basics of Project Management

Learn about the basic terms used in Project Management.

Bottom-up Tasking

Bottom-up (tactical) tasking means that you plan small, individual units of work that are required, then build a project up to include larger phases. Take this approach when you know what individual tasks are required to be accomplished and you are more flexible about overall project duration and estimated cost. Use this approach to see how much a project costs and how long it takes if you include every task. Project management supports tactical tasking by using rollup calculations on several project fields, such as project duration, so that the project adjusts to the tasks it contains. It is the recommended approach for the Project Management application.

Top-down Tasking

Top-down (strategic) tasking means that you plan high-level tasks first, then break down the work into smaller units. Take this approach when you want to build a project with fixed or inflexible time and budgetary constraints and well-defined phases. Establish well-defined milestones and dependencies between tasks that you consider from the beginning. Gradually add smaller tasks to the project later. This approach avoids including all possible tasks in a project and stays flexible with what tasks are included.

Note:

When you use this method, the Project Management application still rolls up several values, such as task duration. Creating a task with a longer duration than the project, expands to cover the entire duration of the task, and defeats the purpose of using this approach. Values are not rolled down from parent tasks, nor are there any restrictions on creating child tasks that are longer than specified duration of the parent.

Project relationships and dependencies

The Project Management application enables you a create parent-child relationships between tasks and dependencies, such as finish-to-start and finish-to-finish, between tasks. A task dependency is created when one task is prevented from starting or finishing based on its relationship with the preceding and succeeding tasks.

Project relationships and dependencies

Concept	Description
Finish-to-start dependency	A dependency that indicates that a task must not be started until its predecessor finishes.
Start-to-start dependency	A dependency that indicates that a successor task must not be started until the predecessor task has started.
Start-to-finish dependency	A dependency that indicates that a successor must not be finished until the predecessor task starts.
Finish-to-finish dependency	A dependency that indicates that a task must not be finished until another task finishes.
Lag time	A manually specified time break between predecessor and successor tasks.
Parent task	A project task with smaller tasks, referred to as child tasks, underneath it. Child tasks break down the work of a parent task into more manageable subsets. Certain fields for child tasks, such as planned end date, roll up and affect the same field in the parent task.
Child task	A project task that is a subset of a larger task. Child task start dates cannot occur before the start date of the parent task.
Rollup task	Another term for a parent task in the context of aggregating child task items, such as effort or resources, into a larger parent task calculation. All fields on rollup task forms are read-only.
Roll down	State changes roll down from the project to project tasks, and from parent tasks to child tasks.

Note:

Only one relationship can exist between two tasks.

The Project Management application provides several properties that control how tasks are calculated and behave. See [Project property](#) for more information.

Task time constraints

The Project Management application supports several types of dependencies.

The Project Task form includes a **Time Constraint** field, which can be one of the following values:

- If a task is set to **Start ASAP**: The task appears on the Gantt chart as starting when the dependency allows it. However, a task can start on a later date when a lag value is set for the relationship.
- If a task is set to **Start on specific date**: The task appears on the Gantt chart as starting on the constraint date. The start date of such a task is not impacted even after you put the task in a relation to another task, for example, FS relation.
- If a task is set to **Start no earlier than**: The task appears on the Gantt chart as starting on or after the constraint date. If the task has no predecessor, the task starts on the specified date. The start date changes to a later date based on the predecessor task end date or if the task is in a relation to another task, for example, FS relationship.
- If a task is set to **Start no later than**: The task appears on the Gantt chart as starting on or before the constraint date. If the task has any predecessor task, the dependency on the predecessor task determines when the task can start. A scheduling conflict occurs if the predecessor task attempts to move the task beyond the date specified in the **Constraint date** field.

Note:

The [project property Retain start on constraint on tasks after adding relations](#) controls the behavior for **Start on** selection. The property is set to True by default and is not editable.

- A task that is not honoring dependency is indicated with a red calendar icon  on the Planning Console. If you want the task to honor the dependency and adjust the start accordingly, change the constraint type of the task to **Start ASAP**.

Parent-child task relationships

If a task is relatively large and requires several users with different skills to manage, break the task into subtasks and create parent-child relationships. A child task is a relatively smaller, manageable size of work.

When you group child tasks together under a parent, values such as **Estimated cost** aggregate and roll up to the parent task. So the parent task takes on the form of a summary task or rollup task for its child tasks. **Planned start date** and **Planned end date** rollup occurs when you create child tasks: the duration of the parent automatically adjusts to cover its child tasks.

A parent-child relationship is different from a dependency relationship. In a dependency, one task must finish before another begins. In a parent-child relationship, any number of tasks can be nested under a parent task with or without any dependencies. When you create a parent-child relationship, the parent task number is saved in the **Parent** field in the Project Tasks table. All project management tasks have a parent: either another project task or the project itself.

Unlike a dependency, a parent-child relationship is not saved as a record in any table. The only modification that takes place when a parent-child relationship is modified is the **Parent** field in the child task record.

You can create predecessor-successor relationships between child tasks with different parents, between two different parent tasks, or between a child task and another parent task. However, if the predecessor task finishes after the successor task starts, creating a dependency between child tasks that have different parents is not allowed.

Note:

On the Gantt chart, you can drag-and-drop the parent task to move the entire hierarchy to a new location on the schedule.

Time constraints in parent-child relationships

Parent-child task relationships have several effects on task time constraints.

When a child task is set to Start ASAP

The child task starts at the same time as the parent task. If Project itself is set as a parent, the **Start ASAP** tasks starts on the same date as set in the **Constraint Date** field, as long as it does not have dependencies with other child tasks.

When a parent task is set to Start ASAP and child tasks are set to Start on specific date:

- The earliest child task start date determines the start date of the parent, assuming no other dependencies.
- In this case, the **Time constraint** field of the parent remains **Start ASAP**, but the actual start date is changed to the start date of the earliest child task.

When a parent task is set to Start ASAP and child tasks are set to Start on specific date:

Child precedence also applies to end dates. If the estimated end date of the child task is later than the end date of the parent task, the estimated end date extends to cover the child. For actual values, a parent has the same start date as the earliest start date of its children. The latest actual end date is the latest end date of its children. Assuming the child tasks are **Closed Complete**. If the child tasks are not in the **Closed Complete** state, the actual end date of the parent is empty.

For the planned start date of the parent task:

- The planned start date is the earliest planned start date of all the children that do not have an actual start date.
- If all child tasks have actual start dates, the planned start date of the parent task is set to the actual start date.

For the planned end date of the parent task: The latest planned end date or actual end date of the child tasks determines the planned end date of the parent.

A task with **Start no later than** or **Start on specific date** time constraint cannot be a parent task. When a new child task is added to a task with these time constraints, the time constraint for the parent task is changed to **Start ASAP**.

Top-down and bottom-up planning

- For top-down planning, create a task that you already know includes several child tasks. Then create the child tasks and specify that they are child tasks of the first task you created.
- For bottom-up planning, create tasks for the smallest units of work first. Then you can create intermediary parent tasks that cover a group of related child tasks. For example, if there are five sequential tasks that comprise a phase of a project called install database, create the five tasks first. Then create another task called Database installation and make it the parent task of the five tasks. Rollup calculations, such as **Planned duration**, for the Database installation task are automatically calculated based on the child tasks.

It is easiest to build task relationships and dependencies while creating sets of tasks.

- A dependency means that a task relies on other tasks to be performed (completely or partially) before it can be performed.
- A relationship means a parent-child relationship whereby several subtasks are configured under a parent task or phase, which rolls up fields like **Planned duration** and **Estimated cost**.

Use the [Gantt chart](#) with task forms and related lists to build relationships. Add milestones based on the major events of a project and create dependencies between milestones and tasks, if necessary.

Also set up notifications to alert project task assignees when their tasks move to the **Work in Progress** state. See [Creating Project Tasks](#) for more information on creating tasks.

Related topics

[Parent-child rollup task calculations](#)

[Create a parent-child relationship on the Project Task form](#)

Parent-child rollup task calculations

Date changes, stage changes, and value calculations roll up from child tasks to parent tasks.

- Date changes involve modifying the planned start or end date of a parent task based on those values in child tasks.
- State changes involve modifying the state of the project record or parent task records when all child records are set to a certain state.
- Calculations involve summing the values of child tasks and then automatically updating the parent to reflect a new total.

The following fields change on rollup tasks:

- **Planned Start date:** Set to read only for parent tasks. Remains editable for the project record (also considered the top-level task).
- **Planned End Date:** Becomes read only.
- **Planned Duration:** Becomes read only.
- **Actual Start Date:** Becomes read only.
- **Actual end date:** Becomes read only.
- **State:** Becomes read only.

Duration Rollups

Rollups are calculated for the following items:

- **Planned duration and planned effort:** the sum of all planned duration and planned effort values for all child tasks.
- **Actual duration and actual effort:** the sum of all actual duration and actual effort values. Actual duration and actual effort values are calculated when all child tasks are in the **Closed Complete** state. Actual effort values can include rollups from time cards.

i Note:

Verify that the time card property **com.snc.time_card.update.effort** is enabled. Navigate to **System Properties > All Properties** to enable this property.

Cost Rollups

Cost calculations roll up when the costing add-on is active.

- **Estimated cost:** The sum of all cost estimates at the beginning of a project. Estimated costs of child tasks roll up to parent tasks and to the project.
- **Actual cost:** By default for the project, the sum of all costs of all the expense lines, and are typically associated with a time card and a labor rate. To track costs, you can derive rates using any of the following options:

- Associate a [rate model](#) to the project.
- Define rate cards for the task and labor expenses.
- Associate rate at the resource plan level.

These rates automatically generate expense lines showing actual expenditures, which are associated with the projects. If rate cards are defined, the task expense lines are generated as each project task closes, and labor expense lines are generated when time cards are approved. Expense lines are visible in the **Expense Lines** related list, which requires the **Advanced view** on both Project and Project Task forms.

To ensure actual costs of child tasks correctly roll up to the project and added to project expense lines, the following must be true:

- The `com.snc.project.rollup.cost` property must be set to **true**. To enable this property, navigate to **Project Administration > Settings > Preferences - Project** and select the **Enable project cost rollup** check box.
- The `glide.cost_mgmt.process_task_top_task` property must be set to false. Go to the costing properties in the Cost Management application. Check the **When creating a task expense line should the system also create expense lines for the task's top task box** is not checked.
- The `glide.cost_mgmt.calc_actual_cost` property must be set to true. Go to the costing properties in the Cost Management application. Check the **For planned tasks types, calculate the actual cost field using the total of expense lines for the task** box.

Project State Rollups and Roll Downs

Project task states roll up. The state of parent tasks becomes read only, and changes automatically when you change the states of child tasks.

Project task states can roll up if:

- The state of the child task is manually changed and there are no other conditions on the parent task.
- The state of the child task is changed to **Work in Progress** or **Closed**. These states roll up to the parent. **Pending** and **Open** do not roll up to the parent task.

Project states can also roll down. If you change the state of a project to closed, all tasks under it change to the default closed value (**Closed Complete**). If a closed project or closed task is reopened, all tasks under it change as follows:

- Project or parent changed from closed to **Pending** or **Open**: Child tasks change to **Open**.
- Project or parent changed from closed to **Work in Progress**:
 - Child tasks with a **Start on** date that has passed are changed to start **ASAP** and the state is changed to **Work in Progress**.
 - Child tasks with a **Start on** date that has not yet passed retain the same start on date but the state is changed to **Open**.

Project tasks

Create project tasks in several ways, even from other applications in the instance.

Before you begin

Role required: it_project_manager

About this task

You can create a project task using any of the following options.

Procedure

- Use the Project Tasks related list.
This related list is available from both a project record and a project task record. You can use the [New UI action](#) or [insert a new row in the related list](#).
- Use the [planning console](#).
- Use [the project task creator](#).
Use a dialog box to create multiple tasks at one time. The project task creator is available from both a project record and a project task record.
- By [copying an existing project or task](#).
This option copies a selected task, or even a whole project, including all child tasks.
- From [an incident, problem, or change request](#).
The Project Task related list is also available from the Incident, Problem, and Change Request forms. The tasks you create from these forms makes the project task a child of the incident, problem, or change, rather than a project.

Related topics

[Link change requests to a project task](#)

Schedule conflicts between project tasks

Scheduling conflict helps you to identify project tasks that are not honoring dependencies. A scheduling conflict occurs when one project task prevents other task from starting on the specified date because of dependencies or constraint types.

A scheduling conflict occurs when any action such as applying a dependency, changing constraint type, or constraint date causes the task start date to violate the project's constraint date.

When a scheduling conflict occurs, the system warns you about the conflict. You can choose to cancel the action that is causing the conflict or continue with the conflict. If you choose to continue with the conflict, the constraint date is given highest precedence and dates are recalculated. The start date is moved till allowed by the task constraint date, but dependency is not honored.

For example, consider the following scenario:

For a project with project task's **Constraint date** set as 20 January, there are two tasks:

- T1 with constraint type set to As soon as possible and start date of 20 January.
- T2 with constraint type set to Start no later than and start date of 20 January.

If you add an FS dependency between tasks T1 and T2, the task T2 should start on 21 January, but due to Start no later than constraint, task T2 cannot start on 21 January. This inability of starting task T2 on the specified date is an example of conflict.

In this example, if you choose to proceed with the conflict, the start date of task T2 is moved to 20 January which is the constraint date.

Scheduling conflict between tasks is shown for tasks with **Start no later than** and **Start on specific date** time constraints.

If you want the task to honor the dependency and adjust the start accordingly, change the constraint type of the task to **Start ASAP**.

When a scheduling conflict is identified, you can identify such tasks in the planning console.

- The client-side planning console displays a pop-up message with an option to proceed with the conflict or cancel the action. If you proceed with the conflict, the constraint type is applied or date is changed appropriately to the next feasible date.
- The calendar icon (📅) on the client side planning console changes to red (📅) to indicate the conflict.
- The calendar icon on the server side planning console changes to red (📅) to indicate the conflict.

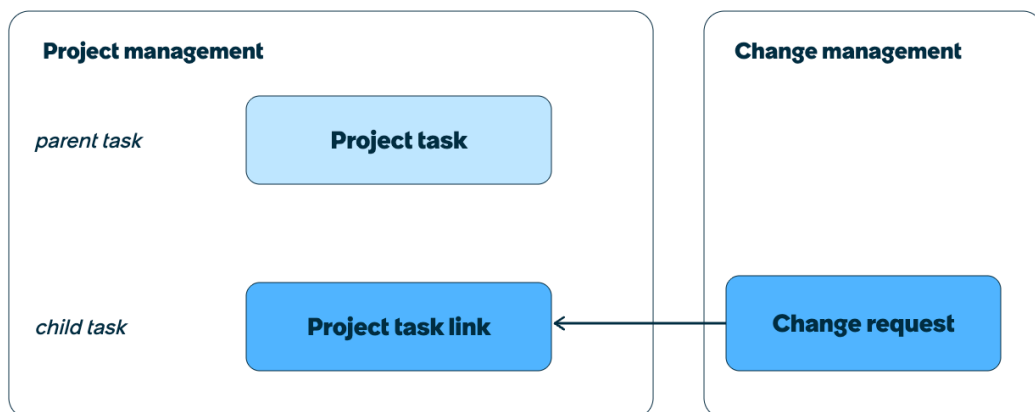

Change requests and project tasks

Large-scale changes approved by your change approval board (CAB) require new or existing projects to be implemented.

To bridge the gap between change management and project management, the instance allows you to link one or more change requests to a project task. You can link an existing change request to a project task or create a new change request directly from a project task.

When you link a project task to a change request record, a new project task link record is created. It provides the actual link between the project task record and the change request record. The project task link copies all attributes of the change request record. It then becomes a child task of the project task that you linked to the change request. The rules that govern the relationship between the project task and the project task link are the same as the rules for all parent and child tasks.

Project tasks linked to change requests

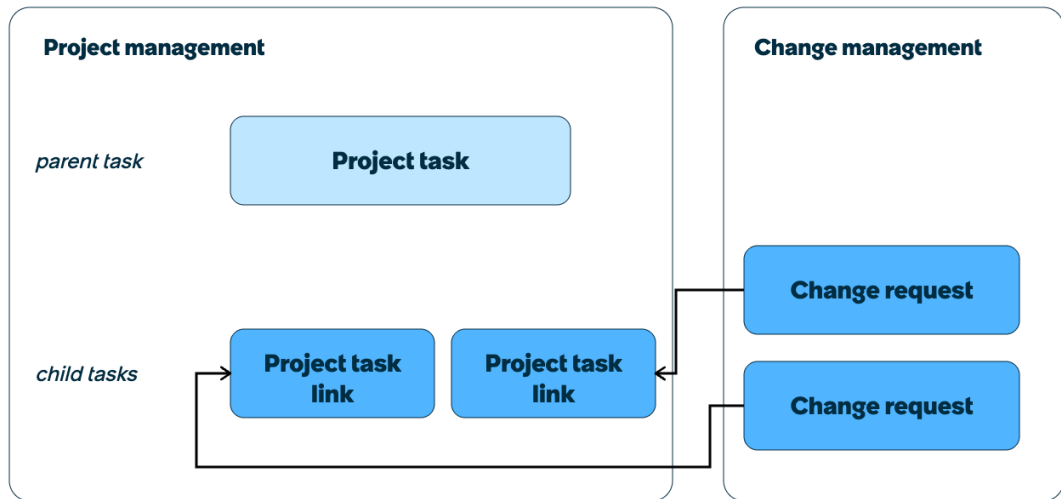

Note:

A project task cannot have both task link records and child project tasks. When a project task is linked to a change request, you cannot also create child tasks for that project task. Likewise, when a project task has child tasks, you cannot link the parent project task to a change record.

The project task link record is read only. You can view the project task links from a related list on the Project Task form.

You can also link multiple change requests to a single project task. In this case, a project task link record is created for each link and all the project task link records become child tasks of the project task.

Project tasks links

Change request project task relationship

The rules that apply to all parent-child tasks also govern the relationship between project task and the project task link. The project task link inherits start and end dates from the change request. However, the Project Management application adjusts the dates when these situations occur:

Start and end dates:

- If the project task and the change request have different planned start dates, the project task link uses the later of the two dates. For example, if the project task starts on October 1 but the change request starts on October 2, the project task link changes to October 2.
- If the change request has an earlier start date, the **Time constraint** value for the project task link becomes **Start ASAP** when the link is created. The end date remains the same as the end date specified in the change request record.
- If the change request starts and ends before the project start date, the project task link has a duration of zero (0). It also appears as a milestone that occurs when the project starts.
- If a change request is scheduled to start during non-work time according to the project schedule, the planned start date of the project task link ignores the schedule. It also starts at the time specified by the change request. However, the duration of the project task link does take the schedule into consideration. For example: the project uses the default schedule, which specifies that work hours are Monday to Friday from 08:00 to 17:00 with an hour break from noon to 13:00. A change request with a 13-hour duration starts at midnight. The project task link starts at midnight and continues through the start of the schedule at 08:00. It stops at noon for one hour, and continues from 13:00 until 14:00. The total duration would be 13 hours.

Project Task Duration

The duration of the change request determines the duration of the project task link. That duration is rolled up to the parent project task just as all child task durations roll up to parent tasks. The **Planned start date** and **Planned end date** in the Change Request form **Schedule** section are the

fields that determine the duration. If there are no planned dates on the Change Request form, the default duration is one project day. The project has a schedule or 24 hours when the project has no schedule.

Multiple Linked Change Requests

If you link additional change requests to a project task, additional project task links are created. All become child tasks of the project task. The dates roll up to the parent task. For example, if a linked project task is planned to finish on October 30. You link a new change request scheduled to finish on November 30, a new project task link is created. The parent task planned end date extends to November 30 to cover the duration of both project task links. A change request can only be linked to one project task. It cannot be linked to multiple tasks in the same project or across multiple projects. A project task that has one or more child tasks cannot also have a project task link connecting it to a change request.

Project Task State

If the state of a change request changes to **Pending**, **Open**, or **Work in Progress**, the state of the project task link changes accordingly. If the state of the change request changes to any of the closed states, the state of the project task link changes to **Closed Complete**.

How Modifications Propagate Between Change Requests and Project Tasks

Modifications to a linked change request propagate to the project task link. However, the reverse is not true. You cannot modify the change request record from the Project Management application.

Modifications to the following fields propagate from the change request to the project task link:

- **Planned start date**
- **Planned end date**
- **State**

These change request settings also roll up to the project task that is the parent of the project task link, and also up to the project record. Consider the following example: a project has not yet been started and all its tasks are in the **Pending** state. If you changed the state of a linked change request record from **Open** to **Work in Progress**, the project task link, its parent task, and the project itself all change to **Work in Progress**.

When you start a project, tasks that have **Start ASAP** as the time constraint and have no other start dependencies start immediately. However, project tasks with linked change requests do not start automatically. The project manager must start the task manually by changing the **State** field to **Work in Progress**.

Modifications made in the Project Management application do not propagate to a linked change request record, so closing a project does not close a linked change. When you successfully implement a change and close the project it belongs to, you must go to the change request record and manually change the state to **Closed**.

[Link change requests to a project task](#)

Project task checklists

A project task checklist gives you the ability to track activities that must be completed on a task.

For a project task to be considered complete, you can track activities that do not require separate subtasks. For example, you have a human resources-related project that includes a task for interviewing candidates. You can also track booking a meeting room or getting an interview

confirmation from the candidate. Create a checklist item for each and mark when they have been completed.

Checklist items do not have start or end dates, nor do they track effort or cost. By default, a checklist item record provides only a name and a Complete field, which can be set to true or false. The state of the project task is independent of the state of the Complete field on the checklist item.

Checklists, as well as tasks, are copied into a project template. You also have access to all checklist templates from any project task form.

Note:

Checklists are available for any form that is based on a table extended from the Task table. Administrators can add or remove checklists as needed.

Project and project task states

In the base system, the states in project and project task inherit the states in Task table.

The states are grouped into different categories as shown below:

State	Label	Category
-5	Pending	Pending
1	Open	Open
2	Work in Progress	Work in Progress
3	Closed Complete	Closed
4	Closed Incomplete	Closed
7	Closed Skipped	Closed

The category information for the states is declared in [dictionary override](#) of State column in Planned task (planned_task) table in **Attributes** field. Planned task is the parent table for project and project task tables.

The start and end dates are displayed based on the project or task status:

- Pending/Open: Planned start date is displayed.
- Open/Work in Progress: Actual start date is displayed.
- Closed: Actual end date is displayed.

Related topics

[View default project and project task state categories](#)

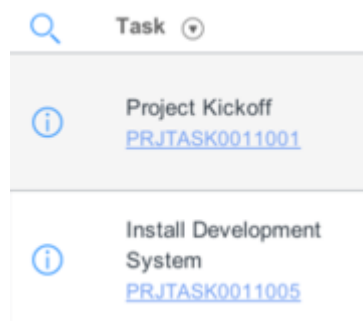

[Customize a state for project or project task](#)

Composite Fields

A composite field combines information from two fields in a table to form a single field.

For example, the **Task** field on the Project Tasks list displays the short description and the project task number. The short description appears above the project task number. The project task number appears and is a link to the Project Task form.

Composite field

Use a composite field

- Editing a composite field changes the short description. Editing the short description changes the composite field.
- Sorting on a composite field is based only on the short description and not the number.
- Searching on a composite field is enabled for both the short description and the number:
 - To search by the number using the list header, enter an asterisk (*) before the search term. For example, *PRJTASK0010016.
 - To search by the number using the filter, create a condition similar to: [Task] [contains] [PRJTASK0010016].

Cost plan breakdown

A cost plan breakdown captures the estimated cost and actual cost for every fiscal period. Cost plan, project, demand, program, and portfolio are the breakdowns types that are available.

Requirement

Requirement corresponds to a single cost plan. For example, for a regular calendar and a cost plan spanning across one year, 12 breakdowns would appear.

Task

Task corresponds to a project or a demand. The cost across all the cost plans per period is rolled up to the project or demand level. These records have breakdown type set to **Task**. There would be only one record of type **Task** per period. The number of records of type **Task** that are created depends on the duration of the

project or demand, and the requirements planned in the project or demand. For example, for a regular calendar and a project with three cost plans, 12 breakdowns appear.

Program

If a project or a demand is part of a program, the breakdown type of **Program** provides the aggregate of program level costs per period.

Portfolio

If a project or a demand is part of a portfolio, the breakdown type of **Portfolio** provides the aggregate of portfolio level costs per period.

System-generated cost plans

When an expense line is created without populating the **Cost Plan** field, system-generated cost plans are created automatically.

The orphan expense lines are associated to the system-generated cost plans. This association ensures that the project actuals shown on the widgets or the total actuals are the same as the aggregate of the cost plan actuals on the grid shown on the Project Financials page and Investment Portal.

Note:

System-generated cost plans are created only when the project has a minimum of one cost plan.

System-generated cost plans are created for any of the following reasons:

- When you create an expense line without populating the **Cost Plan** field.
- When you create a time card and approve it.

There are two system-generated cost plans, CapEx and OpEx. Depending on the type of expense selected while creating an expense line, the type of system-generated cost plan is created. The following are the name formats for the system-generated cost plans:

- <project number> System generated CapEx costplan
- <project number> System generated OpEx costplan

When you create a time card and approve it, an expense line of type CapEx is created and then the orphan expense line is associated to the system-generated cost plan of type CapEx. The system-generated cost plans are created to ensure that none of the expense lines are left without being associated to a cost plan. The system-generated cost plans are read-only.

For customers upgrading to Zurich, you can run the project diagnostics, **Associate orphan expense lines to the system generated cost plan**, to associate orphan expense lines to a system-generated cost plan. The diagnostic scan lists the expense lines that are not associated to any cost plan. When you run the fix script, system-generated cost plans are created, and the orphan expense lines are associated to the system-generated cost plans.

Actual project costs

Actual project costs come after you create expense lines for cost plans or after human resources use time cards to create expense lines.

The system captures actual project costs from expense lines:

- **Expense lines from cost plans:** You can [create expense lines from a cost plan](#). Allows you to specify the amount and date when the expense was incurred. The actual amount incurred is included in the cost plan after the expense line is processed.
- **Expense lines from timecards:** Human resources can record time for project work by using time cards. When time cards are approved, the system generates expense lines. After the expense lines are processed, the actual costs are recorded for the project. If you provide a resource plan when creating time cards, the cost plan name is derived from resource plan and cost is captured against the resource plan. If you do not provide a resource plan, the cost is captured against the project.

Related topics

[View actual project costs](#)

Types of external dependencies

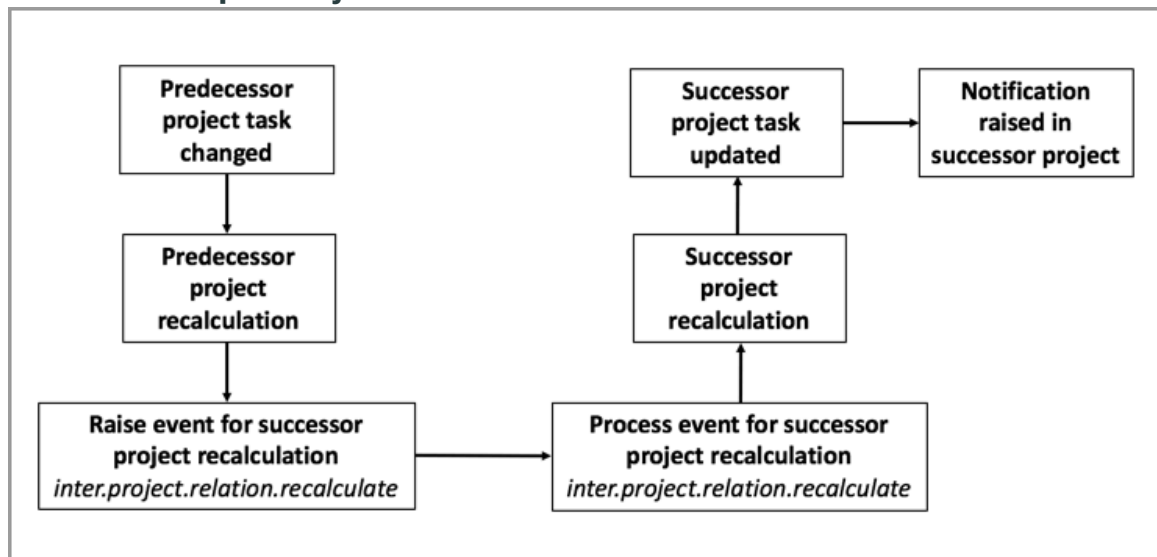

The Project management application supports two types of external dependencies - hard and soft.

The type of external dependency can be set during [adding a dependency](#) between two projects tasks on the planning console.

Hard dependencies

In a hard dependency, any changes made in the predecessor project are automatically propagated to the successor project. A [notification](#) for the changes made is triggered in the successor project. The following image shows the process flow for a hard dependency type:

External hard dependency

Soft dependencies

In a soft dependency, any changes made in the predecessor project trigger a notification in the successor project. As the project manager of the successor project, you can choose to accept or reject the changes in the notification. If you accept the notification changes, the changes in the predecessor project are synced to the successor project and the project is recalculated. If you reject the notification changes, the changes are not propagated to the successor project. The following image shows the process flow for a soft dependency type:

External soft dependency

Project and portfolio funding

Specify the amount of money that projects and portfolios are allowed to have.

You can fund projects and portfolios when you activate PPM Standard with Financials.

The funding process follows these steps:

1. Identify the costs for time, such as a financial year, by creating cost plans at the project or demand level. These costs roll up to the portfolio Cost Plans related list. Cost plans automatically include cost plan breakdowns for each fiscal period. See [Create a project cost plan](#) and [Create a demand cost plan](#).
2. Enter the target cost values for operational and capital expenses for the portfolio. See [Create a portfolio](#).
3. Create budget plans for the projects in your portfolio and promote the plans to forecasts.

Multicurrency in Project Management

Use the multicurrency feature to execute a project or part of a project in a different geographic location that has a different local currency.

The feature helps you to view the cost details of the project in a currency that is different from your functional currency. The values in the project's cost plans, benefit plans, and corresponding cost fields of the project form are also converted to a currency that you specify as project currency. Therefore, you don't need to convert the project currency to the functional currency of the project when the project is executed at a location that uses a currency different than your functional currency.

Activation information

Activate the PPM Standard Multicurrency (`com.snc.ppm_multicurrency`) plugin to enable the multicurrency features in Project Management. Activating the plugin enables the project currency view in project, cost plans, and benefit plans forms. With the project currency view, you can manage your project financials and cost plans in multiple project currencies.

Note:

Activating this plugin automatically activates PPM Standard (com.snc.financial_planning_pmo) plugin and therefore you get the option to switch between the default view and the project currency view.

Project currency view

In addition to the default view in the Project form, there is Project Currency view, which you can optionally enable to view the multicurrency fields. You can enable this view from the form context menu. The view appears only when you activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Unlike the Default view, the Project Currency view contains multicurrency-related fields.

You can designate a currency other than the functional currency as the processing Project Currency for a project. The **Financials** tab of the Project form has the **Project currency** field. You can select an active currency from the Currencies [fx_currency] table.

Note:

The **Project currency** field of a project becomes read-only field and locked down for updating the currency once you create a cost plan, cost plan breakdown, benefit plan, benefit plan breakdown, or an expense line for the project.

Specify project currency in Demand

You can specify the project currency that you want to use for managing a project when you convert a demand to a project. You can continue to manage the demand using your functional currency, project currency, or a local currency. For more information, see [Multicurrency in Demand Management](#).

Projects in Project Workspace

Track your projects in project currency in the Project Workspace. Create and monitor the cost plans and benefit plans for a project in project currency. For more information on project workspace, see [Project Workspace](#).

To view the cost component in project currency at the grid level and at the breakdown level, see [Create and manage cost plans and benefit plans for a project](#).

Project status reports

To view the planned and actual cost status of your projects in project currency, open the overview and cost sections of [project status reports](#).

Updates in cost plan and recalculation of cost in project currency

If the unit cost, quantity, or fiscal period of a cost plan are updated, then all the related amount fields in the cost plan, its breakdowns, and the project to which it is rolling up are recalculated in project currency.

Changes in Unit cost, Quantity, and Recurring check box of a cost plan

When you modify the **Unit cost** field, **Quantity** field, or **Recurring** check box of the Cost Plan form, the Total planned cost is recalculated in project currency. Similarly, the **Cost in project currency** in the Cost Plan Breakdown is also recalculated.

Therefore, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Changes in the fiscal period of a cost plan

When you change the fiscal period, either the start or end dates in the Cost Plan form, the **Total planned cost** and the **Cost in project currency** of the cost plan are recalculated. Therefore, the Cost Plan Breakdown records may be added or removed. If the **Recurring** check box is not selected, then the **Cost in project currency** of each Cost Plan Breakdown record is recalculated. In line with this, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Changes in the entered cost of a cost plan

If you change the **Entered cost** in an individual Cost Plan Breakdown record, then the **Total planned cost** of the cost plan is recalculated in project currency. Therefore, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Addition of breakdowns to a cost plan

If you manually add cost plan breakdowns to a cost plan, then the **Total planned cost** of the cost plan is recalculated in project currency. Therefore, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Predictive Intelligence for Project Management

The Predictive Intelligence for Project Management capability uses machine-learning algorithms to search and display similar projects while defining a new project using the project form. You can also search for existing projects and compare similar projects for project planning.

The PPM Predictive Intelligence Workbench includes a prebuilt use case template that systematically guides you through the process of creating and training new predictive models, evaluating and testing them, and finally adding them to your business process to add value to your Idea, Demand, and Project Management.

Once you train your custom use cases, they are usable immediately. No prior knowledge or experience with artificial intelligence or machine learning is required when you use the PPM Predictive Intelligence Workbench.

The application includes templates with prebuilt guidance to assist you in creating, training, evaluating, testing, and producing your unique predictive models.

Predictive Intelligence for Project Management has the following benefits:

- Improves the quality of your database by avoiding duplicate projects.
- Helps you in planning your project. You can view planning details of similar projects that were created and executed in the past.

Activation information

Activate the following plugins before using the Predictive Intelligence Workbench:

- Predictive Intelligence for PPM (com.snc.ppm_ml) plugin
- Predictive Intelligence for Ideation (com.snc.innovation_management_ml) plugin

Solution definitions for Predictive Intelligence for Project Management

The solution definition for Predictive Intelligence for Project Management capability is available in the Predictive Intelligence for PPM plugin (com.snc.ppm_ml). For more information about Predictive Intelligence, see [Predictive Intelligence](#) and [Contextual search](#).

Solution Definition for Project Management

Solution Definition	Solution Type	Description
<p>Similar Projects</p> <p>Note: This solution definition is available as a template on instances where the following plugins are active:</p> <ul style="list-style-type: none"> Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) PPM Standard plugin (com.snc.financial_planning_pmo) Predictive Intelligence for PPM plugin (com.snc.ppm_ml) 	Similarity	View similar projects based on the Project Name and Description fields. You can see the results in the Similar projects section on the Project form.

Configuring Project Management

Learn about the process required to set up and configure Project Management to enable your project managers initiate and plan projects.

Configuration overview

With the Project Management application, you can plan, organize, and manage projects and resources more effectively, making it easier and faster to complete projects. To use the Project Management application, you need to install the PPM Standard plugin. For more information, see [PPM Standard \(Project Portfolio Management\)](#).

Upgrade existing projects on activating multicurrency plugin

Execute the *PM upgrade project currency for active projects* and *PM upgrade project currency for inactive projects* scheduled jobs to upgrade your active and inactive projects, respectively, after you activate the multicurrency plugin. Select the scheduled jobs and run them on demand to upgrade your projects in project currency only when necessary.

Before you begin

Role required: admin or it_project_manager

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Click the *PM upgrade project currency for active projects*.
3. Click **Execute Now** to upgrade all your existing active projects to project currency.

On execution of the job, all amounts in the cost-related fields of the Project, Project Task, Baseline, Cost Plan, Cost Plan Breakdown, Benefit Plan, Benefit Plan Breakdown forms are copied from functional currency to project currency fields. Once the values of functional currency fields are copied to the project currency fields project currency cannot be edited since the financial costs already exist.

4. To upgrade your inactive projects, click *PM upgrade project currency for inactive projects*.
5. Click **Execute Now**.

On executing the scheduled job, the project currency value for all existing projects is set to the functional currency. The project currency in the Project Tasks, Baselines, Cost Plans, Cost Plan Breakdowns, Benefit Plans, Benefit Plan Breakdowns, Expense Lines forms is set to functional currency.

Note:

The jobs may have performance impact depending on the number of projects and cost plans, hence run the jobs only when necessary.

Using Project Management

Use Project Management to plan, manage, and track projects effectively.

Plan the project

Before creating a project, consider the following questions and issues:

- Do you want a top-down or bottom-up approach to tasking?

Top-down tasking involves creating a project first, then identifying major project phases. Later on, phases can be broken down into tasks and subtasks. The emphasis is on creating estimates for high-level items such as phases and parent tasks and then building the project down from there toward a more detailed level. Use caution when creating tasks for top-down tasking. Creating a task under a project that has a start-on date later than the start date of the project, the project shifts to the later start date. The Project Management application supports bottom-up tasking better.

Bottom-up tasking involves creating several sets of small tasks and estimating task items such as effort, cost, and duration. These estimations are then aggregated into high-level parent tasks (rollup tasks) and phases. The emphasis is on estimating smaller chunks of work as accurately as possible first, then letting those estimations roll up into parent tasks, phases, and the project itself.

- Is the project part of a larger portfolio of projects?

Also consider [portfolio planning](#) and how the project relates to similar projects or initiatives.

- What types of dependencies do the tasks have with other tasks?

The Project Management application supports various dependencies.

- Can milestones and project baselines help manage a project?

A milestone is a project task with a duration of 0. Use milestones to indicate important dates in a project. If necessary, create dependencies between tasks and milestones so that a task does not start until a milestone has been reached.

A baseline is a snapshot of the current planned start and end dates at the time the baseline was created for each task. A line appears under each task on the Gantt chart for the original planned start and end dates. The line appears shifted to the left or right depending on whether the task was started early or late. If tasks slip to later dates, the baseline indicator provides an easy way to see how severe the delays are.

- Have the necessary skills, groups, and resources been created in ServiceNow?

If project tasks are assigned to different groups or individual resources with the required skills, create users and groups and configure the Skills Management application.

- Does an existing incident, problem, or change justify creating a project to track it?

Of these record types, a change is most likely to lead to activities that are tracked as a project.

- Do you want to track project costs?

Estimate group resource costs before starting the project. Then track the actual cost of each user resource from time cards. The Project Management application can also calculate the costs of affected CIs in a project. The Project Management Costing add-on is required to track costs.

- What goals do you want the project to achieve?

Every project has at least one goal. Project goals are saved in the Goal table and can link to any task. In a typical scenario, link one goal to each project and keep the **State** field of the goal up to date.

Assign resources or assignment groups to the tasks

User resources are the individuals in an organization who are assigned to project tasks. You can manage your resources with resource plans in the Resource Management application.

Add the project to a portfolio

A portfolio is a group of related projects. If the project is related to other projects, create a portfolio and add the project. The Project Management application provides a useful portfolio view that makes it easy to report on the status of all projects in a portfolio. Portfolios also include demands.

Starting a project

Initiate a project by changing the project state to **Work in Progress**. Define important aspects of your Agile, Waterfall, or Hybrid project such as the duration, estimated cost, and net value to your organization to efficiently track the project's progress.

Before you begin

Role required: it_project_manager

About this task

When you change the **State** field on the Project form to **Work in Progress**, the Actual start date of the project changes to the planned start date.

You can create a project from the Projects list or from the project planning console. You must have the Agile Development 2.0 plugin to create an Agile or Hybrid project and the Test Management plugin to create a test phase for your project.

Note:

You can also create a project from the [demand workbench](#).

After you start the project:

- The read-only **Actual start date** field of the project is populated with the planned date.
- If a task or set of tasks are scheduled to start immediately upon project start (meaning that their time constraints are set to **Start ASAP** and they have no other start dependencies), the actual start dates of those tasks also get populated with the planned date.
- The planned start dates of all other tasks adjust accordingly based on the time you started the project. Their new planned start dates depend on several factors, including dependent relationships with other tasks and the duration for each task.

Note:

Once a project is in the **Work in Progress** state, it does not mean that the state of every task will start updating automatically based on planned start date. Other than the project tasks that you schedule to start **ASAP** when the project starts, project tasks are not started automatically. Continue to manage the project and change the state of each task to **Work in Progress**.

You can also use the multi-currency feature to create a project in a local currency different from your functional currency. You must enable the PPM Standard Multicurrency plugin (com.snc.ppm_multicurrency) and switch to the Project Currency view for the additional fields in the **Financials** tab of the Project form. For more information, see [Multi-currency in project financials](#).

Procedure

1. Create a project in any of the following ways.
2. On the form, fill in the fields.
For field information, see #unique_1265.
3. Select **Submit**.

Related topics

#unique_1265

[Project Portfolio Management](#)

Create a project task from a project

Create tasks from the project form to break down project objectives into manageable units of work.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Select the project from the list.
3. In the **Project Tasks** related list, select **New**.
4. On the form, fill in the fields.
For more information on project task form, see [Project task form](#).
5. Select **Submit**.

Result

The new task appears in the **Project Task** related list on the Project form. If time cards are in use, the application creates a time card for the resource.

What to do next

The value in the **Percent complete** field is related to the **State** field in the v3 application. If you change the percentage complete from **0** to any other value, the state of the task changes to **Work in progress** when you save or update the record. Likewise, if you change the state of the task to **Closed complete**, the **Percent complete** field is set to **100** and becomes read-only.

If you change the state of a project task from **Work in progress** to **Closed Skipped** or **Closed Incomplete**, the **Percent complete** field retains the current value and becomes read-only.

The **Percent complete** field appears in the Gantt chart for parent tasks as a light-colored bar (the part of the task that is complete). The bar overlaps the darker, underlying bar (the full task). For example, a Demo project is 5.41% complete as shown in a pop-up window. The **Phase 1** task is about 50% complete (not shown in the pop-up window).

The Project Tasks list and the Project Tasks related list on the Project form include a **Dependency** field. Any dependencies for a task, such as a parent task, are displayed in this field. Click a dependency record. See [Predecessor dependencies in the planning console](#) for a description of what you see in this column.

Create a task from an incident, problem, or change request

You can create a new project task from the Project Task related list on the Incident, Problem, and Change Request forms. The tasks you create from these forms makes the project task a child of the incident, problem, or change, rather than a project.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to the Incident, Problem, or Change Request form.
2. Configure the form to add **Project Task > Parent** if the related list is not already present.
3. In the **Projects** related list, select **New**.
4. Fill in the project form.

The project task becomes a child task of the incident, problem, or change record.

Create tasks from project task creator

Use the project task creator to create multiple tasks at once.

Before you begin

Role required: it_project_manager

Procedure

1. In the Project form, right-click the header bar and select **Project task creator**.
2. Enter the number of tasks to create.
3. Select the **Create FS dependency** check box to create a finish-to-start dependency between these tasks (when the first task finishes, the next task starts).
Clear the check box to create the tasks with no dependencies.
4. Select **OK**.
The new tasks appear in the **Project Tasks** related list. The application automatically creates a task **Number** and a **Short Description** that starts with **Auto Created Task**, followed by a number when more than one task is created.

Insert a row into the project tasks list

You can create a new project task from the Project Task related list on the Project form. Administrators must enable this task-creation feature.

Before you begin

Role required: it_project_manager

Procedure

1. In the Project form, navigate to the Project Tasks related list.
2. Double-click **Insert a new row**.
3. Select the green check mark.
4. Open the new task and edit the record as required.

Copy an existing task or project

Save time when building a project by copying tasks from other projects.

Before you begin

Role required: it_project_manager

About this task

The **Copy partial project** option copies a selected task and its child tasks into the project, or all project tasks into a sub-project. It also preserves all dependencies and relationships among the copied tasks and their child tasks. Any relationships or dependencies that involve tasks outside of the scope of the copied task are not preserved.

Procedure

1. In the Project or Project Task form, right-click the header bar and select **Copy partial project**.
2. In the **Task** field, select a project task or project to copy.
By default, projects begin with PRJ and project tasks begin with PRJTASK.
3. Enter a **Name** for the new project or task.
4. Select **OK**.

The copied task is added to the current task or project. If a project was copied, then all the tasks are inserted into a new sub-project.

Result

The copied tasks are inserted as a child of whatever task or project that you are currently viewing. Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to **0**.

By default only the short description, planned dates and duration fields are copied from source project to the target project. If additional columns must be copied, they should be declared in the [project property List of attributes that will be copied from the originating project task](#).

Related topics

[Change default values of copied fields](#)

Change default values of copied fields

Change the default values of in the new partial project.

Before you begin

Role required: admin

About this task

Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to **0**. Administrators can modify UI pages to determine which fields are reset or to change the default values.

Procedure

1. Navigate to **All > System UI > UI Pages**.
2. Open the `copy_partial_project` record.
3. Use the following script if in the **Processing script** field:

```
/* resetFields is the array containing the list of names of
   * fields that need to be erased from the copied project tasks
   * defaultFields is the array containing the key, value
   * pairs of field names and values that need to be set on the
   * copied tasks
   */var resetFields =new Array();var defaultFields ={};
resetFields.push("work_start", "work_end", "work_duration");
defaultFields["state"]="-5";
defaultFields["percent_complete"]="0";
```

Related topics

[Copy an existing task or project](#)

Create a task from a project task template

You can save a project task as a template and reuse it when creating a task.

Before you begin

Role required: `it_project_manager`

You must have a template from an existing project task that has the required field values. See [Templates](#)  for more information on this platform feature.

Procedure

1. Navigate to **All > Project > Tasks > All**.
2. Select **New**.

3. If the templates do not appear at the bottom, select the ellipsis () icon at the top of the form, and select **Toggle Template Bar**.
4. Select the template link in the template bar at the bottom of the form.

The template is applied to the project.

View default project and project task state categories

View category information for the default project and project task states. In the base system, the states in project and project task inherit the states in Task table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Dictionary**.
2. Update the filter with the following AND conditions:
 - a. **[Table] [is] [task]**
 - b. **[Column name] [is] [state]**
3. Run the filter.
4. Select the task table, and then choose **planned_task** table in **Dictionary Overrides** related list.

Result

The **Attributes** field displays different states and the categories for a state as shown below. It also displays the default state value for each category.

```
close_states=3;4;7,default_close_state=3,default_work_state=2,default_open_s
```

[Project and project task states](#)

Customize a state for project or project task

Add or modify a state of project or project task using dictionary override.

Before you begin

Role required: admin

About this task

As an example, the steps for adding custom states for **Work in progress** state category for Project task are described. In this example,

- the existing **Work in Progress** state is removed and following three new states are added:

State	Label	Category
10	Design	Work in Progress
11	Development	Work in Progress

State	Label	Category
12	Testing	Work in Progress

- the default **Work in Progress** is kept as 10 (Design).

Procedure

1. **Define**  a new dictionary override for `pm_project_task` table under `Task - State` dictionary.
2. Specify the override attributes for the dictionary override in **Attributes** field as follows:
`close_states=3;4;7, default_close_state=3, default_work_state=10, default_open`

Result

- As specified in Step 2, the `default_work_state` is declared as 10 and the `work_in_progress_states` as 10, 11, and 12. Now whenever a project task changes to any of the new **Work in Progress** states, its parent also moves to corresponding **Work in progress** state.

Suppose that a project task has two children records, and if the first child record moves to **Development** state, the parent also moves to **Development** state. Now if the second child record moves to **Design** state, the two children records under the project task are in two different work in progress states. In such cases, the parent record moves to the default work in progress state. In this case, the parent record moves to **Design** as the `default_work_state` is specified as 10 (Design).

- The project states can also be customized using the same steps.

Link change requests to a project task

Link change requests to tasks on the Project Task form. You can link change requests only to project tasks that have no child tasks.

Before you begin

Role required: `it_project_manager`

About this task

You can link any change request record to a project task, regardless of the change request schedule or state. However, as a good practice, consider:

- **Change Schedule:** The change request has a schedule that falls within the time frame of the project it links to. Or, it has no values in the **Planned start date** and **Planned end date** fields in the **Schedule** section of the Change Request form.
- **Change State:** An **Open** or **Pending** state is required when linking a change request. Changes that are already in progress or closed can be stopped and copied to a new change request.

Procedure

1. Open a project task that does not have any child tasks.
You cannot link change request to the tasks that already have child tasks.
2. Select one of the following related links:

- **Link an Existing Change Request to Project Task:**

In the dialog box that appears, enter or select the change that you want to link.

- **Create Change and link from Project Task:**

The Change Request form appears. Enter the information in the form. The short description of the change request is taken from the project task.

Note:

These related links are available only when the project task type is waterfall.

Result

On the Project Task form, a notification appears at the top specifying that the task is linked to one or more change requests.

Accept or reject project task notifications

Approve or reject the changes in a notification for an external soft dependency.

Before you begin

Role required: it_project_manager

About this task

The **Notifications** related list on the project record lists the [external dependency](#) related notifications raised in the successor project. The [notifications](#) are triggered as a result of changes made in the predecessor project that can impact successor project or task.

- The notifications for the hard dependency have the **State** set to Processed by default.
- The notifications for the soft dependency have the **State** set to New by default. As the project manager of the successor project, you can choose to accept or reject the changes in the notification.

Procedure

1. Open the project form.
2. Select the **Notifications** related list.
3. Select the reference icon  to open the project task notification record for an external soft dependency.
4. Select **Approve** or **Reject**.

Result

- The **Status** of the notification record changes to Accept or Reject.
- The **State** of the notification record changes to Processed.

Use a project task checklist

You can create a checklist in a project task to track items that must be completed in the task.

Before you begin

Role required: it_project_user, it_project_manager

Procedure

1. Navigate to a project task.
2. To create a checklist for the project task, select **Create new** in the **Checklist** section and specify a name for the checklist.
3. To remove a checklist from the project task, select the down arrow next to **Checklist** and select **Remove Checklist**.
4. **Note:**
This option appears when there is at least one checklist in the **Checklist** section.

To save a checklist as a template, select the down arrow next to **Checklist** and select **Save as Template**.

Related topics

[Project task checklists](#)

[Save a checklist as a template](#)

Save a checklist as a template

After you create a checklist on a project task, you can save it as a template and reuse it on other tasks.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to a project task.
2. Select the down arrow next to **Checklist**.
3. Select **Save as Template**.
4. Enter a name for the checklist.
5. Select **Save**.

Create a parent-child relationship on the Project Task form

Create a child task from any project task form.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to the parent task in the relationship.
2. In the **Project Tasks** related list, select **New**.
3. Create the task and select **Submit**.
The newly created task becomes the child task in the relationship.

What to do next

To help remember what the parent of any task is, view the breadcrumb at the top of the Project Task form. It is also helpful to configure the form layout to include the **Parent** field. You can also change the parent task from this field.

Create a monetary benefit plan for a project

Create a monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods. Project benefit plans capture the potential benefits accrued by the project when the project is executed.

Before you begin

Role required: it_project_manager

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Open the required project.
3. In the **Monetary Benefit Plans** related list, select **New**.

Note:

To create a monetary benefit plan from the **Financials** tab in Project Workspace, select **Manage**.

4. On the form, fill in the fields.

For field information, see [Benefit Plan form](#).

Note:

When you move the project or the milestone date, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the project start date, end date, or one of the project milestones. The [project property Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change](#) controls the behavior for project date changes.

5. Select **Submit**.

What to do next

On the Benefit Plan form, view the benefit breakdown by fiscal period in the Monetary Benefit Plan Breakdowns related list.

Related topics

[Create a non-monetary benefit plan for a project](#)

Create a non-monetary benefit plan for a project

Create a non-monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods. Project benefit plans capture the potential non-financial benefits accrued by the project when the project is executed.

Before you begin

Role required: it_project_manager

About this task

The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: April and FY16: May. The Non-monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period for the project.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Open the required project.
3. Select the Non-monetary Benefit Plans related list.
4. To create a non-monetary benefit plan, select **New**.
5. On the form, fill in the fields.

For more information, see [Non-monetary benefit plans form](#).

Note:

When you move the project or the milestone date, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the project start date, end date, or one of the project milestones. The [project property Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change](#) controls the behavior for project date changes.

6. Select Submit.**What to do next**

- On the Benefit Plan form, view the benefit breakdown by fiscal period in the Non-monetary Benefit Plan Breakdowns related list.
- [Associate monetary and non-monetary benefit plans](#), so that you can capture the potential benefits (financial and non-financial) accrued by the project for the hybrid benefit plans.

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the project for the hybrid benefit plans.

Before you begin

Role required: it_project_manager

About this task

You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

Note:

When you delete a benefit plan, its relationship with the associated benefit plan (if any) is also removed.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Open the required project form.
3. Select the Monetary Benefit Plans or Non-monetary Benefit Plans related list.
4. Select the information icon () for a benefit plan that you want to associate.
5. Select **Open Record**.
6. Associate a monetary or non-monetary benefit plan.

7. Select **Save**.

Result

The selected benefit plan is associated with another plan.

What to do next

Select the **View Associated benefit plan** related link to view the associated benefit plan.

View actual project costs

When you are using Project Portfolio Management with Financials, you can view actual project costs on cost plans and projects.

Before you begin

Role required: it_project_manager

About this task

An expense line has to be processed to be considered for actual cost. The actual cost is recorded against the creation date of the expense line, not the processed date. The expense lines are created only for approved time cards.

Actual costs for projects also roll up to portfolios in the same way.

Procedure

1. Navigate to **Project > Projects > All**.
2. Open the project for which you want to view the actual costs.
3. Select the **Cost Plans** related list.

Related topics

[Actual project costs](#)

Recalculating costs of all resource plans in a project

Recalculate the resource costs of all resource plans in a project whenever the hourly rates change in the associated rate model so that the plan costs are up to date.

Before you begin

Ensure the following setup:

- The project must be active.
- The project must have an active rate model assigned.
- The resource plans must be in the Planned, Requested, Confirmed, or Allocated state.

Role required: project_manager

About this task

This option recalculates the costs of all resource plans of the project at once. You can also open a resource plan from the **Resource Plans** related list to [recalculate the resource costs of an individual resource plan](#).

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Open a project.
3. On the Project form, right-click on the header bar and select the **Recalculate Resource Costs** option.
4. In the Recalculate Resource Cost dialog box, fill in the fields.

Recalculate Resource Costs dialog box

Field	Description
Start date	Start date of the time period for which the costs are recalculated. By default, the field shows the current date.
End date	End date of the time period for which the costs are recalculated. By default, the field shows the end date of the project.
Planned costs for Requested Resource plans	Option for recalculating the planned cost of Requested resource plans.
Confirmed/Allocated costs for Confirmed/Allocated resource plans	Option for recalculating the confirmed or allocated cost of Requested resource plans.
Planned costs for Confirmed/Allocated resource plans	Option for including the planned cost of a Confirmed or Allocated plan. The option is enabled if the Confirmed/Allocated costs for Confirmed/Allocated resource plans option is selected. By default, the option is not selected.

5. Select **OK**.

Result

- Recalculates the selected resource costs of all the applicable resource plans in the project based on the latest hourly rates. The hourly rates are derived from the rate model associated with the project.
- Updates the recalculated resource costs on the respective cost fields on the resource plan form and the Resource Plans related list.
- Reflects the revised values on the respective cost fields of the project.

Create an expense line

A project expense line is cost associated with a specific source, such as a user, fixed asset, or a CI. Expense lines are part of project cost plans.

Before you begin

Role required: it_project_manager

Application required: Project Portfolio Management with Financials

About this task

Only processed expense lines are considered for projects, project tasks, and demands. You can create multiple expense lines for a project or demand.

Procedure

1. Open the project form.
2. In the related lists, select **Cost Plans**.
3. Right-click on a cost plan.
4. Select **Create Expense Line**.
5. On the form, fill in the details.
For more information, see [Expense line form](#).
6. Select **Submit**.

Note:

- Imported processed expense lines are not rolled up to the Total actual cost field in Cost Plans.
- If you change the **Amount** of a Pending expense line and change the state to Processed, the latest value is captured in expense line and the same is rolled up to Total actual costs in Cost Plans.

Result

Once the expense line is processed, the actual amount incurred becomes part of the cost plan. The actual amount spent is recorded against the project cost plan under the appropriate expense type: **Capex** or **Opex**. Not providing a cost plan reference when creating an expense line, the actual cost is recorded at the project level in the cost plan related list.

If you create an expense line without populating the **Cost Plan** field, a [system-generated cost plans](#) is created.

Create and manage waterfall projects

Plan, create, and manage projects using the Waterfall methodology.

The following tables, arranged by task group, list the tasks involved in creating a waterfall project.

Create a new project

Task	Steps
Create a new project	Navigate to All > Project > Projects > Create New .

Open an existing project

Task	Steps
Open a project in the project workbench	Select the Project Workbench related link on the Project form.

Add phases to a project from the project workbench

Task	Steps
Create a waterfall phase for a project	Select the Add phase icon () and select Waterfall from the Phase Type choice list.
Create a test phase for a project	Select the Add phase icon () and select Test from the Phase Type choice list.

Edit a project phase from the project workbench

Task	Steps
Edit a waterfall phase for a project	Select the Edit phase icon () on a project phase and make the required changes in the details of the project phase.
Edit a test phase for a project	Select the Edit phase icon () on the test phase and make the required changes in the details of the test phase.

Add milestones to a project from the project workbench

Task	Steps
Add milestones to a project	Select the Add phase icon () and then select Milestone at the top of the Add Phase pop-up window.

Set up manual testing

Task	Steps
Create a test plan	Navigate to All > Test Management > Test Execution > Test Plans > New.
Add test cases to a test plan	Select the Add Test Cases from Test Suite related link on the Test Plan form.
Create a test phase	Select the Add Phase button on the project workbench.
Add a test plan to a test phase	Select the Edit Phase icon () for the test phase and enter the name of the Test Plan .
Assign test cases to testers	Select a user in the Assigned to field on the Test Case form.
Notify testers to start testing	Select the Notify testers to start testing related link on the Test Plan form.
Monitor the testing progress	The Test Plans list, Test Plan form, and Test Case form all display results for test cases and individual tests.
Testing sign-off	Select the Sign-off Test Plan related link on Test Plan form.

[Create baseline of a project](#)

Update a project

Update the project and make adjustments in fields to handle scope, cost, and schedule. While a project is underway, keep actual values as current as possible. Continue to measure actual values, analyze the impact of any potential project risks.

Before you begin

Role required: it_project_manager

Procedure

1. Open a project in the **Work in Progress** state.

2. Keep the following fields up to date:

While the status of the project is **Work in Progress**, keep these fields up to date:

- **Priority:** the priority of the project, especially as it relates to other projects in the portfolio.
- **Net value:** the value of the project to the company expressed in expected revenue.
- **Risk cost:** the sum of all costs involved with potential project risks. Although this field is not related to cost management, you can use this field to estimate the costs of risks that arise during the project.
- **Configuration item:** the CI related to the project.
- **Schedule:** the type of work schedule.
- **Work notes:** a useful record of notes and comments related to the project.
- **Live feed:** a record of the collaboration between various project stakeholders.

For project tasks, keep these fields up to date:

- **State:** remember to change project task states to **Work in Progress** when the task should begin (for tasks that have a specified start date) and **Closed** when the task is finished. Task states do not change automatically except when the time constraint of the task is set to **Start ASAP** and the state of the predecessor task is changed to one of the closed states.
- **Assignment group:** the group of resources currently working on the task.
- **Assigned to:** the individual assigned to the task.
- **Time cards:** the amount of time resources work on a project, which roll up into **Actual effort**. If a labor rate is configured for a time card, changes to the time cards affect the **Actual cost** of the project.

3. Select **Update** to save the record.

Related topics

[Track project comments and collaborate with stakeholders](#)

Track project comments and collaborate with stakeholders

When a project is in progress, you can take advantage of two platform features that help project participants interact and collaborate: journal fields and live feed. Two useful journal fields are Comments and Work notes.

Before you begin

Role required: it_project_manager

Procedure

- To add journal fields to a project form:
 1. **Configure**  any project form to show **Comments** and **Work notes** .
- To add **live feed**  to a project form:
 1. Navigate to **All > System Definition > Dictionary**.
 2. Select the **pm_project** table name that has no corresponding **Column name**.
 3. In the **Attributes** field, enter `live_feed=true`.
 4. Select **Update**.
 5. Navigate to **All > System Definition > UI Actions**.
 6. Open the **Follow on Live Feed** list action.
 7. In the **Table** field, select the [pm_project] table.
 8. Right-click the header and select **Insert** to create a copy of the UI action for the [pm_project] table.
 9. Repeat the steps for the UI actions for the **Show Live Feed** form action.
- 10. Personalize the Project form and add **Activities (filtered)**, which is the activity formatter, to the desired location on the Project form.

Related topics

[Update a project](#)

Copy a project

Another option for creating a project is to copy an existing project with all its tasks and relationships. After you specify the start date for the copy, the system adjusts all task start and end dates automatically.

Before you begin

Role required: it_project_manager

Procedure

1. On the Project form, select additional actions icon () and select **Copy Project**.
2. On Copy the selected project modal, enter the **New Project Name**.
3. Select a **Start date** and select **OK**.
Copy partial project, which is available from the Project Task form, provides similar functionality. It copies all task or project relationships and children from the selected project and inserts them into the current project. In this case, a new project record is not created.

Result

Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to **0**.

By default only the short description, planned dates and duration fields are copied from source project to the target project. If additional columns must be copied, they should be declared in the **project property List of attributes that will be copied from the originating project task**.

Related topics

[Change default values of copied project](#)

Change default values of copied project

Reset or change the default values for copied fields in the new copied partial or complete project.

Before you begin

Role required: admin

About this task

Child tasks are defined with the same relationships, each lasting for the same duration as the original tasks. All project tasks are set to **Pending**. Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to 0. Administrators can override the Script Include CopyProjectFieldOverride to determine which fields are reset or to change the default values.

Procedure

1. Navigate to **All > System UI > Script Include**.
2. Open the CopyProjectFieldOverride record.
3. Add the method to override the method defined in the CopyProjectFieldOverrideSNC script for resetting or defaulting the values.

For example, to copy partial project:

```

    /* getResetFieldsForCopyPartialProject method returns the
    array containing the list of names of fields that need to be
    erased from the copied project tasks
        * getDefaultObjectForCopyPartialProject
    method returns the object containing the key, value pairs of
    field names and values that need to be set on the copied tasks
        */var CopyProjectFieldOverride =
    Class.create();
        CopyProjectFieldOverride.prototype =
    Object.extendObject(CopyProjectFieldOverrideSNC, {
        getResetFieldsForCopyPartialProject:
    function() {
        return ['work_start', 'work_end',
        'work_duration'];
        },
        getDefaultObjForCopyPartialProject:
    function() {
        return {'state': -5, 'percent_complete: 0'};
        },
        type: 'CopyProjectFieldOverride'
    });
  
```

To copy complete project:

```

/* getResetFieldsForCopyProject method returns the array
containing the list of names of fields that need to be erased
from the copied project tasks
    * getDefaultObjectForCopyProject method returns
the object containing the key, value pairs of field names and
values that need to be set on the copied tasks
    */var CopyProjectFieldOverride = Class.create();
    CopyProjectFieldOverride.prototype =
    Object.extendObject(CopyProjectFieldOverrideSNC, {
        getResetFieldsForCopyProject: function() {
  
```

```

        return
    ['work_start' , "work_end", "work_duration"];},
        getDefaultObjForCopyProject: function()
        {
            return {'state': -5, 'percent_complete:
0'};
        },
        type: 'CopyProjectFieldOverride'
    });

```

4. Select **Update**.

Related topics

[Copy a project](#)

Assign a project schedule

Without an assigned schedule, a project calculates a day as a full 24 work hours. To schedule tasks by a more realistic work day, assign a schedule to the project. If the schedules provided in the base system do not suit your needs, define a new one.

Before you begin

Role required: it_project_manager

Procedure

1. Open a project.
2. If the **Default** view is active, right-click the header bar and select **View > Advanced**.
3. Select a schedule in the **Schedule** field and select **Save**.

Create baseline of a project

Create a schedule baseline and financial baseline of a project. A schedule baseline captures planned dates of all tasks and milestones at a particular moment in time. A financial baseline captures benefit and financial metric information (snapshot of cost plan, benefit plan, and project-level financial metrics) at a particular moment in time.

Before you begin

Role required: it_project_manager

About this task

Schedule baseline

You can create as many schedule baselines as necessary and review the changes that have been made to the project since the previous baseline. If a project is not on schedule, you can create a schedule baseline to know how much schedule slippage has occurred. It also helps to view the real-time deviations between actual and planned values.

The baseline appears as a set of gray lines below the bars that represent the actual tasks on the Gantt chart. These baselines represent planned dates, while the task bars represent the actual dates. If the project tasks are shifted to the right of the baselines, the project is running behind schedule.

Financial baseline

You can create as many financial baselines as necessary and [compare them](#) to review the financial changes that have been made to the project since the previous baseline. Any financial baseline does not capture actual cost component of the project.

i Note:

Nested projects cannot have baselines. Baselines are allowed for the top-level projects only.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Select the required project.
3. To create schedule and financial baselines of a project, use any of the following options.

i Note:

In the Create Baseline pop-up, the **Create Schedule Baseline** and the **Create Financial Baseline** check boxes are selected by default. Clear a check box if you do not intend to create a specific baseline.

Compare financial baselines of a project

Compare baselines to review the variances in the financial data of a project and see what changed.

Before you begin

Role required: it_project_manager

About this task

You can [create](#) multiple baselines at various stages of a project, for example, at the end of each phase or after every calendar month or quarter. Each baseline captures the financial data of the project at a particular moment, providing a basis from which you can identify and review the changes made to the project. Having multiple baselines and comparing them helps you track the performance of your projects.

Procedure

1. To compare the financial baselines of a project, use one of the following options.
2. On the Financial Baseline form, select the baselines you want to compare from the two choice lists.
By default, the current and the most recent baselines are selected.
3. Select **Compare**.
The comparative data of the baselines display in the following two sections:

- The **Financial Baseline Summary** section displays four widgets: the first two widgets contain the financial data of the two baselines, the third widget contains their variance, and the fourth widget contains the actual costs to date of the project.
- The **Financial Baseline Details** section displays the cost plans and benefit plans of the two baselines in two different grids. Each plan type has two rows corresponding to each baseline data.

Note:

Select the baseline legend icon () to see the color code of rows representing each baseline.

4. Optional: Review additional fields or reorganize the comparative data on the form.

- To show or hide additional fields on the widgets in the **Financial Baseline Summary** section, select the configuration icon () and select the field names.

The selected field preferences are saved and are available when you reopen the Financial Baseline form. To reset to the default widget layout, select **Reset to defaults**.

- To view cost plan or benefit plan comparative data in yearly, quarterly, or monthly format, select the **Year** or **Quarter** or **Month** views respectively.
- To toggle viewing the **Financial Baseline Summary** section, select the **Collapse** icon () or **Expand** icon ()

Compare schedule baselines of a project

Compare baselines to review variance between tasks and identify which task has variance from the current planned end date and the baseline end date. The baseline variance column displays the amount of variance between the two date comparisons.

Before you begin

Role required: it_project_manager

About this task

[Create schedule baselines](#) at various stages of a project, for example, at the end of each phase or after every calendar month or quarter. Each baseline captures the schedule information of project tasks at a particular moment. This snapshot provides a basis for comparison and helps you to identify and review the changes made to the project. Having multiple baselines and comparing them helps you track the performance of your projects.

Procedure

- 1.** To compare the schedule baselines of a project, use one of the following options.
The Planning Console displays the selected schedule baseline.
- 2.** On the Planning Console, select different baselines to view schedule variance information of project tasks.
The following columns display the baseline information:
 - **Baseline start date:** The planned start date for the task.
 - **Baseline end date:** The planned end date for the task.
 - **Baseline variance:** The difference between the baseline end date and planned end date. The value of this field column if there are any changes made to the project tasks or project. If the planned end date for a task is prior to the baseline date, the variance is shown as

a negative value. For example, for a task with the planned end date of April 24 and the baseline created on April 17 means it is past due or late. The Baseline variance column in this case displays a value of -5 days.

Note:

Use the show or hide columns in gantt icon () to add these columns to the Planning Console.

[Create baseline of a project](#)

Create a milestone

A milestone is a project task with a duration of zero (0). Use milestones to mark key dates in your project, such as key decision points, approvals, and holidays. Milestones are treated like any other project task and you can create dependencies between tasks and milestones.

Before you begin

Role required: it_project_manager

About this task

Note:

Milestones cannot be shared between projects unless one project is nested under another project.

Procedure

1. Create a project task and give the **Duration** field a value of **0**.
2. Open the planning console Gantt chart and verify that it appears as a diamond.
You can also convert a task to milestone through [Planning console tasks](#).

Activate project task email notifications

The following email notifications for the Project Management application are available by default, but are inactive. You must activate them manually.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Notification > Email > Notifications**.
2. Activate the following notifications:

Email Notifications

Notification	Table	Field	Condition	Description
Project task assigned	pm_project_task	Assigned to	Inserted or updated	Sends an email notification when a task is assigned to a resource or the assigned resource is changed.
Project task started	pm_project_task	State	Changes to	Sends an email notification when the project task starts.

Notification	Table	Field	Condition	Description
			Work in Progress	
Project task commented	pm_project_task	Additional comments	Any changes occur	Sends an email notification when the comment field is updated.

Set up project notifications with the workflow tool

Use the workflow tool, for example, to set up a workflow that sends an email notification when the state of a project task becomes **Work in Progress**.

Before you begin

Role required: admin

Procedure

1. Create a workflow with the following attributes:

- **Name:** Notify assignee
- **Table:** Project task [pm_project_task]
- **If condition matches:** Run if no other workflows matched yet
- **Condition:** State is **Work in Progress** and **Assigned to** is not empty

Note:

Do not modify other attributes in this example.

2. Add a single Notification activity between the Start and End activities.

Drag the activity onto the connector line until it changes color. The attributes of the activity are similar to the following example:

- **Name:** Notify assignee
- **To:** \${assigned_to}
- **Subject:** Project task \${number} has been activated and is assigned to you
- **Message:**Project task \${number} has been activated and is assigned to you
 - Number: \${number}
 - Short description: \${short_description}
 - Planned start date: \${start_date}

- Planned end date: \${end_date}
- Planned duration: \${duration}

[Activate project task email notifications](#)

Change the planned start date of a project

Adjust the schedule of a project by changing the planned start date of a project and shifting it later or earlier than the current planned schedule.

Before you begin

Role required: it_project_manager

About this task

Changing the planned start date of a project to a new date also moves all its tasks and subprojects relative to the updated start date of the project. You can change the planned start date of a project when the following conditions are true:

- The **State** of the project is Pending or Open.
- To move the start date of a project in WIP state, set the **Enable move project for WIP projects** property (*com.snc.project.move_project.wip*) to true. The default value of this property is false.
- No project_funding records are selected for execution.
- The project actual dates are not populated.

i Note:

- The **Move project** option is available for a project only when it has a task or subproject.
- If an agile phase with sprints is associated to the project, then changing the planned start date of the project also clears the start and end dates of the sprints.

Procedure

1. Change the planned start date of a project using either of the following options.
2. In the dialog box, pick a date.
3. Select or clear the **Move all tasks regardless of constraint type** check box.

- Clearing the check box moves the tasks with Start ASAP constraint only to the new project date.
- Selecting the check box moves all the project tasks irrespective of their constraints to the new project date with the same offset except the task with Start ASAP constraint.

This check box is selected by default.

Note:

The tasks in WIP and Close states are not moved.

4. Select **OK**.

Result

- The planned start date of the project is updated to the new date.
- Program dates are updated relative to the project start date.
- If the **Move all tasks regardless of constraint type** check box is selected, all project tasks with Start on specific date and Start no earlier than constraints are moved to a new start date by the same offset as from the earlier project start date. The constraint date is also moved by the same offset.

For example, say a project is starting on November 10 with a Start On task starting on November 15, giving an offset of five days. If you move the project start date to November 20, then the task start date will be moved to November 25, maintaining the five-day offset from the project start date.

- All project tasks with Start ASAP constraint are moved to the new start date based on the **Constraint Date** field on the project form. The tasks must be in the Open or Pending state.
- If the **Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change** property is selected, all related entities like cost plan, resource plan, and benefit plans are moved relative to the project start date. For more information on how to set this property, see [Properties installed with Project Management](#).

[Pre-date a project task](#)

[Starting a project](#)

Pre-date a project task

Move the planned start date of a task prior to the planned start date of a project. Adding a pre-dated task allows you to accommodate tasks which need to start before the planned start date of a project.

Before you begin

You should have created or added project tasks to your project.

Role required: it_project_manager

About this task

Before pre-dating a project task, note the following conditions:

- The property `project.rollup_project_start_date` should be set to true.
- Pre-dating a task's planned start date also moves the project's planned start date.
- The start date of a child task cannot be moved prior to the parent task's start date. For example, if a parent task with Start no earlier than constraint starts on 20th and the child task starts on 30th, the start date of the child task can only be moved up to 20th.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Select the project from the list.
3. On the Project form, update the planned start date for a project task using either of the following options.
4. In the Move date dialog box, select **OK**.

Create a cost type definition

Create a cost type definition to associate a cost type, operating, or capital, to an account in the General Ledger from the Financial Management application. Create a cost type definition if you are using Project Portfolio Management with Financials.

Before you begin

Role required: `it_pps_admin`

Procedure

1. Navigate to **All > Project Administration > Settings > Cost Type Definitions**.
2. Select **New** and enter name.
3. Select an account from the General Ledger Account `[itfm_gl_accounts]` table.
4. Select **Capex** if a capital expense or **Opex** if an operating expense.
5. Select **Submit**.

Costing add-on in Project Management

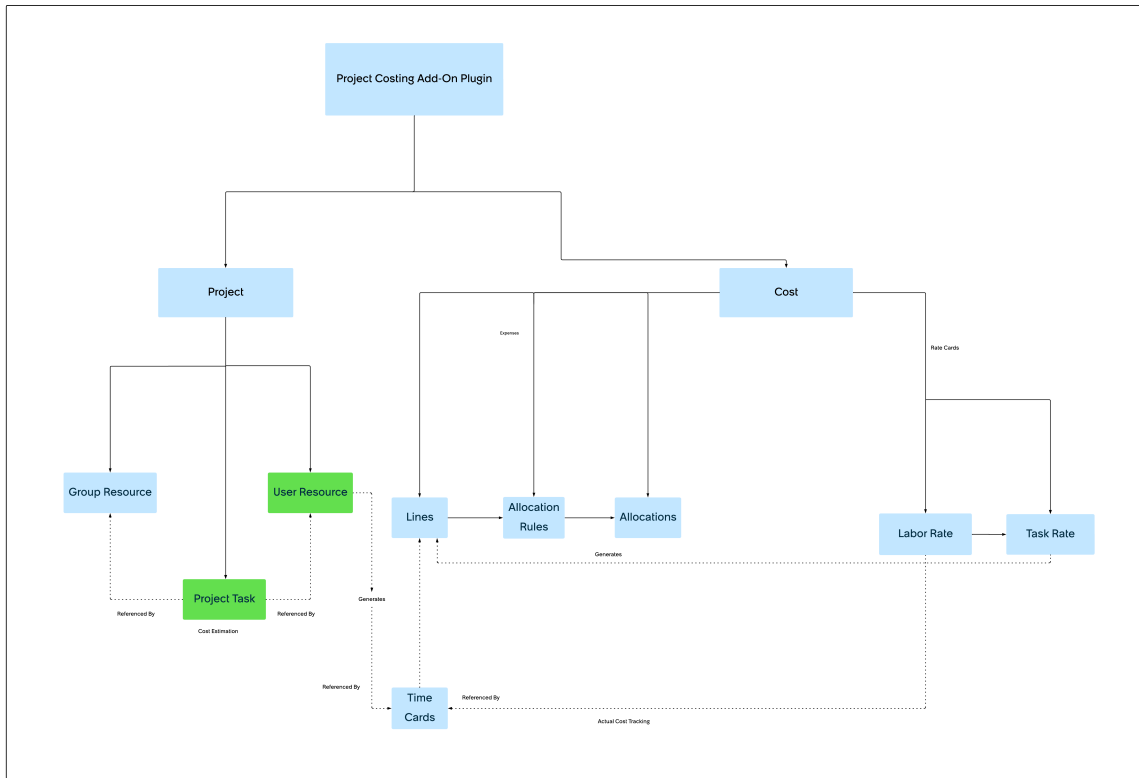

The Project Management costing add-on connects the Project Management application to the Cost Management application to allow for estimating and tracking the costs associated with projects.

This plugin enables the following project costing features:

- Estimate group resource costs during project planning.
- Tracking the actual cost of each user resource for a project.
- Track actual project task costs from time cards and other project expenses.
- Allocate project costs to the business.
- Represent project costs to the CIs that the project affects.
- Rollups of actual task expenses to parent tasks and the project record.

The Project and Cost applications work together as shown in the diagram:

Project and Cost applications

The following properties are available with this plugin:

Costing add-on properties

Description	Property Name	Notes
For planned tasks types, calculate the actual cost field using the total of expense lines for the task.	glide.cost_mgmt.calc_actual_cost	Default: true . This property is from Cost Management. When an expense line is created against any task of planned_tasktype and this property is true, the system gets a sum of the costs for all the expense lines and sets the total cost in the work_cost field.
When creating a task expense line should the system also create expense lines for the top task?	glide.cost_mgmt.process_task_top_task	Default: true
Enable project cost rollup (estimated and actual) - updating the cost of a project task	com.snc.project.rollup.cost	Default: true

Costing add-on properties (continued)

Description	Property Name	Notes
updates the cost of its parent.		

The following business rules are added or modified with this plugin:

Costing add-on business rules

Name	Table	Description
Project Cost Rollup	Planned task [planned_task]	Default: true . This property is from Cost Management. When an expense line is created against any task of planned_tasktype and this property is true, the system gets a sum of the costs for all the expense lines and sets the total cost in the work_cost field.
Process Top Task Parent	[fm_expense_line]	Default: true

Generate labor costs

Generate labor costs based on the planning attributes configured for financials in the planning attributes page for the resource assignments in a project.

Before you begin

- Review the planning attributes enabled for financials. For more information, see [Using the Planning attributes](#).
- Role required: it_project_manager

Procedure

1. Navigate to **All > Project > Projects > All** and select the required project.
Make sure that the resource assignments are finalized to generate cost plans. If there are no resource assignments for the project, migrate the resource plans to resource assignments. For more information, see [Migrate resource plans and cost plans for projects and demands](#).
2. Generate labor costs using one of the following options.
3. Refresh the browser page to view attribute-based labor costs in the Cost Plans related list.

Result

Attribute-based labor costs are created for the unique combination of attributes that are reflected as the name of the cost plans.

Related topics

Create a project status report

Create project status report from the related lists of the project form. The project status report created for the most recent status date updates the status of the project in portfolios.

Before you begin

Role required: it_project_manager

About this task

The project status report shows snapshot status of RIDAC (Risk, Issues, Decisions, Actions, and Request Changes) records, key milestones, and charts only.

To include RIDAC records in the status report, select the **Show on project status report** option on individual RIDAC forms.

You can also print a project status report from project workspace. To print a report, select the print icon () in the header of **Status Report** tab.

Procedure

1. Create a project status report.
2. On the status report form, fill in the details.
For more information, see [Status report form](#).
3. Select **Submit**.

Related topics

[View project status reports](#)

[Status report form](#)

View project status reports

Project status reports provide the most recent, at-a-glance progress of a project displayed in several categories.

Before you begin

Role required: it_project_manager

About this task

The project status report acts as a snapshot, meaning the report preserves the status of various parameters for the date and time when the status report is generated and does not display the status of various parameters dynamically. For example, the project status report created last week retains the same status as it was for that week and does not update the status dynamically. You can use the project status reports to compare the progress of your project. Generate a new project status report for your recent changes to reflect on the report.

The project status report shows snapshot status of RIDAC (Risk, Issues, Decisions, Actions, and Request Changes) records, key milestones, and charts only.

Procedure

1. Open a project status report.

2. Review project status in the following sections.

Project status report sections

Section	Description
Overview	<p>Provides a general overview about the project such as:</p> <ul style="list-style-type: none"> ○ Project Name: Name of the project. ○ Project Manager: Project manager assigned to the project. ○ Portfolio: Primary portfolio to which the project belongs. ○ State: Current state of the project. ○ Phase: Current phase of the project such as Initiating, Planning, and Executing. ○ % Complete: Percentage of the project completed. ○ Planned Start Date: Intended date the project begins. ○ Planned End Date: Intended date the project ends. ○ Planned Cost: Estimated cost of the project. ○ Actual Start Date: Date on which the project began. ○ Actual End Date: Actual end date of the project. ○ Actual Cost: Actual cost of the project. <p>This information is rolled up from the project form.</p> <p>If you had set your preference as project currency in the Status report currency field of the Project form, then the Overview tab displays the following project currency fields:</p> <ul style="list-style-type: none"> ○ Planned Cost in Project Currency: Estimated cost of the project in project currency. ○ Actual Cost in Project Currency: Cost of the project in project currency.

Section	Description
	<p>Note: The above fields appear when you enable the PPM Standard Multicurrency plugin (com.snc.ppm_multicurrency) and switch to the Project Currency view. For more information, see Multi-currency in project financials.</p>
Summary	<p>Provides information about the overall health of the project.</p> <ul style="list-style-type: none"> ○ Executive Summary: Brief summary and analysis of the project. ○ Last Week's Achievements: Progress of the project in the previous week. ○ Key Activities Planned: Next planned activities for the project.
Cost (Planned vs. Actual) chart	<p>If you have enabled the Project Currency view, then the Cost in Project Currency (Planned vs. Actual) section provides information about the actual cost versus the planned cost in project currency.</p> <p>This information is rolled up from the cost plan for the project.</p> <ul style="list-style-type: none"> ○ Planned: Approved cost for the project. ○ Actual: Actual cost for the project is derived from the expense line created for the project cost plan and from the time cards created for the project.
Resource (Allocated vs. Actual) chart	<p>Provides information about the actual resource hours used versus the allocated hours. This information is rolled up from the resource plan for the project.</p> <ul style="list-style-type: none"> ○ Allocated: Resource hours that have been allocated to execute the project. ○ Actual: The actual time spent is taken from the processed time cards created for the project.
Current Status	<p>Provides the status related to overall health, schedule, cost, resources, and scope of the project. This information is populated from the most recent status entered by the project manager for the project.</p> <ul style="list-style-type: none"> ○ Status: Color indicator to signify the status. ○ Comments: Comments for the status.
Status History	<p>Provides the trend of overall health, schedule, cost, resources, and scope of the project. The Status reports can have maximum 9 entries in the status history tab. This information is populated up from the last 9 status report created for the project.</p> <p>Date: Status date of the status reports. The color indicators signify the status of the project on these dates.</p>
Key Milestones	<p>Provides information about key milestones in the project. This information is populated from the project tasks identified as key milestones.</p> <ul style="list-style-type: none"> ○ Pending: List of key milestone tasks in the Pending, Open, and Work in Progress state. ○ Completed: List of key milestone tasks in the Closed state.
Risks	<p>Provides information about risks concerning the project. This information is rolled up from the risks that are part of the project.</p> <ul style="list-style-type: none"> ○ Pending: List of risks in the Pending state. ○ Completed: List of risks in the Achieved and Not Achieved state.

Section	Description
	<p>The following information from the Risk record is displayed:</p> <ul style="list-style-type: none"> ○ Short description ○ Probability ○ Risk status ○ State ○ Assigned to ○ Due date <p>For more information, see Add risks for a project.</p>
Issues	<p>Provides information about issues included in the project. This information is rolled up from the issues reported for the project.</p> <ul style="list-style-type: none"> ○ Pending: List of issues in the Open and Work in Progress state. ○ Completed: List of issues in the Closed state. <p>The following information from the Issue record is displayed:</p> <ul style="list-style-type: none"> ○ Short description ○ Priority ○ State ○ Assigned to ○ Due date <p>For more information, see Add issues for a project.</p>
Decisions	<p>Provides information about decisions included in the project. This information is rolled up from the decisions reported for the project.</p> <ul style="list-style-type: none"> ○ Pending: List of issues in the Open and Work in Progress state. ○ Completed: List of issues in the Closed state. <p>The following information from the Decision record is displayed:</p> <ul style="list-style-type: none"> ○ Short description ○ Priority ○ Decision status ○ State ○ Assigned to ○ Due date <p>For more information, see Add decisions for a project</p>
Actions	<p>Provides information about action items for the project. This information is rolled up from the actions reported for the project.</p> <ul style="list-style-type: none"> ○ Pending: List of actions in the Open and Work in Progress state. ○ Completed: List of actions in the Closed state. <p>The following information from the Action record is displayed:</p>

Section	Description
	<ul style="list-style-type: none"> ○ Short description ○ Priority ○ State ○ Approval ○ Assigned to ○ Due date <p>For more information, see Add actions for a project.</p>
Request Changes	<p>Provides information about a change request for the project. This information is rolled up from the change requests created for the project.</p> <ul style="list-style-type: none"> ○ Pending: List of project change requests in the Pending, Open, and Work in Progress state. ○ Completed: List of project change requests in the Closed state. <p>The following information from the Request Change record is displayed:</p> <ul style="list-style-type: none"> ○ Title ○ Priority ○ State ○ Category ○ Approval ○ Assigned to ○ Due date <p>For more information, see Create a request change.</p>

Allocate budget to a project

Set the budget of a project according to the fiscal years.

Before you begin

Role required: it_portfolio_manager

Procedure

1. Open the project form.
2. In the related links, select **Project Budget**.
The **Project Budget** dialog box opens.
3. Select the fiscal year for which you want to set the budget for the project.
4. Enter the amounts for **Capex Budget** and **Opex Budget**.
The **Total Budget** is updated with the sum of capex and opex amounts.
5. Select **OK**.

- If the project does not have any cost plan associated, then project budget is distributed by honoring planned start and end dates of the project.
- If the project has any cost plan associated, then project budget is distributed by honoring the cost plan fiscal periods.

Result

The project budget for the selected year appears in the **Project Budget** related list. You can click the amounts in the list to revise them.

Migrate budget of active projects to Next Experience

Migrate the project budget to Next Experience to manage the financials using Project Workspace.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Migrate baselines using one of the following options.

Note:

After migration, you won't be able to view the budget on Classic UI. You're encouraged to manage budget using the Financials in Next Experience.

Related topics

[Migrate financial baselines of projects to Next Experience](#)

Migrate financial baselines of projects to Next Experience

Migrate the financial baselines of your project to Next Experience to manage the financial using Project Workspace.

About this task

Next Experience uses new data model that has two new tables Investment Baselines (`sn_invst_pln_invst_investment_baseline`) and Investment Baseline Header (`sn_invst_pln_invst_investment_baseline_header`) which are used to capture financial baselines. The financial baselines created for demands in classic experience aren't visible in Next Experience. You can migrate the existing baselines from classic to Next Experience as an on-demand activity for the required projects, or as bulk by activating and running a scheduled job.

Baselines view in the Next Experience provides better insights to view and analyze the financial performance of your projects.

Unlike the financial baselines created using Next Experience, the financial baselines created in the Classic UI don't capture the actual expenses along with planned costs as a default behavior. To have relevant information for baselines comparison, the actual costs are captured as part of the baseline migration using the processed expense lines as of the baseline creation date of the financial baseline.

For detailed information and use cases on using financials in Next Experience, see [Managing financials for planning items in Portfolio Planning](#).

Note:

Starting March 2026 release, for customers using multicurrency, migration of financial baselines updates the baseline data in project currency to investment currency.

1. Existing projects that have only project baselines but no investment baselines. With the migration, project baseline will be migrated to investment baseline and you can view the migrated baseline from the `sn_invst_pln_invst_investment_baseline` table list view.
2. Existing projects that have both project and investment baselines, you need to run the scheduled job to populate the fields for investment currency in the baselines with the values from project currency. For more information, see [Activate scheduled job to populate to multicurrency fields](#).

Before you begin

The data in project currency fields will be migrated to investment currency fields on migrating baselines for customers using multicurrency.

Role required: `it_project_manager`

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Migrate baselines using one of the following options.

Tip:

After migration, you're encouraged to create financial baselines using the Financials in Next Experience.

Result

Financial baselines for the selected projects will be migrated to Next Experience and you can view them in the [Baseline view](#).

What to do next

[View and compare the migrated baselines](#) with any existing baselines or current baseline ().

Related topics

[Migrate budget of active projects to Next Experience](#)

Adding external dependencies for projects

As a project manager, you can use an external dependency to set up a dependency from a task in one project to a task in another project.

External dependencies help you to see the impact of changes in project schedules when a predecessor project changes.

How external dependencies work

To define the external dependency, select a project task from the predecessor project to be linked to the task in the successor project. When an external dependency is **added**, the system adds shadow tasks in both the successor and predecessor projects.

A shadow task is a read-only task in the respective project. It has the database attribute **shadow** set to true and **orig_sys_id** pointing to the **sys_id** of its original task. The shadow task is kept in sync with its original task whenever the relations are processed.

In addition to the shadow tasks, two shadow relations are also added in the `planned_task_rel_planned_task` table. These relations are shadows of the original relations.

For example, for two projects, project P1 is the predecessor project, and P2 is the successor project. Project P1 has a task T1, and project P2 has a task T2.

If an external dependency is created from T1 to T2, the following tasks are added in the two projects:

Project	Task
P1	Shadow of T2
P2	Shadow of T1

After adding the external dependency, the following shadow relation records are created in the `planned_task_rel_planned_task` table:

Parent	Child	Project	External
T1	T2		True
Shadow of T1	T2	P2	False
T1	Shadow of T2	P1	False

Where:

- **Parent** is the predecessor project.
- **Child** is the successor project.
- **Project** is the project where the relation is seen.
- **External** is the external dependency.

Adding RIDAC (Risks, Issues, Actions, Decisions, and Request Changes) records for a project

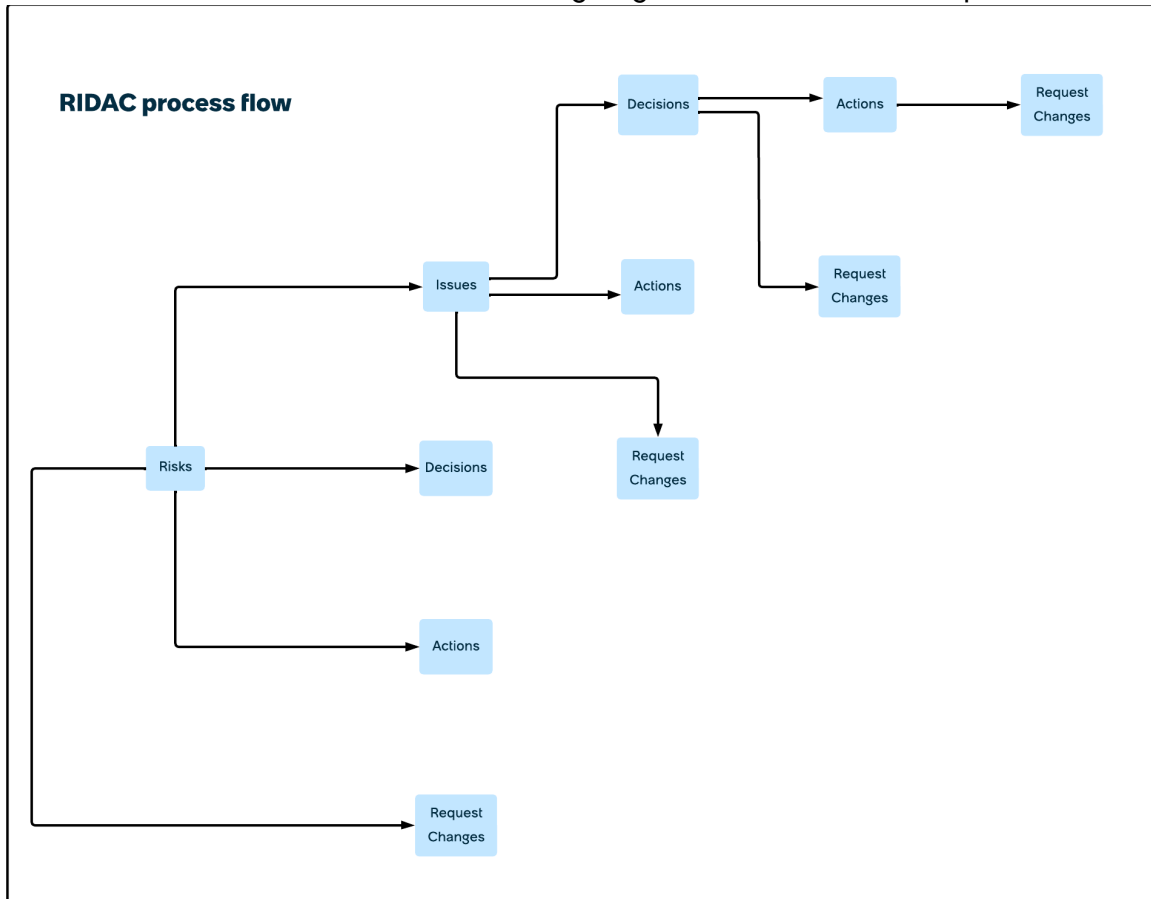

Create a risk record for your project that you can convert to other records during the project life cycle. Track issues and avoid copying relevant details in the related records.

As a project progresses through the project life cycle, a risk might result in an issue, or a new issue might occur. After you have a risk record, you can convert that record into related records such as issues, actions, or decisions. The conversion and association of records helps you analyze and identify patterns, trends, and probable resolution for planning future projects.

Plan and manage all RIDAC records on a single RIDAC page in Project Workspace. This page enables you to create, edit, convert, and associate RIDAC records on a central location. Navigate to the RIDAC page or Classic Project Workspace from Project Workspace interface.

Consider the following points before converting or associating RIDAC records in Project Workspace:

- You can convert one record to another only in the RIDAC sequence. For example, you can convert a risk to an issue, decision, action, or request change but you can't convert an issue to a risk or a decision to an issue. The following diagram illustrates the RIDAC process flow.

- You can convert one record into multiple RIDAC records. For example, you can create multiple issue records from one risk record.

For converting RIDAC records in Classic Project Workspace, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) record to another for a project](#). For converting RIDAC records in Project Workspace, see [Convert one RIDAC record to another for a project in Project Workspace](#).

- You can associate one record with multiple different records. For example, you can link one issue record to multiple different risk, decision, action, or request change records.

For associating RIDAC records in Classic Project Workspace, see [Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#). For associating RIDAC records in Project Workspace, see [Associate existing RIDAC records for a project in Project Workspace](#).

Related topics

[Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) record to another for a project](#)

[Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#)

Add risks for a project

Add a risk to a project to identify, analyze, prioritize, plan, and track a risk during any phase of the project life cycle. Assess potential problems and the severity of their impact to take informed decisions about the project.

Before you begin

Role required: it_project_manager

About this task

A risk is any uncertain event that can potentially impact the success or outcome of a project. For example, an incorrect estimate of factors like financial outlay or resource assignments can cause schedule slippage. Another example of a risk is a change in project requirements. Recording risks ensures that decision makers have all relevant information when assessing a project's progress. A project manager can add risks to a project and assess them. While adding risks, the project manager can add risks from an existing library of project risks that are applicable for their unique projects.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Select the project to which you want to add risks.
3. In the Risks related list, select **New**.
4. Alternatively, select **Create from Library** if you have the Advanced Risk plugin activated.
 - a. Select the risk statements as required.
 - b. Select **Create Risks**.
Only the risks statements that belong to the Project category are displayed for the user.
5. On the Risk form, fill in the fields.

For more information, see [Risk, issues, decisions, actions, and request change \(RIDAC\) form](#).

i Note:

The Risk Assessment Summary section only appears when the *Enable Advanced Risk PPM Integration* property is enabled.

6. Select **Submit**.

What to do next

- Assess the risks that have been added. For more information, see [Assign project risks to stakeholders for assessment](#) 
- Convert an existing risk to an issue, decision, action, or request change and close the risk. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) record to another for a project](#).
- Associate the risk with existing issues so you can track dependencies and recognize trends for the future. For more information, see [Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#).

Related topics

- [Adding RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#)

Convert one RIDAC (Risk, Issue, Decision, Action, and Request Changes) record to another for a project

Associate existing RIDAC (Risks, Issues, Actions, Decisions, and Request Changes) records for a project

Configure custom Risk rank and Risk value for a project

Configure custom risk rank and value scores (such as High-Medium, Medium-Low, or Absolute-Low) to rate the impact and probability factors for a risk.

Before you begin

Role required: pps_admin

About this task

Use the Risk Value Lookup module to set up the risk rank and risk value for a specific combination of risk impact and probability. The system uses these values to determine the degree of risk (Absolute, High, Medium, Low) based on the impact and probability factors of a risk.

The value in the **Probability** field is multiplied by the value of the **Impact** field to generate the values for the **Risk rank** and corresponding **Risk value** in the Risk form.

By default, you can use the following impact, value, and probability scores for a risk to create a risk rank and risk value score:

- Absolute
- Low
- Medium or Moderate
- High

For example, a risk might have high probability and medium impact but you might want to consider it as an overall low risk for the project. In that case, you would configure the Risk Value Matcher form with the following values:

- Impact = 2 Medium
- Risk Rank Color = Green
- Probability = High
- Probability Number = 1
- Risk Value = 3 Low

Procedure

1. Navigate to **All > Project Administration > Settings > Risk Value Lookup**.
2. Select **New**.
3. On the form, fill in the fields.
For more information, see [Risk value matcher form](#).
4. Select **Submit**.

Related topics

Add issues for a project

Add an issue to a project to escalate a risk or to track an unexpected problem such as a technical malfunction or resource unavailability that occurs during any phase of the project life cycle. If the issue remains unresolved, unnecessary conflicts, delays, or even a failure can occur.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Select the project to which you want to add an issue.
3. In the Issues related list, select **New**.
4. On the Issue form, fill in the fields.

For more information, see [Risk, issues, decisions, actions, and request change \(RIDAC\) form](#).

5. **Optional:** Search in the knowledge base for any article related to the issue.

- a. Select the search knowledge icon ().

- b. If you find relevant articles, select the title of an article to view its content.

- c. If you want to include the content of the article in the issue, select **Attach to Issue**. The article content is copied in to the **Description** field of the Issue form. You can modify the text if necessary.

6. Select **Submit**.

What to do next

- Convert an existing issue to decision, action, or request change and close the issue. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) record to another for a project](#).
- Associate the issue with your existing risks so you can track dependencies and recognize trends for future. For more information, see [Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#).

Related topics

Add decisions for a project

As a project manager, develop a plan to manage risks and issues proactively with solutions. Add the solution for a risk or issue to a project in the form of a decision. You can also convert a risk or an issue to a decision or a decision to an action or a request change.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Project > Projects > All**.
2. Select the project to which you want to add a decision.
3. In the Decisions related list, select **New**.
4. On the Decision form, fill in the fields.

For more information, see [Risk, issues, decisions, actions, and request change \(RIDAC\) form](#).

5. **Optional:** Search in the knowledge base for any article related to the decision.
 - a. Select the search knowledge icon ().
 - b. If you find relevant articles, select the title of an article to view its content.
 - c. If you want to include the content of the article in the issue, select **Attach to Decision**.
The article content is copied in to the **Description** field of the Decision form. You can modify the text if necessary.
6. Select **Submit**.

What to do next

- Convert a decision to an action or request change and close the decision. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) record to another for a project](#).
- Associate the decision with your existing issues and risks so you can track dependencies and recognize trends for future. For more information, see [Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#).

Related topics

[Adding RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#)

Add actions for a project

Add actions that are required for resolving an issue or risk for a project. You can also convert a risk, issue, or decision to an action based on your analysis and plan for resolution of a risk or issue.

Before you begin

Role required: it_project_manager

About this task

After analyzing the risks and issues and taking a decision on how to manage those risks and issues, add an action for resolving the risk or issue to a project.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Select the project to which you want to add an action.
3. From the Actions related list, select **New**.

4. On the Action form, fill in the fields.

For more information, see [Risk, issues, decisions, actions, and request change \(RIDAC\) form](#).

5. **Optional:** If the action requires approval from other stakeholders, request approval with a due date using the **Approval** and **Due date** fields.

6. Select **Submit**.

What to do next

- Convert an action to a request change and close the action. For more information, see [Convert one RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) record to another for a project](#).
- Associate the action with your existing risk, issue, and decision records so you can track dependencies and recognize trends for future. For more information, see [Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#).

Related topics

[Adding RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#)

Create a request change

As a project manager, you might create a request change as the outcome of the action taken to resolve an issue or mitigate a risk. The request change might result in changing the project's scope, resource requirement, cost, or schedule to minimize the impact of a risk or issue.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Project > Projects > All**.
2. Select the project to which you want to add a request change.
3. In the Request Changes related list and select **New**.
4. On the form, fill in the fields.

For more information, see [Risk, issues, decisions, actions, and request change \(RIDAC\) form](#).

5. Select **Submit**.

What to do next

- Associate the request change with your existing risk, issue, decision, and action records so you can track dependencies and recognize trends for future. For more information, see [Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#).
- Create tasks for working on the change request. For more information see, [Create a task from an incident, problem, or change request](#).

Related topics

[Adding RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#)

Convert one RIDAC (Risk, Issue, Decision, Action, and Request Changes) record to another for a project

Convert one RIDAC record (risk, issue, action, decision, and request changes) to another, in that order, to retain the record information instead of having to create a new record manually and to more easily track the issue.

Before you begin

Role required: it_project_manager

About this task

When you convert a RIDAC record to another record, the values for the **Short description**, **Requester**, and **Assigned to** fields are carried forward.

You can also specify to close the parent record on creation of the new record instead of manually closing the parent record.

You can also view the consolidated list of all converted RIDAC records using the **View RIDAC** related link on the Project form and **View RIDAC** in the application navigator of the Project module.

Procedure

1. Navigate to **Project > Projects > All**.
2. Select the project for which you want to convert a risk, issue, decision, action, or request change record to another RIDAC record.
3. From the Project form related list, select the risks, issues, decisions, actions, or request changes record to open the form view.
4. Select the **Convert to RIDAC** related link on the form.
5. **Optional:** On the Convert dialog box, from the Select task type list, select the RIDAC record to which you want to convert the selected record.
For example, if you wanted to convert a risk to an issue, you would select **Issue**.
6. **Optional:** Modify the text in the **Short description** field, which is copied from the parent record.
7. **Optional:** Change the default assignment copied from the parent record in the **Assigned to** field by selecting the lookup icon () and selecting a different user.
8. **Optional:** If you want to close the parent RIDAC record on creation of the new record, select the close parent record option.
The label of the close parent record option changes depending on the parent record type.
For example, if the parent record is Risk and you are converting it to an issue record, the close record option would appear as **Close Risk**.
9. Select **OK**.

[Associate existing RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#)

Associate existing RIDAC (Risks, Issues, Actions, Decisions, and Request Changes) records for a project

Link existing RIDAC records (risks, issues, actions, decisions, and request changes) to one another for your project. Associating RIDAC records with each other enables you to keep a

record of risks or issues and their outcome for analysis at project closure and planning. It also helps to track the risks and issues throughout the project life cycle.

Before you begin

Role required: it_project_manager

About this task

You can associate one record with multiple different records. For example, you can link one issue record to multiple risk, decision, action, or request change records.

Procedure

1. Navigate to **Project > Projects > All**.
2. Select the project for which you want to associate one RIDAC entry to another.
3. In the Project form related list, select the RIDAC record.
4. On the form, select the **Associate RIDAC** related link.
5. In the Associate dialog box, from the Select type list, select the RIDAC record to which you want to associate the selected record.
For example, if you wanted to associate a risk to an issue, you would select **Issue**.
6. Select the record number to which you want to associate the selected record from the Associate to list.
For example, if you wanted to associate the selected risk to issue (ISU0010003), you would select **ISU0010003**.
7. Select **OK**.

Applying templates to projects

A project template defines the basic structure of a project.

Project templates can include project tasks and subtasks, attachments, checklists, and other project information. Because projects often get repeated, templates enable you to create, save, and reuse project structure. You can also modify existing templates, create projects from templates, and apply templates to empty projects. A project is considered empty when it does not contain any subtasks.

With the project manager role, you can:

- Create project templates
- Use templates to create a project

With the PPS admin role, you can modify the project template configuration.

Create a project template

Create a template from an existing template or a project.

Before you begin

Role required: it_project_manager

About this task

When you create a template from a project, all the project attachments and checklists are copied to the template. You can add or remove attachments from the template using the Project Template form. A project template created from an off-schedule project honors the off-schedule tasks.

Procedure

1. Create a template.
2. Fill in the following fields:
 - **Template name:** enter a unique name for the new template.
 - **Description:** enter a brief description of the new template.
3. Select **OK**.
The project template form opens for the newly created template.
4. Make any desired changes to the fields on the project template form.
The top section of the Project Template form includes basic template information, such as the template name and description. The middle section of the project template form defines the specific data included in the template. The information in this section is built from fields on the project [pm_project] table that the user selects and the values for those fields that the user defines.
5. Select **Update**.

Related topics

[Applying templates to projects](#)

Add an attachment to a project template

Attach a file to a project template just as you can attach a file to a project or task.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All > Project > Projects > Templates**.
2. Open the desired template.
3. Select the **Attachments** tab to open the related list.
4. Select **New**.
5. Select **Browse** on the Attachments dialog box and select a file.
6. If desired, select **Add Another Attachment** to select another file.
7. Select **Attach**.
The selected file appears in the Attachments related list.

Apply a template on the Project form

While creating a project using the Project form, you can apply a project template to include project tasks and subtasks, attachments, checklists, and other project information. You can apply a project template to a new project or an existing project.

Before you begin

Role required: it_project_manager

About this task

A project created from the off-schedule project template honors the off-schedule tasks and adjusts the dates according to the given start date.

When applying a template to a project, the project state is set to the default state. Activate the default project state (pm_project.state = -5), and use it as the default value as it is Out Of The Box. You can update the label for the **State** field to meet your requirements if **Pending** doesn't fit well.

Procedure

- To apply a template on the blank project form:
 1. Navigate to **All > Project > Projects > Create New**.
 2. Select the link next to **To create project from a template**.
The **Apply Template** window appears.
 3. Enter the project name, select the start date, and select a project template.
- To apply a template to an existing project without any project tasks or subprojects:
 1. Navigate to **All > Project > Projects > All** and select a project.
 2. Select the **To apply template click here** link.
The **Apply Template** window appears.
 3. Select the start date and select a project template.

Apply template to an existing project

Apply one or multiple project templates to an existing project from the project form or Planning Console.

Before you begin

Role required: it_project_manager

About this task

A project created from the off-schedule project template honors the off-schedule tasks and adjusts the dates according to the given start date.

When applying a template to a project, the project state is set to the default state. Activate the default project state (pm_project.state = -5), and use it as the default value as it is Out Of The Box. You can update the label for the **State** field to meet your requirements if **Pending** doesn't fit well.

Important:

Application of template on a project having project tasks does not apply header information and only appends project tasks after the last project task of the project.

Procedure

1. Apply project template to an existing project from any of the following locations.
2. In the Apply template dialog box, from the Project template list, select a project template.
3. Select **Save**.

- 4. Optional:** To apply multiple project templates, repeat the steps 1 to 3. Tasks from the template are added at the end of the last task.

Apply template to a blank project in project workspace

When you create a new project in the project workspace, you can apply a template.

Before you begin

Role required: it_project_manager

About this task

A project created from the off-schedule project template honors the off-schedule tasks and adjusts the dates according to the given start date.

When applying a template to a project, the project state is set to the default state. Activate the default project state (pm_project.state = -5), and use it as the default value as it is Out Of The Box. You can update the label for the **State** field to meet your requirements if **Pending** doesn't fit well.

Procedure

1. Navigate to **All > Project > Projects > Project Workspace**.
2. In the project workspace header, select **New**.
3. Enter the project name, select the start date, and select a template in **Create Project** dialog box.
4. Select **OK**.

[Starting a project](#)

Project template configuration

The Project Template Configuration list defines the items that are included in a template.

Navigate to **All > Project Administration > Settings > Template Config** to display the Project Template Configuration list. Each item in this list has:

- A defined parent table. The exception is pm_project, which is the root or top-level object in the template.
- A link element. A field that links the parent table and the child table.
- A list of fields to include in the template. The fields defined in this column are the fields that are copied to a project template.

The Project Template Configuration list contains three default template configuration items: project, project task, and project subtask. You can modify these default items or create additional items from this list.

Default Project Template Configuration Items

Item	Definition	Parent	Link Element
pm_project	Project object	None. This object does not have a parent because it is the root level.	None. This object does not have a link element because it is at the root level.

Default Project Template Configuration Items (continued)

Item	Definition	Parent	Link Element
pm_project_task	Project task object	pm_project	Parent. Because this task object is one level below the root level, it uses the parent table as a link element.
pm_project_task	Project subtask object	pm_project_task	Parent. Because this subtask object is two levels below the root level, it uses the parent table as a link element.

Select an item in the Project Template Configuration list to open the project Template Configuration form. For more information, see [Project template configuration form](#).

Project Template Configuration form

The screenshot shows the 'Project Template Configuration' form. At the top, there is a navigation bar with a back arrow, a hamburger menu, the title 'Project Template Configuration Task', and icons for edit, settings, and a menu. On the right side of the bar are 'Update' and 'Delete' buttons. The form fields are:

- Table:** A dropdown menu with 'Project Task [pm_project_task]' selected.
- Parent Table:** A dropdown menu with 'Project [pm_project]' selected.
- Link element:** A dropdown menu with 'Parent' selected.
- Active:** A checked checkbox.
- Elements:** A text input field containing 'short_description,description,comments,assignment_group,assigned_to'.

 At the bottom left of the form are 'Update' and 'Delete' buttons.

Add a project template configuration item

Add a project template configuration item to include in a template.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All > Project Administration > Settings > Template Config**.
2. Select **New**.
3. Fill in the fields on the Project Template Configuration form. For more information, see [Project template configuration form](#).
4. Select **Submit**. For example, to add a requirement object to the project template configuration, fill in the fields as follows:
 - **Table:** Requirement [dmn_requirement]
 - **Parent table:** Project [pm_project]
 - **Link element:** Parent
 - **Active:** Enable this check box
 - **Elements:** short_description, description, priority, type, state

Related topics

[Applying templates to projects](#)

[Project template configuration](#)

Modify a project template configuration item

Modify a project template configuration item included in a template.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All > Project Administration > Settings > Template Config.**
2. Select a configuration item from the list.
3. Make any desired changes to the fields on the Project Template Configuration form.
4. Select **Update**.
To delete a project template, select a configuration item from the list and select **Delete**. Do not delete any of the default template configuration items: project, project task, or project subtask. Doing so affects the ability to create project templates.

[Add a project template configuration item](#)

Importing and exporting projects

You can manage projects using both Microsoft Project and the ServiceNow Project Management application.

Project Import

Users with it_project_manager role can import projects and project tasks from Microsoft Project into ServiceNow Project Management.

Create a project or update an existing project by importing the project data from Microsoft Project into your ServiceNow instance. For more information, see [Project import from Microsoft Project](#).

While importing a project into your ServiceNow instance, you can also specify the calculation method for calculating project dates. You can import the project tasks with different constraint types using Manual or Automatic calculation. For information about supported constraints and their conversion, see [Project import from Microsoft Project](#).

You can create custom fields in your ServiceNow instance and map these fields with your Microsoft Project while importing a project. For more information, see [Create custom field mapping for Microsoft Project file import](#).

You can import project tasks for multiple projects in one time using data files and transform maps. For more information, see [Import project tasks for multiple projects](#).

Some calendar elements are not imported from Microsoft Project into Project Management. For information about calendar elements and schedules, see [Calendars and schedules- Limitations](#).

Project Export

If you have the it_project_manager role, you can export project data. The project data, such as project tasks and task constraints, can be exported as an export file. Use this export file to import the projects into other ServiceNow instances.

If you are managing your projects using Microsoft Project, you can export your ServiceNow projects using the export functionality.

You can choose to export the project data in MPP, XML, or CSV file formats. For more information, see [Project export to Microsoft Project](#).

If your project in the ServiceNow instance contains dates with any of the supported constraint types, then these constraints are also exported when you export the project and project tasks. For more information, see [Project export to Microsoft Project](#).

Supported versions

Projects created in the following versions of Microsoft Project can be imported into the ServiceNow Project Management application.

- Microsoft Project 2003
- Microsoft Project 2007
- Microsoft Project 2010
- Microsoft Project 2013
- Microsoft Project 2016

Project field mapping

During an import, values from Microsoft Project overwrite fields in project records.

Project Field Mapping

Microsoft Project fields	Project Management fields
Task Name	Short description. The field is overwritten only while you import the first time.
Note	Description
Start	Planned start date
Finish	Planned end date
Duration	Planned duration
Actual Start	Actual start date
Actual Finish	Actual end date
Actual Duration	Actual duration
% Complete	Percent complete (personalize the form to add this field)
Predecessor Lag	Lag time between predecessor and successor
WBS	WBS
Critical	Critical path
Rollup	Rollup
Text10 (Field used for syncing purposes)	Task Sys_Id
Project Header Title	Project name
Project Header Subject (Field used for syncing purposes)	Top Task Sys_Id

Project Field Mapping (continued)

Microsoft Project fields	Project Management fields
Resource	Assigned to [assigned_to] Note: During import, if there are multiple resources assigned to a task in Microsoft Project: <ul style="list-style-type: none"> • The first resource is added to the Assigned to field. • The rest of the resources are added to the Additional assignee list field.
Resource Group	Assignment Group

Related topics

[Importing and exporting projects](#)

Create custom field mapping for Microsoft Project file import

Map custom fields from Microsoft Project to ServiceNow fields before importing a project.

Before you begin

Create custom fields in your ServiceNow instance before mapping them with Microsoft Project. For more information, see [Add and customize a field in a table](#).

Role required: it_pps_admin

About this task

Map the custom fields that you create in your ServiceNow instance with custom fields in the Microsoft Project file you plan to import.

The supported data types for field mapping between Microsoft Project and ServiceNow instances are:

- True/False
- Calendar
- Date/Time
- Choice
- Color
- Currency
- Decimal
- Due Date
- Floating Point Number
- Date
- Date/Time
- Duration
- List
- Time

- HTML
- Integer
- Long
- Percent Complete
- Phone Number (E164)
- Reference
- Name -Value Pairs
- String
- Translated HTML
- Translated Text
- URL
- Wiki

Procedure

1. Navigate to **All > Project Administration > Project - MSP Import Field Mappings**.
2. Select **New**.
3. From the Table list, select the table in which you created the custom field.
4. In the **Microsoft Project Column** field, enter the name of the custom field in your Microsoft Project file that you want to map.
5. In the Destination Column list, select the custom ServiceNow field that you want to map to the Microsoft Project field while importing a project.
6. Select **Submit**.

What to do next

- Import the Microsoft Project file. For more information, see [Import a Microsoft Project file with the Import module](#).
- Configure the Project form to add the custom fields that you want to see. For more information, see [Form configuration](#) .

Related topics

[Importing and exporting projects](#)

Project import from Microsoft Project

Import Microsoft project files into the ServiceNow Project Management application.

Users with the project manager role can import a project using:

- Import module
- Project form
- Planning Console

When you import a project as a new project or into an existing project, the projects are updated as follows:

- **New project:** A new record is created in the Project [pm_project] table. The tasks associated with the project are added to the Project Task [pm_project_task] table.

Only the common or [mapped fields](#) are imported. Imported projects are brought into the instance with both Priority and Risk set to Low.

- **Existing project:** The instance checks the Text10 field in the top-level Microsoft Project task. If the Text10 field contains a recognizable sys_id, it means that the project was previously exported from a ServiceNow instance. In this case, the values from the project overwrite the values for the existing project.

You can also specify the schedule calculation type as **Automatic** or **Manual** for the imported tasks. When you import a project into the instance, project constraints are converted as follows:

- The time constraint for all imported tasks, when you select calculation type as **Manual**, is set to **Start on specific date** irrespective of their constraint type in Microsoft Project.
- The following constraint types are supported when you select calculation type as **Automatic**:
 - **Start on specific date**
 - **As soon as possible**
 - **Start no later than**
 - **Start no earlier than**
 Tasks with other constraint types are converted to **Start on specific date**.

Note:

The resource name in Microsoft Project should map to the name of the user in the instance.

Related topics

[Importing and exporting projects](#)

Import a Microsoft Project file with the Import module

Use the Import module to import a Microsoft project file as a new project into the Project Management application.

Before you begin

Role required: it_project_manager

About this task

Before importing a Microsoft Project file into the ServiceNow instance, consider the following information.

- Microsoft Project project imported into a teamspace is only available to users who can access the teamspace.
- To import custom fields in your Microsoft project, create those custom fields in your ServiceNow instance first, and then create mapping between these fields before importing the project. For more information, see [Create custom field mapping for Microsoft Project file import](#).

Note:

You can also use the Scripted Extension Points for importing custom fields without creating and mapping the custom fields manually. Use the *MSPProjectImportTaskFormatter* Extension Point to create a script include and map custom fields in Microsoft Project and ServiceNow. You can also use this Extension Point to modify the data while importing a project.

- If the calculation type is set as **Manual**, recalculation does not happen on project tasks when they are imported from the Microsoft Project file. Once the project is in the ServiceNow system, it would be treated as a manual project.
- Importing a Microsoft Project project with inter-project dependencies, does not import the shadow tasks.
- Only the subprojects (header and parent task) get imported into the ServiceNow instance, the child tasks are not imported.
- While importing a Microsoft Project file into ServiceNow, the import fails:
 - If the project with tasks was created in ServiceNow instance before the import.
 - If you reimport a project that was imported from Microsoft Project file earlier and you create and add tasks in ServiceNow instance.

Note:

To retain the project tasks that were created in the ServiceNow instance, you must export that project first into the Microsoft Project file. Then, reimport the file back into ServiceNow instance.

- If the task being deleted due to import has any of the related entities: Cost plan, Benefit plan, Resource plan, Time card, or Expense lines.
- If the values for lag or lead time dependencies are not in the supported format.
 - Positive lag time dependency values for days, hours, and minutes are allowed. Negative lag time dependencies are allowed only for days.
 - All other elapsed duration types from Microsoft Project such as emin, eday, eweek, emon, eyr, or % are not allowed for import.

Procedure

1. Navigate to **All > Project > Projects > Import**.
2. Select **Choose File** to select a Microsoft Project (mpp) file.
3. To import the Microsoft project as a new project, select the **Create new project** option.
4. **Optional:** In the **Project name** field, specify a name for the new project.
5. To import the Microsoft project as a subset of an active, existing project:
 - a. Select **Update an existing project**.
 - b. Select the reference lookup icon () and select a project or task. Only active projects appear in the list.
6. Select one of the following options to specify the method for calculating schedule:
 - **Automatic:** Select this option to apply the scheduling engine while importing the project tasks. The supported constraint types are imported with same constraints applied to them while other constraint types are converted to **Start on specific date**.
 - **Manual:** Select this option to import all project tasks with **Start on specific date** constraint type irrespective of their constraint type in Microsoft Project. For more information about supported constraint types, see [Project import from Microsoft Project](#).
7. Select **Import**.

Result

- A project task that was imported in ServiceNow instance earlier and has associated time cards, resource plans, cost plan, benefit plan, or expense lines is retained on reimport even if it is deleted from Microsoft Project.
- Dates in the ServiceNow project remain same as the dates in the Microsoft Project file.
- In a ServiceNow project with subprojects, the following details change:
 - The WBS order of imported tasks is regenerated after import.
 - The **Planned Start Date** and **Planned End Date** of the parent project are rolled up.
 - The **State** of the parent project and tasks are rolled up.
 - The % Complete on the top task is rolled up.

Update a project using a Microsoft Project file

Import project data, from a Microsoft Project file, into an existing project in your ServiceNow instance using the Project form or Planning Console.

Before you begin

Create a [project](#).

Role required: it_project_manager

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Open the project which you want to update.
3. Import the Microsoft Project file to update the selected project from any of the following screens:
 - In the Project form, select **Import from MS Project** from the context menu.
 - In the Planning Console, select the more actions icon () and select the **Import from MS Project** option.
4. In the Microsoft Project Import dialog box, select the Microsoft Project file and calculation type:
 - a. Select **Choose File** to select a Microsoft Project (mpp) file.
 - b. Select one of the following options to specify the method for calculating the schedule:
 - **Automatic:** Select this option to apply the scheduling engine while importing the project tasks. The supported constraint types are imported with the same constraints applied to them while other constraint types are converted to **Start on specific date**.
 - **Manual:** Select this option to import all project tasks with the **Start on specific date** constraint type irrespective of their constraint type in Microsoft Project.

For more information about the supported constraint types, see [Project import from Microsoft Project](#).

5. Select **Import**.

Result

- A project task that was imported in the ServiceNow instance earlier and has associated time cards, resource plans, cost plan, benefit plan, or expense lines is retained on reimport even if it is deleted from Microsoft Project.
- Dates in the ServiceNow project remain same as the dates in the Microsoft Project file.
- In a ServiceNow project with subprojects, the following details change:
 - The WBS order of imported tasks is regenerated after import.
 - The **Planned Start Date** and **Planned End Date** of the parent project are rolled up.
 - The **State** of the parent project and tasks are rolled up.
 - The **% Complete** on the top task is rolled up.

Import project tasks for multiple projects

Import project tasks for multiple projects from an external file system or data source using import sets and transform maps.

Before you begin

Role required: import_transformer, import_admin, or admin

Procedure

1. Navigate to **All > System Import Sets > Load Data**.
2. Select the **Existing table** option.
3. From the Import set table list, select the **Import planned task [imp_planned_task]** option.
4. In the **Source of the import** field, select File, and then select **Choose File** to select the source Excel spreadsheet.
5. **Optional:** If required, specify the Work sheet and Header row number.
6. Select **Submit**
The imported data is available in the selected Import Set table.
7. **Optional:** Create field mappings for custom columns.
For more information, see [Create field mappings](#) .
8. Transform the data from the import set table to the target table.
For more information, see [Run an import](#) .

Project export to Microsoft Project

If you are using Microsoft Project to manage project activities, you can export a project to Microsoft Project (mpp) file, an XML file, or a CSV file.

Users with the project manager role can export a project using:

- Export module
- Project form
- Planning Console

You can also specify the format in which you want to export project data, the available options are:

- **XML:** Suitable, if you want to import the project data into other ServiceNow instance.
- **CSV:** Suitable for exporting project data from Planning Console as is and viewing project data using other applications.
- **Microsoft Project:** Suitable, if you want to import the project data into Microsoft Project.

Note:

The option for exporting project data in CSV and Microsoft Project format is available when exporting a project from Planning Console.

If tasks in your project contain any of the supported constraints, then the constraints are also exported when you export the project. This export of constraints helps you in maintaining project dates when you import the project to another ServiceNow instance. The following constraints are supported:

- **Start on specific date:** Mapped with Must start on constraint when exported to Microsoft project.
- **As soon as possible**
- **Start no later than**
- **Start no earlier than**

Note:

Shadow tasks and external dependencies are not exported when you export the project data.

Related topics

[Importing and exporting projects](#)

Export project data

Export the project data using the Export module, Project form, or Planning Console. Save the export file to a folder on your system in the Microsoft Project (MPP), XML, or CSV format.

Before you begin

Role required: it_project_manager

About this task

Projects must use either the Project Management Schedule or the Default MS Project schedule before they can be exported.

The option for exporting the project data in MPP and CSV format is available when exporting a project from the Planning Console. Only the columns which are visible in the Planning Console are exported.

Procedure

1. Export the project data from any of the following options.
2. **Optional:** A dialog box might prompt you to save the export file.

Save the file as an XML file. If you are exporting the project from the Planning Console and selected the CSV option, you can save the file in CSV format.

Note:

Depending on your browser setting, the browser might automatically save the file to your Download folder.

What to do next

- Use the MPP file to import the project data into a Microsoft Project.
- Use the XML file to import the project data into other ServiceNow instances or Microsoft Project.
- Use the CSV file to view project data using other applications.

Related topics

[Importing and exporting projects](#)

Export project tasks

The task being exported must be associated with a project that uses either the Project Management Schedule or the Default MS Project schedule.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Project > Projects > All**.
2. Open the project.
3. Scroll to the **Project Tasks** related list and select a task number to open the Project Task form.
4. Right-click the form header and select **Export Task to MS Project** from the context menu.

The task is exported to a folder on your system.

5. Open Microsoft Project to import the exported project task files.
Refer to Microsoft product documentation for instructions.

Calendars and schedules- Limitations

Some calendar elements from Microsoft Project are not imported into the Project Management application.

- Project calendars
- User calendars
- Schedules

The imported project uses the default schedule of a Monday to Friday workday from 8 A.M. to 5 P.M. with an hour break for lunch, starting with the v3 application.

Manage status of your projects using Project Status application

The Project Status mobile app enables you to track the status of your projects, collaborate with stakeholders to resolve exceptions, and take timely actions regardless of your location.

You can use the Project Status features to do the following:

- View the latest status of your projects
- View the latest status report of your projects
- Review risks and decisions
- Collaborate with other stakeholders on a project
- Receive mobile notifications when the project status changes or other users add comments or notes

Activation information

The Project Status mobile application runs on the ServiceNow® mobile platform. To enable the Project Status app, activate the PPM Mobile plugin (com.sn_ppm_mobile) if you have the admin role.

Related topics

Activate Mobile Project Status

Activate the MobilenProject Status application from ServiceNow Store, earlier known as PPM Mobile (com.sn_ppm_mobile), if you have an admin role. Installing this application also activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

Mobile: Project Status activates the following related plugin if it is not already active.

Plugin for PPM Mobile

Plugin	Description
Project Portfolio Suite with Financials [com.snc.financial_planning_pmo]	Enables you to manage your demands, resources, portfolios and projects. It also helps you plan, track, and manage the cost and budget of projects and demands in a portfolio to strike a balance between investment and returns.

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#) .

View project details on the mobile app

You can view the status of a project and other project details such as financial data, status reports, risks, and decisions through the mobile app.

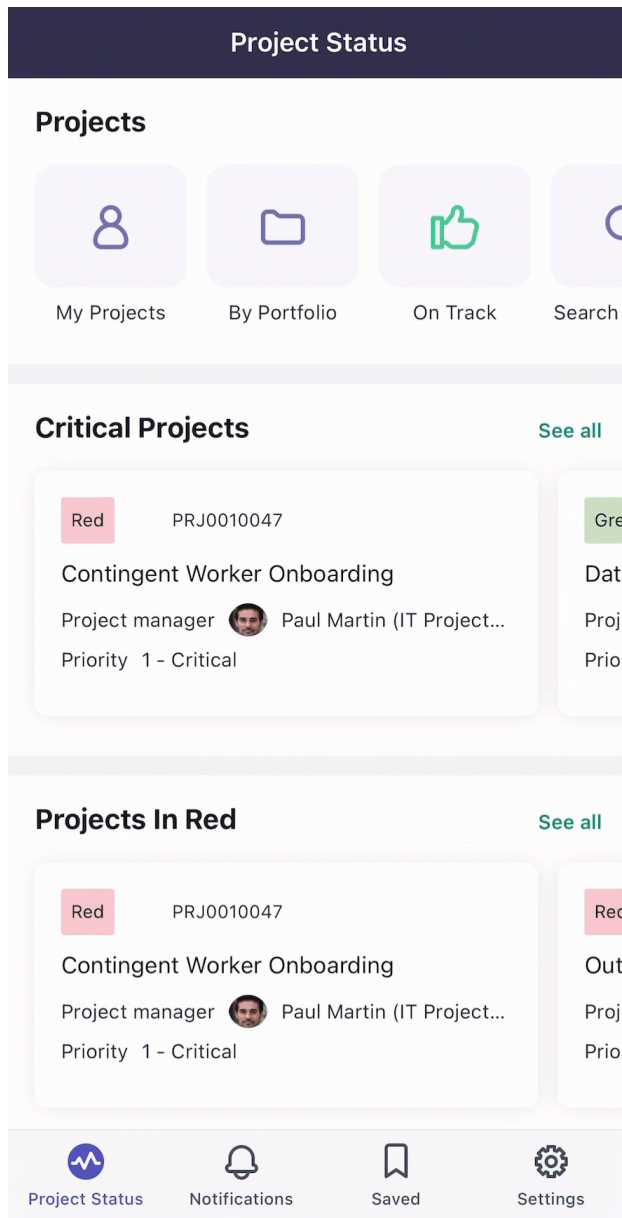

Before you begin

Role required: `portfolio_manager` or `project_manager` or `program_manager`

Procedure

1. Navigate to the Project Status application on your mobile app.
2. Open a project for which you want to view the details using one of the following options.

- Tap to open an applet and then tap on a project.
- Tap on the **Search Projects** applet to find a specific project.
- In the **Critical Projects** or the **Project in Red** lists, tap on a project.

Related topics

[Manage status of your projects using Project Status application](#)

View project status report

You can view the status of a project such as overall progress, executive summary, financial data, and RIDAC records through the mobile app.

Before you begin

Role required: portfolio_manager or project_manager or program_manager

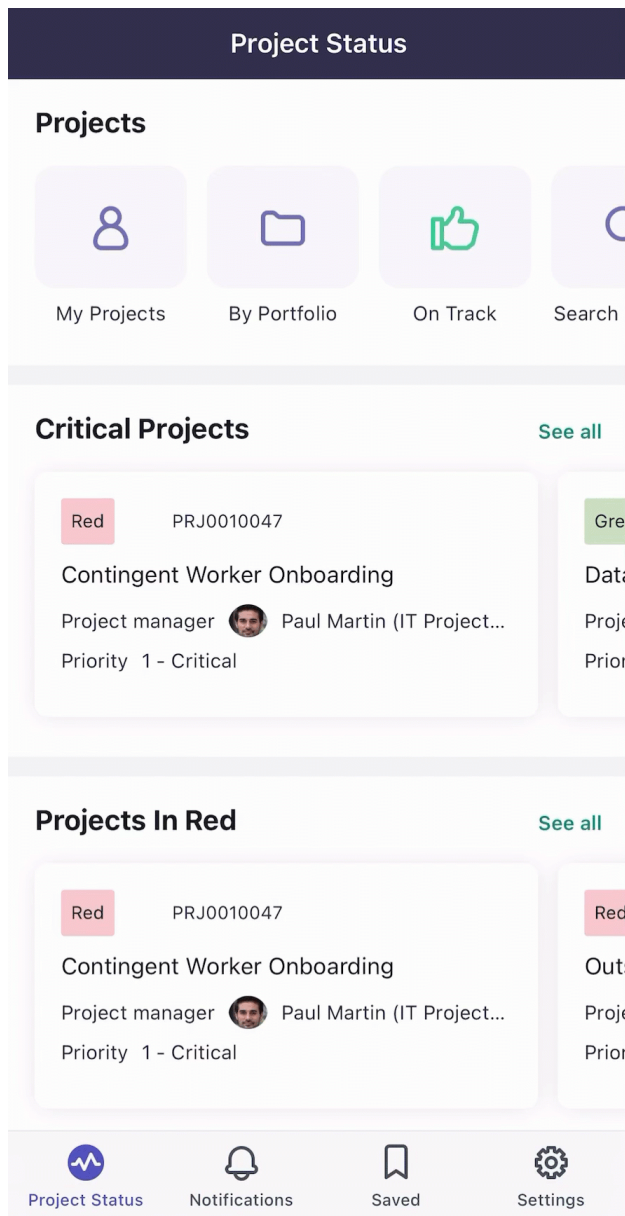

Procedure

1. Navigate to the Project Status application on your mobile app.
2. Open a project for which you want to view the project status report using one of the following options.

- Tap **My Projects** () applet to view your projects.
- Tap on the **Search Projects** () applet to find a specific project.
- In the **Critical Projects** or the **Project in Red** lists, tap on a project.

3. Tap the project card to view its status report.

- The **Status** tab displays the summary of project such as overall health of the project, executive summary, achievements, and key activities planned for the project.
- The **Details** tab displays status and details of information related to schedule, scope, cost, and resources for the project.

Create RIDAC (Risk, Issues, Decisions, Actions, and Request Changes) records

You can create Risk, Issues, Decisions, Actions, and Request Changes records for your project through the mobile app.

Before you begin

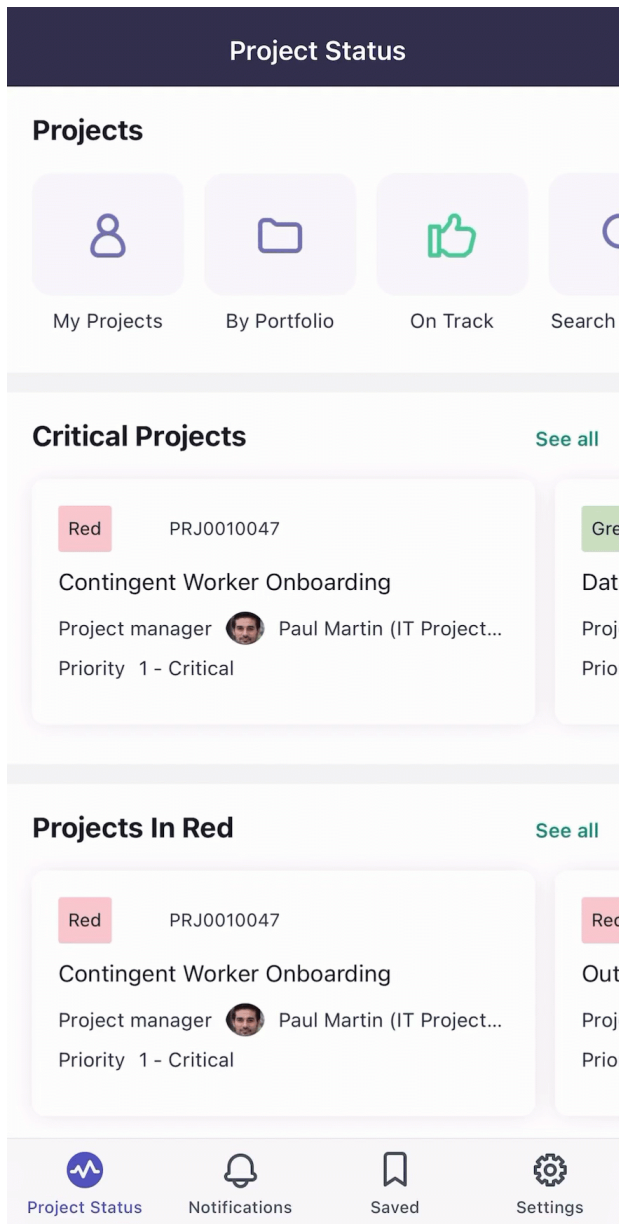

Role required: portfolio_manager or project_manager or project_user

About this task

Analyze the impact of the risks on the project and create RIDAC records to track risks, issues, and their probable resolution for planning future projects. For more information see, [Adding RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#).

Procedure

1. Navigate to the Project Status application on your mobile app.
2. Open a project for which you want to create a RIDAC record using one of the following options.
 - Tap to open an applet and then tap on a project.
 - Tap **My Projects** applet to view your projects.
 - Tap on the **Search Projects** applet to find a specific project.
 - In the **Critical Projects** or the **Project in Red** lists, tap on a project.
3. Create a RIDAC record using one of the following options.
 - Tap the more action icon () and select one of the options:
 - New Risk
 - New Issue
 - New Decision
 - New Action
 - New Request Changes

4. Based on the option that you selected, fill in the fields on the form.

5. Alternatively, open a RIDAC record and create a new RIDAC record.

- o a. Tap the **RIDAC** tab.
- o b. Tap the right arrow for a RIDAC record to view its details, tap the more action icon () and then tap **New Risk, New Issue, New Decision, New Action, or New Request Changes** option based on the selected record.
- o c. Fill in the fields on the form.

Collaborate with project stakeholders

Collaborate with the project manager and other stakeholders on a project to provide project updates, share documents, or send emails through the mobile app.

Before you begin

Role required: portfolio_manager or project_manager or project_user

Procedure

1. Navigate to the Project Status application on your mobile app.
2. Open a project for which you want to view the details using one of the following options:
 - Tap on the **Search Projects** applet to find a specific project.
 - In the **Critical Projects** or the **Project in Red** lists, tap on a project.
3. Collaborate with the project manager and other stakeholders on a project status report in any of the following ways:
 - Add activities to a project status report such as the ability to add work notes or comments, select and upload a picture, or attach photos and files.
 - a. Tap the **Activity** tab.
 - b. Tap the add activity icon () and select one of the options:
 - Add Work Notes
 - Add Additional Comments
 - Open Camera
 - Open Library
 - Attach File
 - Send an email to the project manager for additional details of the project.
 - a. Tap the **Details** tab.
 - b. Tap the send email icon ().
 - c. In the email application, compose the email, add addresses, and send.

By default, the **To** field is populated with the email ID of the project manager. You can add other stakeholders.

Result

When you add an activity or change the status in a project, the project manager receives a mobile notification. The project manager should have installed the Project Status app and enabled notifications to receive notifications on the mobile device.

Using the Planning attributes

Planning attributes are designed to define and work on attribute-based resource mapping in Resource Management and to generate labor costs for these resources in financials.

An attribute is a property or a characteristic defined as a resource or a task type, which is considered for attribute-based planning. These attributes can be used for resource management and financial planning.

After the planning attributes are identified, as an admin, you can [create or edit planning attributes](#) based on project requirements and metadata available from the resource table. Working on creating planning attributes involves identifying and defining the attributes to use for a project planning process.

Role-based advantages of using planning attributes

Role	Advantages
Resource Manager (Resource Management)	<ul style="list-style-type: none"> • Add any resources to a planning level. • Use the resource grid to plan any attribute or make the required detailed changes. • Allocate a heatmap to view and manage weekly or monthly allocation conflicts.
Project Manager (Project Financials)	<ul style="list-style-type: none"> • Attribute-based creation of labor costs based on the new Resource Management. • Automatically generate labor costs for the external resources. • View the labor costs by the expense type based on the tasks assigned to your resources. • View the financial forecasts for split up labor costs.

The following attributes are enabled by default for attribute-based resource mapping and to generate labor costs using financials.

Planning attributes

Attribute name	Resource Management	Financials
Employee Type	✓	✓
Expense Type	✗	✓
Group	✓	✗
Role	✓	✓
Skill	✓	✗

Related topics

[Create or edit planning attributes](#)

Create or edit planning attributes

Create or edit planning attributes to plan and forecast your resources and financials for a project.

Before you begin

Role required: pps_admin, sn_align_core.apw_admin

Procedure

1. Navigate to **All > Project Administration > Planning attributes**.
2. Use the following options to create or edit a planning attribute.
3. Enter field names for the lookup table values in **Planning attribute column configurations** table.
4. **Optional:** To add new configurations to the default column configuration list for any tables containing the financials or resource management attributes:
 - a. Select **New**.
 - b. Select a lookup table from the list.
 - c. Select a field name from the list and select **Submit**.
For example: If you want to create an attribute for the Location field, add the location-related columns to the selected lookup table.
The selected item is added to the column configuration list with an auto-generated field description.
5. Select **Update**.

i Important:

If you're creating an attribute for resource management, make sure that you add the Attribute field to the *resource_allocation*, *resource_plan*, and *sn_plng_att_core_resource_assignment* lookup tables. Similarly, if you're creating an attribute for financials, add the Attribute field to the *cost_plan* lookup table along with the resource management lookup tables.

[Using the Planning attributes](#)

Using Teamspaces in Project Management

A teamspace appears as an application in the instance application navigator. The teamspace includes module links that come from the Project Portfolio Management applications, such as the Project, Idea, Demand, Program and Portfolio applications.

Use teamspace to provide functional and data separation of these applications between different teams in your organization. The following is an example teamspace for a marketing team:

Example teamspace

Marketing TeamSpace

- ☆ Getting Started
- ▶ Ideas
- ▶ Demands
- ▶ Project
- ▶ Tasks
- ▶ Settings

Teamspace activation

You must activate a teamspace plugin to use the teamspace feature. Following teamspace plugins are available:

- **Project Management TeamSpace 1** (com.snc.ppm.teamspace_1)
- **Project Management TeamSpace 2** (com.snc.ppm.teamspace_2)
- **Project Management TeamSpace 3** (com.snc.ppm.teamspace_3)
- **Project Management TeamSpace 4** (com.snc.ppm.teamspace_4)
- **Project Management TeamSpace 5** (com.snc.ppm.teamspace_5)

The teamspaces loaded with these plugins contain the same components, but the components have different prefixes. For example, teamspace 1 includes a project table named **TeamSpace_1 Project [tsp1_project]** and teamspace 5 includes a project table named **TeamSpace_5 Project [tsp5_project]**.

You can enable any or all of these teamspaces and assign the teamspace specific roles to relevant users in the group that should use the teamspace. Maximum five teamspaces can be created through plugins.

Teamspace customization

You can customize the Project and Demand portions of a teamspace without affecting other teamspaces. This table summarizes what you can customize:

Teamspace customization

Customization to Project or Demand within a teamspace	Supported?
Data model changes, such as adding a field to the Project or Demand form.	Yes
Changes to business rules, UI actions, UI policies, security rules, data policies, and workflows.	Yes
Changes to shared roles, such as project_manager, demand_manager, and so on.	Yes
Form and list layouts, list controls, and related lists	Yes
Dictionary overrides	Yes

Related topics

[Activate teamspaces](#)

Activate teamspaces

You can activate one or all teamspace plugins to use the teamspaces feature.

Before you begin

Role required: admin

About this task

You must activate a teamspace plugin to use the teamspace feature. Following teamspace plugins are available:

- **Project Management TeamSpace 1** (com.snc.ppm_teamspace_1)
- **Project Management TeamSpace 2** (com.snc.ppm_teamspace_2)
- **Project Management TeamSpace 3** (com.snc.ppm_teamspace_3)
- **Project Management TeamSpace 4** (com.snc.ppm_teamspace_4)
- **Project Management TeamSpace 5** (com.snc.ppm_teamspace_5)

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>`.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#).

Installed with teamspaces

The tables and roles that are installed with project teamspaces are prefixed with an abbreviation based on the name of teamspace.

Tables

The tables are extended from the Project, Idea, and Demand base application tables.

Tables installed with teamspaces

Tables	Description
Idea [prefix_idea]	Stores ideas.
Demand [prefix_demand]	Stores demands.
Project [prefix_project]	Store projects.
Portfolio [prefix_portfolio]	Stores portfolios.
Project Task [prefix_project_task]	Stores project tasks.

Tables installed with teamspaces (continued)

Tables	Description
Portfolio Goal [prefix_portfolio_goal]	Stores portfolio goals.
Portfolio Issues [prefix_portfolio_issue]	Stores portfolio issues.
Portfolio Risk [prefix_portfolio_risk]	Stores portfolio risks.
Portfolio Project [prefix_portfolio_project]	Stores portfolio projects.
Project Template [prefix_project_template]	Stores project templates. Note: Project templates that are created in a teamspace area are not available in the main Project Management application any longer. They are only available to the teamspace in which they were created.
Project Template Task [prefix_project_template_task]	Stores project template tasks.
Stakeholder Register [prefix_stakeholder_register]	Stores the stakeholders.
Program [prefix_pm_program]	Stores programs.
Program Task [prefix_pm_program_task]	Stores program tasks.
Program Task [prefixpm_program_task project_status]	Stores program task project status.

Roles

Roles installed with teamspaces

Role	Description
prefix_demand_manager	Managers of the demand features for the teamspace.
prefix_demand_user	Users of the demand features for the teamspace.
prefix_project_manager	Managers of the project features for the teamspace.
prefix_project_portfolio_user	Users of the project portfolios for the teamspace.
prefix_project_user	Users of the project features for the teamspace.
prefix_program_manager	Managers of the program features for the teamspace.
prefix_portfolio_manager	Managers of the portfolio features for the teamspace.

The teamspace application uses the same views that are provided in the Project, Idea, and Demand base applications.

Note:

Default client scripts that these base applications use are inherited by the extended tables in the teamspace application. If you created custom client scripts for any of the base applications, select the **Inherited** options on each Client Script form before you create the teamspace.

Related topics

[Using Teamspaces in Project Management](#)

Configure teamspace settings

Configure teamspace settings after you activate a teamspace plugin.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All > Project Administration > Settings > TeamSpaces**.
2. Select a teamspace name.
3. Change the teamspace name if necessary.
Changing the name only changes the title that appears in the application menu. It does not modify the names of other components, such as table names or role names.
4. On the Tables, Roles, and Application Menu related lists, you can add or modify the tables, roles, and application modules for the teamspace.

Result

The teamspace becomes available in the menu. The records that are assigned to the teamspace, such as projects, portfolios, demands, are automatically added to the teamspace.

What to do next

Assign the teamspace roles to the users of that teamspace. Do not assign the general roles that come with the applications in the [Project Portfolio Suite](#).

Related topics

[Using Teamspaces in Project Management](#)

Project reporting

Get an at-a-glance view of projects with reports, the portfolio dashboard, and project views. You can see information such as projects with slipped milestones, graphs of resources by project, and projects listed by percentage complete.

Note:

Much of information available on reports, dashboards, and views is customizable. The examples below derive from default settings.

The application provides several global reports, both lists and charts, that show the status of projects at a glance. You can also create custom reports or create reports that can be viewed by certain groups. The following Project Management reports are available in the base system:

- Active Project Unassigned Tasks 30 Days: list report: list report
- Projects (by priority): bar chart
- Projects (by priority): list report
- Projects (by risk): list report

- Projects (by risk): bar chart
- Projects (by state): list report
- Projects (by state): bar chart
- Active projects: list report
- Pending projects: list report
- Active Projects by Manager: bar chart

[Reporting](#) 

Enable project currency view in project-related forms

Switch over to the project currency view to track the planned costs of a project in the selected project currency.

Before you begin

Role required: it_project_manager

About this task

To manage your projects in local currency and to create a project from a demand, the project currency fields are added in the following tables that have cost details and financials tab:

Tables with project currency fields

Table name	Description
Demand [dmn_demand] table	<p>To create a project from a demand in project currency. Specify the currency that you want to use to manage your project by navigating to the Financials tab of the Demand form and selecting a currency in the Project Currency field.</p> <p>Note: You can specify the project currency only when you switch to the Demand Currency view. For more information, see Multicurrency in Demand Management.</p> <p>To create a demand, see Create a demand.</p>
Project [pm_project] table	To navigate to the Project form, see #unique_1265 .
Cost Plans [cost_plan] table	To navigate to the Cost Plan form, see Create a project cost plan .
Cost Plan Breakdown [cost_plan_breakdown] table	To navigate to the Cost Plan Breakdown form, see Update a cost plan breakdown .
Benefit Plan [benefit_plan] table	If you open the project form in Project Currency view, then by default the project currency related fields appear in the Benefit Plans related list. To create a project benefit plan, see Create a project benefit plan .

Tables with project currency fields (continued)

Table name	Description
Benefit Plan Breakdowns [benefit_plan_breakdown] table	To update a benefit plan breakdown, see Update a benefit plan breakdown .
Expense Line [fm_expense_line] table	Expense lines are part of project cost plans and stores cost associated with a specific resource. To navigate to the Expense line form, see Create an expense line .
Project Funding [project_funding] table	Stores the project target and budget expense values for both capital and operating expenses for a single fiscal period.

Procedure

1. Navigate to the respective form.
2. Right-click the context menu of the form.
3. Click **View**.
4. Select **Project Currency** from the list.

What to do next

Refer to the form fields that are exclusive to the Project Currency view that you have selected. All the other form tabs and fields remain same both for the default view and the project currency view. Continue to enter values in the fields as you would for the default view.

Track project budget in project currency

Allocate budget to a project and enter amounts for capital expense budget (Capex) and operating expense (Opex) budget in project currency. The sum of the Capex and Opex budgets are calculated as total budget in project currency.

Before you begin

Role required: it_portfolio_manager

About this task

Allocate budget in a similar manner as you do with functional currency. For more information, see [Allocate budget to a project](#).

Enable the project currency view of the Project form to allocate budget in project.

Procedure

1. Click the Project Budget related link of the Project form.

Project Budget form

Field	Description
Currency	Currency in which budget is allocated for a project. If you activate multicurrency plugin, then you have the option to budget in project currency or functional currency.

Field	Description
Capex Budget in Project Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex Budget in Project Currency	Operating expense amount in the selected currency.
Total Budget in Project Currency	Sum of Capex and Opex amounts. The total project funding budget amount rolls up to the Budget cost in project currency field .

2. Click **OK**.

3. Click the Project Budget related list to update or view the record.

What to do next

The project target and budget expense values for both capital and operating expenses for a single fiscal period is stored in the [Project Funding \[project_funding\] table](#). When you update the project funding record, the amounts are converted to project currency.

Closing a project

Closing the project involves more than just changing the project state to closed.

Before you begin

Role required: it_project_manager

About this task

Post-project activities include viewing baselines and actual values to evaluate how much the project slipped from its original estimates. They also include following up on related incidents, problems, or changes that are linked to the project through the instance.

When you close a project, all project tasks and sub-projects associated with the project are closed automatically. Normally, you should not reopen a project after it is closed. Updating the project state from Closed to Work In Progress, Pending, or Open is not allowed. If you still need to reopen a closed project, reopen an existing project task or add a new task to the project. This action for a task moves the project from Closed to Work in Progress state without affecting the other closed tasks.

When a project is in the [closed state](#), the Project Management application calculates actual values like **Actual duration**. You can cancel the associated future resource plans and complete the allocated resource plans for a closed project.

Procedure

1. Verify that the work is completed for all tasks in the project.

2. On the Project form, change the **State** field to one of the closed states:

- **Closed Complete:** The project is finished and all tasks are complete.
- **Closed Incomplete:** The project is finished, but tasks remain unfinished.
- **Closed Skipped:** The project was abandoned.

Alternatively, close every project task first, starting with the lowest-level child tasks. The closed states roll up to parent tasks, and when all highest-level parent tasks are closed, the project state changes to closed. However, the default closed states for parent tasks and for the

project is **Closed Complete**. Therefore, even if you change any or all project tasks to **Closed Incomplete** or **Closed Skipped**, the project state is changed to **Closed Complete**.

Also, change the **Phase** value to **Closing**. The project phase is for reference only and is not linked to or dependent on the **State** field.

If your project contains sub-projects, you can close the sub-project without affecting the parent project. Change the **State** of the sub-project to any closed state to close the sub-project. Closing the sub-project closes or changes the state of all the tasks associated with the sub-project. Also, changing the state of the sub-project to Work in Progress, moves all the associated tasks to Work in Progress state.

If there are project tasks associated with the parent project that are not closed, the parent project remains in the Open, Work in Progress, or Pending state. If the tasks associated with the parent project are closed, the state of the parent project also changes to **Closed Complete**.

3. After the project is complete, create a final baseline to see how closely the project's actual values came to the estimated values.

i Note:

Baselines compare only planned start and end date values with actual start and end date values. Use reports to compare the effort and cost.

Result

For projects created from an incident, problem, or change, updating the project state does not automatically update the related incident, problem, or change request record. You must update the related record manually. For example, if the completion of a project also means that a related Change can be closed, go to the Change record and modify its **State** field. It is also a good idea to update the work notes field on the related record to include any relevant information about the project. If the project was successful and can be used as a template for future projects, make a copy of it. If the project was created from a change, incident, or problem record, there are several other activities to perform in ServiceNow.

What to do next

- **Cancel the resource plans** associated with the project in any of the following conditions:
 - There is a corresponding resource plan in the Confirmed, Planning, or Requested state.
 - There is a resource plan in the Allocated state with the start date later than the project end date.
- **Complete the resource plans** associated with the project in the following conditions:
 - There is a corresponding resource plan in the Allocated state.
 - The start date of the resource plan is on or before the actual end date of the project or task.

Project Diagnostics

Project Diagnostics enables you to detect corrupt data in a project such as task validity, dependencies, and relationships using diagnostic scans that execute diagnostic scripts. You can also fix corrupt data using fix scripts.

Data might become corrupt or invalid for various reasons, such as:

- Incorrect field mapping during project import
- Incorrect scheduling of tasks
- Incorrect dependency and relationship definitions

Project Diagnostics uses diagnostic scans and fix scripts to detect and fix corrupt data in your projects. It enables you to do the following action:

- [Create and add diagnostic features](#)
- [Add diagnostic and fix scripts](#) to fix corrupt or invalid project data
- [Create Diagnostic scans and map related scripts](#)
- Define fields for users to create specific filter conditions. The diagnostic scripts use the results of these filter conditions as input for detecting any corrupt or invalid data.

Project Diagnostics page provides the default scans described in the following table.

Project Diagnostics default scans

Diagnostic Scan Name	Description
Tasks with invalid top task	Lists the tasks that have an invalid top task. A task is considered to have an invalid top task if the value for the top task is set to Null or is mapped to a different task in the hierarchy.
Tasks with invalid top portfolio	Lists the tasks that have an invalid top portfolio. A task is considered to have an invalid top portfolio if it belongs to a different portfolio or is not associated with any portfolio.
Tasks with invalid top program	Lists the tasks that have an invalid top program. A task is considered to have an invalid top program if it belongs to a different program in the same portfolio or is not associated with any program.
Invalid relations	Lists the invalid relations in a project. A relation is considered to be invalid if the predecessor or successor is not a part of the project (unless it is an external relation), or if the predecessor or successor record does not exist in the system.
Validate parent tasks	Lists the tasks that have empty or invalid parents.
Check for tasks with cyclic dependencies	Checks for any cyclic relations, which are not permitted, in a project. For example, suppose you have a project in which Task A is related to Task B. A reverse relation from Task B to Task A would be considered a cyclic dependency.
Recalculate project	Recalculates task dates in a project. ⚠ Warning: Performing this action might change the dates in a project.
Check duplicate/redundant relationships	Lists tasks that have duplicate or redundant relations in the selected projects.
Cost plans with no start and end fiscal period	Checks and lists cost plans with no start and end fiscal period within the selected projects.
Validate project task constraints in project	Lists all tasks with invalid constraint types. For example, a task with Start no later than set as a parent or the Constraint date field is empty for a task with Start no earlier than and Start no later than constraint.

Project Diagnostics default scans (continued)

Diagnostic Scan Name	Description
Validate tasks with invalid state	Lists all tasks with invalid WIP or Closed state based on actual dates.
Identify projects with negative planned cost for any year where the budget was not allocated to the corresponding fiscal periods	Checks and lists the projects that have negative fiscal year project budgets.
Identify discrepancies in project budget	Checks and lists the projects for which project funding does not match with the sum of task type breakdown cost or fiscal year project budget.
Identify cost plan breakdowns with invalid fiscal periods	Checks and lists the cost plan breakdowns with invalid fiscal periods.
Identify duplicate task type breakdowns for an expense type and a fiscal period	Checks and lists the duplicate task type breakdowns.
Associate orphan expense lines to the system generated cost plan	Lists the expense lines that are not associated to any cost plan. When you run the fix script, these orphan expense lines are associated to a system-generated cost plan and then to the respective breakdowns of the system-generated cost plan.

Use Project Diagnostics to detect corrupt project data

Project Diagnostics uses the Application Diagnostics Tool to detect corrupt data in a project, such as tasks with invalid parents, tasks without top tasks, and invalid or cyclic relations in a project.

Before you begin

Role required: it_pps_admin

About this task

Project Diagnostics can also detect whether date calculations in a project appear to be incorrect, the planning console does not open for a project, or a few tasks or relationships do not appear in the planning console.

Procedure

1. Determine whether you want to run a diagnostic scan on a single project or multiple projects.
2. On the Application Diagnostics Tool page, select a diagnostic feature.
3. Use the Feature Inputs fields to specify filter conditions.
4. From the **Diagnostics** section, run a single diagnostic scan or multiple scans on the projects matching the filter criteria.
5. View the results of the scans.

What to do next

Add your own [diagnostic scans](#) and [fix scripts](#).

Create and add diagnostic features

Create and add diagnostic features, which consist of single or multiple diagnostic scans that execute mapped scripts to detect data corruption or invalid data.

Before you begin

Role required: adt_admin

Procedure

1. Navigate to **All > Application Diagnostics Tool > Features**.
2. Select **New**.
3. On the form, fill in the fields.
For more information, see [Diagnostics Feature form](#).
4. Define the fields available to users for specifying filter conditions in the **Diagnostics Inputs** section.

The fields that you configure in the **Diagnostics Inputs** section appear in the **Feature Inputs** section of the Application Diagnostics Tool page.

5. Select **Submit**.

What to do next

Create diagnostic scripts and add fix scripts to use with the diagnostic feature. For more information, see [Add diagnostic and fix scripts](#).

Add diagnostic and fix scripts

Add diagnostic scripts to scan the data in your application for any corruption. You can also attach fix scripts to rectify the corrupt or invalid data identified by the diagnostic script.

Before you begin

Role required: adt_admin

About this task

The results of the filter conditions that you specify in a [diagnostic feature](#) are used as an input for the diagnostic script while executing. You can also use the result of one script in subsequent scripts.

Procedure

1. Navigate to **All > Application Diagnostics Tool > Scripts**.
2. Select **New**.
3. On the form, fill in the fields.
For more information, see [Diagnostic Scripts form](#).
4. **Optional:** Include a script for fixing the corrupt or invalid data identified by the diagnostic script.

- a. Select the **Has Fix script** check box.
 - b. Select the Edit User Roles icon () and choose the roles that can access the diagnostic script.
 - c. In the **Fix script** section, add the code for the fix script.
5. Select **Submit**.

Related topics

[Project Diagnostics](#)

Create Diagnostic scans and map related scripts

Once you have created diagnostic features and scripts, map them to a diagnostic scan to check the health of data in your application. Use fix scripts to rectify any corrupt or invalid data that the diagnostic scan identifies.

Before you begin

In order to create a diagnostic scan, you must have already created diagnostic features and scripts. For more information, see [Create and add diagnostic features](#) and [Add diagnostic and fix scripts](#).

Role required: adt_admin

About this task

You can map multiple scripts with each diagnostic scan and define the order of their execution.

Procedure

1. Navigate to **All > Application Diagnostics Tool > Diagnostics**.
2. Select **New**.
3. On the form, fill in the fields.
For more information, see [Diagnostics form](#).
4. Select the Roles icon () and move the desired roles to the Selected list.
The users with the selected roles can access the diagnostic script.
5. Search for and select diagnostic scripts to map with the diagnostic scan in the **Diagnostics and Script Mappings** section.
6. Select **Submit**.

What to do next

- Create related link for navigating to the diagnostic features and scans in the application. For more information, see [Create a UI action](#) .
- Run diagnostic scan and view results. For an example of how the diagnostics scan work, see [Use Project Diagnostics to detect corrupt project data](#).

Using Work breakdown structure (WBS) - Legacy

The work breakdown structure (WBS) is a hierarchical representation of all the tasks in your project.

Important:

Work breakdown structure (WBS) is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new [Project Workspace](#) with enhanced UI to help you efficiently manage your projects.

Use the WBS to get a quick overview of the entire project, including the tasks and subtasks nested in the project. The Gantt chart gives you a similar overview using graphical elements like lines and bars to show dependencies and lengths of tasks. The WBS is more data-driven, presenting a wide variety of task information in expandable rows.

You can view the WBS on the planning console, or as a related list on the Project or Project Task form. See [Open the project planning console](#) or [Access the WBS as a related list](#).

When the WBS is viewed as a related list on the Project or Project task form, several important columns from the table appear by default.

Important columns

Column Name	Description
WBS	The number of the task in the WBS hierarchy. The first task in the hierarchy is assigned the number 1. Subtasks increment the number in the tenth place, such as 1.1 and 1.2. The numbers are read-only.
WBS Order	A number that represents the task in relation to its parent. The first subtask under a task has an WBS Order of 1, and the next task 2. If you edit a number, all tasks are moved accordingly after you refresh the list.
Number	The task ID number, which should not be changed.

Other useful information also appears by default, such as the description and percentage complete. You can personalize the list like any other list by selecting the personalize list icon (⚙️) and selecting the columns you want to view.

Related topics

[Access the WBS as a related list](#)

Access the WBS as a related list

You can view the WBS as a related list on both the Project and Project Task forms.

Before you begin

Role required: it_project_manager

About this task

You can view the full WBS list by navigating to a Project form and selecting the **Planning Console** related link. See [Planning console tasks](#) for a list of the things you can do with the WBS on the planning console.

You can also view the WBS as a related list on the Project or Project Task form.

Procedure

1. Navigate to a Project or Project Task form.
2. Right-click the header and select **View > WBS**.

WBS List appears as a related list.

3. On the WBS, select the arrow icon (▶) to expand a task and view child tasks.

Demo Project WBS

WBS	WBS Order	Number	Short description	State	Planned start date	Planned end date	Planned duration	Percent complete
1		PRJTASK0000001	Phase 1	Work in Progress	2013-08-26 13:00:00	2013-09-08 03:53:14	3 Days 12 Hours 2 Minutes	16.01%
▶ 1.1		PRJTASK0000004	Task 1	Open	2013-08-26 13:00:00	2013-08-27 13:00:00	1 Day	0%
▶ 1.1.1		PRJTASK0010019	Task 1	Open	2013-08-26 13:00:00	2013-08-27 13:00:00	1 Day	0%
No Planned tasks								
▶ 1.2		PRJTASK0000005	Task 2	Work in Progress	2013-09-27 13:00:00	2013-09-08 03:53:14	3 Days 12 Hours 2 Minutes	18.02%
▶ 1.3		PRJTASK0000006	Task 3	Work in Progress	2013-09-08 03:53:14	2013-09-05 15:52:07	1 Day	25%

[Using Work breakdown structure \(WBS\) - Legacy](#)

Using Project workbench - Legacy

The project workbench provides a central location for creating and managing projects.

i Important:

Project Workbench is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new [Project Workspace](#) with enhanced UI to help you efficiently manage your projects.

The workbench supports the Project Management and application life cycle management applications, allowing for a hybrid approach to project management. Project managers can create projects that combine both waterfall and agile methodologies and add waterfall, agile, and test phases to these projects.

The project workbench makes it easy to manage projects by presenting project information in two panes. The top pane displays a timeline with the project phases and milestones. The bottom pane displays details for the phase selected in the timeline. The project workbench provides real-time interaction between the timeline, the list view, and the visual task board.

The project workbench also supports the following features:

- **Project templates:** Project managers can quickly and easily create projects based on templates, which define the basic structure of a project.
- **Manual project calculation:** The workbench adds the capability of creating projects that use manual calculation. Project managers can also create auto calculation projects from the Project Management application.
- **Composite fields:** The field type combines information from two fields in a table to form a single field.

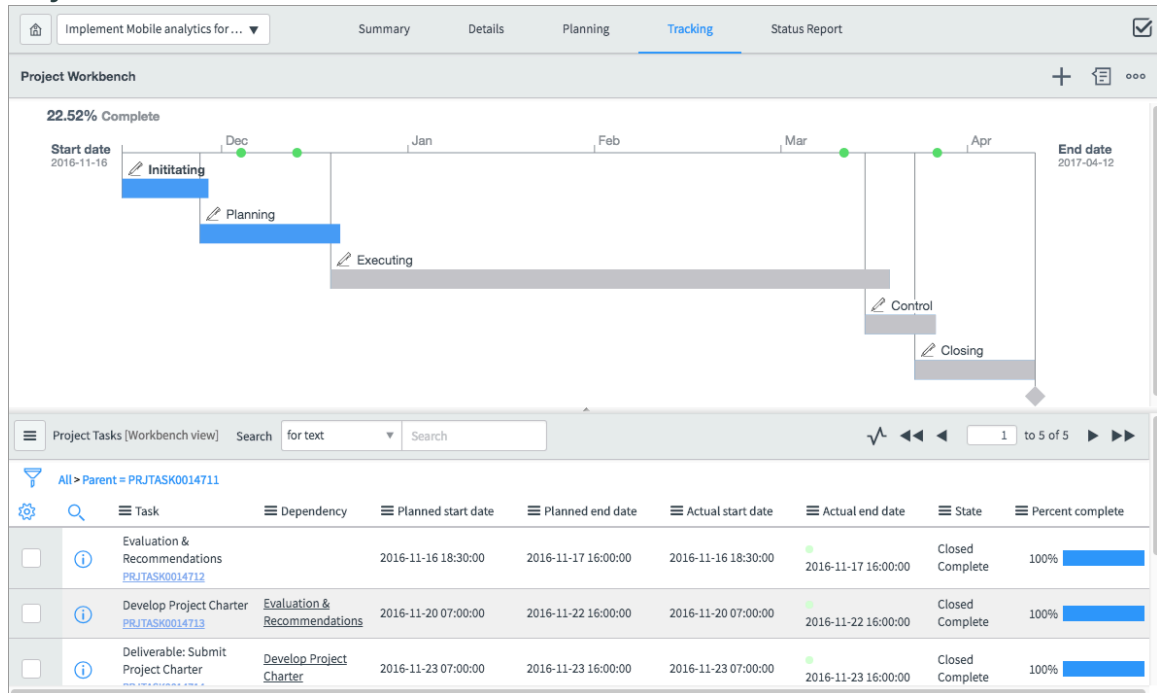

With the project manager role, you can use the project workbench to:

- Manage projects.
- Create and update project phases and milestones.
- Assign a group to an agile phase.
- Create and update project tasks, stories, and test cases.
- Attach test plans to a test phase.
- View and manage project details from a list view or visual task board.

The project workbench displays project information in two distinct areas. The top pane displays the project visualization, and the bottom pane displays phase details in a list view or visual task board. There is also a header above the workbench that includes several buttons and controls.

The project workbench scales to fit the available browser height. If necessary, scroll bars are added to display the workbench details.

Project Workbench

Access the project workbench

Access the project workbench from the Project form or from the application navigator.

Before you begin

Role required: it_project_manager

Procedure

Access the project workbench in one of the following ways.

Note:

If the project workbench opens with no associated sys_id or an incorrect sys_id, an error message appears. Select a project from the project choice list in project workspace banner.

Related topics

[Using Project workbench - Legacy](#)

Components of project workbench

The project workbench displays project information in two distinct areas. The top pane displays the project visualization, and the bottom pane displays phase details in a list view or visual task board. There is also a header above the workbench that includes several buttons and controls.

The project workbench scales to fit the available browser height. If necessary, scroll bars are added to display the workbench details.

Header

The header is a gray bar that runs across the top of the project workbench.

The first time a user accesses the project workbench from the Project menu, the header displays the following components:

After a project is opened, the header displays additional components, depending on the type of project selected.

- Back (<): takes the user to the Project form to view the project details.
- **Select Project:** displays the current project name. Click the down arrow to select a new project.
- Add phase icon (+): adds a phase or milestone to the timeline.
- **Apply Template:** opens a dialog box for setting a start date and adding a template to the project. This button appears for new or blank projects that have no phases.
- **Manage Stories:** under the Options icon (⋮) displays the story backlog for this project.
- **List:** under the Options icon (⋮) displays additional details in list view about the currently selected phase. This button appears if a project has one or more phases.
- **VTB:** under the Options icon (⋮) displays additional details in the Visual Task Board about the currently selected phase. This button appears if a project has one or more phases.

Timeline

The top pane of the project workbench displays the project timeline. The timeline uses monthly or quarterly markers to represent time. If the duration of a project is less than 500 days, these markers represent months and if the duration is greater than 500 days, these markers represent quarters.

The project timeline displays the following project information:

- **Project name:** the name assigned to the project. Point to the project name to see a message about the project date calculation method used for this project.
- **Percentage complete:** the percentage of the project that has been completed. This percentage is based on the duration and the percentage complete of the individual phases.
- **Project start and end dates:** the dates specified in the **Planned start date** and **Planned end date** fields for this project.
- **Project phases:** colored bars that represent the different phases of the project.
- **Milestones:** colored and dynamic circles on the timeline that represent important dates in the project life cycle.

Phases in timeline

A project phase is represented in the timeline by a horizontal bar. The bar is connected to the timeline by a thin vertical line that indicates the phase start date. The name of the phase appears just above the horizontal bar. Project phases are stacked in the timeline by start date, phase, and the earliest start date appearing at the top. If there are phases than can fit on the timeline, a scroll bar appears on the right side.

The color of the horizontal bar changes incrementally to reflect the completion percentage of the phase. The percentage completion is calculated based on the phase type:

- **Waterfall:** includes project tasks. The completion percentage is based on the number of project tasks that have been completed.
- **Agile:** includes stories. The completion percentage is based on the number of story points that have been completed.
- **Test:** includes test cases. The completion percentage is based on the number of test cases that have been completed.

The available phases depend on how Project Management is installed. When Project Management is installed as a standalone app, the project manager can only create and edit the Waterfall phase type. When Project Management is installed as part of the Project Portfolio Management (PPS), the project manager can create and edit all phase types (Waterfall, Agile, and Test).

When you point to a phase, the cursor changes from an arrow to a hand and a pop-up window displays the phase name and the start and end dates. Clicking a phase in the timeline displays the corresponding task information in the bottom pane of the project workbench.

Milestones in timeline

Milestones indicate important dates in a project and are represented along the timeline by colored circles. Three colors are available for milestones: green, yellow, and red. The project manager determines how the colors are used.

Pointing to a milestone changes the cursor from an arrow to a hand and displays a pop-up window with the short description and planned start date.

Select a milestone to update the milestone information. You can also drag a milestone along the timeline to change the date. Milestones can be dragged to any point on the timeline within the boundaries of the project start and end dates.

Detail view

The bottom pane of the project workbench displays detailed information for the phase currently selected in the timeline. The information displayed varies by the phase type selected:

- **Waterfall:** displays the project tasks associated with the phase.
- **Agile:** displays the stories assigned to the phase.
- **Test:** displays the test cases for the testing phase.

Information in the bottom pane can be displayed in list view or in a visual task board. The **List** and **VTB** buttons in the Project Workbench header control how this information is displayed.

Project calculation

When creating a project, the project manager can select the type of calculation to use: manual or automatic (default).

The project workbench displays help text that explains whether the current project is calculated automatically or manually. The help text appears when the project workbench page loads and also when the user points to the project name in the upper left corner.

For manual calculation:

- Dates on tasks do not automatically reflect any changes from dependent tasks.
- New projects created from the project workbench and projects created from demands are set to manual calculation by default. Projects created as manual can be changed to automatic.

- The project timeline reflects the earliest planned start date and latest planned end date based on the project tasks.
- The constraint type cannot be changed.
- Only **Start on specific date** constraint type is allowed for project tasks.

For automatic calculation:

- A task automatically reflects any changes from its dependent and child tasks.
- New projects created from the Project Management application are set to automatic calculation by default.

Note:

- A project created as automatic with one or more tasks cannot be converted to manual.
- Percentage completion and states for phases are updated automatically for both manual and auto calculation.

Related topics

[Using Project workbench - Legacy](#)

Managing Project workbench

The project workbench allows project managers to manage all aspects of a project.

Open a project in the project workbench

The project manager can open an existing project in the project workbench.

Before you begin

Role required: it_project_manager

Procedure

1. In the project workspace banner above the project workbench header, select the down arrow in the project selector box.
2. Select a project from the choice list.
The selected project opens in the project workbench under **Planning** tab in project workspace.

Related topics

[Create a project task in the project workbench](#)

Create a project task in the project workbench

Create a project task for a waterfall phase.

Before you begin

Role required: it_project_manager

About this task

While creating a project task in the project workbench, the time constraint type is defaulted based on the project type.

- For a manual project, the default constraint is Start On and cannot be changed.
- For an automatic project, the default constraint is Start ASAP and can be changed to Start On if required.

- When the constraint is Start ASAP, the **Planned start date** is disabled.
- When you create an agile phase and associate a sprint, the start date of the task is set from the sprint start date and the constraint becomes Start On automatically.

Procedure

1. Select a waterfall phase in the project workbench timeline.
2. Select **New** in the detail view.
3. Fill out the Project Task form.
4. Select **Submit**.

[Managing Project workbench](#)

Manage project stories in the project workbench

If Project Portfolio Management and Agile Development 2.0 are activated, the project manager can manage the stories in a project from the project workbench.

Before you begin

Activate Project Portfolio Management and Agile Development 2.0 plugins.

Role required: it_project_manager

About this task

Manage stories in your project using the **Manage Stories** option in the Project Workbench.

Procedure

1. In the project workbench header, select the options icon () and then select **Manage Stories**. The Backlog section of the Agile Board opens in a new tab.
2. Select a story to open the Story form in the pop-up window, or select **New** to create a new story.
3. Fill in the fields on the Story form.
4. Select **Update** or **Submit**.

Related topics

[Managing Project workbench](#)

Using Planning console - Legacy

The planning console is a centralized interface for the Project Management application.

Important:

Planning console is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#)  article in the Now Support knowledge base. Use new [Project Workspace](#) with enhanced UI to help you efficiently manage your projects.

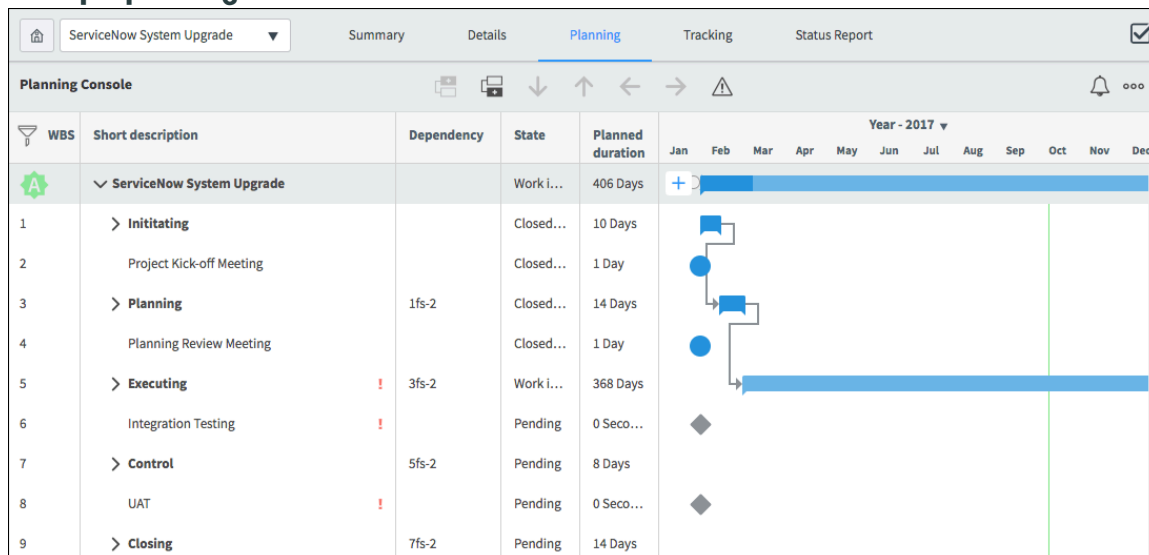

The planning console gives project managers a comprehensive view of all aspects of a project, including a hierarchical list of sub-projects, if any, project tasks that appear in a work breakdown structure (WBS) list, and the project Gantt chart. The console also integrates with Live Feed so your users can collaborate on projects.

Sections in the planning console

The planning console is divided into the following sections:

- A list of the project tasks if you open the planning console for a project.
- The Gantt chart.
- Banner icons and lists for performing tasks on the console.

Example planning console

For more information on the Gantt chart and the task relationships and dependencies that you can build, see [Gantt chart](#) and [Parent-child rollup task calculations](#).

Note:

The resources in the **Assigned to** column of the planning console can be constrained to be derived only from the allocated resource plans associated to the project or any of its tasks.

Business rules

By default, the business rules are not triggered during an operation in the planning console. You can enable the business rules using *Enable firing of Business Rules* property.

Note:

To enable this property, you must clear the **Enable Client Side Planning** check box.

You can also enable business rules when [defining the columns for planning console](#) using the **Fire BR on Save** field.

Client side planning console

Build your project structure quickly on the client side without having to save details in the server for each interaction in planning console. Enabling **Client side planning console** prevents any time lags that occur after you perform any actions in planning console, and improves the scheduling performance.

Automatic and manual projects

In an **automatic** project, any change to the dates, duration, or relationships of a project task automatically updates all the tasks in the entire project, including the project record, as necessary. The automatic project icon () appears adjacent to the project name.

In a **manual** project, changes to the dates, duration, or relationships of a project task do not automatically update all tasks. So parent task dates do not reflect any changes made to dependents or child tasks. The only change that is made automatically is when a task date or duration change updates dates and duration of the project record. In a manual project, any update to actual start date does not update the planned end date of the project or project task. However, enabling the [project property](#) **Enable alter of planned date with Actual for Manual**

Project updates the planned end date from actual start date and planned duration. The manual project icon () appears adjacent to the project name.

You can specify if a project is automatic or manual in the **Calculation** field on the Project form. This field becomes read-only when the project starts.

Tutorial

A tutorial walk through is available in the console. It shows you all the features of the console and how to use them. Access the walk through within the help icon ().

Open the project planning console

Access the planning console to perform the planning for the project.

Before you begin

Role required: it_project_manager

Procedure

Open the planning console using any of the following methods.

Planning console tasks

You can perform several tasks on the planning console that you can perform on lists and forms, such as creating project tasks and copying projects. You can also perform several tasks unique to the console.

General console settings tasks

Task	Steps
Display a project in the planning console	Select the project from the list in the project workspace banner.

WBS hierarchy tasks

Task	Steps
Create a project task	Select the add task below icon on the row to create a new task. You can also select an existing task to determine the insertion point for the new task, and then select the add task above icon or the add task below icon.
Move a task up or down in the hierarchy	Select an existing task, and then select the move up or move down icons.
Indent or unindent a task in the hierarchy	Select an existing task, and then select the unindent or indent icons.
Edit a task record	Right-click a task and select Edit . The Project Task form appears in the overlay. You can also edit a field directly in one of the columns in the planning console. You can also edit project

WBS hierarchy tasks (continued)

Task	Steps
	tasks that represent phases in the project workbench.
Edit the State field	Double-click the value in the State column to select a new state. The value of the State field also changes automatically when % complete is changed for a task.
View and modify task status	<p>View the status of the project task based on the difference of the planned end date of the task from the current date. The status of the task updates automatically from Green to Yellow to Red as the planned end date approaches.</p> <p>You can manually update the task status by double-clicking the Status column and selecting a different task status. For more information, see Status field description in the Create a project task from a project topic.</p>
Add an agile phase or a test phase	<p>Right-click a project and select Add Agile Phase or Add Test Phase. The agile phase icon or test phase icons appear next to the task in the Name column. See phase icons.</p> <p>Note:</p> <ul style="list-style-type: none"> • The Add Agile Phase option is available only for Agile and Hybrid projects. You must also have the Agile Development 2.0 plugin installed. • You can add multiple agile phases and multiple test phases to a project. • You can add only one test phase for a test plan in a project. You must have the Test Management plugin installed to view the Add Test Phase option. • An agile phase cannot overlap another agile phase for an assignment group in a project. • While creating a story, if a project has only one phase, then the story is tagged to the phase.
Open a test plan or story	Right-click a task (a task that represents a phase in the workbench) and then select Manage Test Plan . Select View Stories to view the stories list. If you have the <code>scrum_product_owner</code> role, select View Stories to navigate to the Backlog tab of the Agile Board .

WBS hierarchy tasks (continued)

Task	Steps
	<p>Note: The View Stories option is available only for Agile and Hybrid projects. You must also have the Agile Development 2.0 plugin installed.</p>
<p>Cancel a resource plan for a Closed project</p>	<p>Right-click the project and select Cancel Resource Plans. All past and future allocations for the selected resource plan are canceled.</p> <p>The option is available only for a project in any of the Closed states.</p>
<p>Complete a resource plan for a Closed project</p>	<p>Right-click the project and select Complete Resource Plans. All the requested and resource allocations for the resource plan post the completion date are deleted.</p> <p>The option to complete resource plans is available only for a project in any of the Closed states.</p>
<p>Add an external dependency between tasks of different projects</p>	<p>Right-click a task and select Add External Dependency. Select the project and task to which the dependency is added.</p>
<p>View the project name of an external dependency</p>	<p>Point to the link icon beside the external dependency task to display a tooltip which shows the name of the project to which the external dependency is added.</p>
<p>Change the time constraint for a task</p>	<p>Double-click a task under the Constraint type column and select an option: Start ASAP, Start on specific date, Start no earlier than, or Start no later than.</p> <ul style="list-style-type: none"> You can change the Constraint type for Automatic projects only. When you change the time constraint for a task from Start on specific date to Start ASAP or vice versa, the planned start date and planned end date of the task are recalculated accordingly. The Constraint date column displays the start date for all the constraint types other than Start ASAP tasks. This column is not available by default, you must add this column to the Planning Console from the Configuration menu. The option is not available for a parent task. If a task has child tasks, the option is available only for the child tasks.

WBS hierarchy tasks (continued)

Task	Steps
	<ul style="list-style-type: none"> You cannot create a parent task with Start no later than or Start on specific date time constraint. When a new child task is added to a task with these time constraints, the time constraint for the parent task is converted to Start ASAP. You cannot change constraint type for projects with Calculation type set as Manual.
<p>Allow task dates outside schedule</p>	<p>Right-click a project task and select Allow outside schedule. The selected task is allowed to start and end on a non-schedule day (outside the regular project schedule) such as on a weekend. The off schedule task icon appears next to the task in the Short description column.</p> <p>For example, if you use the project schedule Monday to Friday, 8:00 to 17:00 and a project task of duration 2 days should start on Saturday, then an off-schedule task is allowed to be scheduled on Saturday and end on Sunday. Similarly, if a task of duration 3 days starts on Friday, then an off-schedule will end on Sunday as opposed to ending on Tuesday.</p> <ul style="list-style-type: none"> The option is not available for a parent task. When a task is made off-schedule, its parent also becomes off-schedule. The project also operates as out of schedule if any of the children is set to out of schedule. Once a task is allowed outside the schedule, the Follow schedule option is available for the task. Right-click the task and select Follow schedule to follow the schedule for the task. <p>Note:</p> <ul style="list-style-type: none"> There is no difference between an off-schedule and an on-schedule task if there is no schedule defined at the project level. 1 day is 8 hours for a task in a regular schedule and 24 hours for a task outside the schedule.
<p>Convert a task to milestone</p>	<p>Right-click a task and select Convert to milestone.</p>

WBS hierarchy tasks (continued)

Task	Steps
	<ul style="list-style-type: none"> You can convert a task to a milestone only until it is not in Work in Progress state. Once work in progress, the option appears as greyed out for the task. The option is not available for a parent task. If a task has child tasks, the option is available only for the child tasks.
Show or hide external dependencies	<p>Select the more options icon, and then select the Hide External Dependencies switch.</p> <p>When this option is enabled, the external dependencies are not displayed when you add an external dependency between two projects. However, the Dependency column in the WBS section of the successor project still shows the value of external dependency.</p>
Show external dependency notifications	<p>Select the notification bell icon to display the notifications raised in the successor project. The notifications are triggered as a result of changes made in the predecessor project.</p> <ul style="list-style-type: none"> For a soft dependency, select Accept or Reject to accept or reject the changes in the notification. For a hard dependency, view the displayed notification to review the changes in the notification.
Save changes to the server	<p>Select the save icon to commit changes made in the planning console. The option is available only when Client Side Planning Console is enabled.</p>
Expand or contract column width	<p>Select the side of the column and drag it right or left.</p>
Show or hide columns in the planning console	<p>Select the show or hide columns in gantt icon, and then select or clear the check boxes for the columns available. Admin can customize which columns appear in this list. The selection is saved in the user preference. The next time you open the planning console, the same columns you selected will appear.</p>
Select WBS levels to show	<p>Select the show or hide columns in gantt icon, and then select the level from the WBS Depth list.</p>
Expand or collapse sublevels for any level	<p>Select the arrow to expand or collapse any task that has one or more subtasks.</p>

Gantt chart tasks

Task	How to perform the task
View a summary of a task	Point to a task.
Change the planned start or end dates of a task	Select the task, and then drag the left or right edge of the task bar.
Move a task to a new date	Select the task, and then drag the whole task bar to a new location.
Create a dependency between tasks	<p>Find the successor task in the relationship and double-click the value in the Predecessor column and enter a value that specifies the relationship. See Predecessor dependencies in the planning console for examples.</p> <p>Alternatively, you can create a relationship between two tasks by connecting the ends of the corresponding task bars in the timeline view.</p>
Select a baseline	Select the more options icon, and then select a baseline from the baselines list.
Create a baseline	Select the more options icon, and then select Create new baseline . See Create baseline of a project for more information.
Compare schedule baselines	<p>Select the more options icon, and then select a schedule baseline from the baselines list. Select the show or hide columns in gantt icon, and then select the following columns to compare schedule baselines:</p> <ul style="list-style-type: none"> • Baseline start date • Baseline end date • Baseline variance
Display the critical path	Select the critical path icon. For more information on the critical path, see Gantt chart .
Show date change	Select the more options icon, and then select the Show Date Change switch. When this option is enabled, the start and end dates of the task are displayed when you drag the task bar.
Show duration change	Select the more options icon (⌵), and then select the Show Duration Change switch. When this option is enabled, the duration of the task is displayed when you drag either end of the task bar.
Show weekends on the calendar	Select the more options icon, and then select the Show Weekends switch. The weekends

Gantt chart tasks (continued)

Task	How to perform the task
	appear as light-blue vertical bars in the Gantt chart.
Zoom the calendar in or out	On the top of the calendar, select one of the time periods, such as the month or day. Then select a Zoom Level from the calendar. When the zoom level in calendar is selected as Auto Fit , the Gantt view fits in one page to display the entire timeline for the project in one go without using the scrollbar.
Open the tutorial	Select the more options icon (⋮), and then select Walkthrough .
Open list of keyboard shortcuts	Select the more options icon, and then select Keyboard Shortcuts .

Other features or applications tasks

Client side planning console

During calculation of project schedule in the planning console, it is possible to build your project structure quickly on the client side (browser) without having to save details in the server for each interaction. It prevents any time lags that occur after you perform any actions in the planning console, and improves the scheduling performance.

For example, when a project manager changes dates on a project task in the planning console, re-calculating the dates for the dependent tasks and the project can cause time lag if each interaction is saved to the server. Similarly, when a new task or a dependency is created, there can be a time lag before the new dates are displayed if they are saved on the server side each time.

When client side planning is **enabled**, the changes such as re-calculation of dates are not posted to the server immediately. All the changes in planning console are kept on client side until the user explicitly saves the changes to be committed to the server.

Exceptions

There are a few actions for which you must save your changes immediately to the server side before proceeding such as:

- Create baseline
- Copy project
- Copy partial project
- Add child tasks
- Add external dependency
- Edit Assigned to
- Edit Additional Assignees

In addition, if you enable custom business rules on any of the columns, those columns are also part of exceptions.

[Using Planning console - Legacy](#)

Enable client side planning

Enable client side planning in planning console to enable project scheduling at the client side.

Before you begin

Role required: pps_admin

About this task

Build your project structure quickly on the client side without having to save details in the server for each interaction in planning console.

Procedure

1. Navigate to **All > Project Administration > Settings > Planning Console**.
2. In the Planning Console list, expand **Context: default** and select `Project [pm_project]`.

3. Select the **Enable Client Side Planning** check box to enable project scheduling at client side.

Note:

To enable this check box, the [project property Enable firing of Business Rules on save from Planning Console](#) must be set to false.

Related topics

[Using Planning console - Legacy](#)

Gantt chart

A Gantt chart on the planning console is a visual representation of a project timeline that shows start and end dates of tasks, and the dependencies between tasks.

Use Gantt charts to add and delete tasks, change task dates and dependencies, and assess the progress of the overall project.

The critical path

The critical path is highlighted in red on the Gantt chart to differentiate critical path tasks from standard tasks in blue. Not all tasks are part of the critical path, only those tasks that directly affect the finish date. Use the critical path to determine which tasks are driving the finish date. If schedule adjustments are necessary, consider making resource or other changes to those tasks on the critical path.

The tasks that are not part of the critical path and can therefore be delayed are commonly called **slack** or **float** tasks. The Gantt chart shows the slack/float tasks by default, but calculations that deal with these tasks, such as how long they can be delayed without impacting the project, is not available.

Milestones

A milestone is a project task with a duration of **0**. Use milestones to indicate important dates in a project. If necessary, create dependencies between tasks and milestones so that a task does not start until a milestone has been reached.

Color coding

The colors of the task bars on the Gantt chart are based on the percent complete and state of the task. The default color coding available for project and tasks is shown:

Color coding of project tasks

Color	Explanation
Light blue bar	Task is pending or open.
Dark blue bar (full or partial)	The percentage complete is between 1% and 100%. The dark blue section indicates the percentage complete. The task can be in the Work in Progress state or Completed state.

Note:

The colors of the task bars on the Gantt chart can be configured from [program workbench](#).

SDLC phases

Icons appear next to tasks to indicate what phase they belong to.

Phase icons

Icon	Phase
Agile phase icon	Agile phase.
Testing phase icon	Testing phase.

Note:

Tasks in the waterfall phase do not display an icon.

Gantt chart options

Use the Gantt chart to quickly change task attributes, such as start and end time, rather than opening every Task form and modifying field values one by one.

From a Gantt chart, you can modify the following task attributes:

Modify tasks

Attribute	Description
Planned start date for project tasks	<p>Move the task along the timeline to change the start time and to impose a <i>Time constraint</i> of <i>Start on a specific date</i>. You can also drag a task to change its start date if the task <i>Time constraint</i> is set to <i>Start on a specific date</i> (not <i>Start ASAP</i>) and the task has not yet started. The start date of a task cannot be modified if the task already started (has an actual start date), the task has already ended (has an actual end date), or the task time constraint is set to <i>Start ASAP</i>.</p> <p>You can also modify the dates in the Planned start date column on the console.</p>
Planned start date for the project	<p>Modify the dates in the Planned start date column on the console.</p> <p>You can add tasks that start earlier than the project's planned start date. By default, the planned start date shifts earlier or later when you add tasks to align with the earliest task start date. However, you can enable the project property Rollup project start date from tasks to retain the planned start date of the project even if you add tasks with a planned start date that is earlier or later.</p>
Planned end date	<p>Drag the right edge of the task bar to extend the planned end date. You can extend the planned of date only for tasks that are not parent tasks and that have not yet ended.</p>
Dependencies	<p>To edit or delete a dependency, double-click an existing dependency connector line between two tasks and update the settings in the Planned Task Relationship popup. The relationship <i>Type</i> for planned tasks is <i>Predecessor of::Successor of</i> and should not be changed.</p>
Lag time and lead time	<p>Lag time is an interval of time between the end of a predecessor task and the start of a successor task. The lag time delays the predecessor by an amount that you specify.</p> <p>Lead time is an interval of time that the predecessor task is allowed to start before it normally would. It is essentially a negative lag time. The value in the Lag field specifies both lag and lead time.</p>

Modify tasks (continued)

Attribute	Description
	To edit the Lag value, double-click a connector and update the settings in the Planned Task Relationship form. Enter a negative value to specify a lead time.
Resources	<p>To change a user resource for an existing task or add a resource to a new task, double-click the task bar and edit the <i>Assigned to</i> field in the Project Task form.</p> <p>Note: The resources in Assigned to column can be constrained to be derived only from the allocated resource plans associated with the project or any of its task.</p>

The Project Management application provides several properties that control how tasks are calculated and behave. See [Project property](#) for more information.

Create a parent-child relationship on the planning console

The WBS section of the planning console allows you to create parent-child relationships for new tasks or move around existing tasks in a new parent-child relationship. The position of a task in the hierarchy and the level of indentation determine the parent-child relationship it has with the tasks above or below it.

Before you begin

Role required: it_project_manager

About this task

In this example, the System Readiness Assessment task is a child of the Planning task because it is one level below the Planning task and is indented.

Parent-child relation for tasks

1	▼ Planning	
1.1	System Readiness Assessment	

Procedure

1. Select a task in the WBS section of the planning console to highlight it.
2. Select a combination of any of the following icons to create the task and move it or move the other tasks to create the required hierarchy:

Creating parent-child relationships

Icon	Action
Add task above icon ()	Create a task above the highlighted task.
Add task below icon ()	Create a task below the highlighted task.
Indent icon ()	Makes the highlighted task a child of the task above it.

Related topics

[Using Planning console - Legacy](#)

Predecessor dependencies in the planning console

In the WBS section of the planning console, you can create dependencies between tasks by specifying a series of values.

The **Predecessor** column on the planning console can specify dependencies between tasks. The values that you put in this column must be in the following format:

```
{WBS_number} {dependency_type} + {lag_time}
```

Where

- **WBS_number** is the number of the predecessor task in the relationship.
- **dependency_type** is one of the [types of dependencies](#) that the application supports.
- **lag_time** is the amount of time, in days, to delay the start of the dependent task. This value can be positive or negative integers.

The values are entered without the curly braces {}. See the examples in the table.

Note:

You can also edit tasks from the Gantt chart by clicking the relationship line. See [Gantt chart options](#) and [Modify a project task dependency](#) for details.

Project task dependency values

Dependency type	Example	Additional information
Finish to start	1.1fs+0	The task you are editing starts when task 1.1 is finished.
Start to start	1.1ss+0	Task 1.1 cannot finish until the task you are editing finishes.
Start to finish	1.1sf+0	Task 1.1 cannot start until the task you are editing finishes.
Finish to finish	1.1ff+0	The task you are editing cannot finish until task 1.1 finishes.

Custom columns in the planning console

In addition to the regular columns that are provided in the base system, as the PPS admin, you can configure which columns appear in the planning console.

You can define the columns that are available in the [project planning console](#), program workbench, planning, and tracking views in portfolio workbench, and the release management Gantt chart. From this list of defined columns, you can select the columns that you want to view in these planning console UIs at any time.

These tables are used for custom column configuration:

- **Planning Console [pm_console]:** Stores the definition for planning consoles such as Project and Portfolio.
- **Planning Console Display Column [pm_console_display_column]:** Stores the planning console display columns such as Short Description, WBS, and Priority.

A console stored in [pm_console] has multiple display columns that are stored in [pm_console_display_column].

Note:

You cannot edit list of column if the column refers to a table other than the [sys_user] table.

- **Planning Console Table [pm_console_table]:** Contains a list of tables which provide data to a console.

A console sources the data from multiple tables. For example, Project console [pm_project] pulls data from pm_project and pm_project_task table. This list of tables is maintained in [pm_console_table].

- **Planning Console Column [pm_console_column]:** Maintains the columns that should be pulled from each table and the mapping of the column in pm_console_display_column.

Add a custom column to the planning console

Define the columns that you want to make available in the project planning console, portfolio workbench, program workbench, and the release management Gantt chart.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All > Project Administration > Settings > Planning Console.**
2. Add a custom display column for planning console.
 - a. In the Planning Console list, select a console to which you want to add the custom column. For example, select Project [pm_project] to add a column to the project planning console.
 - b. To create a display column for the selected console, select **New** in the **Planning Console Display Column** related list.
 - c. On the Planning Console Display Column form, fill in the fields.

Planning Console Display Column form

Field	Description
Label	Label for the column to be displayed in the planning console.
Type	Data type of the column.
JSON Column	The JSON column name used internally by the Gantt chart when data is sent. Note: Leave blank. This field is auto-populated when you add a column for the display column in step 3.

Field	Description
Order	Position at which the column appears in the planning console.
Include in Tooltip	Check box for the column to be shown in tooltip in timeline in the planning console.
Width	Default width of the column in planning console.
Fire BR on Save	Option if the business rules should be triggered when the column is modified in the planning console. Note: The field is not visible on the form by default. Configure the form to add this field.
Trigger recalculation	Option if the recalculation of date and duration should be triggered when the column is modified in the planning console. Note: The field is not visible on the form by default. Configure the form to add this field.

d. Select Submit.

The column is added in the `Planning Console Display Column [pm_console_display_column]` table.

3. Map the planning console display column created in step 2 to a column in a table defined in `Planning Console Table [pm_console_table]`.

a. In the `Planning Console Display Column` related list, open the display column record.

b. To create a record of actual column in the `Planning Console Column [pm_console_column]` table, select **New in `Planning Console Columns` related list.**

c. On the `Planning Console Column` form, fill in the fields.

Planning Console Column form

Field	Description
Display Column	Display column created in the <code>Planning Console Display Column [pm_console_display_column]</code> table.
Console Table	Console table to be mapped to the display column.
Table	Actual table from where the data is pulled in the display column. The field is auto-populated when you select a Console Table. For example, select a table from <code>[pm_project]</code> or <code>[pm_project_task]</code> for a display column added in the Project planning console <code>Project [pm_project]</code> .
Column	Actual column in the Table from where data comes for the display column.

Field	Description
Editable	Check box to make the column editable in the planning console.

d. Select **Submit**.

Result

The display column appears in the column filter list () in the planning console.

[Using Planning console - Legacy](#)

Create a dependency from the planning console

Create a dependency between two tasks on the planning console.

Before you begin

Role required: it_project_manager

About this task

You can create any type of dependency. See [Parent-child rollup task calculations](#) for an explanation of each type.

You can also create dependencies by using the Predecessor column on the Planning Console. See [Predecessor dependencies in the planning console](#) for more information.

Procedure

1. Select a task on the Gantt chart portion of the planning console.
A white circle appears on either end of the task, one at the start of the task and the other at the end of the task.
2. To create a dependency, select one of the white circles and drag it to the start or end of another task.
3. Double-click the dependency line to see the dependency on the Planned Task Relationship form.
4. Confirm that your dependency is correct.
You can [make changes to the dependency](#) as needed.

Related topics

[Modify a project task dependency](#)

Add an external dependency on planning console

Add an external dependency between two projects on the planning console. Use the work breakdown structure (WBS) column of the planning console to create a dependency between the different projects tasks.

Before you begin

Role required: it_project_manager

Procedure

1. Right-click a task in the WBS column of the planning console.
2. Select **Add External Dependency**.
3. On the Add dependency form, fill in the following fields:

- Project: The predecessor project that the dependency is added from.
- Task: The task in the predecessor project that the dependency is added from.
- Dependency Type: The **type** of external dependency: **Hard** or **Soft**.

4. Select OK.

Result

- A shadow task corresponding to the predecessor task appears in the WBS section of the planning console of the successor project. A similar shadow task corresponding to the successor task appears in the WBS section of the planning console of the predecessor project.

A shadow task is shown as a grayed out task in WBS column.

- A shadow task corresponding to the predecessor task appears in the **Project Tasks** related list on the successor project form. A similar shadow task for the successor task appears in the **Project Tasks** related list on the predecessor project form.
- The **Dependency** column in WBS column of the planning console of the successor project shows the external dependency value between the projects and tasks. The external dependency value has the following format:

`{project_number} \ {WBS_number} {dependency_type} + {lag_time}`

Where

- `project_number` is the number of the predecessor project.
- `WBS_number` is the number of the predecessor task in the relationship.
- `dependency_type` is the **finish to start** dependency type that the application supports.
- `lag_time` is the amount of time, in days, to delay the start of the dependent task. This value can be positive or negative integers.

Note:

The external dependencies are displayed only when the **Hide External Dependencies** switch on the **planning console** is turned off. However, the **Dependency** column in the WBS section of the successor project still shows the value of the external dependency.

Example:

In the example below, an external dependency is created between two projects P1 and P2. P1T1 is a shadow task of predecessor project P1, and PRJ0010127\1fs+0 is the external dependency value in **the Dependency** column of the planning console of the successor project P2.

What to do next

Check for any external dependency related **notifications** that may impact the project or its tasks.

Modify a project task dependency

Modify a dependency when editing the tasks that are linked in the dependency, the dependency type, or the lag time.

Before you begin

Role required: it_project_manager

About this task

Project task dependencies are saved on the Planned Task Relationship [planned_task_rel_planned_task] table. You can access dependencies from the planning console.

Procedure

1. Double-click a dependency on the Gantt chart of the [planning console](#).
2. On the form, fill in the details.

For more information, see [Planned Task Relationship form](#).

Planned Task Relationship form

Planned Task Relationship
Created 2015-09-02 13:17:23

Predecessor: PRJTASK0011753 (NRU)

Successor: PRJTASK0011752 (NRU)

Type: Predecessor of::Successor of

Sub Type: Start to Finish

Lag: Days 0

Hours 00 00 00

Update Delete

3. Select **Update**.

You can view dependencies in the Project Task related list on a Project or Project Task form and from the Project Tasks list on the workbench. These columns show the dependencies:

- The **Dependency** column shows the successor task in the relationship.
- The **Dependencies** column shows the dependency value. See [Predecessor dependencies in the planning console](#) for a description of what you see in this column.

Related topics

Train the similarity solution for Project Management to find similar projects

Train the Similar Projects solution definition included within the Predictive Intelligence for PPM capability to find related projects when defining a project.

Before you begin

Ensure that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml), PPM Standard plugin (com.snc.financial_planning_pmo), and Predictive Intelligence for PPM plugin (com.snc.ppm_ml) are activated. For more information about Predictive Intelligence, see [Predictive Intelligence](#).

Role required: admin

Procedure

1. Navigate to **All > Predictive Intelligence > Similarity > Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Similar Projects solution definition (ml_sn_global_global_similar_projects).
3. On the Similarity Definition form, verify the default field values for projects. For more information about the Similarity Definition form fields, see [Create and train a similarity solution](#).
4. Click **Update & Retrain**.
5. Open the Similarity Definition form for the Similar Projects solution definition (ml_sn_global_global_similar_projects).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column.

i Note:

Alternatively, you can click the link for the solution in the **Active** column. On the ML Solution form, click the **Show training progress** related link to check the training solution progress.

Result

When the solution is complete, the similar projects appear in the Similar projects section on the Project form.

What to do next

- Review similarity examples: On the Similarity Definition form, in the ML Solutions related list, when **Progress** is 100%, in the **Active** column, click the link for the solution. On the ML Solution form, click the **Similarity Examples** related link to view the Similarity Examples list.
- Update the similarity score threshold: On the ML Solution form, on the **Solution Statistics** tab, enter the required value in the **Similarity Score Threshold** field. Right-click the ML Solution form and click **Save**.
- Test the prediction output for the records: On the ML Solution form, on the **Test solution** tab, enter your text in the **Short description** field and the maximum number of expected results in the **Top N** field, and then click **Run test**. The results above the similarity score threshold value are displayed.

Collaborate with your project teams using PPM Collaboration application

Collaborate with your project team on a common enterprise messaging platform such as Slack or Microsoft Teams using the PPM Collaboration application. Facilitate active and timely communication about the project among the project's team members, be involved in critical discussions on your project, and receive real-time updates on the project's status.

By using a project-specific channel on Slack, or a team on Microsoft Teams, decisions taken or updates made for the project would effectively reach all the team members. The team would have easy access to its past communication through the chat history and shared project documents all at one place. By doing so, the project manager and the team members can save the time spent on emails and other offline communication.

PPM Collaboration advantages

A project collaboration channel or team provides the following advantages for the project managers and the team members:

PPM Collaboration advantages for project managers and team members

Project Manager	Team member
<ul style="list-style-type: none"> • Start your day with a detailed status of the project that you're managing • Using the status details, choose to follow up with relevant team members through your preferred mode of communication • Open the project directly from the collaboration channel or team to drill down into further details 	<ul style="list-style-type: none"> • Communicate with the team members to resolve an issue you're facing • Receive status updates from the team members • Contribute to the discussions regarding the project

- Real-time updates on changes to milestones, risks, issues, decisions, actions, and change requests (RIDAC), and project financials.
- Automatic addition and removal of members of the collaboration channel or team based on who the project tasks are assigned to.

Note:

PPM Collaboration is not supported for teamspaces.

Related topics

[Install PPM Collaboration](#)

Install PPM Collaboration

Install the PPM Collaboration (sn_ppm_collab) application from ServiceNow Store.

Before you begin

- Complete the following setup checklist for a smooth installation and configuration.

Note:

If you are enabling collaboration with Slack, the Slack spoke v2 plugin must be activated. If you are enabling collaboration with Microsoft Teams, the Microsoft Teams Graph and Microsoft Azure AD spokes must be activated. Collaboration cannot be enabled for both Slack and Microsoft Teams for the same project.

Setup checklist

Setup tasks	Description
Verify that the PPM Standard (com.snc.financial_planning_pmo) plugin is activated.	Navigate to All > Subscription Management > Subscriptions in your instance. The list displays the subscriptions that your organization has purchased.
Verify that the Slack spoke v2 (sn_slack_ah_v2) plugin is activated, for collaboration with Slack.	Navigate to All > Subscription Management > Subscriptions in your instance. The list displays the subscriptions that your organization has purchased.
Verify that the Microsoft Teams Graph spoke (sn_msteams_ahv2) plugin is activated, for collaboration with Microsoft Teams.	Navigate to All > Subscription Management > Subscriptions in your instance. The list displays the subscriptions that your organization has purchased.
Verify that the Microsoft Azure AD spoke (com.sn.azure_ad.spoke) plugin is activated, for collaboration with Microsoft Teams.	Navigate to All > Subscription Management > Subscriptions in your instance. The list displays the subscriptions that your organization has purchased.

Note:

Activation of the PPM Standard, Microsoft Teams, and Slack spoke plugins on production instances may require separate licenses. Contact ServiceNow Customer Support for details.

- Ensure that the PPM Collaboration application and all of its associated store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).

Role required: admin

Procedure

1. Navigate to the [ServiceNow Store](#).
2. In the ServiceNow Store, search for PPM Collaboration.
3. Select the application tile.
You can view detailed information about the application. Consider reading the Other Requirements and Dependencies sections, as applicable.
4. Select **Get** and enter your Now Support login credentials.
5. Select **Request Install**.
6. In the **Instance Name** field, enter your details and select **Validate Instance**.
7. In the **Reason for the Instance** field, enter your details and select **Request**.
You receive an email with detailed installation instructions.
8. Log in to the instance on which you want to install the PPM Collaboration application.
9. Select **System Applications > All Available Applications > All**.
10. Locate the application using the filter criteria and search bar, select it, and select **Install**.

Result

The following components are installed with installation of the application:

- Roles
- Tables

For more information, see [Components installed with PPM Collaboration](#).

What to do next

[Setting up PPM collaboration for Slack](#).

Components installed with PPM Collaboration

Roles and tables are installed with activation of the PPM Collaboration application.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Roles installed

Role	Description
Collaboration user [SN_collab_common.collab_user]	Users with this role have read-only access to the Entity Channel table. This role is automatically assigned to project managers and task assignees.
Collaboration owner [SN_collab_common.collab_owner]	Users with this role have complete create, read, update, and delete access to the Entity Channel table.

Role	Description
	This role is automatically assigned to project managers.

Tables installed

Table	Description
Entity Channel [sn_collab_common_entity_channel]	Stores the list of IDs and names of the Slack channels that are created for the projects.

[Collaborate with your project teams using PPM Collaboration application](#)

Setting up PPM collaboration for Microsoft Teams

Integrate your ServiceNow instance with your organization's Microsoft Teams to enable collaboration of your projects in Microsoft Teams.

PPM Collaboration uses the Microsoft Teams Graph and Microsoft Azure AD spoke actions such as creating a team for your project, adding or removing your project team members, archiving the team when the project is closed, posting a message when a record is updated, and so on. To enable these spoke actions, you must integrate your ServiceNow instance with Microsoft Teams Graph and Microsoft Azure AD to authenticate ServiceNow requests. For more information, see the [Set up Microsoft Teams Graph spoke](#) and [Set up Microsoft Azure AD spoke](#) topics.

Important:

When you activate the Microsoft Teams Graph and Microsoft Azure AD spokes, a [Connection & Credential alias](#) for Microsoft Teams Graph and Microsoft Azure AD is created by default with the IDs *sn_msteams_ahv2.Microsoft_Teams_Spoke* and *sn_azure_ad_spoke.AzureAD* respectively. The connection that is active (the Active field is set to *true*) in Connections related list of this alias uses this default ID to connect your ServiceNow instance to Microsoft Teams Graph and Microsoft Azure AD. Therefore, you can have multiple connections associated with this alias but ensure that only one connection is active at any given time.

Setting up PPM collaboration for Slack

Integrate your ServiceNow instance with your organization's Slack to enable collaboration of your projects in Slack.

PPM Collaboration uses the Slack spoke actions such as creating a channel for your project, adding or removing your project team members, archiving the channel when the project is closed, posting a message when a record is updated, and so on. To enable these spoke actions, you must integrate your ServiceNow instance with Slack to authenticate ServiceNow requests. For more information, see [Set up Slack spoke](#).

Important:

When you activate Slack spoke, a [Connection & Credential alias](#) for Slack is created by default with the ID *sn_slack_ah_v2.Slack*. The connection that is active (the Active field is set to *true*) in Connections related list of this alias uses this default ID to connect your ServiceNow instance to Slack. Therefore, you can have multiple connections associated with this alias but ensure that only one connection is active at any given time.

Flows designed to synchronize projects with your collaboration tool

Understand the flows designed for the PPM Collaboration application so that you can edit the configurations as required.

PPM Collaboration flows

Slack Flow [Name]	Microsoft Teams Flow [Name]	Description
Action Slack [action_slack]	Action Teams [action_teams]	Posts a message to the project channel or team whenever an Action is created with priority 1-Critical or 2-High or if the priority of an existing Action is updated to 1-Critical or 2-High .
Add Assigned Users To Channel [add_assigned_users_to_channel]	Add Assigned Users To MS Group [add_assigned_users_to_ms_group]	Handles adding the users in the Assigned to or Additional Assignee list fields of the project tasks to the project channel or team.
Archive Project Channel [archive_project_channel]	Archive MS Group [archive_group]	Handles archival of the project channel or team based on the count of number of days from which the project is moved to a closed state. This flow is set to run daily at 08:00 AM.
Change Request Slack [cr_updated_slack]	Change Request Teams [change_request_teams]	Posts a message to the project channel or team whenever a Change request with priority 1-Critical or 2-High is created or if the priority of an existing Change request record is updated to 1-Critical or 2-High .
Daily Project Status Slack [daily_project_status]	Daily Project Status Teams [daily_project_status_teams]	Triggers a message about the overall status of the project to the project channel or team everyday at 08:00 AM.
Decision Slack [decision_updated_slack]	Decision Teams [decision_teams]	Posts a message to the project channel or team whenever a Decision with priority 1-Critical or 2-High is created or if the priority of an existing Decision is updated to 1-Critical or 2-High .
Issue Slack [issue_updated_slack]	Issue Teams [issue_teams]	Posts a message to the project channel or team whenever an Issue with priority 1-Critical or 2-High is created or if the priority of an existing Issue is updated to 1-Critical or 2-High .
Milestone/KeyMilestone Slack [milestonekeymilestone]	Milestone/KeyMilestone Teams [milestonekeymilestone_teams]	Posts a message to the project channel or team whenever a Milestone or a Key Milestone task is moved to the closed state.
Project Manager Changes Slack [project_manager_changes]	Project Manager Changes MS Teams [project_manager_changes_teams]	Handles adding the new project manager as a member to the project channel or team. This flow also checks if the user who was the old project manager is assigned to any project tasks and if

PPM Collaboration flows (continued)

Slack Flow [Name]	Microsoft Teams Flow [Name]	Description
		not assigned to any task, removes the user from the channel.
Project Status Slack [project_status_slack]	Project Status Teams [project_status_teams]	Posts a message to the project channel or team in the following three scenarios: <ul style="list-style-type: none"> • State field is updated to Closed Complete, Closed Incomplete, or Close Skipped states • Status fields is updated • Project manager changes for this project
Risk Flow Slack [risk_created_slack]	Risk Flow Teams [risk_created_teams]	Posts a message to the project channel or team whenever a Risk with probability High or Absolute is created or if the probability of an existing risk is updated to High or Absolute .

All the flows, except the subflows, are inactive by default. Enable the collaboration between PPM and Slack or Microsoft Teams for a specific action by activating these flows. You can view all these flows by navigating to **Flow Designer > Designer** and filtering the flows by the PPM collaboration application. For more information, see [Activate a flow](#).

If you want to update the configuration for any of these flows, you can edit them. For example, if you want to update the time of daily status update from 8:00 AM to 9:00 AM, you can edit the Daily Project Status Slack [daily_project_status] or Daily Project Status Teams [daily_project_status_teams] flow. For more information, see [Edit a flow](#).

Create a Microsoft team for your project

Create a Microsoft team for your project to start collaborating with your team and receive timely updates of the project.

Before you begin

Ensure that the project for which you want to create a team is active and not in a closed state.

Role required: it_project_manager

Important:

You must be the designated project manager for this project in addition to having the it_project_manager role.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Open the project for which you want to create a team.

Ensure that you are the project manager for the project you open.

3. Enable collaboration for the project by selecting the **Enable MS Teams Collaboration** related link.

Result

- A Microsoft team is created for the project. You can see the team's name in the success message on your project form. You can also view a link in the project form to access your MS team group, selecting on the link will navigate you to the MS team group for your project.
- You and the administrator are added as owners in the team.
- Any assignees and additional assignees of active project tasks for this project are added as members to this team.

Assignees and additional assignees of project tasks that you create later will be automatically added as members to this team if you enable the Add Assigned Users To MS Group flow. However, new or existing stakeholders added to the project are not added as members to this channel.

i Note:

Users assigned to the tasks (assignee and additional assignee) from Planning Console will not be added automatically to the Microsoft team.

- Once a team is successfully created for a project, the **Enable MS Teams Collaboration** related link is removed from that project. Collaboration cannot be enabled for both Slack and Microsoft Teams for the same project. If you have selected on the **Enable MS Teams Collaboration** related link for a project, and you select the **Enable Slack Collaboration** related link before the MS team is created, a message will be displayed specifying that MS Teams creation is in progress.

If you are unable to create a team, retry the procedure after sometime. If the issue persists, contact your system administrator.

Create a Slack channel for your project

Create a Slack channel for your project to start collaborating with your team and receive timely updates of the project.

Before you begin

Ensure that the project for which you want to create a Slack channel is active and not in a closed state.

Role required: it_project_manager

i Important:

You must be the designated project manager for this project in addition to having the it_project_manager role.

Procedure

1. Navigate to **All > Project > Projects > All**.
2. Open the project for which you want to create a Slack channel.

Ensure that you are the project manager for the project you open.

3. Enable collaboration for the project by selecting the **Enable Slack Collaboration** related link.

Result

- A channel in Slack is created for this project. You can see the channel's name in the success message on your project form. You can also view a link in the project form to access your Slack channel, selecting on the link will navigate you to the Slack channel for your project.
- You and any existing assignees and additional assignees of active project tasks for this project are added as members to this channel.

Assignees and additional assignees of project tasks that you create later will be automatically added as members to this channel if you enable the Add Assigned Users To Channel flow. However, new or existing stakeholders added to the project are not added as members to this channel.

Note:

Users assigned to the tasks (assignee and additional assignee) from Planning Console will not be added automatically to the Slack channel.

- Once a channel is successfully created for a project, the **Enable Slack Collaboration** related link is removed from that project. Collaboration cannot be enabled for both Slack and Microsoft Teams for the same project. If you have selected on the **Enable Slack Collaboration** related link for a project, and you select the **Enable MS Teams Collaboration** related link before the Slack channel is created, a message will be displayed specifying that Slack channel creation is in progress.

If you are unable to create a channel, retry the procedure after sometime. If the issue persists, contact your system administrator.

Notifications for project updates in your collaboration tool

Receive updates related to your project on your Slack channel or Microsoft team. Analyze the delayed and overdue tasks, follow closure of milestones, and monitor changes to risk, issue, decision, action, and change request (RIDAC) items of your project.

Using the automatic project status updates on the project collaboration channel or team, project managers can take informed decisions about project planning, resource management, finance allocation. The team members can understand updates made to the project and actively collaborate on any delayed or overdue tasks.

Note:

Project managers can reach out to their system administrators to configure the application settings for these notifications according to their preferences.

Daily notification on project status

A notification with the consolidated project status is sent to the project's channel daily at 8:00 AM which consists of the following information.

Project overview

- A direct URL of the project. Selecting this URL opens the project in your ServiceNow instance.
- Name of the project.
- Planned start and end dates of the project.
- State of the project, for example, Work in Progress.
- Status of the project, for example, Green.
- Percentage of project completion.

Project tasks due today

List of project tasks that have planned end date marked as today and are in the Work in Progress state. The list displays only five project tasks that are sorted alphabetically by their short description.

Overdue tasks

List of project tasks which have a planned start date before today but are not in either the Work in Progress or Closed states. The list displays only five project tasks that are sorted in an ascending order of the planned start dates so that you get high visibility into the tasks that are overdue for a longer period.

Delayed tasks

List of project tasks which have a planned start date before today and are in the Work in Progress state. The list displays only five project tasks that are sorted in ascending order of the planned end dates so that you get high visibility into the tasks that have been delayed for a longer period.

Project tasks due within seven days

List of five of the following project tasks that have a planned end date within seven days from today. All these tasks are displayed in ascending order of their due dates so that you get high visibility into the tasks that are due soon.

Note:

Tasks that in Closed state are not displayed in the list.

- High priority risks, issues, and action items
- Milestone or key milestone tasks

Other updates

Notifications are sent to the project channel for the following scenarios.

- Cost estimate at completion (EAC) exceeds the planned cost of the project
- Planned end date is later than the approved end date
- Project did not start on the planned start date
- Project is not complete by the planned end date

Notification regarding change of project manager

When there is a change in the manager of your project, an update is made to the Project manager field of the project record.

- A notification including the project URL is sent to your project channel on this update.
- New project manager is added as a member of the channel.
- If no project tasks are assigned to the old project manager, this user is removed as a member of the channel.

Notification for other updates to the project

Project's status

When an update is made to the Status field of the project, a notification including the project URL is sent to your project channel.

RIDAC records

You receive notifications in your project channel when a new RIDAC record is added to or an existing RIDAC record is updated in the project for the following scenarios. With every notification, you receive a direct URL to the corresponding record.

- Risk
 - New risk is created with the priority field set to **High** or **Absolute**
 - Updates are made to the State or Risk status fields for an existing risk
- Issue, Decision, Action, and Change request
 - New record is created with the priority field set to **1-Critical** or **2-High**
 - Priority of an existing record is updated to **1-Critical** or **2-High**

Milestones

Whenever a key milestone is closed, you are notified about the closure and the user who closed it, with a direct URL to the milestone task.

Related topics

[Collaborate with your project teams using PPM Collaboration application](#)

Archiving your project collaboration channel or team

Understand how your project Slack channel or Microsoft team is archived when your project is moved to a closed state.

Moving the project to a closed state

When the project manager moves the project to Closed Complete, Closed Incomplete, or Closed skipped state, the following actions are triggered:

- A notification about project closure is sent to the channel or team immediately.
- The channel or team is archived within 15 days from the day the project is moved to a closed state.

This duration of 15 days helps the project members to bring any pending communication to closure or share any pending project documentation.

Project managers can contact their administrator to update this duration of 15 days to a value of their choice.

Deletion of a project task

When a project task is deleted, the members in the corresponding Slack channel or Microsoft team are not removed automatically. To remove the members on deletion of a project task, you must enable the **Remove Users From Slack/Teams Channel** business rule. This business rule is created on the Project Task table and is not enabled by default. For more information, see [Business rules](#) .

Deletion of the project channel or team

If the channel is deleted in the Slack application, or the team is deleted in the Microsoft Teams application, the PPM Collaboration application does not handle the deletion of the project's reference in the Entity Channel [sn_collab_common_entity_channel] table automatically. So, the project manager cannot see the **Enable Slack Collaboration** or **Enable MS Teams Collaboration** related link on the project form again.

If the project manager wants to create a channel or team again for this project, administrator must manually delete the project's reference from the Entity Channel table. Then, the related link to enable collaboration appears on the project form.

Related topics

Virtual Agent for PPM

ServiceNow[®] Virtual Agent for PPM enables project managers to get quick answers to business-related queries by interacting with a virtual agent through various messaging services.

Virtual Agent for PPM helps project managers view business-related information quickly in a single step rather than having to navigate through various lists. For example, you can get the list of all your project tasks that are overdue.

The base system provides the following predefined Virtual Agent topics (chatbot conversations):

- Project and Task status
 - All active projects
 - Projects with status red
 - Projects ending next week and % complete less than 60%
 - Overdue milestones/ key milestones
 - Overdue tasks
 - Delayed tasks
- Resources
 - Resource plans with actual hours greater than allocated hours
 - Unallocated resource plans starting next week
 - Unallocated resource plans with requested extension
- Financials
 - My active projects
 - Projects with EAC greater than planned cost
 - Projects with EAC greater than budget
- RIDAC (Risk, Issue, Decision, Action, and Request Changes)

- Absolute and high probability risks due this week
- Critical and high priority issues due this week
- Critical and high priority action items due this week
- Data quality
 - Projects without business case
 - Projects without strategy
 - Projects without program or portfolio

A topic defines the dialog between the Virtual Agent (chat support bot) and user, which enables you to gather information for a specific business need. For more information, see [Virtual Agent](#).

Integration with messaging applications

You can run Virtual Agent bot conversations for PPM using third-party messaging applications like Slack or Microsoft Teams.

Use the Virtual Agent integration app to configure the messaging apps for your instance.

For more information, see [Virtual Agent integration with messaging apps](#).

For more information on integrating with Slack or Microsoft Teams, see [Setting up Virtual Agent notifications](#).

Related topics

- [Install Virtual Agent for PPM](#)
- [Enable Virtual Agent for PPM](#)

Install Virtual Agent for PPM

Install Virtual Agent for PPM from the ServiceNow store.

Before you begin

Role required: admin

About this task

To install Virtual Agent for PPM, activate the following plugins:

Name	Description
PPM Standard (com.snc.financial_planning_pmo)	Activates the PPM Standard basic plugin for the PPM (Project Portfolio Management) applications.
Glide Virtual Agent (com.glide.cs.chatbot)	Activates the Virtual Agent framework and other necessary plugins.
Virtual Agent for PPM (com.sn_ppm_va)	Activates a conversational bot platform for providing user assistance through conversations within a messaging interface for PPM.

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.

2. Find the application using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find an application, you may have to request it from ServiceNow store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. Select **Install**.

4. In the Application installation dialog box, review the application dependencies.

Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If there are any plugins or applications that need to be installed, you must install them before you can install Virtual Agent for PPM.

5. **Optional:** If demo data is available and you want to install it, select **Load demo data**.

(Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

Important:

If you don't load the demo data during installation, it's unavailable to load later.

6. Select **Install**.

[Reusable PPM Virtual Agent topic blocks](#)

Enable Virtual Agent for PPM

Enable Virtual Agent for PPM to start chatting with the Virtual Agent.

Before you begin

Role required: admin, virtual_agent_admin

The base system provides predefined Virtual Agent topics (chatbot conversations). To customize a topic, duplicate it and then edit it. See [Virtual Agent Designer](#).

Procedure

1. Navigate to **All > Collaboration > Virtual Agent > Designer > Topics**.

2. Select the **PPM Virtual Agent** card to open it.

- To use the provided topic with no changes, select **Publish**.
- To duplicate the topic so you can customize it, select **Duplicate**. Enter a name for the duplicate topic and select **Save**.

Related topics[PPM Virtual Agent conversation flows](#)[Reusable PPM Virtual Agent topic blocks](#)**PPM Virtual Agent conversation flows**

Virtual Agent for PPM provides several predefined topic conversations to enable project managers to gather information on their business-related tasks.

The following predefined topic conversations are available to view if you have the `it_project_manager` role.

Project and task status

Project and task-related information like active projects, projects that are in the red state, projects due to end in the near future, and projects with overdue tasks and milestones. This information helps you track and plan projects per set milestones.

Resources

Resource-related information such as resource plans containing actual hours greater than allocated hours, or unallocated resource plans that are due to start in the coming week or have an extension requested. You can then manage resources and act on resource plans that are not progressing as planned.

Financials

Finance-related information such as projects where the estimate at completion amount is greater than the planned cost or projects where the estimate at completion amount is greater than the budget amount. This information helps you understand the financial performance of your projects.

RIDAC

RIDAC (Risks, Issues, Decisions, Actions, and Request Changes) related information like projects with absolute or high probability risks due in the coming week, or projects with critical or high probability issues and actions due in the current week. This information helps you analyze and identify patterns, trends, and probable resolution for planning future projects.

Data quality

Quality-related information like projects that do not have a business case, strategy, program, or portfolio assigned to them. This information helps you evaluate projects that are not aligned to any strategy, business case, program, or portfolio.

Related topics[Install Virtual Agent for PPM](#)[Enable Virtual Agent for PPM](#)[Reusable PPM Virtual Agent topic blocks](#)**Reusable PPM Virtual Agent topic blocks**

Create and reuse topics blocks to simplify the topic authoring and maintenance process. Topic blocks enable you to reuse standard procedures across conversation topics.

The following predefined reusable topic blocks are available:

- Project Topic for PPM VA
- Specific Project Options
- Project Data Quality Topic for PPM VA
- Project Financials Topic for PPM VA

- Resource Topic for PPM VA
- RIDAC Topic for PPM VA

To view just the reusable topic functions, access the Topics page in Virtual Agent Designer and select the **Topic Blocks** tab. For detailed information, see [Reusable topic blocks](#).

Project Management reference

Reference information to provide additional details about Project Management such as the fields, user roles, tables, and properties.

Properties installed with Project Management

There are several Project properties that you can configure.

You need the pps_admin role to access the Project properties.

Navigate to **Project Administration > Settings > Preferences - Project** to configure the following properties.

Property	Description
<p>Enable firing of Business Rules on save from Planning Console. This property will be applicable only during insert and delete of tasks and relations.</p> <p>com.snc.project.fire_brs_from_planning_console</p>	<p>If set to true, the project planning console triggers business rules.</p> <p>Note: Reload the console if you make changes to this property.</p> <p>Default value: false</p>
<p>Enable move project for WIP projects</p> <p>com.snc.project.move_project.wip</p>	<p>If set to true, this property enables you to move the projects which are in WIP state.</p> <p>Note: When a project is moved, only tasks in open and pending state are moved and the project takes the rolled up dates from all the project tasks.</p> <p>Default value: false</p>

Property	Description
<p>Calculate ROI percentage based on a project's estimated cost and its net value</p> <p>com.snc.project.calculate_roi</p>	<p>If set to true, this property calculates the return on investment using the (net value/ estimated cost) x 100 formula. This field is only available from the Advanced view of the Project form.</p> <p>Default value: true</p>
<p>Enable alter of planned date with Actual for Manual Project</p> <p>com.snc.project.change_planned_date_from_actual_for_manual</p>	<p>If set to true, the property recalculates the planned end date of a manual project from actual start date and planned duration.</p> <p>Default value: false</p>
<p>Enable project cost rollup (estimated and actual) – updating the cost of a project task will update the cost of its parent</p> <p>com.snc.project.rollup.cost</p>	<p>If set to true, this property updates the cost of a parent project task if the cost of the child task is updated.</p> <p>Default value: false</p>
<p>Roll up project start date from tasks</p> <p>com.snc.project.rollup_project_start_date</p>	<p>If set to true, the project planned start date rolls up from the planned start date of the earliest task. Disable this property if you want the project planned start date to remain the same despite the start date of the earliest task.</p> <p>Default value: true</p>
<p>Automatically close project milestone tasks when they change to work state</p> <p>com.snc.project.auto_close_milestones</p>	<p>If set to true, this property closes milestones automatically so you do not have to close them manually.</p> <p>Default value: false</p>
<p>Enable altering of planned date(s) for task in WIP/Closed</p> <p>com.snc.project.enable_alter_of_planned_dates</p>	<p>If set to true, this property enables you to change the planned start date for tasks even if they are in the Work in</p>

Property	Description
	<p>progress state or any of the closed states.</p> <p>Default value: false</p>
<p>Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date change. Benefit Plan Start Date will change only if the offset type for the plan is not None</p> <p>com.snc.project.date_change_cascade</p>	<p>If set to true, this property changes the start dates for a resource plan, cost plan, and benefit plan when there is a change in the project or demand start dates.</p> <p>Note: The start date of benefit plans with the offset type None does not change with the project or demand date change.</p> <p>Default value: true</p>
<p>Retain users & resource plan state as confirmed / allocated when project moves</p> <p>com.snc.project.date_change_cascade_persist_resource_plan_state</p>	<p>If set to true, this property retains the confirmed or allocated state of a resource plan, booked resources, and planned daily contour when a property is moved. On moving the project, the resource plan is reallocated or reconfirmed based on the availability of the resources in the future time period to which the project is moved.</p> <p>Note: This property is enabled only when the Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change property has been set to true.</p> <p>Default value: true</p>

Property	Description
<p>Create project(s) on confirming demands from portfolio workbench</p> <p>com.snc.project.portfolio_workbench.confirm_to_create_project</p>	<p>If set to true, this property converts all selected demands in a portfolio to projects.</p> <p>Default value: false</p>
<p>List of attributes (comma-separated) that will be copied from the originating project task</p> <p>com.snc.project.copy.additional_attributes</p>	<p>By default, the Copy Project and Copy partial project options only copy the short description, planned dates, and duration fields from source project to the target project. If additional columns must be copied, they should be declared in this property.</p> <p>Default value: blank</p>
<p>Default the expense type for a new project.</p> <p>sn_plng_att_core.default.expense_type</p>	<p>When a new project is created in the Project Workspace, expense type of the project is marked as Opex.</p>

The following project properties are available in system property [sys_properties] table. Only pps_admin can edit these properties.

Property	Description
<p>Retain start on constraint on tasks after adding relations</p> <p>com.snc.project.allow_start_on_relations</p>	<p>The property keeps the Start on selection of a task even after you put the task in a relation to another task, for example, FS relation.</p> <p>Default value: true</p>
<p>Max duration (in days) allowed for a project/project task</p> <p>com.snc.project.task.max_task_duration</p>	<p>The property governs the max duration of a project task or the overall project.</p> <p>Note: If your project includes milestones, the duration is calculated taking holidays and weekends into account.</p> <p>Default value: 2600</p>

Property	Description
	<p>⚠ Warning: Increasing the value of the property to more than 2600 will have an impact on memory usage of the platform. A very high value causes out of memory error, for example, if you try to create a project or a project task with 15000 days duration.</p>
<p>Max date span into future or past from the current date for the project/project task</p> <p>com.snc.project.task.check_date_span_years</p>	<p>The property governs the max date in future when entering the planned dates of a project or a project task.</p> <p>Default value: 10</p> <p>⚠ Warning: Increasing the value of the property to more than 10 will have an impact on memory usage of the platform. A very high value causes out of memory error.</p>
<p>Synchronize the planned and original dates when creating or updating a project or task</p> <p>com.snc.project.sync_original_dates_with_planned_dates</p>	<p>If set to true, this property synchronizes the planned and original dates.</p> <p>Default value: true</p>
<p>Use a predefined template when generating a status report</p> <p>sn_pw.project_status_report_default_templateId</p>	<p>The property specifies the default template used for generating project status reports. You can replace the existing default template with your desired template and set it as default by updating the sys id in value field of project status report default template property.</p>
<p>Generate the status report as read-only</p> <p>sn_pw.doc_status_report_read_only</p>	<p>The property restrict edits in the status report. The property sets the status report to read-only.</p> <p>Default value: true</p>

Quick start tests for PPM Standard Multicurrency

Validate that PPM Standard Multicurrency still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Project currency quick start tests require activating the PPM Standard Multicurrency – ATF Tests plugin (com.snc.ppm_multicurrency.atf).

Product currency test suite tests

Test	Description	Release version
Verify cost in project currency on cost plan	Validate the calculation of cost line breakdown with budget reference rate and verify roll up to cost plan and also for the project in project currency.	Orlando
Verify benefit in project currency on benefit plan	Validate the calculation of benefit line breakdown with budget reference rate and verify roll up to benefit plan and also for the project in project currency.	Orlando

Benefit Plan form

Learn about the fields of benefit plan form.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Project or demand to which the benefit plan belongs.
Sponsor	Sponsor for the project.
Category	Type of benefit: <ul style="list-style-type: none"> • Hard: Benefits that can be measured in terms of revenue. • Soft: Benefits that are measured in terms of value.
Sub category	Sub-categories of hard and soft benefits. The selection in Category field determines the selections available in this field.
Benefit type	Type of benefit. Select Monetary benefits .
Offset type	Field to indicate when the benefits start realizing. Select any of the following options: <ul style="list-style-type: none"> • None: The default value is None. When you select None, you need to manually enter the benefit plan start and end fiscal periods. • Milestone: After completion of a milestone. • Start Date: At the start of the project. • End Date: After the project ends.

Benefit Plan form (continued)

Field	Description
	If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the end date of the project changes, the benefit plan start date shifts to align with the new end date of the project.
Milestone	<p>Note: The field appears if you select Milestone in the Offset type field.</p> <p>Project milestones to which the benefit plan belongs.</p>
Milestone start date	<p>Note: The field appears if you select Milestone in the Offset type field.</p> <p>Start date of the selected milestone.</p>
Work start date	<p>Note: The field appears if you select Start Date in the Offset type field.</p> <p>Start date of the project or demand.</p>
Work end date	<p>Note: The field appears if you select End Date in the Offset type field.</p> <p>End date of the project or demand.</p>
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as End Date and the offset is -2, the benefit plan is two periods prior to the project end date. If the project end date shifts, the benefit plan start date shifts to two periods prior to the new project due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	<p>Starting fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date, and Duration in period values.</p> <p>The field is editable if you select None in the Offset type field.</p> <p>When you change the start fiscal period, the associated benefit breakdown values also change.</p>
End fiscal period	<p>Ending fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date, and Duration in period values.</p> <p>The field is editable if you select None in the Offset type field.</p> <p>When you change the end fiscal period, the associated benefit breakdown values also change.</p>
Associated benefit	Non-monetary benefit that is associated to this monetary benefit plan.

Financials details

Field	Description
Entered benefit	Benefit incurred from the project or demand specified in terms of entered currency. If the selected currency is different from the functional currency, the corresponding budget reference rate is used to calculate the Total planned benefit of the project.
Entered currency	Currency in which you want the benefit plan to be created.
Functional currency	Currency that is obtained from the glide.system.locale property  . For upgraded customers, if the selected currency is different from the functional currency configured in the Financial Management application, the corresponding budget reference rate is used to calculate the Total planned benefit of the project.
Total planned benefit	Estimated amount of potential benefit of the project or demand.
Benefit in functional currency	Benefit incurred from project or demand in terms of functional currency.
Actual benefit	Actual benefit that is incurred from the project or demand. This value is rolled up from the Actual benefit field of all the benefit plan breakdowns.
Recurring	Check box to indicate that the benefit is recurring for all the fiscal periods in the benefit plan.

Cost Plan form

Field	Description
Name	Descriptive name of the cost plan.
Project/ Demand	Project or demand to which the cost plan belongs.
Start fiscal period	Indicates the starting fiscal period.

Cost Plan form (continued)

Field	Description
	When you change the start fiscal period, the associated cost plan breakdowns also change. Start fiscal period also changes when you create cost plan breakdowns earlier than the start fiscal period.
End fiscal period	Indicates the ending fiscal period. When you change the end fiscal period, the associated cost plan breakdowns also change. End fiscal period also changes when you create cost plan breakdowns later than the end fiscal period.

Financials section of the Cost Plan form

Field	Description
Entered currency	Currency in which you want the cost plan to be created. If the selected currency is different from the functional currency, the corresponding budget reference rate is used to calculate the total planned cost, planned capital, planned operating of the project.
Unit cost	Cost of a single unit of the resource, which is in terms of entered currency.
Quantity	Quantity of the resource that is required.
Recurring	Option to indicate that the cost is recurring for each fiscal period. Quantity x Unit cost incurred for every fiscal period.
Cost type	Cost type definition.
Investment	Name of the investment created for the project. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Source type	Funding entity to associated with the project investment for funding. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin

Financials section of the Cost Plan form (continued)

Field	Description
	is activated or the Investment Funding (sn_invst_pln) application is installed.
Source	<p>Funding entity value from which you request fund.</p> <p>The field is available when you select a value in the Source type field.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>
Total planned cost	<p>Total estimated cost of the cost plan.</p> <p>If the cost is recurring, the calculation is Quantity x Unit cost x number of fiscal periods. If the cost is non-recurring, the calculation is Quantity x Unit cost.</p>
Functional currency	<p>Currency that is obtained from the glide.system.locale property .</p> <p>For upgraded customers, if the selected currency is different from the functional currency configured in the Financial Management application, the corresponding budget reference rate is used to calculate the total planned cost, planned capital, planned operating of the project.</p> <p>Note: If budget reference rates are not defined, then exchange rate is considered as 1. For example, if functional currency is USD, entered cost is EUR, and no exchange rate is defined, then 1000 USD equals to 1000 EUR.</p>
Cost in functional currency	Value that is rolled up from the Functional cost field of all cost plan breakdowns.
Total actual cost	Value that is rolled up from the Actual cost field of all cost plan breakdowns.
Estimate at Completion	<p>Sum of all actuals for past fiscal periods added to the functional cost for future fiscal periods.</p> <p>For example, the duration of a project is from January 01 to December 31, and if you check the Estimate at Completion in the month of May, it is calculated as: Sum of</p>

Financials section of the Cost Plan form (continued)

Field	Description
	actuals from Jan to April + Sum of functional cost from May to December.

Cost plan breakdown form

Learn and update the enabled fields of cost plan breakdown form.

Cost plan breakdown form

Field	Description
Task	Task to which the cost plan breakdown belongs.
Portfolio	Portfolio to which the cost plan breakdown belongs.
Entered currency	Currency specified in the cost plan.
Exchange rate	Rate in effect for the period corresponding to the cost plan breakdown. When the period corresponding to the cost plan break down has multiple rates, the rate in effect on the first date of that period is used. Exchange rate is used to convert entered cost into functional cost. It is obtained from the itfm_fx_rate [budget_reference_rates] table.
Actual	Actual cost generated from processed expense lines.
Cost plan	Cost plan to which the cost plan breakdown belongs.
Fiscal period	Fiscals generated at period level. For information on periods, see fiscal calendars  .
Entered cost	Breakdown amount in entered currency.
Functional cost	Functional cost obtained by multiplying exchange rate with entered cost.
Exchange rate date	First date of the fiscal period corresponding to the cost plan breakdown.

Field	Description
	end date of the project changes, the benefit plan start date shifts to align with the new end date of the project.
Milestone	Project milestones to which the benefit plan belongs. This field appears only when Milestone is selected from the Offset type field.
Milestone start date	Start date of the selected milestone. This field appears only when Milestone is selected from the Offset type field.
Work start date	Start date of the project or demand. This field appears only when Start Date is selected from the Offset type field.
Work end date	End date of the project or demand. This field appears only when End Date is selected from the Offset type field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as End Date and the offset is -2, the benefit plan is two periods prior to the project end date. If the project end date shifts, the benefit plan start date shifts to two periods prior to the new project due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Project/Demand start date, or Project/Demand end date , and Duration in periods field values. The field is editable if you select None in the Offset type field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date , and Duration in period values. The field is editable if you select None in the Offset type field. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Monetary benefit that is associated to this non-monetary benefit plan.

Non-monetary Details

Measure	Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score. Select the option Yes/No to track the benefits that are not quantifiable. When this option is selected, the only field available is Benefits achieved . You can select the check box to indicate that the benefits have been achieved.
---------	---

Non-monetary Details (continued)

Non-monetary entered benefit	<p>Estimated value of the potential benefit.</p> <p>Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods only.</p>
Non-monetary planned benefit	Benefit value that is rolled up from the benefit breakdown.
Benefits achieved	Option to indicate if the benefit is achieved.
Breakdown type	<p>Type of breakdown creation when you save the benefit plan.</p> <ul style="list-style-type: none"> • None: No breakdowns are created. • Automatic: A Non-monetary Benefit Plan Breakdowns record is created automatically with data. The breakdown is calculated linearly. • Manual: A Non-monetary Benefit Plan Breakdown record is created automatically but without data in the Entered benefit column.
Aggregation mode	<p>Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the Non-monetary planned benefit and Non-monetary actual benefit fields.</p> <ul style="list-style-type: none"> • Sum: Aggregates data from all breakdowns. • Average: Average value from all breakdowns. • Most recent: Recent breakdown value. • Max: Maximum value among the breakdowns. • Min: Minimum value among the breakdowns.
Non-monetary actual benefit	Actual benefit value that is rolled up from the actual benefit in the non-monetary benefit plan breakdown.

Project task form

Learn about the fields of project task form. The fields appear when the Project Portfolio Management is active and the Project form is in the **Basic** view. Configure the form to display the fields.

Project Task form

Field	Description
Short description	Brief description of the project task.
Number	System-generated number with a configurable prefix.
Status	<p>Status of the project task.</p> <p>The status updates automatically based on the difference of the planned end date of the task from the current date. The color of the status changes as the planned end date approaches:</p> <ul style="list-style-type: none"> • Green: The planned end date for the project task is more than the offset working days that you defined. • Yellow: The planned end date for the project task is less than the offset working days that you defined. • Red: The planned end date for the project task is past the offset working days that you defined. <p>The default offset for status calculation is 3 working days. You can update the <code>com.snc.ppm.yellow_status_duration</code> property to change the offset duration. Your project schedule determines the working days.</p> <div style="background-color: #e1f5fe; padding: 5px;"> <p>Important: The status of the project task does not affect the overall status of the project, meaning the project task status does not roll up to the project. Also, the status of the child tasks does not affect the status of the parent task.</p> </div> <p>Execute the <i>Update Active Project Task Status</i> scheduled job to update the status of your existing tasks. This scheduled job runs daily by default, however you can execute this job on demand also.</p> <p>If you do not want the status of a task to update automatically, you can change the status of the task manually. Changing the status manually, overrides the automatic update and the execution of the scheduled job does not change the status of the project task.</p> <div style="background-color: #e1f5fe; padding: 5px;"> <p>Note: Configure the property <code>com.snc.status_process_planned_task_entities</code> to include or exclude task types for automatic status updates.</p> </div>
Override status	Indicates if the project task status is updated manually. By default, this check box is deselected. When you change the Status field manually, this check box becomes selected.
State	Current state of the project. The states include: <i>Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, Closed Skipped</i> .

Project Task form (continued)

Field	Description
	The state is automatically rolled up from the project tasks. For more information, see Project calculation and Parent-child rollup task calculations .
Description	Detailed description of the project task.
Assigned to	User assigned to the project task. The following conditions apply: <ul style="list-style-type: none"> • If an assignment group is defined, only users in the assignment group appear in the lookup list. • If skills are defined, only users with those skills appear in the lookup list. • If no assignment groups or skills are defined, only users with one of the Project Management application user roles appear in the lookup list. • Users with <code>timecard_user</code> role also appear in the lookup list.
Assignment group	User group assigned to the project task.
Additional assignee list	Additional users assigned to the project task.
Percent complete	Percentage of the work that has been completed for the project task.

Details tab

Field	Description
Milestone	Option for converting the task to a milestone.
Key milestone	Option for converting the task to a key milestone.
Allow dates outside schedule	<p>Indicates whether the project task is set to start and end on a non-schedule day (outside regular project schedule) such as on a weekend. An off-schedule task can start any time during the day and on any day of the week.</p> <p>For example, if you use the project schedule Monday to Friday, 8:00 to 17:00 and a project task of duration 2 days should start on Saturday, then an off-schedule task is allowed to be scheduled on Saturday and end on Sunday. Similarly, if a task of duration 3 days starts on Friday, then an off-schedule will end on Sunday instead of ending on Tuesday.</p> <p>The option is not enabled for a parent task. The value of this field on the parent task is derived from the child tasks.</p>

Details tab (continued)

Field	Description
	<p>Note:</p> <ul style="list-style-type: none"> • There is no difference between an off-schedule and an on-schedule task if there is no schedule defined at the project. • 1 day is 8 hours for a task in regular schedule and 24 hours for a task outside schedule.

Dates tab

Field	Description
Planned start date	<p>Estimated date and time for the project task to start. You can edit this date when the Time constraint is Start on Specific Date, Start no earlier than, or Start no later than.</p> <p>If the constraint type is Start ASAP or Start no later than, changing the planned start date for a task changes the constraint type to Start no earlier than.</p>
Planned end date	<p>Estimated date and time for the project task to end.</p> <p>For a manual project, any update to the actual start date does not update the planned end date of the project task. Enable the project property Enable alter of planned date with Actual for Manual Project to update planned end date from the actual start date and planned duration.</p>
Planned duration	<p>Estimated length of time (from start time to end time) of the project task.</p>
Planned effort	<p>Estimate of how much time it will take to complete this task. After you add child tasks, this field becomes read-only, rolls-up calculation and overwrites any earlier entry that you made.</p>
Constraint date	<p>A read-only field that determines the start date for tasks with Start no earlier than, Start no later than, and Start on specific date constraints. Use the Move project related link to change this date. For more information, see Change the planned start date of a project.</p>
Original start date	<p>Original planned date and time for the task to start.</p>

Dates tab (continued)

Field	Description
Actual start date	<p>Date on which the project task started. The task is set to Work in Progress when the actual start date is populated.</p> <p>When you change the State or Percent complete of the task, the actual dates are auto-populated with the date component copied from the planned dates.</p> <p>When you populate the actual start and end dates, the time component in actual dates is defaulted to the date component in planned dates when the derive time component from planned dates field on Project form is set to True.</p>
Actual end date	<p>Date on which the project task ended. The task is set to Closed Complete when the actual end date is populated.</p>
Actual duration	<p>Duration of the task from task start to task closure. As with planned duration, the actual duration shows total task time.</p>
Actual effort	<p>Actual number of hours charged from the resources on this project task. If you are using the Time Card Management application, the value for the field comes from the application automatically. The application calculates the actual effort on the task by taking the total time worked from all approved time cards of all resources who worked on the task.</p>
Time constraint	<p>When the project task begins:</p> <ul style="list-style-type: none"> • Start ASAP: The task starts as soon as possible as determined by the relationships and dependencies. The dates for these tasks are derived from the constraint date of the project. • Start on specific date: The task starts on a date that you specify. The task dependencies are not considered for date calculation. • Start no earlier than: The task starts on or after the constraint date. • Start no later than: The task starts on or before the constraint date. The start date is determined by the relationships and dependencies.

Dates tab (continued)

Field	Description
	<p>Note: If the Calculation field on the Project form is set to Manual, you cannot change the constraint type for such projects. To change the constraint type, change the project to Automatic.</p>
Original end date	Original planned date and time for the task to end.

Notes tab

Field	Description
Activity / Work notes / Additional comments	Information about the milestones, impediments, or changes as the project progresses. Enter notes or comments in the Activity field and click Additional comments or Work notes . The text appears in the feed.

Checklist tab

Field	Description
Checklist	Checklist to track items that must be completed for the task.

Planned Task Relationship form fields

Field	Description
Predecessor	The predecessor, or determiner, in the relationship. You can select a new task. However, it is a good practice to delete the relationship and create a new relationship between the correct tasks.
Successor	The successor in the relationship. The successor depends on the predecessor. You can select a new task. However, it is a good practice to delete the relationship and create a new relationship between the correct tasks.

Planned Task Relationship form fields (continued)

Field	Description
Type	The type of relationship, which is always Predecessor of::Successor of . Do not change this value.
Sub Type	The type of dependency.
Lag	The lag time between the tasks. The Enter the days, hours, minutes, and seconds for the lag. Lag time can be positive or negative.

Portal board widget form

Learn about the fields of portal board widget form.

Portal board widget form

Field	Description
Name	Unique name for the widget you are configuring.
Order	The order in which your widgets appear on both your Investment Board and the Investment Portal page. Lower numbers are placed ahead of higher numbers. For example, a widget with an order set to 100 appears before a widget with an order set to 200.
Aggregate type	Type of aggregation applied for the investment widget calculation: Sum, Average, Minimum, Maximum, and Count . For example, you are aggregating the actual cost of three projects, A, B, and C, surfaced by a filter. Actual costs are 1000 for project A, 2000 for project B, and 3000 for project C. If sum is selected as the aggregate type, then the actual cost metric value would be 6000. If average is selected as the aggregate type, then the actual cost metric value would be 2000. If minimum is selected as the aggregate type, then the actual cost metric value would be 1000. If maximum is selected as the aggregate type, then the actual cost metric value would be 3000. If count is selected as the aggregate type, then the actual cost metric value would be 3.
Scripted	Check box to specify a script for the investment widget calculation.
Show Label	Check box to display either the label or the color indicator. If you clear the check box, the Color field displays, which allows you to set the color.
Active	Check box to indicate that the investment widget is active.
Display on board	Check box to display the investment widget on your investment board.
Parent widget	Parent widget for this investment metric widget. A parent widget can have up to a maximum of three child widgets.

Portal board widget form (continued)

Field	Description
Include by default	<p>Check box to show an active investment widget by default on:</p> <ul style="list-style-type: none"> • new boards • existing boards that do not have widget selection configured <p>The check box is selected by default.</p> <p>For more information on configuring widgets on an investment board, see Widget Configuration.</p>
Short description	Brief description about the investment widget.
Script	<p>Script written for the dynamic calculation of investment widget. This field is displayed only when the Scripted check box is selected.</p> <p>The following script returns a string containing the desired output to be displayed on widget. Five variables (which are programmatically introduced to the script) are available:</p> <ul style="list-style-type: none"> • projectFilter: Project filter of Investment Portal board. • demandFilter: Demand filter of Investment Portal board. • projectClass: Project class of Investment Portal board which is used during teamspaces value evaluation. It returns tsp1_project for Teamspace1 Portal Board. • demandClass: Demand class of Investment Portal board which is used during teamspaces value evaluation. It returns tsp1_demand for Teamspace1 Portal Board. • boardSysId: SysId of Investment Portal board. It provides access to more information on Investment Portal board when needed. <p>Sample scripted widget for project cost</p> <pre>totalProjectCost(); function totalProjectCost() { var totalCost = 0; if(!JSUtil.nil(projectClass) && !JSUtil.nil(projectFilter)) { var projectGa = new GlideAggregate(projectClass); projectGa.addEncodedQuery(projectFilter); projectGa.setGroup(false); projectGa.addAggregate('SUM', 'cost'); projectGa.query(); if(projectGa.next()) {</pre>

Portal board widget form (continued)

Field	Description
	<pre> if(projectGa.getAggregate('SUM', 'cost')) totalCost += parseFloat(projectGa.getAggregate('SUM', 'cost')); } } return PPMCurrencyHelper.defaultCurrencySymbol() + PPMCurrencyHelper.getFormattedAmount(totalCost); } </pre>

Project section of the Portal board widget form

Field	Description
Project aggregate column	Aggregation is applied on the selected column of the Project [pm_project] table.
Project table	Table from which projects are being filtered.
Project filter	Criteria applied to filter projects from the Project table.

Demand section of the Portal board widget form

Field	Description
Demand aggregate column	Aggregation is applied on the selected column of the Demand [dmn_demand] table.
Demand table	Table from which demands are being filtered.
Demand filter	Criteria applied to filter demands from the Demand table.

Risk, issues, decisions, actions, and request change (RIDAC) form

Learn about the fields of the RIDAC form.

Risk form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the risk. All new risks are created in the Pending state.</p> <p>The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped.</p>
Risk status	Status of the risk. It provides information on current status of the risk, whether it is achieved or mitigated or accepted.

Risk form (continued)

Field	Description
	The available options are: Pending, Achieved, Not Achieved, Avoid, Mitigate, Transfer, and Accept.
Probability	The likelihood that the event described in the risk will occur. The available options are: Absolute, High, Moderate, and Low
Impact	Impact of the risk event on the outcome of the project.
Estimated cost	Estimated cost the risk event generates.
Risk rank	A value and color assigned to the risk. This value is calculated using risk probability and impact. You can configure the color and value using Risk Value Lookup. For more information, see Configure custom Risk rank and Risk value for a project .
Risk owner	Primary resource who is responsible for monitoring and managing the risk.
Assigned to	Primary resource assigned to work on the risk.
Risk value	A value calculated from Risk Value Lookup. For more information, see Configure custom Risk rank and Risk value for a project .
Due date	Requested date for the assigned resource to resolve the risk or the date on which the risk must be closed or addressed if not assigned to any resource.
Show on project status report	Option to specify whether the risk information should be included in the project status report.
Task	Project to which this risk belongs.
Short description	Brief description of the event and its potential impact on the success of the project. If the risk is created from the risk library, then this field displays the Risk Statement name.
Description	Details of the event and its potential impact. If the risk is created from the risk library, then this field displays the Risk Statement short description.
Actual cost	Cost generated by the risk event. This information gets added when and if the event occurs.
Mitigation plan	Brief description of efforts taken to mitigate the risk.

Risk Assessment Summary section in the Risk form

Field	Description
Inherent risk	This field gets auto-populated with the risk scores when the risk assessor assesses the inherent risk.
Elevated to enterprise risk	This option gets selected automatically when the risk is elevated to enterprise risk by the project manager.

Risk Assessment Summary section in the Risk form (continued)

Field	Description
Residual risk	This field gets auto-populated with the risk scores when the risk assessor assess the residual risk.
Enterprise inherent risk	This field gets auto-populated with the risk scores when the risk assessor assesses the enterprise inherent risk.
Enterprise residual risk	This field gets auto-populated with the risk scores when the risk assessor assesses the enterprise residual risk.

Issue form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the issue. All new issue records are created in the Open state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency of resolving or managing the issue based on possible impact.
Estimated cost	Estimated cost the issue generates.
Impact	Impact on the outcome of the project if the issue remains unresolved.
Due date	Requested date for the assigned resource to resolve the issue or the date on which the issue must be closed or addressed if not assigned to any resource.
Assigned to	Primary resource assigned to work on the issue resolution.
Parent	Project to which this issue belongs.
Show on project status report	Option to specify whether the issue information should be included in the project status report.
Short description	Brief description of the issue and its potential impact on the success of the project. As you start typing the title for your issue, related issues that potentially match your issue are displayed. Select the suggestion icon () to select from the list of predefined issue descriptions.
Description	Details of the issue and its potential impact.
Work notes	Information to record and track the work accomplished for resolving the issue.

Decision form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the decision. All new decision records are created with Open state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency of approving or implementing the decision based on possible impact.
Decision status	Status of the decision. The available options are: Pending, Approved, and Rejected.
Impact	Impact on the outcome of the project if you do not implement the decision.
Approval required	Option for determining whether approval of the decision is required.
Estimated Cost	Estimated cost of implementing the decision.
Due date	Requested date on which the decision must be approved or implemented.
Assigned to	Primary resource assigned to work on the decision. The default value is the name of the user creating the decision record.
Parent	Project number to which this decision belongs.
Show on project status report	Option to specify whether the decision information should be included in the project status report.
Short description	Brief description of the decision such as what the decision is about, who made it, what it affects, and the decision outcome. As you start typing the title for your decision, related decisions that potentially match your decision are displayed. Select the Suggestion icon () to select a description from the list of predefined decision descriptions.
Description	Details of the decision and its potential impact.
Work notes	Information to record and track the status of decision implementation or approvals.

Action form

Field	Description
Number	System-generated number with a configurable prefix.
State	Current state of the action. All new action records are created with the state set to Open. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency for implementing or approving the action based on impact.

Action form (continued)

Field	Description
Estimated Cost	Estimated cost the action generates.
Impact	The impact on the outcome of the project if you do not implement the action.
Approval	Status of approval from the stakeholders for the action. A user with approval administrator role can only change the status of approval.
Assigned to	Primary resource assigned to implement the action.
Due date	Requested date on which the action must be approved or implemented.
Parent	The project to which this action belongs.
Show on project status report	Option to specify whether the action information should be included in the project status report.
Short description	<p>Brief description of the action such as what the action entails, how to implement the action, who it affects, and the action outcome.</p> <p>As you start typing the title for your action, the related actions that potentially match your action title appear.</p> <p>Select the Suggestion icon () to select a description from the list of predefined actions.</p>
Description	Details of the action and its potential impact.
Work notes	Information about the action. Add work notes to communicate about the status of action approval, rejection, or implementation with other users.

Request Change form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the request change. All new request change records are created in the Open state.</p> <p>The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped</p>
Priority	Urgency for approving the requested changes based on impact.
Estimated Cost	Estimated cost the requested changes generate.
Impact	Impact on the outcome of the project if you do not approve the requested changes.
Approval	Status of approval from the stakeholders for the requested changes.
Assigned to	Primary resource assigned to work on the request change.
Due date	Requested date to complete the request change.
Category	Entity for which you are creating the request change. The options are: Resource, Scope, Cost, and Schedule.

Request Change form (continued)

Field	Description
Parent	Project number to which this request change belongs.
Show on project status report	Option to specify whether the request change information should be included in the project status report.
Title	Title for the change request.
Description	Details of the request change and its potential impact.
Business Justification	Reason for requesting the proposed change in the project and its impact on the business.
Work notes	Additional information to indicate progress on the project request change.

Risk value matcher form

Learn about the fields of risk value matcher form.

Risk Value Matcher form

Field	Description
Impact	Impact value of the risk. The default values are: <ul style="list-style-type: none"> • 1 = High • 2 = Medium • 3 = Low
Application	The application to which these risk values belong.
Risk Rank Color	Color to indicate the severity of the risk. 💡 Tip: You can enter variations of a color to differentiate between risks with similar impact and probability values. For example, you could enter lightgreen to indicate a low-severity risk.
Risk Value	The value for the specified risk impact and probability combination. The options are: High, Medium, and Low. This value is displayed in the Risk value field of the Risk form.
Probability	Risk probability value to associate with the impact value of the risk. The options are: Absolute, High, Moderate, and Low.

Risk Value Matcher form (continued)

Field	Description
Probability Number	<p>Numerical value to indicate the probability. This value is multiplied by the value of the Impact field for calculating risk rank.</p> <p>The default values are:</p> <ul style="list-style-type: none"> • 1 = Absolute • 1 = High • 2 = Moderate • 3 = Low <p>The calculated risk rank and the risk rank color are displayed in the Risk rank field of the Risk form.</p>

Scheduled Script Execution Form

Use the scheduled script execution form to define a scheduled job.

Schedule Item form

Field	Description
Name	Name that identifies this scheduled job.
Active	Option that indicates that scheduled job is active and should be executed at the specified date and time.
Run	<p>Time interval to use for running the scheduled job:</p> <ul style="list-style-type: none"> • Daily: Runs daily, at a designated time. • Weekly: Runs on a weekly basis, at a designated time and day of the week. • Monthly: Runs on a monthly basis, at a designated time and day of the month. • Periodically: Runs on a designated repeating interval. • Once: Runs for a single occurrence only. • On Demand: Runs immediately on demand. • Business Calendar: Entry Start: Runs on the starting entry dates for the business calendar that you select in the Business Calendar field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. <p>For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month.</p> <ul style="list-style-type: none"> • Business Calendar: Entry End: Runs for the ending date for the business calendar that you select in the Business Calendar field. This selection runs in

Schedule Item form (continued)

Field	Description
	<p>the same manner as Business Calendar: Entry Start, but for the end dates of the associated business calendar entries.</p> <p>Note: When you select Business Calendar: Entry Start or Business Calendar: Entry End, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. To learn more, see the Offset type and Offset fields.</p> <p>To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.</p>
Time zone	<p>Time zone to use with the Time field entry when you specify the time at which the scheduled job should run. Select a time zone entry:</p> <ul style="list-style-type: none"> -None-: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it is the user's assigned time zone, and you enter 16 : 45 into the Time field. Use System Time Zone: Use the default system time zone that is specified for the instance in which it runs. For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter 22 : 15 in the Time field. Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select US/Eastern, and enter 13 : 30 in the Time field.
Day	<p>Day on which the scheduled job should run.</p> <ul style="list-style-type: none"> If Run is set to Weekly, select the day of the week. For example, select Wednesday. If Run is set to Monthly, select the day of the month. For example, select 25 for the 25th day of the month. <p>This field appears only if you select Monthly or Weekly in the Run field.</p>
Repeat Interval	<p>Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example:</p> <ul style="list-style-type: none"> To run the scheduled job every four days, enter 04 in the Days field. To run it every 26 hours, enter 26 in the Hours field. If it should repeat at an interval of 13:30:25, enter 13 in the Hours field, and then enter 30 and 25 in the two unlabeled fields after it. <p>These fields appear only if you select Periodically in the Run field.</p>

Schedule Item form (continued)

Field	Description
	<p>Note: This setting does not account for Daylight Saving Time changes. For example, if you select a period of one day, the calculation adds 24 hours to the starting time of the job. If the start time is in a Daylight Saving Time (DST) period, the job runs with a one-hour offset when that time zone is not in DST.</p>
Business Calendar	<p>Business calendar entry that you are using to determine the business calendar start or end date for the scheduled job. This field appears only if you select Business Entry: Start Date or Business Entry: End Date in the Time field.</p>
Offset Type	<p>Type of time offset, if any, to apply to the business calendar that you selected for scheduling this job:</p> <ul style="list-style-type: none"> • Past: Apply an offset factor to schedule the job to run before the start of the time span of the selected business calendar. • Future: Apply an offset factor to schedule the job to run after the end of the time span of the selected business calendar. • --None--: Do not apply a time offset when scheduling this job. <p>Adding an offset factor enables you to schedule the job to run before, or after, the formal time span that is defined in the business calendar for the following use cases:</p> <ul style="list-style-type: none"> • Schedule a job at a certain time, outside of the time span for the selected business calendar. • Arrange multiple jobs to run in sequence, around the time span of the selected business calendar. <p>The Offset type and Offset fields appear only if you select Business Calendar: Entry Start or Business Calendar: Entry End in the Run field.</p>
Offset	<p>Amount of time offset, expressed in days, hours, minutes, and seconds, to apply to the business calendar that you selected for scheduling this job. For example, if you want to schedule the job to start three days, 14 hours, 10 minutes, and 45 seconds before the business calendar start date, do the following actions:</p> <ul style="list-style-type: none"> • Select Past in the Offset type field. • Enter 3 in the Days field. • Enter 14, 10, and 45 in the Hours field. <p>The Offset Days and Hours fields appear only if you select Business Calendar: Entry Start or Business Calendar: Entry End in the Run field, and Past or Future in the Offset type field.</p>
Time	<p>Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the Time zone field determines the time zone for this entry.</p>

Schedule Item form (continued)

Field	Description
	<p>Note: Time values are always saved in the ServiceNow AI Platform[®] in UTC time and then translated into the proper time. This translation depends on the selected Time zone and the entry in the Time field.</p> <p>This field appears only if you select Daily, Weekly, or Monthly in the Run field.</p>
Starting	Date and time of the first scheduled job generation. Select the calendar date and time. This field appears only if you select Periodically in the Run field.
Priority	<p>Numerical priority for the scheduled job:</p> <ul style="list-style-type: none"> • Set essential jobs to a priority value below 100. • Set nonessential jobs to a priority above 100. • If 70 percent or more of all scheduled jobs are Overdue, any jobs that are marked with a value above 100 do not run.
Run as	Name of the user who is creating and running the scheduled job. To assign the scheduled job to the system instead of the person creating the scheduled job, create a system or dummy user and add it to this field.
Conditional	Option for enabling the running of the scheduled job if certain conditions are met in the associated script.
Condition	Conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select Use conditions .
Starting	Date and time of the first scheduled job generation. Select the calendar date and time. This field appears only if you select Periodically in the Run field.

Status report form

Learn about the fields on the status report form.

Status report form fields

Field	Description
Project	Name of the project.
Status Date	Date until which you want to generate the status report.
Number	A system generated number for the status report with a configurable prefix.
State	Current state of the project.
Percent complete	Percentage of the project that has been completed.
Planned start date	Planned start date of the project.
Planned end date	Planned end date of the project.

Status report form fields (continued)

Field	Description
Actual start date	Actual start date of the project.
Actual end date	Actual end date of the project.
Estimated cost	Estimated cost of the project.
Actual cost	Actual cost of the project.

Overall status tab details

Field	Description
Overall health	Color to signify the status of the overall health of the project in the report.
Executive Summary	Brief summary and analysis of the project.
Comments	Comments for the overall status.
Last Week's Achievements	Progress of the project in the last week.
Key Activities planned	Next planned activities for the project.

Schedule tab details

Field	Description
Schedule	Color to signify the status of the schedule-related information of the project in the report.
Comments on Schedule	Comments related to the project schedule.

Cost tab details

Field	Description
Cost	Color to signify the status of the cost-related information of the project in the report.
Comments on cost	Comments related to the project cost.

Resource tab details

Field	Description
Resources	Color to signify the status of the resources-related information of the project in the report.
Comments on Resources	Comments related to the project resources.

Scope tab details

Field	Description
Scope	Color to signify the status of the scope-related information of the project in the report.

Scope tab details (continued)

Field	Description
Comments on Scope	Comments related to the project scope.

Multicurrency fields in project-related forms

When you enable the Project Currency view in Project, Cost Plan, and Cost Plan Breakdown forms, you can observe multicurrency fields in the Financials section of the forms.

Financials tab of the Project form

Project form

Field	Description
Project currency	<p>Currency in which the project is to be implemented.</p> <p>Note:</p> <p>The Project currency field defaults to the Functional Currency if you modify the currency field and save the Project form without selecting a currency.</p> <p>The Project currency field of a project becomes read-only field and cannot be modified once you create a cost plan, cost plan breakdown, benefit plan, benefit plan breakdown, or an expense line for the project.</p>
Total planned cost in project currency	Estimated cost of the project in project currency.
Planned capital in project currency	Capital expenditure (Capex) for the project.
Planned operating in project currency	Operational expenditure (Opex) for the project in project currency.
Budget cost in project currency	Budgeted cost in local currency for the project.
Actual cost in project currency	Actual cost of the project in local currency.
Estimate at completion in project currency	Sum of all actuals for past fiscal periods added to the functional cost for future fiscal periods in project currency.
Planned benefit in project currency	Planned benefit for the project in project currency.
Planned return in project currency	Difference between Planned benefit and Planned cost values.

Project form (continued)

Field	Description
Planned ROI %	Percentage calculated based on the values in the Planned return and Estimated cost fields.
Net present value in project currency	Present value of future cash in project currency based on the given annual interest rate.
Internal rate of return %	Annual interest rate required to achieve the net present value (NPV) of zero.
Estimate to completion in project currency	Sum of functional cost for all fiscal periods in project currency.

Preferences section of the Project form

Field	Description
Status report currency	<p>Currency in which the project status report is generated.</p> <p>If you have the Project currency view enabled in the Project form, then you have the choice to generate the project status report using any of the following currency options:</p> <ul style="list-style-type: none"> • Functional currency: Currency obtained from the glide.system.locale property in which the project status report is created. • Project currency: Project status report is created in the local currency that is selected. If you select Project currency, you can view the planned cost and actual cost in the selected project currency. <p>To view the status report of the project, see View project status reports.</p>

Financials section of the Cost Plan form

Cost Plan form

Field	Description
Project currency	Currency in which you can create the cost plan.
Cost in project currency	Value that is rolled up from the Entered cost field of all cost plan breakdowns.
Total actual cost in project currency	Value that is rolled up from the Actual cost field of all cost plan breakdowns in project currency.

Cost Plan form (continued)

Field	Description
Estimate at completion in project currency	Sum of all actuals for past fiscal periods added to the functional cost for future fiscal periods in project currency.
Estimate to completion in project currency	Sum of functional cost for all fiscal periods in project currency.

Note:

Any change that you make to the unit cost, quantity, or fiscal period of a cost plan has the amounts recalculated in project currency. See [Updates in cost plan and recalculation of cost in project currency](#).

Multicurrency fields in the Cost Plan Breakdown form

Cost Plan Breakdown form

Field	Description
Exchange rate for project currency	Rate in effect for the period corresponding to the cost plan breakdown in project currency.
Project currency	Local currency selected for the cost plan breakdown.
Cost in project currency	Breakdown amount in project currency.
Actual cost in project currency	Actual cost generated from processed expense lines in project currency.
Variance project currency	Difference between Cost in project currency and Actual cost in project currency.
Budget	Project budget amount entered for a fiscal year gets distributed equally into monthly breakdowns in functional currency.
Budget cost in project currency	Project budget amount entered for a fiscal year gets distributed equally into monthly breakdowns in project currency.

Financials section of the Benefit Plan form

Benefit Plan form

Field	Description
Project currency	Project currency that was selected in the project is populated. Benefit plan attached to a project inherits the same currency as that of the project.
Benefit in project currency	Benefit incurred from project or demand in project currency.

Multicurrency fields in the Benefit Plan Breakdowns form

Benefit Plan Breakdowns form

Field	Description
Project currency	Currency that is selected in the Project form.
Benefit in project currency	Benefit incurred from project or demand in project currency.
Project currency exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown in project currency.
Project currency reference rate	Rate at which the entered currency is exchanged for project currency.

Multicurrency fields in the Expense Line form

Expense Line form

Field	Description
Project currency	Currency inherited from the project if the project has a related expense line.
Amount in project currency	Expense cost in project currency. Amount entered in the Amount field is converted to project currency.

Multicurrency fields in the Project Funding form

Project Funding form

Field	Description
Capital budget in project currency	Planned expense amount allocated for capital expenditure in the selected currency.
Operating budget in project currency	Operating expense amount in the selected currency.
Budget in project currency	Sum of Capex and Opex amounts. The total project funding budget amount rolls up to the Budget cost in project currency field.
Project currency	Currency in which the project is funded.
Exchange rate	Currency conversion based on the exchange rates between currencies.
Exchange rate date	Date on which the exchange rate is applied.
Exchange reference date	Budget Reference Rate from where the exchange rate is retrieved.

Cost rollup in project currency

Cost rollup calculation in projects and sub-projects with different currencies varies with the budget reference rate. The rate at which the amount is converted depends on the conversion rate.

Convert amount entered in functional currency fields to project currency

When you create a project in functional currency of the Default view, you can manually enter or update the amount in the **Planned capital**, **Planned operating**, **Actual cost**, and **Planned benefit** fields. As you enter values in these fields, the amount is converted to project currency and stored in the corresponding project currency fields such as **Planned cost in project currency**, **Planned operating in project currency**, **Actual cost in project currency**, and **Planned benefit in project currency** fields.

Note:

You can do so only if the project does not have a cost plan, benefit plan, or expense lines attached to it.

Roll up project financials from sub-projects to parent projects

Use the `com.snc.project.multicurrency.rollup_if_different` property for financial rollups when the sub-projects and parent project have different project currencies.

Multicurrency cost rollup property behavior

Property flag	Behavior
True	<p>If the property is set to True, then you can:</p> <ol style="list-style-type: none"> 1. Associate a sub-project to a parent project, where both the projects have different project currencies. 2. Roll up the sub-project amounts to the parent project amounts. However, the accuracy of the rolled up amount in the parent project varies because of the currency variation. <ul style="list-style-type: none"> ○ If the project currencies of the parent project and the sub-project are the same, then the project currency amounts from the sub-projects to its parent and the top project are rolled up by adding up the amounts in the sub-project, and the rolled up amount is accurate. ○ If the project currencies of the parent project and the sub-project are different, then all the costs of the sub-projects are converted to the project currency of the parent or the top project, referencing the Budget Reference Rate. The rate at which the amount is converted depends on the exchange rates between the project currencies, and the specified time period

Multicurrency cost rollup property behavior (continued)

Property flag	Behavior
	at which the conversion is made. Hence, the rolled up amount is only an estimate or an approximate value.
False	<p>If the property is set to False, then you can:</p> <ol style="list-style-type: none"> 1. Associate any number of sub-projects to a parent project, where the project currencies are same or different. 2. Roll up only if the project currencies of the sub-project and the parent project match.

However, the behavior of *com.snc.project.multicurrency.rollup_if_different* property is different when flagged along with *com.snc.project.rollup.cost* property.

Multicurrency cost rollup property in combination with functional currency property

Properties flag	Behavior
<i>com.snc.project.rollup.cost</i> property is false	You can associate any sub-projects with parent project that have same or different project currency but the costs of sub-projects do not roll up to the parent project.
<i>com.snc.project.rollup.cost</i> property is true and <i>com.snc.project.multicurrency.rollup_if_different</i> property is false	You can associate sub-projects with parent project that has the same project currency.
<i>com.snc.project.rollup.cost</i> property is true and <i>com.snc.project.multicurrency.rollup_if_different</i> is true	You can associate any sub-project that has the same or different project currency with the parent project.

Illegal association of properties and possible errors

Following are the possible errors that may occur while making an illegal association:

Property combinations for sub-project and parent project association

com.snc.project.rollup.cost	com.snc.project.multicurrency.rollup_if_different	Behavior
False	Either true or false	Can associate sub-project to parent project even though project currency of sub-project and parent project is different but costs from sub-project to parent project cannot be rolled up.

Property combinations for sub-project and parent project association (continued)

com.snc.project.rollup.cost	com.snc.project.multicurrency.rol	Behavior
True	False	<p>Cannot associate sub-project to parent project if project currency of the sub-project and parent project is different.</p> <p>In such case of an association, an error message: System policy does not allow parent and child projects to have different project currency pops up.</p>

Project currency in cost and benefit plans

The currency fields in cost and benefit plans defaults to the project currency of the project.

Entered currency field in cost and benefit plans

The **Entered Currency** field of the cost plan defaults to the project currency of the project if multicurrency plugin is installed, irrespective of the views – default or functional currency. However, if multicurrency plugin is not installed, the **Entered currency** field of the cost plan defaults to the functional currency of the project.

Similarly, the **Entered Currency** field of the benefit plan defaults to the project currency of the project if multicurrency plugin is installed, irrespective of the views – default or functional currency. However, if multicurrency plugin is not installed, the **Entered Currency** field of the benefit plan defaults to the functional currency of the project.

Project Workspace

ServiceNow® Project Workspace helps project managers to plan and manage projects from a central location.

The new Project Workspace comes with a Planning, Details, Financials, RIDAC, Analytics, Docs, Status Reports, and Resources page.

Project Workspace Overview

The Project Workspace enables you to collaborate, plan, organize, and execute tasks in a single workspace. This application provides the ability to create and monitor projects, tasks, sub-projects, dependencies, and timelines. Project managers can allocate and optimize resources within the Project Workspace and make sure that the right individuals are assigned to the right tasks. With Project Workspace, you can plan and track your project finances, budgets, and cost plans. This project management application helps in making informed and timely decisions by providing relevant project information in one place.

Use playbooks to deliver a guided, stage-based experience within the project workspace.

Create a status report for your projects and run analytics for your projects. Experience the Gen AI feature in Project Workspace. Summarize, elaborate, or shorten the selected content on Docs to quickly understand the key information in documents using Project Gen AI Docs skill.

Refine planning item descriptions using write items skill to improve the clarity and completeness of your work item and reduce the rework due to missing or unclear planning item information.

Exploring Project Workspace

The ServiceNow[®] Project Workspace application helps you to manage projects, resources, and financials in a single workspace.

Project Workspace overview

Project Workspace is a project management application that optimizes different workflows and enables planning and managing of projects or tasks, resources, and financials in one place. This application centralizes access to Projects, subprojects, project tasks, resources, and financials, reducing the need to navigate through various applications.

The Project Workspace provides Project Managers with a comprehensive overview of the all projects and project-related information. This project management application enables better project planning by providing ways to define project scope, dependencies, and time lines.

Project Workspace benefits

Benefit	Feature
Initiate a project and start planning your project tasks.	Create a project and initiate project planning
Add project tasks to your project and assign tasks directly to your team for successful project implementation.	Create project tasks and add them to your project
Add project task dependencies to establish a structured workflow within the project.	Create internal dependencies for your project
Add a dependency between tasks of different projects to align timelines between interrelated projects.	Connect tasks in different projects through external dependencies
Create and compare baselines for your project to capture the project's progress over time.	Set up a baseline for your project
Create a status report to monitor project health, metrics, risks, issues, and milestones.	Create a status report in Project Workspace
Tag stakeholders for their feedback or notes and add comments to collaborate on your project.	Collaborate with Stakeholders for your project
Generate a summary of selected text in Docs using Now Assist.	Generate the summary for selected or complete content with Project doc summarization skill in Project Workspace
Generate and schedule project summary emails for your projects.	Schedule the project insights email
Add Risk, Issue, Decision, Action, or Change request to your project to track and manage the RIDAC records throughout project development.	Add a RIDAC record to your project
Export your project as a PowerPoint file directly from the workspace without copying the project information in to slides.	Export a project to Microsoft PowerPoint
Create and track resource assignments at project or task level to optimize resource allocation throughout the project.	Create resource assignments and initiate resources planning
Create a cost plan for the required duration to monitor your projected and actual expenses.	Create a cost plan for your project
Add an expense line into project cost plans to establish a comprehensive and detailed financial framework for your project.	Add an expense line for a cost plan
Generate labor costs for attribute-based resource assignments to track expenses for your project.	Generate labor costs for your project
Collaborate with team members, save notes, generate project charters, and create project briefs using Docs.	Collaborate on projects using Docs

Benefit	Feature
Secure a project to ensure only authorized users can access the project.	Enable security for a project in Project Workspace
Configure and use playbooks in Project Workspace to guide project teams through standard project stages and activities.	Use Playbooks in Project Workspace

Project planning in Project Workspace

Plan your projects with an intuitive Project Workspace application to achieve successful project outcomes.

The Project Workspace application enables Project Managers to define, plan, and prioritize projects, subprojects, project tasks within a single workspace.

The Project Workspace structures the project planning phase from defining the project dates and milestones to allocating resources, scheduling tasks, and establishing dependencies.

Key benefits

Use the planning page to organize project tasks, allocate resources, and set project timelines. As a project manager, you can:

- Initiate new projects, define project details, objectives, and initial plans to provide a clear direction to the project team.
- Establish the project's structure within the workspace, including creating projects, subprojects, tasks, milestones, and dependencies.
- Define the planned start date and end date for your projects.
- Allocate resources and analyze resource availability and utilization for projects.
- Monitor the progress of projects, subprojects, tasks, and milestones. Track the project's overall advancement.
- Organize and manage project documentation and make sure that all relevant files, reports, and data are easily accessible.
- Engage in financial planning, tracking budget allocations, expenses, and financial metrics.

Project task checklist items

Track the activities that must be completed on a task using the project task checklist items.

For a project task to be considered complete, you can track activities that do not require separate sub tasks. For example, you have a human resources-related project that includes a task for interviewing candidates. You can also track booking a meeting room or getting an interview confirmation from the candidate. Create a checklist item for each and mark when they have been completed.

Checklist items do not have start or end dates, nor do they track effort or cost. By default, a checklist item record provides only a name with a check box, which can be selected or unselected. The state of the project task is independent of the state of the checklist items.

Checklists, as well as tasks, are copied into a project template. You also have access to all checklist templates from any project task form.

[Create checklist items for a project task](#)

Playbooks in Project Workspace

Organize and guide project teams with Playbooks to maintain consistency, streamline projects, and keep work on track.

Playbooks overview

A Playbook provides a guided framework that helps you follow a process step by step. It shows what to do, when to do it, and where to find the tools or information required to complete each task.

Playbooks provide a structured way to manage work by guiding teams through predefined steps. You can apply a playbook to processes such as managing a project, resolving an issue, launching a product, onboarding new employees, or define key steps of a process. For more information on playbooks, see [Workflow studio playbooks](#) .

Playbook benefits

Use playbooks in Project Workspace to guide project teams through standard project stages and activities and ensure consistency across all projects. For example:

- Set up a new project using predefined stages and action items.
- Provide self-educating guidance for first-time users.
- Verify key steps such as defining objectives, assigning tasks, and tracking deliverables are completed on time.
- Support processes that require stage gating and control over each step.
- Combine with Flow Designer to set up different business logic for each playbook flow.

Types of Playbooks

- Project default
- Stage-gate default

Project default playbook is a free-form playbook where all stages and tasks are visible and accessible to the project manager. The project manager can navigate to any stage or task at any time. It serves as a standard framework playbook for managing project activities.

In a Stage-gate playbook, the stages and tasks must be completed in a linear order. Each stage must be finished before moving to the next one. The stages are visible only when all activities in the previous stage are completed or skipped. After completing a stage, project managers can still return to previous stages if needed. This playbook is commonly used in research and development projects.

[Use Playbooks in Project Workspace](#)

Resource planning in Project Workspace

Plan and allocate resources using the Project Workspace application to enable optimal resource utilization and execution.

The Resource Management application enables Project Managers to create resource assignments, allocate resources, and analyze resource availability in Project Workspace. The Resource Management application can be used along with Project Workspace for any project or project tasks.

Key benefits

The Resource Management application provides visibility into resource assignments and allocations in Project Workspace at any phase of the project.

With Resource Management in Project Workspace, you can:

- Assign resources at any stage of project development. Resources can be planned at a granular level.
- Change resource assignment dates, resources, and efforts for resource availability at any phase of the project.
- Create an attribute-based resource assignment in Project Workspace.
- View availability in the heatmap and make allocations based on the resource availability. The allocations are color-coded to display the availability of the resources for a task.
- Request and allocate resources and verify resource availability on a single location in the Project Workspace.

Resource Management workflow in Project Workspace

The Project Manager can create an attribute-based resource assignment in Project Workspace. Any type of project task can be added to the resource assignment.

After a resource assignment is created, the project manager verifies resource availability, and then assigns the resource to a resource assignment. If the resource isn't available, then the Project Manager coordinates with the Resource Manager for resource availability. If all parties agree, the resources begin work. Project Managers can view the resource allocation in the heatmap.

i Note:

After the resource assignment is created and has any requested allocations, a resource plan is created automatically in the allocated state in the back-end. Either a new resource plan and resource allocation are created, or an existing resource plan is retrieved based on the attributes. As a result, its planned cost and allocated cost are matched, and its planned and allocated hours are also matched. These resource plans aren't displayed in the Resource Allocation Workbench.

Financials in Project Workspace

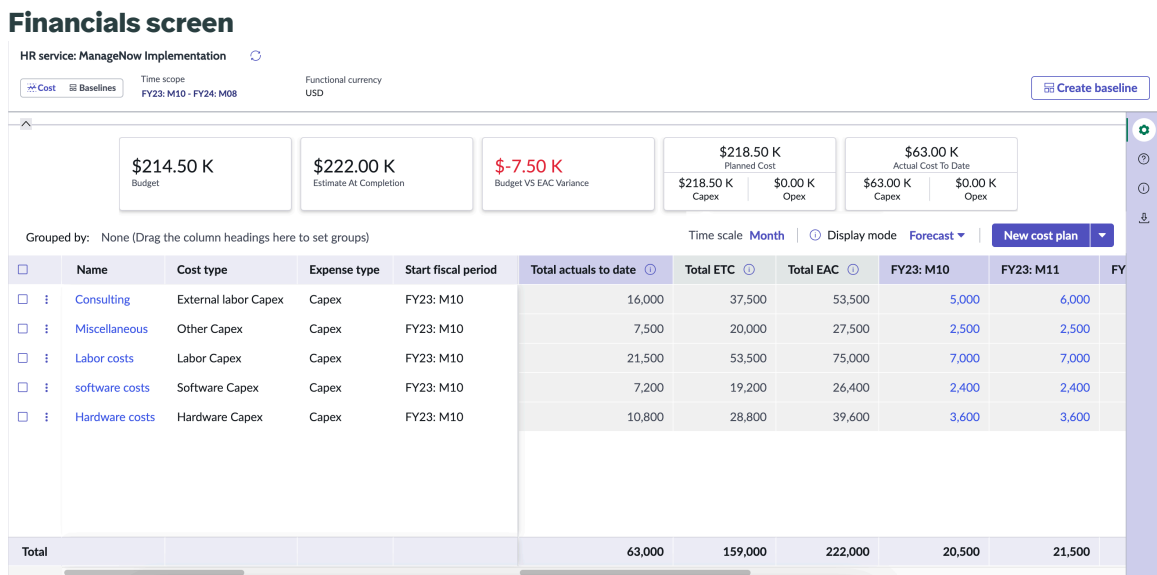

Plan, re-forecast, track the financials, and create baselines for projects and demands.

The financials view provides a streamlined perspective, showcasing the actual and planned expenses for the entire fiscal period. You can view the latest estimated cost of completion by

displaying the Actual costs for the past fiscal periods, planned costs for the current and future fiscal periods, the totals for quarter, year, and total duration of work.

The interface gives you the ability to create cost plans, expense lines, and baselines. As a project manager or a financial user, you can:

- Enter high-level financial forecasts for planning items using the simple financials section in the Details tab.
- Work on high-level estimating for Planned opEx and Planned capEx.
- Create a detailed breakdown of the planned costs [using the financials](#).
- [Add, edit, or delete cost plans](#) from the side panel.
- Re-forecast your planned expenses using the in-line editing feature.
- View a streamlined perspective, showcasing your actual costs for the past and planned expenses for the future, for the entire time scope of the planning item.
- Get a better comprehensive solution by viewing the Forecast (previously EAC - Estimate at Completion), Remaining Estimates (previously ETC - Estimate to Completion), and Actuals of each cost plan for the total time scope and the yearly breakdowns.
- Re-forecast the planned cost for future fiscal periods by directly updating the quarterly and yearly totals using the in-line editing capability of the grid.
- [Generate labor costs](#) depending on the resource assignments for the entire scope of the planning item broken down by the financial attributes configured for your organization. For more information on the planning attributes for attribute-based mapping, see [Using the Planning attributes](#).
- [Add or edit expense lines](#) against the cost plans from the side panel with the associated cost plan details pre-populated.
- Record unplanned expenses using the New expense line side panel.
- Create and compare financial baseline to track the financials of your projects while you execute them.
- Compare the latest costs (actual expenses for past fiscal periods and planned costs for current and future fiscal periods) with the initial forecasted planned costs by creating financial baseline and using the compare baselines capability.
- Analyze the cause of variance in costs and when did this occur over time by capturing the financial baselines manually or automatically.

You can view the following information on the financials screen.

- Time scope: duration of the planning item or a cost plan, whichever has a larger fiscal period range.
- Functional currency: currency defined and used to calculate the financials.
- Customizable widgets showing different financial information such as allocated budget, Forecast (previously EAC - Estimate at Completion), Variance (the difference between budget and Forecast), breakdown of planned costs, and actuals by cost type.

Note:

Budget and Budget vs EAC Variance widgets are available for Demands and Projects only.

- Time scale: time period breakdowns to view the financials. Default value is set to Month/Period, depending on the fiscal calendar type.
- Generate labor costs: one-click solution to generate or refresh the planned labor costs for the planning item depending on resource assignments.

Note:

This option is enabled for the projects with resource assignments only.

- The pane gives you a tabulated view of the cost plan attributes displaying the Name, Cost type, Expense type, Stat fiscal period, End fiscal period, Total planned cost, Employee type, and Role. You can customize these fields. For more information, see [Customize the left pane view for financials](#).
- In the right pane, you can view the total Actuals, Forecast, and Remaining Estimates for the selected Time scope duration. Actual expenses against a cost plan for the past fiscal periods, Actuals, Forecast, and Remaining Estimates for the current fiscal year, and planned costs for the current and future fiscal periods.

Note:

The header rows of actuals and planned are color-coded differently to help you easily identify and differentiate between the expense types.

- New cost plan: opens a simplified side-panel to create a new cost plan for the entity.
- Personalize option to customize the columns in the left pane of the table.
- Export option to download Cost or Baselines comparison as Microsoft Excel or CSV file.

Status reporting in Project Workspace

A status report in Project Workspace is a snapshot in time that gives an overview of your overall project health across key areas such as cost, resources, milestones, health, and more.

https://player.vimeo.com/video/1093765468?h=414833d0a6&badge=0&autoplay=0&player_id=0&app_id=58479

The Status reports in Project Workspace provide a comprehensive, configurable, and customizable view of the current state of a project by capturing and displaying key project metrics such as overall health, schedule, scope, cost, and resource utilization. Status reports help project teams and stakeholders track progress, identify risks, and manage any project-related issues in real-time.

Status report main metrics

Metric	Description
Overall health	The general condition of the project (green, yellow, or red).
Completion status	The percentage of project completion.
Schedule and scope	Key milestones and any changes in scope.
Cost metrics	Planned and actual costs, and budget variance.
Resource utilization	Allocation and effort tracking for project resources.

Key benefits

The status report feature in Project Workspace provides a clear view of the project's overall health, progress, and key metrics, confirming effective communication and tracking throughout the project life-cycle.

With status reports in Project Workspace, you can:

- Gain improved project visibility by having a concise summary of key metrics such as schedule, cost, and resource utilization, enabling stakeholders to track the progress.
- Facilitate better decision-making by providing a snapshot of the project's current state, helping project managers and stakeholders address potential challenges.
- Enhance risk management by highlighting any risks, issues, or variances, enabling teams to respond proactively to project concerns.
- Maintain consistent communication across teams and stakeholders by delivering regular, standardized updates, confirming everyone stays informed about the project's progress and health.
- Increase efficiency through the use of templates that streamline the creation of reports, saving time and confirming consistency across projects while enabling for customization as needed.

Status report templates

Status report templates simplify the process of generating project updates by providing pre-defined structures, confirming consistency and saving time. Two default templates are available:

- **One Page Status Report:** This template provides a concise one-page summary of key project metrics, making it ideal for quick updates where a high-level overview is sufficient.
- **Default Status Report:** This template includes a more comprehensive range of data points, covering areas such as milestones, risks, issues, decisions, and change requests. It offers a detailed view of the project's progress and status, similar to a classic status report.
- You can create a status report using one of the existing templates: [Create a status report in Project Workspace](#)
- You can also create your own status report template from scratch: [Create a status report template in Project Workspace](#)

Better together with other ServiceNow® applications

Integrate Hardware Asset Management (HAM) with Project Workspace to track which HAM requests or refreshes belong to an SPM project. Provide portfolio and project managers visibility into request status without leaving Project Workspace.

This integration enables Hardware Asset Management (HAM) requests and refreshes to be associated with Strategic Portfolio Management (SPM) projects in Project Workspace, allowing hardware-related tasks to be tracked within the context of a project.

Key capabilities

- Track HAM requests as part of an SPM project.
- View project-tagged asset requests from the project record.
- Create new asset project requests from the asset project request list.

Configuring Project Workspace

Set up and configure the Project Workspace application to initiate and plan your projects, financials, and resources.

Related topics

[Managing projects with Project Workspace](#)

[Managing financials for your projects](#)

[Resource planning with Project Workspace](#)

[Project Workspace reference](#)

Configuring projects with Project Workspace

Set up the Project Workspace application and start planning on your project.

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .
- Review the [Project Workspace](#)  application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- [Install Project Workspace](#).

Install Project Workspace

You can install the Project Workspace application (sn_pw) if you have the admin role.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the [Project Workspace](#) application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Starting with Zurich release, installing the PPM Standard plugin also installs the Project Workspace application.
- Ensure you have activated the PPM Standard plugin (com.snc.financial_planning_pmo).

Role required: admin

About this task

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.

2. Find the Project Workspace application (sn_pw) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

5. Optional: If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install**.

Result

Planning attributes dependency plug-in is installed along with Project Workspace.

Playbooks configuration

Configure playbooks to organize project workflows, maintain consistency, and keep projects on track.

Define a trigger condition in Workflow Studio to use a Playbook, either by selecting an existing one or creating a Playbook.

In Project Workspace, Playbooks are triggered by record creation, record update, or both. For example, a Playbook created for projects is associated with project records, and the Playbook tab appears when a project meets the trigger condition. For more information on how to configure a playbook, see [Configuring playbooks](#).

There are two pre-defined project management playbooks available in the Workflow studio:

- Project default
- Stage-gate default

To configure playbooks, perform these tasks:

1. Navigate to **Workflow Studio** and select **Playbooks**.
2. Create and configure playbooks as per your requirement. For more information, see [Create and configure playbooks](#) .
3. Activate one of the two pre-defined playbooks for the Project Workspace and define an appropriate trigger condition. For more information, see [Activate playbooks](#)  and [Triggers](#) .

Multiple playbooks can be enabled at a time, and the trigger should be defined in such a way that each project is mapped to only one type of playbook. To activate a playbook, see [Activate playbooks](#) .

Note:

When a project template is applied or project is created from a demand, the project information is automatically copied into the project record and reflected in the Playbook.

Configuring resources with Project Workspace

Configure various aspects of Resource Management based on your requirements in Project Workspace to allocate resources for your project.

- Review the [Project Workspace](#)  application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- [Install Project Workspace](#).
- Ensure you've activated the PPM Standard plugin (com.snc.financial_planning_pmo).
- Ensure you have enabled attributes for Resource Management. For more information, see [Using the Planning attributes](#).

Configure financials for Project Workspace

Customize financials view, planning attributes, and activate scheduled jobs to work on the financial planning for your projects.

Before you begin

Role required: admin

Procedure

1. Configure the attributes to generate labor costs in financials based on the resource assignments on the work items.
For more information, see [Using the Planning attributes](#) and [Create or edit planning attributes](#).
2. Generate default mapping configurations to create table maps.
For more information, see [Generate default mapping configurations](#).

3. Enable the budget allocation for projects.
For more information, see [Enable financial budget allocation for projects in Project Workspace](#).
4. Define the budget allocation attribute to allocate budget by cost type or expense type.
For more information, see [Configure budget attribute at instance-level to allocate budget](#).
5. Enable the expense type attribute for resource assignments to capture relevant expenses for the work.
For more information, see [Enable expense type on resource assignments](#).
6. Create new widgets to view the rolled up financial data at planning item level.
For more information, see [Configure a widget and associate it with project](#).
7. **Optional:** Customize the left pane in the financials screen to match the requirements of your organization.
For more information, see [Customize the left pane view for financials](#).
8. Customize the Create cost plan form fields to match the requirements of your organization.
For more information, see [Customise cost plan form](#).
9. Customize the default expense types to manage cost plans for your projects and demands.
For more information, see [Change the default expense type for projects](#).
10. Activate and define scheduled job to create financial baselines for your planning items.
For more information, see [Activate a scheduled job to create financial baselines for your projects](#).
11. Activate and define a scheduled job to generate labor costs for your projects based on the attribute-based resource assignments.
For more information, see [Activate a scheduled job to generate labor costs for your projects](#).

Enable monetary benefit plans for projects

Enable the benefit plans property to create and manage benefit plans for planning items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.enable_benefit_plan_in_new_financials** property.
3. Enter **true** in the Value field.
4. Select the **Update** button.

Enable financial budget allocation for projects in Project Workspace

Enable allocation property after migrating to Next Experience to work on budget allocation for your projects using Project Workspace.

Before you begin

- For new customers accessing financials in Next Experience, this property is enabled by default.
- Role required: admin

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.enable_budget_allocation_v2** property.
3. Update the Value field to **True** and select **Update**.

What to do next

Configure budget attributes to work on managing budget of your planning items. For more information, see [Configure budget attribute at instance-level to allocate budget](#).

Configure budget attribute at instance-level to allocate budget

Configure the budget attribute by expense type or cost type as an instance-level to work on budget allocations for your projects using Project Workspace.

Before you begin

- Enable the budget allocation property to work on budgeting for projects. For more information, see [Enable financial budget allocation for projects in Project Workspace](#).
- Role required: admin

Important:

Existing customers cannot change the budget attribute to cost_type.

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.budget_allocation_attribute** property.
3. Update the Value field to one of the following.
 - **cost_type** - view financials by cost types such as Hardware Opex, External labor Capex, Software Capex, Software Opex, and so on.
 - **expense_type** - view financials by expense types such as Capex and Opex.
4. Select **Update**.

Enable expense type on resource assignments

Resource assignments have the same expense type as the project or demand for which they're created. Enabling expense type on resource assignments helps you to accurately expense different type of expenses for your work.

Before you begin

Role required: admin

Procedure

1. Active and execute the scheduled job.
 - a. Navigate to **All > System Definition > Scheduled Jobs**.
 - b. Filter the name field to locate and open **Update task type planning attributes on resource assignments**.
 - c. Select the **Active** option to activate the schedule job.

- d. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.

For more information about the field description and scripts, see [Automatically run a script of your choosing](#) .

- e. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.
2. Enable expense type on resource assignments.
 - a. Navigate to **All > System Definition > Tables**.
 - b. Filter the name field to locate and open the **sn_plng_att_core_resource_assignment** table for resource assignments.
 - c. Select the **Show List** related link.
 - d. Select the **Personalize List** () icon.
 - e. In the Personalize List Column, add **Expense type** from the Available list to the Selected list.
 - f. Select **OK**.

Result

Expense type field is enabled on resource assignments for the projects and demands. You can expense different expense types to record different work types such as Capex or OpEx.

Configure a widget and associate it with project

Enable and associate a widget to view financial summary of your projects at high-level.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Project Administration > Widgets**.
2. Select **New**.
3. On the Widget New Record form, fill the fields.
For a description of the field names, see [Widget New Record form](#).
4. Select the **Additional actions menu** and select **Save**
5. In the Widget associations related list, select **New**.
6. On the Widget association New Record form, fill the fields.
For a description of the field names, see [Widget association form](#).
7. Select **Submit**.

Customize the left pane view for financials

Customize the left pane for financials to view custom field information.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate and open the **Cost Plan** table.
3. Select the **Show List** related link.

4. Select the financials view by navigating to **List controls > View > Financials View**.
The selected view is displayed on the header.
5. Select the header options to configure list layout.
6. Add or remove the fields in the Selected column to customize the left pane view in financials view.
7. Select **Save**.

Result

Cost plans table with customized fields for Financials View is displayed.

Customise cost plan form

Manage the fields required on the new cost plan form as per your organization needs.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate and open the **Cost Plan** table.
3. Select the **Design Form** related link.
4. On the header row, select **Cost Plan [cost_plan]** from the table list and **Financials View** from the view list.
5. On the form, you can:
 - Drag and drop the required fields from the Fields column.
 - Remove the existing fields using the Remove field icon.
6. Select **Save**.

Change the default expense type for your projects

Configure the default expense type to create or edit cost plans for your projects.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > All properties**.
2. Filter the name to locate and open the **sn_plng_att_core.default.expense_type** table.
3. Change the Value field to the required expense type and select **Save**.
Opex is the default value.

Create a custom prefix for baseline

Modify the prefix to customize the name of the baselines for your projects.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > All Properties**.
2. Filter the name field to locate and open **sn_invst_pln.baseline_prefix**.
3. Modify the **Value** field to create a custom prefix for your baselines.

If you're working on a sales portfolio, you may change the **Value** field to **Sales baseline** on.

4. Select **Update**.

Activate a scheduled job to migrate budget of your projects

Activate the **Migrate budget for active demands and projects** scheduled job to migrate budget of active projects from Classic UI to Next Experience.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Migrate budget for active demands and projects**.
3. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#) .
4. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Configuring security for a project in Project Workspace

Configure security in a project to make the project confidential to ensure that only the authorized users can access the project and its sub projects and related entities.

You can make sensitive projects visible and accessible only to specified users and user groups. The security settings applied to a project also apply to sub projects, forms, and related entities of the project, ensuring that all project-related data remains protected and accessible only to the authorized personnel.

To enable these advanced security features, you need to install the Project Advanced Security plugin. The plugin requires the PPM Standard plugin as a prerequisite.

Related topics

[Activate the Project Advanced Security plugin](#)

[Enable security for a project in Project Workspace](#)

Activate the Project Advanced Security plugin

Activate the Project Advanced Security plugin to enable project security settings on a project.

Before you begin

Role required: admin

Procedure

1. Select **All > System Definition > Plugins**.
2. Search for **Project Advanced Security** and install it.

Related topics

[Configuring security for a project in Project Workspace](#)

[Enable security for a project in Project Workspace](#)

Enable security for a project in Project Workspace

Enable security in a project to make the project confidential to ensure that only authorized users can access the project and its related sub projects and entities.

Before you begin

Install the Project Advanced Security plugin.

Role required: admin

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the Details page of the project by selecting **Details** from the list.
3. Scroll down all the way to locate **Confidential** and select it.
4. In the following fields, specify the users and user groups that can access the project.

You need to specify at least one user or user group for access.

The confidential project can be accessed by **Allowed users**, **Allowed groups**, the **Assigned to user**, **Additional assignee**, the **Project Manager**, and the administrator.

5. Select **Save**.

Once you make the project confidential, the confidentiality setting is applied to the project, all sub projects, and entities such as cost plans, cost plan breakdowns, benefit plans, benefit plan breakdowns, expense lines, time cards, status reports, baselines, story, investment object, project tasks, resource plan, resource assignments, and RIDAC.

These will only be accessible to individuals who have been explicitly added to the project.

This setting applies to all associated workspaces. If the project is marked confidential in one workspace, it is automatically made confidential across all other workspaces, including:

- Project Management Workspace
- Resource Management Workspace
- Strategic Portfolio Workspace

Managing projects with Project Workspace

Use the features of Project Workspace to plan and manage your project.

Access the new Project Workspace

Learn how to navigate to the new Project Workspace and open a project in the planning page.

Before you begin

[Install Project Workspace.](#)

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces > Project Workspace.**
2. Depending on the projects that you want to view, select **My Projects** or **All Projects.**

Projects on the homepage can be viewed in card or list view.

3. Select a project to open it in the planning page.

What to do next

[Create a project from Project Workspace](#)

Create a project from Project Workspace

Use Project Workspace to create a project and start planning for your project tasks.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces > Project Workspace.**
2. Select **New** to create project from the homepage.
3. On the form, fill in the fields.

For field information, see [Project form in Project Workspace.](#)

4. Select **Confirm.**

What to do next

- [Update the project details from Project Workspace](#)
- [Personalize the planning page view in Project Workspace](#)

Update the project details from Project Workspace

Update the details of a project to reflect the updates or changed priorities using the details page from Project Workspace.

Before you begin

Role required: it_project_manager

About this task

You can edit the Project, project dates, business case, financials, score, notes, and preferences for a project. Use the related tabs on the details page to view and edit the Project tasks, Sub-projects, Requirements, Resource Plans, Cost Plans, Monetary, and others.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the details page of the project by selecting **Details** from the left menu.
3. Edit the fields that you want to update.

In the Project Workspace, you can add stakeholders, extend or confirm a resource plan, and add new resource allocations daily. You can also view the status report of the program and save the project as a template with the **Save as New Template** option.

From the Project Workspace, you can create an Agile phase or a Test phase. You can also create stories or add existing ones to the project, as well as add new epics.

You can refine project description using the write planning item skill if you have Now assist for SPM application installed.

4. Select **Save**.
You can view the project or project task details from the side panel. Select Open task in the new tab () icon to open the project in a new tab. You can use the Full Details page to add work notes, attachments, and view related lists of a project or task.

Generate and track project details from AI insights page

Generate and monitor project insights directly from AI insights page in Project Workspace.

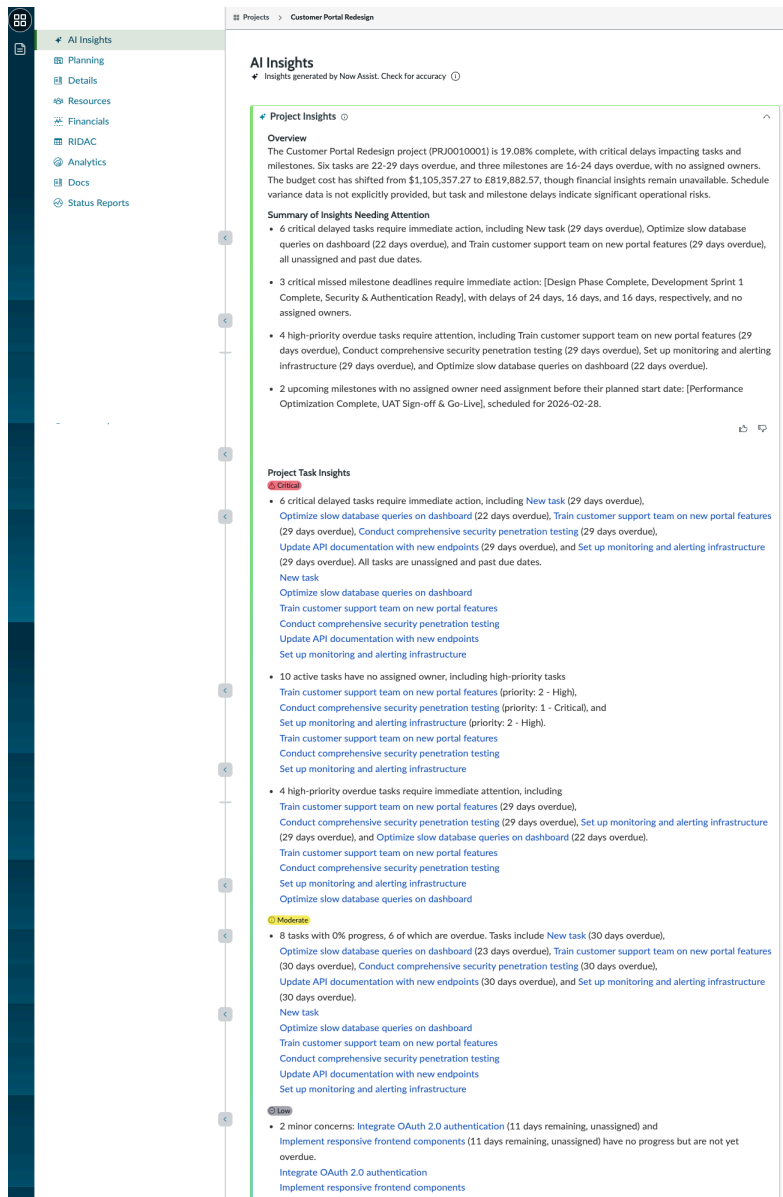

Before you begin

Ensure that the Project insights generation skill is active.

Role required: it_project_manager

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open AI insights page by selecting **AI insights** from the list.
3. Select **Generate insights** to generate AI insights of your project.

Project insights are generated using the same Project insights generation skill used for email insights. Insights are displayed directly in the in-app AI insights experience.

4. Review the generation project insights.

Result

The project insights are generated from the AI insights page with access to current project insights in a single in-app view.

What to do next

- View and reuse stored insights:
 - Generated insights are stored and reused based on a defined date threshold.
 - When you revisit the AI Insights page, previously generated insights are displayed if they are still within the threshold.
- Regenerate project insights:
 - From the AI insights page, select **Regenerate** icon.
 - Now Assist generates updated project insights.

Generate a project plan using project plan generation skill

Use Project plan generation skill to generate a project plan from natural language input, uploaded files, or both.

Before you begin

Role required: it_project_manager

- Install Now Assist for Strategic Portfolio Management (SPM) plugin.
- To use attachments to generate a project, activate the document intelligence skill. The default LLM is Azure OpenAI. Switching to a different model may affect accuracy.
- The project plan generation skill is activated by default. For more information on how to activate the skill if it isn't automatically activated or if you want to change the skill configuration, see [Configure Now Assist Admin features](#).

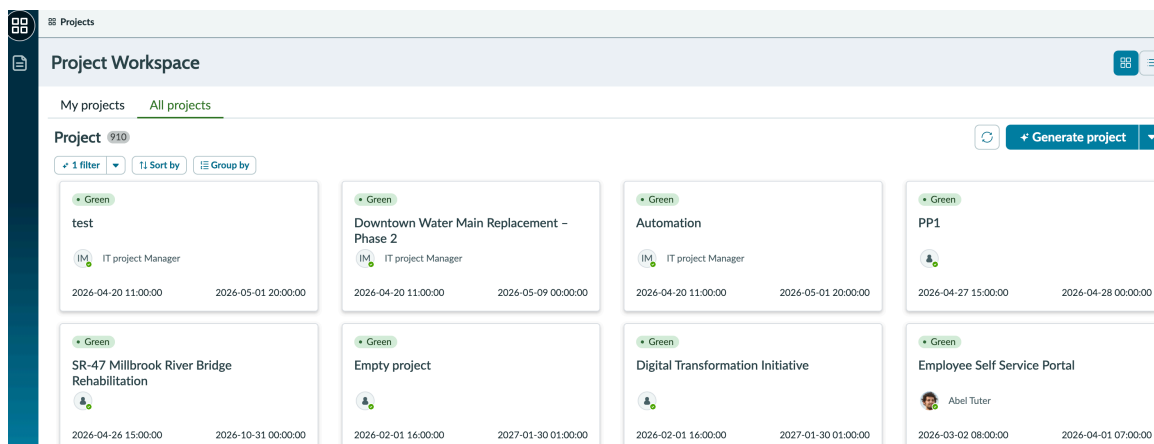

About this task

Now Assist scans your project and task details to generate content. Review and edit the output before creating the project. Supported file types are word, pdf, excel, and powerpoint, with a 5 MB file size limit. Only the first five attachments are processed.

For project and task supported column configurations, see [Supported columns for project and task generation](#).

Procedure

1. Navigate to **Workspaces > Project Workspace**.
2. Select **Generate project** to use Now Assist to generate a project.

To create a project without using Now Assist, use **New project from template** or **New project** options.

3. Provide your project input using one or more of these methods.
 - In the text field, describe your project using natural language. If you provide only natural language input, the document intelligence skill is not required.
 - Select Attach files and upload a word, pdf, excel, or powerpoint document. To use file attachments, activate the document intelligence skill. For more information, see [Activate a Now Assist in Document Intelligence skill](#) .

Note:

Attach a file or enter context as free-form text before proceeding. No input returns an error. Insufficient context may also trigger an error.

4. Select **Next** to generate the project.

5. Select **Create project**.

6. Review the pre-populated project name, approved start date, approved end date, or business case.

WBS	Short description	Planned sta...	Planned en...	Planned dur...	Time constr...
1	Security Review	2026-04-29	2026-04-30	2 Days	Start no earl...

3	Requirements Gathering	2026-04-29	2026-04-30	2 Days	Start no earl...
4	Backend Development	2026-04-29	2026-04-30	2 Days	Start no earl...
5	Deployment Planning	2026-04-29	2026-04-30	2 Days	Start no earl...
6	QA Testing	2026-04-29	2026-04-30	2 Days	Start no earl...
7	System Architecture Desi...	2026-04-29	2026-04-30	2 Days	Start no earl...
8	Frontend Development	2026-04-29	2026-04-30	2 Days	Start no earl...

Edit the fields as needed and add a description.

Note:

Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

Result

The project is created with the generated tasks, including task hierarchy and dates derived from your input.

Example: Generate a project plan from an Excel file

Input: An excel file with two sheets:

- Sheet 1: Project details such as project name, start and end dates, budget, and key objectives.
- Sheet 2: 18 tasks with task name, phase, start date, end date, and duration.

Output AI reads the file and creates the following:

- Project record with: Name, description, start and end dates, and business case derived from the key objectives.
- 18 task records with: Task name, description, start and end dates, duration, and state. Fields not present in the file, such as key milestone and time constraint, are auto-populated with default values.

Generate tasks for a project using project plan generation skill

Use project plan generation skill to populate an empty project with tasks by providing text input, uploading files, or both.

Before you begin

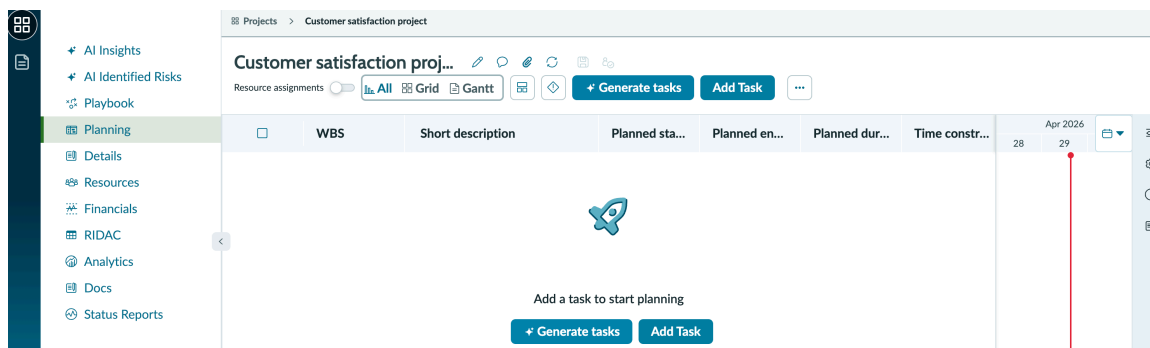

Role required: it_project_manager

- Install Now Assist for Strategic Portfolio Management (SPM) plugin.
- To use attachments to generate a project, activate the document intelligence skill. The default LLM is Azure OpenAI. Switching to a different model may affect accuracy.
- The project plan generation skill is activated by default. For more information on how to activate the skill if it isn't automatically activated or if you want to change the skill configuration, see [Configure Now Assist Admin features](#).

Procedure

1. Navigate to **Workspaces > Project Workspace**.
2. Create a project or open any project without tasks.
3. Select **Generate tasks** to use Now Assist to generate tasks.

To create a project task without using Now Assist, use **Add Task** option.

4. Provide your project task input using one or more of these methods.
 - In the text field, describe your project tasks using natural language. If you provide only natural language input, the document intelligence skill is not required.
 - Select Attach files and upload a word, pdf, excel, or powerpoint document. A preview of the attachment appears before you proceed. To use file attachments, activate the document intelligence skill. For more information, see [Activate a Now Assist in Document Intelligence skill](#).

Note:

Attach a file or enter context as free-form text before proceeding. No input returns an error. Insufficient context may also trigger an error.

5. Select **Submit** to generate the project.
6. Review the task details for a project on the planning page.

Note: Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

Result

The project is created with the generated tasks, including task hierarchy and dates derived from your input.

Example: Generate tasks for an empty project

Input: A project manager types the following in the text input: Create tasks for a website redesign project starting May 1, 2026 and ending July 31, 2026. Tasks include requirements gathering, UI design, and user acceptance testing.

Output AI creates three task records: Requirements gathering, UI design, and user acceptance testing. Each task is populated with a name, description, start and end dates, and duration. Fields not present in the input are auto-populated with default values.

Create an Asset Project Request from Project Workspace

Create a new asset project request directly from Project Workspace and associate it to a project for tracking and reporting purpose.

Before you begin

Role required: it_project_manager or asset manager or portfolio manager

About this task

Portfolio and project managers can create and track asset requests across multiple projects. Asset requests become part of the SPM project tracking and reporting workflow.

Procedure

1. Open a project from the home page of Project Workspace.
For information, see [Access the new Project Workspace](#).
2. Open the details page of the project by selecting **Details** from the list.
3. Select **Asset Project Requests** related link and select **New**.
4. From the Create Asset Project Request form:
 - a. Select the appropriate **Request item**.
 - b. Verify that the **Project** field.
5. Select **Save**.

Result

A new asset project request is created and linked to the project. The request appears in the Asset Project Requests list for the project.

View asset project requests for a project

Analyze asset project requests associated with a project from Project Workspace, so you can track hardware requests and refresh activities linked to the project plan.

Before you begin

Role required: it_project_manager or asset manager or portfolio manager

About this task

This helps portfolio or project managers quickly understand which asset requests are tied to the project and track their current status.

Procedure

1. Open a project from the home page of Project Workspace.
For information, see [Access the new Project Workspace](#).
2. Open the details page of the project by selecting **Details** from the list.
3. Select **Asset Project Requests** related link.
4. From asset project requests list, view the list of asset project requests tagged to the project.

Result

You can see all hardware asset requests and refresh requests associated with the project.

Use Playbooks in Project Workspace

Plan your project stages and assign specific actions to each stage using Playbooks.

https://player.vimeo.com/video/1156991435?h=3b5cf5de67&badge=0&autoplay=0&player_id=0&app_id=58479%22

Before you begin

Role required: admin or project_manager

As a system administrator, ensure that a playbook is activate or created before use.

About this task

A playbook defines the standard stages of a project (for example, Initiation, Planning, Execution, Monitoring, and Closure) and includes activities or action items to complete at each stage.

There are two playbooks for Project Workspace. This task topic follows the Project default playbook. It's a PMBOK standard playbook comprising five stages: Initiation, Planning, Execution, Monitoring and Delivering, and Closure. Each stage consists of activities, action items, or steps that guide the project manager in successfully completing the project.

You can view the **Playbook** menu only if a playbook is active and the project matches the trigger condition defined for that playbook. The playbook is displayed only when the project meets the defined trigger conditions. Two playbooks are available in Workflow Studio for Project Workspace.

Procedure

1. Navigate to **Workspaces > Project Workspace** and [Create a project](#).
2. Use an existing playbook or create a new one.
 - To create a new playbook, define the trigger condition in Workflow Studio. For more information, see [Triggers](#) .
 - To use an existing playbook:

- a. From the menu, select **Playbooks**.
- b. For each stage, select **Mark complete**, or **Skip**, or **Save**.

Note:

- Select **Save** to save the stage, or **Skip** to skip the stage.
- When you select **Mark Complete** or **Skip**, the activity becomes read-only.
- A stage is marked complete once all activities within it are either completed or skipped.
- Use the **Restart** option (available at both the activity and stage levels) to revisit or edit completed or skipped activities.

For more information on how to use playbooks, see [Building playbooks](#) and [Designing playbooks](#).

Analyze project analytics from Project Workspace

View the summary of a project in Analytics tab of Project Workspace.

Before you begin

Note:

The Project Summary Waterfall, Hybrid, and Scrum dashboards are available in the Next experience UI framework.

Role required: it_project_user

About this task

The Analytics tab is a dashboard that showcases preconfigured widgets and reports to monitor the progress of a project, including aspects like open risks, actual costs, and delayed milestones. The reports aggregate data from the fields in the project form. For details on the various widgets and reports available for different project types, see the [Project analytics widgets and reports](#).

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the analytics page of the project by selecting **Analytics** from the list.
3. Review the displayed reports and take necessary actions, if required.

Widgets and reports for project analytics

Widgets and reports that provide information for the project summary in the Analytics page of the project workspace for Agile, Waterfall, and Hybrid projects.

Project widgets and reports

Widgets and reports provide information that enables you to view and track the progress of your Agile, Waterfall, and Hybrid project.

Note:

You must have the Agile Development 2.0 plugin installed to view the widgets and reports for your Agile and Hybrid projects. The Project Summary Waterfall, Hybrid, and Scrum dashboards are available in the Next experience UI framework.

Your system administrator can configure the widgets and reports in the dashboard to display project information on the **Analytics** page. The following dashboards are available:

Project Execution Type	Dashboard Displayed	Description
Hybrid	Project Summary – Hybrid	Contains reports and widgets for hybrid projects.
Agile	Project Summary – Scrum	Contains reports and widgets for agile projects.
Waterfall	Project Summary – Waterfall Note: This dashboard was previously known as Project Manager Summary Dashboard.	Contains reports and widgets for waterfall projects.

The project execution type determines the dashboard displayed on the **Analytics** page.

You can also embed a custom dashboard in the **Analytics** page. Your system admin can modify the `PMViewDataUtils` script include and configure the variable value for the `dashboards_tabs` in the `getDashboardUrl` method. As a result, you can view the custom dashboard in Project Analytics. For example:

```
var dashboards_tabs =
{
    waterfall: {
        dashboard_sysId:
'5d4959dd878003008b9b3a0548cb0bd0',
        tab_sysId:
'1d99d5dd878003008b9b3a0548cb0bbd'
    },
    hybrid: {
        dashboard_sysId:
'96dc46c78700330047d84c2c59cb0bf1',
        tab_sysId:
'520d4ac78700330047d84c2c59cb0bab'
    },
    agile: {
        dashboard_sysId:
'f3dd4ec78700330047d84c2c59cb0b93&tab',
        tab_sysId:
'52fd8ec78700330047d84c2c59cb0bae'
    }
}
```

```

        any_other_executionType: {
            dashboard_sysId:
'custom_dashboard_sys_id',
            tab_sysId:
'custom_dashboard_tab_sys_id'
        },
    };

```

The following widgets and reports for all project types are provided in the **Analytics** page to help the project manager analyze the project.

Widgets and reports for Agile project

Name	Description
Stories Missing Acceptance Criteria	Number of stories in the project without acceptance criteria information.
Stories Missing Points	Number of stories in the project with the Points field blank.
Stories Acceptance Overdue	Number of stories in the project that are not in the Completed or Cancelled state after the sprint end.
Team-wise Sprint Status	Track the sprint-wise status of various scrum teams across the release. Click the team name to view sprint details.
Stories by State	Donut chart showing the number of stories in different stages of development such as Draft, Ready, and WIP. Click the appropriate state to view details of the stories.
Progress by Points	Track the progress of the project based on points. You can group and stack stories based on any combination of Epic, Assignment group, and State.
Progress by Stories	Track the progress of the project based on the number of stories. You can group and stack stories based on Epic, Assignment group, and state.

Widgets and reports for Waterfall and Hybrid project

Name	Description
Issues	Number of issues in the Pending, Open, and Work In Progress states included in the project.
Actions	Number of action items in the Pending, Open, and Work In Progress states for the project.
Change Requests	Number of change requests in the Pending, Open, and Work In Progress states for the project.

Widgets and reports for Waterfall and Hybrid project (continued)

Name	Description
Stories by State	<p>Pie chart showing the number of stories in different stages of development such as Draft, Ready, and WIP. Click the appropriate state to view the details for the stories.</p> <p>Note: This widget is applicable for Hybrid projects only.</p>
Tasks by State	<p>Donut chart showing the number of project tasks in different stages of development such as Pending, Open, Work In Progress, and Closed Complete. Click the appropriate state to view the task details.</p>
Project Member Allocation Details (Hrs)	<p>Stacked bar chart showing allocated and actual hours of the resources assigned to the project.</p>
Project Member Allocation Details – Monthly (Hrs)	<p>Pivot chart showing the monthly allocated and actual hours for the resources assigned to the project.</p>
Task Assignments	<p>Track the state of various project tasks across the release based on the assigned users or group. Click the user or group name to view the details of the assigned tasks.</p>
Resource Plans by State	<p>Donut chart showing the number of resource plans grouped according to their current state.</p>
Overdue Tasks and Milestones	<p>List of overdue project tasks and milestones, which are the tasks that satisfy either of the following conditions in the Project Task [pm_project_task] table:</p> <ul style="list-style-type: none"> • The value of the Planned start date is before today's date and the State value is Open or Pending. • The value of the Shadow field is set to false.
Upcoming Tasks (next 2 weeks) with no assignee	<p>List of unassigned Open or Pending project tasks that are planned to start 14 days from the current date.</p>

Common widgets

Name	Description
Phase	<p>Current state of the project such as Initiating or Planning.</p>
Status	<p>Color indicator that signifies the status of the project.</p>

Common widgets (continued)

Name	Description
Percent Complete	Percentage of the project that has been completed.
Time Elapsed	<p>Amount of time that has passed while working on the project from the actual start date to the planned end date.</p> <p>If the project is in the Open or Pending state, then the time elapsed is calculated based on the Planned start date and the current date.</p>
Risks	Number of risks in the Pending, Achieved, and Not Achieved states concerning the project.
Cost Trend Analysis	Line graph showing a comparison between the planned costs and actual costs on a monthly basis.
Monetary Benefit Trend Analysis	Line graph showing a trend of planned financial benefits on a monthly basis.
Non-monetary Benefit Plans	Breakdown of the number of non-monetary benefit plans for active projects along with its associated benefit plans.
Non-monetary Planned vs Actual Benefits	Comparison of total planned and actual non-financial benefits for active projects grouped by fiscal period.
Confirmed vs Allocated vs Actual Hours	Comparison of total confirmed, allocated, and actual hours for the project.
Time Cards – Pending Approval	Time cards for the selected project that are submitted but not yet approved.
Time Card – Exception Report	List of users who did not submit their time cards for the selected project, and time cards that are not yet approved for the selected project. The exception report is generated for users who are assigned to a task in progress, or hard-allocated to the project or task.

Personalize the planning page view in Project Workspace

Customize the display of the planning page. Choose the data you want to see on the data grid and the timeline.

Before you begin

Role required: it_project_manager

About this task

Steps 2 through 4 provide guidance on customizing various aspects of the workspace. Choose the options that you want to apply.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Use the side panel to customize your planning page view.
 - a. Select the Settings icon ().
The Settings side panel opens.
 - b. From the Columns tab, select the columns that you want to see on the data grid of the planning console.
These columns provide information of the project tasks.
 - c. From the General tab, choose the attributes that you want to see on the timeline view, such as the dependency lines, critical path, or the project task names on the bars.
Use the Display summary task option to show all the project tasks grouped under one project summary task.
 - d. From the Advanced tab, choose to enable the auto-save option, change the date format for the planned date columns, and change the mode of calculation as Manual or Automatic.
You can change the calculation mode from Automatic to Manual, from the workspace, only if the project has no tasks.
3. View additional columns to the project tasks in the planning page view.

If you want additional columns to be displayed in the planning page view, other than those fields available in the side panel, you can do so by customizing the Project Workspace view of the project task list (pm_project_task_list.do). See [Add new columns to the planning page](#).

Note:

You can personalize your settings for timescale, Displaying summary tasks, Bar labels, and Dependency lines. Any changes you make to the Display summary task settings and timescale view is saved in the preferences.

4. Reduce or increase the visibility of the project period on the timeline by changing the timescale.

Select the timescale icon () and choose from Day, Week, Month, Quarter, Year, or Autofit.

Add new columns to the planning page

Display new columns on the planning page of the new project workspace so that your project managers can view custom fields for the project tasks on the planning page.

Before you begin

Role required: it_project_manager

About this task

The project tasks displayed in the planning page of the new project workspace show the fields according to the Project Workspace view of the pm_project_task table. To display new fields, you must personalize this Project Workspace view of the pm_project_task table.

Procedure

1. Navigate to **pm_project_task_list.do**.
2. Change the view to Project Workspace.
 - a. Right-click the header and select **View**.
 - b. Select **Project Workspace**
3. Add the necessary columns to the list.
 - a. Select the personalize list icon ().
 - b. Move the required fields from available to selected.
 - c. Select **OK**.

Result

The Project Workspace view of the pm_project_task table is updated according to your changes. The planning page of the new project workspace reflects these changes.

Create and assign project tasks from Project Workspace

Add new tasks for your projects and assign them to your team directly from the new Project Workspace.

Before you begin

Role required: it_project_manager

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Select **Add Task**.

A new row is added to the bottom of the data grid of the planning page, with **New Task** as the default name for the task.

Alternatively, select a project task row and select the Add task below icon (). This action adds a new task right after the task that you selected.

3. Edit the details of the task.
For example, task name, planned dates, assigned to, and others.
4. **Optional:** Press the Enter key to save the details and create a row for another task.
5. Select anywhere on the data grid outside the task fields to save the details.
6. Assign a task to a user by updating the **Assigned to** field.

The user who is assigned this task to, is sent an email notification and is also notified in the ServiceNow[®] instance when they log in.

For notifications to work, your admin must enable them by setting the **Project task assigned to** notification record as **true** in Email Notifications and Provider Notifications.

What to do next

- Make the new task a subtask of an existing task or a sub project by using the indent task icon ()
- [Update a project task from the Project Workspace.](#)

Update a project task from the Project Workspace

Update the details of existing tasks from the planning page of the Project Workspace.

Before you begin

Role required: it_project_manager, it_project_user

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace.](#)
2. From the list of tasks on the data grid, select a task that you want to update.
The task details open in the side panel.
3. Edit the fields.
4. Select **Update**.

Create checklist items for a project task

Create checklist items for a project task to track items to be completed in the task.

Before you begin

Role required: it_project_user, it_project_manager

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace.](#)
2. Navigate to a project task.
3. Select project tasks and then select the checklist icon () from the side panel to add checklist items.
You can add, edit, organize, or remove checklist items as needed.
4. Create a checklist item by entering the checklist name and press enter.
5. Select **Save** to save the checklist items.
To edit a checklist item for a task, select edit item icon () in the checklist section. This option appears when there is at least one checklist in the Checklist side panel. To remove a checklist from the project task, select remove item icon ()

Add internal project task dependencies from Project Workspace

Create dependencies between project tasks using the interactive UI of Project Workspace.

Before you begin

Verify that you have the Dependency Lines toggle enabled on the settings of the timeline. For information on how to update the settings, see [Personalize the planning page view in Project Workspace](#).

Role required: it_project_manager

Procedure

1. Select a project to open it from the planning page.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Create task dependencies in one of the following ways.
The created dependency is shown as a line between the two task bars, on the timeline view.

What to do next

You can edit the dependency. For more information, see [Update the dependency details for tasks from Project Workspace](#).

Update the dependency details for tasks from Project Workspace

Update the details of the dependency including its type and lag time from Project Workspace.

Before you begin

Role required: it_project_manager

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the dependency side panel in one of the two ways.
3. Edit the fields.
4. Select **Update**.

Add external dependencies between projects from Project Workspace

Set up a dependency between tasks of different projects using the new Project Workspace.

Before you begin

Role required: it_project_manager

About this task

External dependencies help you understand the impact on project schedules when there is a change in the predecessor task. Use the row context menu of your project task to add a dependency from the task of a different project.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. From the data grid, select the project task to which you want to add the dependency.

3. Select the row context menu () of the task and select **Add external dependency**.
4. On the External Dependency form, select the **Project** to which the external task belongs.
5. Select the **Task** for which the dependency is added.
6. Select the **Dependency type**.
7. Select **Submit**.
The default selection is **Hard**. In a hard dependency, any changes made in the predecessor project are automatically propagated to the successor project.

Result

- Dependency is created for the tasks of the two projects.
- The short description of your project is greyed out and is renamed to indicate the external dependency in the format of **External project name: External task name**
- A link icon () is added to the short description cell of the task, to indicate the dependency.

What to do next

You can navigate to the external project directly from the current project to view the status or update the details of the predecessor task. From the row context menu of the dependent task, select **View project**.

Create and compare project baselines in Project Workspace

Create a schedule baseline and financial baseline of a project. A baseline is a snapshot of the project's progress at the particular moment of time.

Before you begin

Role required: it_project_manager

About this task

Create as many baselines as necessary to review the changes made to and progress of your project by comparing these baselines. Comparing baselines helps you understand the real-time deviations between planned and actual values of the project tasks.

Note:

If your project has sub projects in it, you cannot create baselines for them from the planning page view.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Create a baseline for the project.

a. Select the Baselines icon ().

b. Select **Create new**.

- c. On the form, fill in the fields.
Provide the name and description for the baseline, and select Schedule baseline or Financial baseline, or both.

- d. Select **Save**.

A baseline is created for the current day and is listed when you select Baselines ().

3. Compare baselines for the project.

- a. Select the Baselines icon ().

- b. From the list of available baselines, select the ones that you want to compare.
You can select up to two baselines.

- c. Select **Apply**.

- o On the timeline view, the baseline appears as a set of grey lines following the task bars. These grey lines represent the planned dates while the task bars represent the actual dates.
- o On the grid view, you can add the columns related to baselines that show the following information of the selected baselines. You can select these columns from the Settings side panel ().
 - Start date
 - End date
 - Variance

Trouble?

If you don't see the baseline columns on the data grid, refresh the workspace using the

Refresh icon .

Create a status report template in Project Workspace

Create a custom template for status reporting in Project Workspace. Use the template to create status reports according to your specific requirements.

Before you begin

Role required: it_project_manager

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Select **Doc Templates** .
3. Select **New**.
4. On the Create new document template form, fill in the fields.

For a description of the field values, see [Create new document template form](#).

The screenshot shows the 'Create New Document Template' interface. The form fields are as follows:

- Name:** PWS automation
- Category:** Project status report
- Description:** (Empty text area)
- Viability:** Public
- Owner:** Adela Cervantsz
- Icon:** (Empty field with an 'Attach Image' link)

On the right, the 'Attachments' panel contains a dashed box for file upload, a placeholder image, and a 'Select file' button. A 'Save' button is located in the top right corner of the form area.

5. Select **Save**.

Note:

In the Project Workspace, the `it_project_manager` role is required to create a document template. The option to create a document template from the Project Workspace is available only to users with the Project Manager role.

If your role has create access to document templates at the platform level, you can still create a template even without the `it_project_manager` role. While `it_project_manager` controls visibility within the Project Workspace, the ability to create templates is ultimately governed by platform-level Access Control Lists (ACLs).

Result

The template you created appears as an option when you try to create a status report: [Create a status report in Project Workspace](#).

Generate a project status report with Now Assist

Generate an AI-assisted project status report with predicted health indicators. Now assist pre-populates project health, an executive summary, and supporting rationale based on weekly project data.

Before you begin

Role required: `it_project_manager`

About this task

When the Project status generation skill is enabled, project managers can generate a status report pre-populated by Now Assist. Now Assist predicts overall and dimension-level project health (such as schedule, cost, resources, and scope), generates an executive summary using weekly project data, and provides a rationale for each prediction.

After generation, project managers can review:

- Predicted overall health
- Predicted dimension statuses
- Explanation/rationale text for each prediction in analysis sections
- Executive summary text generated from the project's recent data

After submission, the same information appears in the report view, including rationale text (for example, a rationale/status explanation column).

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the Status reports page of the project by selecting **Status Reports** from the list.
3. From the Pages section, select **Generate status report**.
The system invokes LLM to pre-populate the form with predicted fields and an executive summary.
4. Review the AI-generated fields:

Create + All sections were generated by Now Assist. Please review the content for accuracy.

Status report: Automation project 2026-03-05

Status: Draft Overall health: Red

Overall Status

AI Overall Health Analysis

The project has a red schedule health status due to a 6000% delay (60-day variance) and an overdue milestone without an assigned owner. While resource, cost, and scope health are green, the presence of a red sub-indicator (schedule) triggers an overall red status per evaluation criteria.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Executive summary

As of this reporting period, PRJ0010001 is Work in Progress. Key achievements this period include Security & Authentication Ready. Looking ahead, the team is tracking toward UAT Sign-off & Go-Live, targeted for 2026-03-09 00:55:23. Attention is required on 4 high-priority overdue tasks, including 'Train customer support team on new portal features' (PRJTASK0010015) and 'Conduct comprehensive security penetration testing' (PRJTASK0010011), with immediate focus on resolving overdue high-priority items to keep the project on track.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Comments

Empty comment box with rich text editor toolbar.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Last Week's Achievements

Empty text box with rich text editor toolbar.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Key activities planned

Empty text box with rich text editor toolbar.

Schedule

Schedule

Red

AI Schedule Health Analysis

Schedule health is red. The project is 6000% behind schedule, with a 60-day delay from the original baseline end date (2026-02-09) to the current forecasted completion date (2026-04-11). Additionally, 1 active milestone ('Security & Authentication Ready') is overdue and lacks an assigned owner, requiring immediate attention. The combination of extreme variance and critical milestone risks indicates significant delays requiring urgent management intervention.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Comments on schedule

Empty comment box with rich text editor toolbar.

Cost

Cost

Green

AI Cost Health Analysis

Cost health is green. No budget or cost overrun issues have been reported. Project spending remains within acceptable tolerance limits with no variance exceeding 10% of planned costs.

- Overall health (predicted)
- Dimension health such as schedule/cost/resources/scope (predicted)
- Executive summary (generated from project data for the reporting period)
- Rationale/analysis sections explaining each prediction (for example, schedule health analysis, cost health analysis).

5. Edit any fields as needed.

6. Select **Submit**.

7. Optional: Verify the submitted report.

8. Optional: Select **Now Assist** to ask more questions on the generated status report or select **Summarize** to generate a short summary of generated report.

(Optional) You can export and edit the AI-generated status report. You cannot duplicate an AI-generated status report.

Result

An AI-assisted status report is generated with predicted health values, an executive summary, and rationale text.

Create a status report in Project Workspace

Create a status report in Project Workspace for your projects. Your team can view the report and be updated on project health, metrics, risks, issues, and milestones.

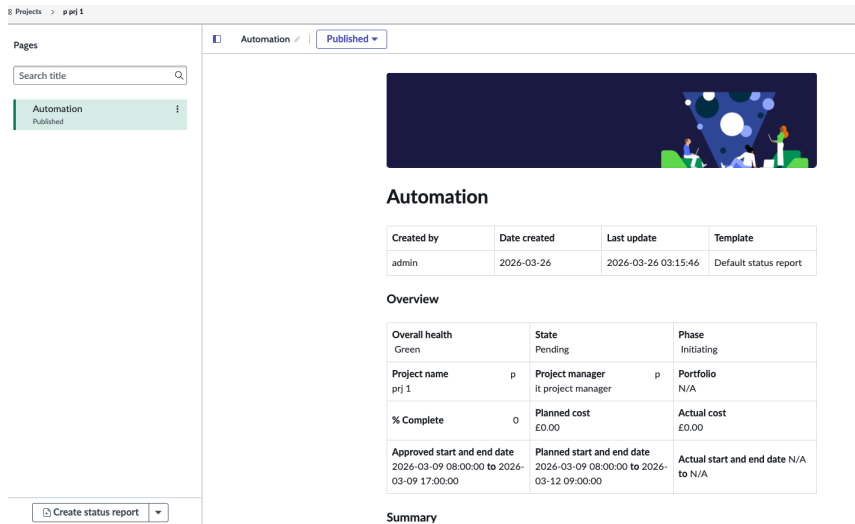

Before you begin

Role required: it_pps_admin, it_project_manager

About this task

Procedure

- 1.** Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
- 2.** Open the Status reports page of the project by selecting **Status Reports** from the list.
- 3.** From the Pages section, select **Create status report**.
- 4. Optional:** To create status report from a template:
 - a.** From the Pages section, select **Create new from template** from the drop down.
 - b.** From the "Welcome to your Template Center!" screen, select **Use** for the template that you want to use.
- 5.** On the Create status report form, fill in the fields.
For a description of the field values, see [Create status report form](#).
- 6.** Select **Submit**.

Note:

The status report appears with the data and information that you entered populated in the default status report template. You can replace the existing default template with your desired template and set it as default by updating the sys id in value field of system property (sn_pw.project_status_report_default_templateId).

7. Optional: Select the **More actions** icon and then perform these steps.

- a. Select **Export as PDF** to share and archive a PDF version of the report.
- b. Select **Keyboard shortcuts** to view keyboard shortcuts on status report
- c. Select **Hide Live Presence** to hide the live presence.
- d. Select **Edit status report** to open and edit the status report.
- e. Select **Duplicate status report** to create a copy of status report.

(Optional) You can't edit the status report. To edit the status report, you can disable the status report read-only system property (sn_pw.status_report_doc_read_only). By default, it is set to true, and the status report is read only.

8. Make changes to the report by editing the data, formatting, organizing the content, and entering additional data.

The changes you make to the status report here are saved to the underlying status report record, which you access from the status report related list in Projects form.

9. Observe and monitor the report.

For more information on viewing and analyzing status reports, see [Analyze the status report in Project Workspace](#).

If you don't have old status reports, you can't see the import option. For more information on importing existing status report, see [Import old project status report to Project Workspace](#).

Analyze the status report in Project Workspace

Observe a status report in Project Workspace for your project to learn about project health, metrics, risks, issues, and milestones.

Before you begin

Role required: it_pps_admin, it_project_manager

About this task

The following are the headers in a report created using the Default status report template. A report created using the One-page status report template has fewer information headers.

Aspect	Description
Overview	View a high-level summary of the project, including key details such as phase, health, and % completion.
Key Milestones	Track critical project milestones, comparing planned vs actual dates and identifying any variances.
Cost (Planned vs Actual)	Compare planned project costs to actual expenditures over time, helping identify budget deviations.
Resources (Allocated vs Actual)	Analyze planned resource allocation versus actual usage, helping identify resource over/under-utilization.
Schedule	Evaluate the project’s timeline, identifying delays and comparing planned vs actual task completion.
Risks	Assess potential risks, their probability, impact, and current mitigation plans.
Issues	Identify ongoing issues affecting the project, with ownership and target resolution dates.
Dependencies	Assess external or internal factors that could impact the project’s progress or completion.

You can also compare two reports to compare and analyze the progress.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the Status report page of the project by selecting **Status Reports** from the list.

3. From the Pages section, select the name of the status report you want to view.
4. Observe and monitor the report.

Related topics

- [Status reporting in Project Workspace](#)

- [Add dynamic content to status report in Project Workspace](#)

Update status report in Project Workspace

Modify a status report in Project Workspace for your project to update project health, metrics, risks, issues, and milestones.

Before you begin

Role required: `it_pps_admin`, `it_project_manager`

About this task

By default, the status report is read-only and the `sn_pw.status_report_doc_read_only` system property is set to true. To edit the status report, you can disable this system property by setting it to false. Once you change the property to false, you can edit or update the report. You can also navigate to the Details page and set **Allow edit status report** field to true.

Any updates made on the status report form are reflected in the status report, regardless of whether the property is set to true or false.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the Status reports page of the project by selecting **Status Reports** from the list.
3. From the Pages section, select the name of the status report you want to update.
4. Select the **More actions** icon and select **Edit status report** to edit the status report.
 - When editing is disabled, all fields in the status report are read-only.
 - When editing is enabled, only dynamic fields in the status report remain read-only and you can add any static or manual information in the report.
 - You can still edit the dynamic fields in both the scenarios using Edit Status Report option.
5. Make changes to the report by editing the data, formatting, organizing the content, and entering additional data.

To edit the `sn_pw.status_report_doc_read_only` property, enter `sys_properties.list`. In the list, search for `sn_pw.status_report_doc_read_only`. You can modify the **Value** field and select **Update**.

If the existing status reports are incompatible with the new changes, following actions are taken. These actions are applicable on both status report and project status form:

- If a report is read-only, it automatically updates to the new format without notification.
- If a report is editable, a message appears prompting you to copy the static data and regenerate the report.
- A Regenerate button is provided, which allows you to regenerate the report and ensure compatibility with the new updates.

Duplicate a status report in Project Workspace

Save time by duplicating an existing status report to copy all the project details without having to copy the information manually in the Project Workspace.

Before you begin

Role required: it_project_manager

Procedure

1. Create a status report in Project Workspace.

The status report appears with the data and information that you entered populated.

2. **Optional:** Make changes to the report by editing the data, formatting, organizing the content, and entering additional data.

(Optional) The changes you make to the status report here are saved to the status report in the project workspace and also get saved to the underlying status report record, which you access from the status report related list in Projects form.

3. Select the **More actions** icon and select **Duplicate status report** to create a copy of status report.

- The duplicated report reflects the latest project status and metrics.
- Any static or manually added information from the original report is retained in the duplicated version.
- The dynamic data refreshes to the current date and shows the latest information. The new status report is added to the same location as the original status report.

[Create a status report template in Project Workspace](#)

Import old project status report to Project Workspace

Migrate your old status reports from the classic Project Workspace to the new Project Workspace and optimize reporting process of your projects.

Before you begin

Role required: it_pps_admin, it_project_manager

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the Status reports page of the project by selecting Status Reports from the list.
3. From the Pages section, select **Create status report** and select **Import existing status report**.

By default, the create status report and create new from template options are visible, while the import existing status report option appears only if an old status report exists.

4. Select **Import** to import old status report to new reporting tool.

You can export a status report at the project level from the classic Project Workspace using the **Export status reports to Next Experience** link. You can export a status report at the record level using the **Export to Next Experience** link.

Add dynamic content to status report in Project Workspace

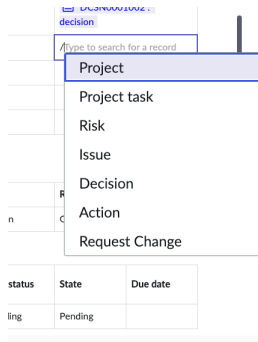

Add dynamic content to a status report in Project Workspace for your projects. The dynamic content gets updated automatically in the status report as a change is made to the record.

Before you begin

Role required: it_pps_admin, it_project_manager

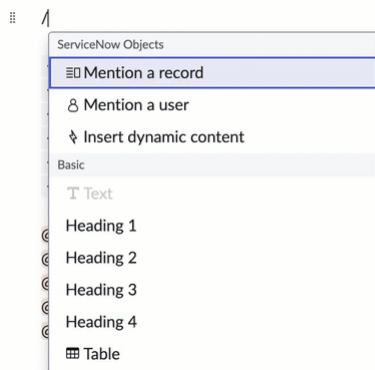

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the Docs template page of the project by selecting **Docs template** from the list.
3. From **Docs template** page, select the template to open it.
4. Select **Doc** tab and select at the appropriate place and then type / (forward slash) to open a list of actions, including **Mention a user** or **Mention a record** or **Insert dynamic content** as required.
 - a. You can type in / (forward slash) and select **Mention a user** to tag a user.
 - b. You can type in / (forward slash) and select **Mention a record** to insert a record.

Once you insert a record, it is embedded as a link, which you can click to open the related record and see its details.

- c. You can type in / (forward slash) and select **Insert a dynamic content** to add insert dynamic content in the status report.

Using insert dynamic content option, you can configure and view the status date, project, and other dynamic data in your status report template. This option is only available if **Is dynamic** field is selected in the Doc template form. You can select formatting options such headings, bullets, and others.

5. Observe and monitor the report.

For more information on viewing and analyzing status reports, see [Analyze the status report in Project Workspace](#).

Collaborate with stakeholders from Project Workspace

Add comments and attachments to the project or a project task and share them with other users of your organization. Collaborate and verify that your project is in line with your organizational priorities.

Before you begin

Role required: it_project_manager

About this task

Browse and upload files from your computer. Add comments and tag stakeholders for their feedback or notes.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Attach files to your project or project task.
3. Add comments or tag stakeholders to draw their attention to an attachment or information about the project.
You can add comments directly at the project level or for a project task.

Collaborate on projects using Docs

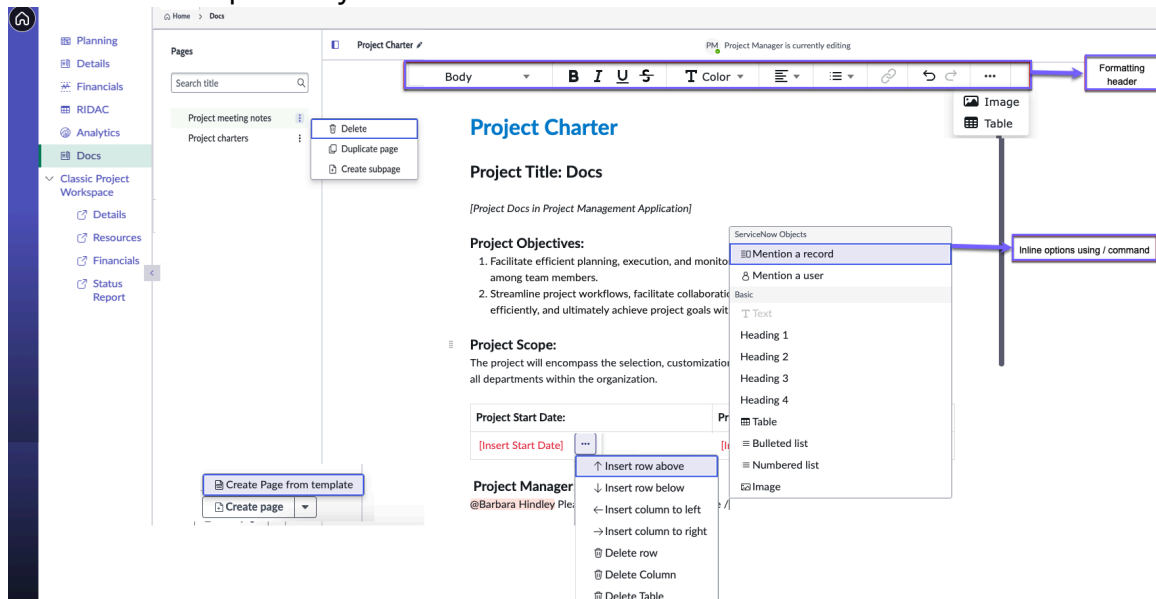

Collaborate with team members, save notes, create project charters, and project briefs using Docs.

Before you begin

Role required: it_project_user

Procedure

1. Open a project in Project Workspace.
For more information, see [Access the new Project Workspace](#).
2. Open the docs page of the project by selecting **Docs** from the list.
3. From the Pages section, select **Create page** and then select **Create Page from template** if you want to add a template for your document.

4. You can perform these tasks under the **Docs** page:

- Use the forward slash on the keyboard to open a list of actions, including **Mention a user** or **Mention a record** as required.
- Use the feature of live presence to see who is opening or working on a Doc.
- Create templates for documents such as project charters, project briefs, and meeting notes.
- Add meeting notes to record discussions, decisions, action items, and any relevant information discussed during meetings.
- Store information related to your tasks, add images, or tables and collaborate in real-time using Docs.
- Select the more actions menu to delete, duplicate, or create child pages in the pages section.
- Apply rich text paragraph formatting, which includes headings, lists, alignment, and other styling options.

Generate the summary for selected or complete content with Project doc summarization skill in Project Workspace

Quickly learn the details of the documents from the summary that is generated by Now Assist in Strategic Planning.

https://player.vimeo.com/video/1038147968?h=9451c75819&badge=0&autoplay=0&player_id=0&app_id=58479

Before you begin

Important:

This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

Role required: it_project_user

If you have users with custom roles that need access to this skill, you must update ACLs for those roles.

About this task

Minimize the time that you spend reading documents, meeting notes, project reports and so on by using a summary that is generated by Now Assist. You can also copy-and-paste the source materials that meet your learning needs in Docs and generate a quick summary.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open the required project.
2. From the Docs, perform one of these action according to your requirements.

Note:

Summarization of the entire content is also permitted for users with the read role.

3. **Optional:** When you're finished summarizing the page in Docs, you can provide feedback, copy, or view information about it.

Note:

Because the information in these fields is AI generated, it's a good idea to review the text and make sure it's accurate.

Only an administrator can activate the Now Assist skills. For more information, see [Activate a Now Assist skill](#).

The Project doc summarization skill checks the doc content to determine if enough information is available to generate a summary. If there isn't enough content to summarize, you can add more content and retry.

Note:

The **Summarize** button is visible only if the Project doc summarization skill is active. If the selected text exceeds the token limit for Now Assist, the Project doc summarization skill can't be executed. If there is more content to summarize, you can remove some content and retry.

Schedule the project insights email

Schedule the project insights email to prioritize and track the most important changes in the project in Project Workspace.

https://player.vimeo.com/video/1156994852?h=fc02bd8ee8&badge=0&autoplay=0&player_id=0&app_id=58479%22

Before you begin

Important:

This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

If you have users with custom roles that need access to this skill, you must update ACLs for those roles.

Role required: it_project_manager

About this task

By using the Project insights generation skill, you can generate a concise project insights. The project insights are shared through email. Project managers can monitor key elements such as project, project task, milestone, resource assignment, ridac, and financial. They can also prioritize their projects and decide the cadence of receiving these project insights email.

When a project is created in the work in progress state, the project insight generation skill is automatically enabled. This ensures that projects begin generating insights early in the execution phase without requiring manual setup. In addition, all existing projects in the work in progress state are automatically enabled for email-based project insights.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open any project.

2. From the planning page, select the more actions icon () and then select **Configure project insights**.

From Project insights generation skill card, select **Edit** to modify the email conditions. From project insights configuration screen, select **Switch scope** and then select **Edit conditions**. Administrators can control insight generation through admin-level configuration. For more information on configurations, see [Configure Now Assist Admin features](#). From Email condition modal, admins can define which projects should generate insights and trigger email notifications, providing flexibility over when and for which projects insights are sent.

3. From the Configure project insights modal, in Choose topics step, select **Next**.

You can select or deselect the project, project task, milestone, resource assignment, ridac, and financial card to customize what information is displayed in the Project insights email.

4. In Personalize content step, add your requirements and select **Next**.

You can define your tone, writing style, and priority entities. For example, identify risks of this project. Please provide a formal summary in bullet points.

5. In Set frequency step, select the **Cadence** as Weekly, Bi-weekly, or Monthly according to your requirement.

6. Select **On this day**, as days for weekly or bi-weekly or dates for monthly cadence.

7. Select **Users** from the list.

- The project manager is automatically set as the default email recipient for the project.
- You can select one or multiple users. Only users with sn_ppm_read role or have read or view access to project information appear for selection in the users list.
- When an email is sent to recipients, the project manager is placed in the To list, while all other recipients are included in the Cc list.
- For confidential projects, recipients are required to be included in the list of users authorized to view the project.

8. **Optional:** Select **Send preview** to generate and send a preview of the insights email instantly.

When you select Send preview, you receive a project insights instantly and also receive insights based on the selected cadence. The email would go to the recipients selected along with the Project Manager.

Example: Schedule a project insight email

Let's assume that you have selected a weekly cadence and chosen Monday (which falls on 2025-07-07). After adding recipients:

- If you select **Schedule**, the project insights are emailed to you and the recipients weekly on Mondays, starting from 2025-07-07 and continues until the project is inactive.
- If you select **Send preview**, you will receive an initial insights email immediately and will also receive insights according to the selected cadence and day.

Project financials and Source-to-Pay Operations integration

Request, track, and manage procurement requests of assets for your projects.

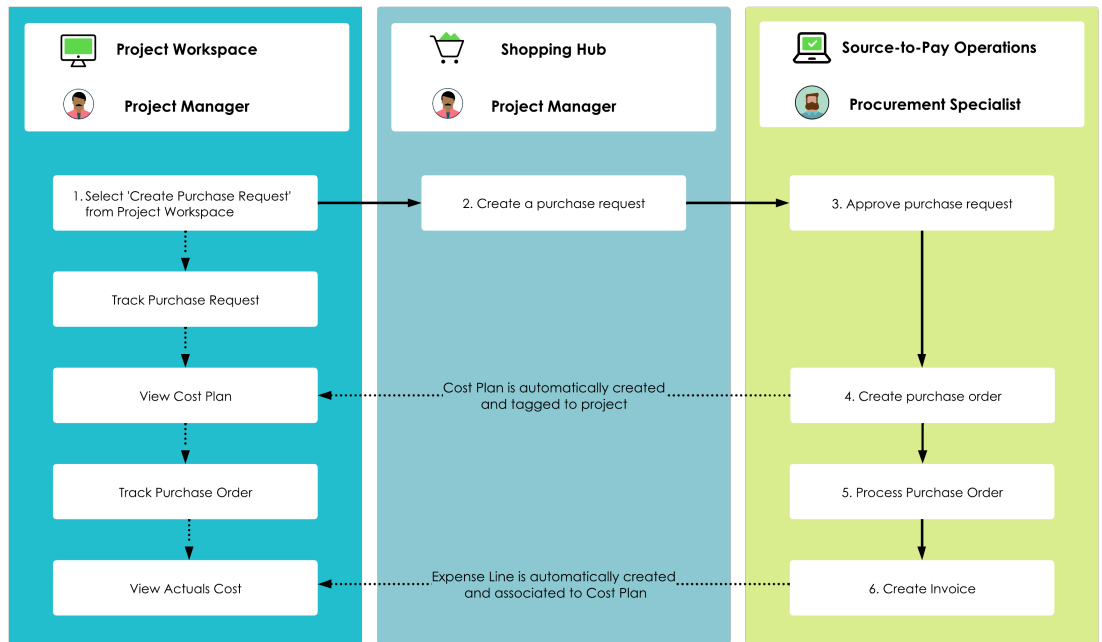

Before you begin

[Install Sourcing and Procurement Operations](#) 

Role required: it_project_manager

About this task

Project managers can navigate from Project Workspace to procurement applications and create purchase requests for their projects. The ordered purchase requests are reflected in the Project Workspace. After the purchase request is processed, the purchase line, cost plan, and expense lines are automatically generated. For more information about the integration, see [Sourcing and Procurement Operations integration with Project](#)

[Management](#) 

Procedure

1. Navigate to **Workspaces > Project Workspace**.
2. Open a project and select **Details** from the left menu.

Create purchase request

As a Project Manager, you can directly access the Source-to-Pay Operations shopping hub portal to place a request to meet your project requirements.

Before you begin

Role required: it_project_manager

Procedure

1. In the project details page, select More Actions () icon and select **Create Purchase Requests**.
The Source-to-Pay Operations shopping hub portal opens in a new tab.
2. Place the request for an asset.
For more details on how to request a product using Source-to-Pay Common Architecture, see [Order a product with quick checkout](#) .

Note:

While placing the request for the asset, enter the project number in the **What project is this request for?** field.

Track purchase line and purchase order lines

After the purchase request is placed, you can track the request details such as Purchase line number, Purchased quantity, unit cost, tax, and state from Project Workspace.

Before you begin

Role required: it_project_manager

Procedure

1. Open the project selected while creating the purchase request.
2. Select **Details** from the left menu.
3. Select the **Purchase Lines** related list.
A procurement specialist from the Source-to-Pay Operations approves the purchase requisition. Once the purchase order is created, purchase order line is automatically created in Project Workspace.

To view the purchase order in Project Workspace:

- a. Open the project selected while creating the purchase request.
- b. Select **Details** from the left menu.
- c. In the Details page, select the **Purchase Order Line** related list.

Note:

Every purchase order line creates a cost plan in the selected project.

Tracking financials of procurement requests

Once the requested purchase orders are approved and processed, a purchase order line and a cost plan is automatically created. You can view cost plans for the requisition in Project Workspace.

Before you begin

Role required: it_project_manager

Procedure

1. Open the project selected while creating the purchase request.
2. Select **Details** from the left menu.
3. Select the **Cost Plans** related list.

Note:

The cost plan is reflected in Financials along with additional details such as start and end fiscal period, planned cost plan breakdown for each fiscal period.

As next steps, a purchase order is processed and an invoice is generated. An invoice line is created which captures the actual expense of the purchase request. You can view the expense lines generated from the processed invoice from Project Workspace.

- a. Open the project selected while creating the purchase request.
- b. Select **Financials** from the left menu.
- c. Locate the cost plan created for the Purchase Order Line.
- d. Scroll through the cost plan monthly breakdown, select the row options  for fiscal period in which the purchase order is created and select **View expense lines**.
- e. In the Expense lines view, select the **Auto generated expense line for cost plan:** option.
- f. Total expense incurred while generating the purchase order are displayed in the **Amount** field.

Result

The processed purchase request is tagged to the selected project. Financials records such as cost plans and expense lines are automatically created and associated with the project expense.

Add a RIDAC record to a project in Project Workspace

Add a Risk, Issue, Decision, Action, or Request Change (RIDAC) record to your project in the Project Workspace. Adding RIDAC records enable you to keep a track of risks or issues during the project life cycle and help in analyzing the outcome of a project.

Before you begin

Role required: it_project_manager

About this task

You can select the type of record you want to create, fill in the required details, and associate it to your project. You can use the RIDAC page in Project Workspace to view, add, manage, and evaluate all the RIDAC records.

For information about RIDAC records for project management, see [Adding RIDAC \(Risks, Issues, Actions, Decisions, and Request Changes\) records for a project](#).

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the RIDAC page of the project by selecting **RIDAC** from the list.
3. From the More actions menu, select the type of RIDAC record that you want to create.
4. On the form, fill in the fields.

For field information, see:

- [Risk form of Project Workspace](#)
- [Issue form on Project Workspace](#)
- [Action form of Project Workspace](#)
- [Decision form on Project Workspace](#)
- [Request change form on Project Workspace](#)

5. Select **Submit**.

What to do next

- Convert an existing project risk to an issue, decision, action, or request change and close the risk. For more information, see [Convert one RIDAC record to another for a project in Project Workspace](#).
- Associate a project risk with existing issues so that you can track dependencies and recognize trends for the future. For more information, see [Associate existing RIDAC records for a project in Project Workspace](#).

Associate existing RIDAC records for a project in Project Workspace

Link existing RIDAC records to one another for your project in Project Workspace. A RIDAC record stands for Risks, Issues, Actions, Decisions, and Request Changes. Keep a record of risks or issues and their outcome for analysis at project closure and planning.

Before you begin

Role required: it_project_manager

About this task

You can associate one record with multiple different records. For example, you can link one issue record to multiple risk, decision, action, or request change records.

Procedure

1. Select the project for which you want to associate one RIDAC entry to another.
For information on how to navigate to a Project in the Project Workspace, see [Access the new Project Workspace](#).
2. Open the RIDAC page of the project by selecting **RIDAC** from the list.
3. On the Project form, select **Row context menu** for an individual risk, issue, decision, action, or request change record.
4. Select **Associate RIDAC**.
5. On the Associate dialog box, from the Select type list, select the RIDAC record to which you want to associate the selected record.
For example, if you wanted to associate an issue to a decision, you would select **Decision**.
6. From the Associate to list, select the record number to which you want to associate the selected record.
For example, if you wanted to associate the selected issue to a decision (DCSN0001005), you would select **DCSN0001005**.
7. Select **OK**.

Convert one RIDAC record to another for a project in Project Workspace

Convert one RIDAC (Risk, Issue, Decision, Action, and Request Change) record to another for a project in the Project Workspace. Keep a record of risks or issues and their outcome for analysis at project closure and planning. Track the risks and issues throughout the project life cycle.

Before you begin

Role required: it_project_manager

About this task

When you convert a RIDAC record to another record, the values for the **Short description**, **Requester**, and **Assigned to** fields are carried forward from the parent record.

You can also specify to close the parent record on creation of the new record instead of manually closing the parent record.

Procedure

1. Select the project for which you want to convert one RIDAC entry to another.
For information on how to navigate to a Project in the Project Workspace, see [Access the new Project Workspace](#).
2. Open the RIDAC page of the project by selecting **RIDAC** from the list.
3. On the Project form, select **Row context menu** for an individual risk, issue, decision, action, or request change record.
4. Select **Convert to RIDAC**.
5. On the Convert dialog box, from the Select task type list, select the RIDAC record to which you want to convert the selected record.
For example, if you wanted to convert an issue to decision, you would select **Decision**.
6. Modify the text in the **Short description** field, which is copied from the parent record.
7. **Optional:** Change the default assignment copied from the parent record in the **Assigned to** field by selecting the search for record icon () and selecting a different user.
8. **Optional:** If you want to close the parent RIDAC record on creation of a new record, select the close parent record option.
The label of the close parent record option changes depending on the parent record type. For example, if the parent record is an issue and you're converting it to decision record, then the close record option would appear as **Close Issue**.
9. Select **OK**.

Generate, accept, and reject risks using risk generation skill

Use generative AI to identify, generate, and manage potential risks in your project based on insights, resources, financials, and milestones.

Before you begin

Role required: it_project_manager

- Install Now Assist for Strategic Portfolio Management (SPM) plugin.
- Verify risk generation skill is active.
- The risk generation skill is activated by default. For more information on how to activate the skill if it isn't automatically activated or if you want to change the skill configuration, see [Configure Now Assist Admin features](#).

About this task

AI analyzes project data to identify potential risks and presents them for project manager review. AI-suggested risks are generated as part of the project insights cadence and appear in the AI Risks menu for project managers to accept or reject. AI generates risks by analyzing data from project insights, resources, financials, and milestones.

The AI Identified Risks menu is visible only to project managers when the risk generation skill is active. If no risks are identified during generation or regeneration, the AI Identified Risks page displays an empty state where you can generate risks again.

Procedure

1. Navigate to **Workspaces > Project Workspace**.
2. From Project Workspace, [Create a project](#) or open an existing project.
3. Select **AI Identified Risks** from the navigation menu.
4. Review the AI-suggested risks in the list and perform one of these actions:
 - Regenerate: When you select regenerate option, the risk is generated again and added to the AI identified risks list. AI-generated risks appear in AI draft state.
 - Accept: When you accept a risk, the approved risk appear in the RIDAC list and its state moves from AI Draft to Pending.
 - Reject: When you reject a risk, the rejected risk is removed or hided from the AI identified risks list and its state moves to Closed skipped. The rejected risks are retained so that AI does not generate the same risk again.

If no risks are identified during generation or regeneration, the AI identified risks page displays an empty state. In this case, you cannot regenerate risks immediately and are advised to revisit the page later as the project evolves.

5. Optional: Select **Generate AI Risks** if no risks are identified for the project.

Number	Short description	Description	Impact	Probability	AI rationale	Mitigation plan

Export a project status report to Microsoft PowerPoint from Project Workspace

Generate a status report of your project and export it as a Microsoft PowerPoint file from Project Workspace. You can use this file to present the project status to stakeholders or to collaborate with them over risks and next steps. Save time by generating a Microsoft PowerPoint file with the latest information and avoid copying information into slides.

Before you begin

- Install the Export to PowerPoint for Strategic Portfolio Management application from ServiceNow store. For more information, see [Install Export to PowerPoint for Strategic Portfolio Management](#).
- Create and upload a Microsoft PowerPoint template to apply to your status report. For more information on how to create and upload a template, see [Create a Microsoft PowerPoint template](#) and [Upload your Microsoft PowerPoint template](#) respectively.

Role required: it_project_manager

Important:

Export to PowerPoint is currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. Please check for availability updates in future releases.

About this task

Create a status report or use an existing status report to download it as a Microsoft PowerPoint file.

Exporting the project is beneficial if your stakeholders prefer a slide deck rather than using a dashboard. It also helps the wider audience or external stakeholders who don't have access to the dashboards but are waiting for an update.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. From the More actions menu (), select **Export status report**.
3. On the Export status report form, fill in the fields for an existing project.
For field information, see [Export status report form on Project Workspace](#).
4. Select **Export**.
5. When prompted, select the desired location, and save the file.
6. **Optional:** On the Export status report form, create a status report for a project by selecting the **Please create a status report to be able to export** link.

Export status report

No status report available for the project.

[Please create a status report to be able to export.](#)

7. On the **Status Report** Tab, create a status report by clicking **Create New**.
8. On the Status Report form, fill in the fields.
For field information, see [Create a project status report](#).
9. Select **Submit**.
10. Select the Export to PowerPoint icon ().
11. From the Export to PowerPoint window, select the report date by clicking **Status report date**.

12. From the Export to PowerPoint window, select a template by clicking **Select a template**.

13. Select **Export**.

Result

The project status report is downloaded as a Microsoft PowerPoint file with the project number and status report date as the file name.

Export a project from Project Workspace

Export your project as a file from Project Workspace. Use this file to provide project updates to external stakeholders or a wider audience. Save time by generating an export file with the latest information and avoid copying information into different files.

Before you begin

For Microsoft PowerPoint:

- Install the Export to PowerPoint for Strategic Portfolio Management application from the ServiceNow store. For more information, see [Install Export to PowerPoint for Strategic Portfolio Management](#).
- Create and upload a Microsoft PowerPoint template to apply to your status report. For more information on how to create and upload a template, see [Create a Microsoft PowerPoint template](#) and [Upload your Microsoft PowerPoint template](#).

Important:

Export to PowerPoint is currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. Please check for availability updates in future releases.

Role required: it_project_manager

About this task

Create a project or use an existing project to download it in the required file format. You can choose to export the project data in Excel, CSV, PPT, MS Project (MPP), and XML file format.

Exporting the project is beneficial if your stakeholders prefer a file rather than using a dashboard. It also helps the wider audience or external stakeholders who don't have access to the dashboards but are waiting for an update.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. From the More actions menu () , select **Export project**.
3. Select the file format and then select a template if needed.
4. Select **Export**.
Only the columns that are visible in the Planning page of the project are exported.

Result

The project is downloaded in the selected file format.

Closing a project in Project Workspace

End the project when all tasks are completed. When you close a project, all project tasks, sub-projects, and resource assignments associated with the project are closed automatically.

Before you begin

Role required: it_project_manager

About this task

Ideally, you should not reopen a project after it is closed. Updating the project state from Closed to Work In Progress, Pending, or Open is not allowed. If you still need to reopen a closed project, reopen an existing project task or add a new task to the project. This action for a task moves the project from Closed to Work in Progress state without affecting the other closed tasks. You can cancel the associated future resource plans and complete the allocated resource plans for a closed project.

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Verify that your work is completed for all the tasks in the project you want to close.
3. On the Project form, change the state field to one of the closed states:
 - Closed complete
 - Closed Incomplete
 - Closed skipped

Note:

- When you close a project, a notification is displayed, which enables you to view all resource assignments associated with the project. You can synchronize all resource assignment dates with project dates. The resource assignment ends on the exact date and time that the project ends.
- You can track, modify, and synchronize all resource assignments for a project from the Resource Assignment List page.

Alternatively, close every project task first, starting with the lowest-level child tasks. The closed states roll up to parent tasks, and when all highest-level parent tasks are closed, the project state changes to closed. However, the default closed states for parent tasks and for the project is **Closed Complete**. Therefore, even if you change any or all project tasks to **Closed Incomplete** or **Closed Skipped**, the project state is changed to **Closed Complete**.

Also, change the **Phase** value to **Closing**. The project phase is for reference only and isn't linked to or dependent on the **State** field.

If your project contains sub-projects, you can close the sub-project without affecting the parent project. Change the **State** of the sub-project to any closed state to close the sub-project. Closing the sub-project closes or changes the state of all the tasks associated with the sub-project. Also, changing the state of the sub-project to Work in Progress, moves all the associated tasks to Work in Progress state.

If there are project tasks associated with the parent project that are not closed, the parent project remains in the Open, Work in Progress, or Pending state. If the tasks associated with the parent project are closed, the state of the parent project also changes to **Closed Complete**.

4. After the project is complete, create a final baseline to see how closely the project's actual values came to the estimated values.

Note:

Baselines compare only planned start and end date values with actual start and end date values. Use reports to compare the effort and cost.

Result

For projects created from an incident, problem, or change, updating the project state does not automatically update the related incident, problem, or change request record. You must update the related record manually. For example, if the completion of a project also means that a related Change can be closed, go to the Change record and modify its **State** field. It is also a good idea to update the work notes field on the related record to include any relevant information about the project.

Managing financials for your projects

Manage budget, cost plans as forecasts, actual expenses as expense lines, generate labor costs, create financial baselines, and view, analyze, and compare the financial performance of your projects at required cadence in Project Workspace.

The comprehensive financials view helps you to understand planned and actual costs, Forecast (previously EAC - Estimate At Completion), Remaining Estimates (previously ETC - Estimate To Completion), Actual (previously Actuals to date), and so on, for the selected item. You can manage cost plans and associate the expense lines and process them to reflect the actuals for a planning item.

Export the financials data from Costs and benefits or Baseline comparison view as Microsoft Excel or a CSV file and share it with your stakeholders to review the financial performance of your projects and portfolio.

Cost view

Forecast your planned costs, create, and manage cost plans and expense lines to track the financial performance of your projects, review the latest costs and actuals.

In the Cost screen, you can:

- As a Project Manager, you have the enhanced visibility and ability to manage the financial data across multiple project levels. Cost view of financials shows cost plans and expense lines from sub-projects, allowing you to track the finances.
- The parent project widgets display the consolidated values of forecasted costs and expenses.
- Identify and manage costs using the **Project/Demand** column for any sub project or demand directly from Cost view of the parent planning item.
- Re-forecast all the cost plan values for future fiscal periods by double-clicking to edit the value in the least time scale view, either by month or by period.
- Manage cost plans for your projects. For more information, see [Add, edit, or delete cost plans](#).
- Add or edit expense lines for your projects to record any planned or unplanned expenses. For more information, see [Add or edit expense lines](#).
- Generate labor costs for the fiscal period. For more information, see [Generate labor costs](#).

- Create and compare baselines to capture the financial snapshot of your projects. For more information, see [Create and compare financial baselines for your projects](#).
- [Configure widgets](#) to get a high-level overview of the financial data for your planning item.
- All financial details from sub-projects will be aggregated and displayed in the parent project's cost plans and widgets.

Tip:

Cost view gives you enhanced user experience to customize the left pane columns by using the personalize icon () and by saving user preferences to retain the customizations made to hide, view, or adjust columns, time scope viewing, and so on.

Multicurrency

The multicurrency feature enables you to manage the financials of your planning items in two different currencies, Functional currency and Investment currency. Functional currency is typically defined by the admin based as the primary currency that is used for planning, budgeting, and tracking the financials of your planning items.

Financial users can now perform the following financial activities in Investment currency.

- Ability to select the Investment currency.
- Track the planned and actual expenses.
- Allocate and manage the budget.
- View simple financials data.

Important:

New customers should install the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin to enable multicurrency feature and [Activate scheduled job to populate to multicurrency fields](#).

Using this feature, you can work on financial reporting at global level and see the real-time currency conversions of your financial records.

Organizations operation at global or multinational level, the work is planned and financed at one location and executed at a different location. Each might use a different currency from what was used in the planning phase, multicurrency makes it easy to manage and track your planning items using any currency.

You can monitor and track the financials in one currency, and capture the costs in a different currency.

Using multicurrency, you can see all the costs in the currency you choose for the planning item, instead of restricting to use Functional currency defined in your locale. For more information on how to choose investment currency of your planning items, see [Configure multicurrency for projects](#).

Financial records and widgets will display the costs based on the currency selection.

Note:

Once a cost plan, benefit plan or expense line or an investment budget gets created, you won't be able to change investment currency. You can change the investment currency as long as there are no financial records captured against the planning item.

Display modes

On the financials page for a planning item in Project Workspace, you have Display Mode drop-down switch between different modes to view different formats of financial information of your planning items. These views provide the relevant and focused information which helps project managers and funding users to work on the financial planning.

- Forecast
- Budget vs forecast
- Planned vs actual
- Planned

Users with financial funding role [it_portfolio_manager] will see Budget allocation option instead of the Budget vs forecast.

Display modes value

Mode	Value
Forecast	<p>View Actuals, Remaining estimates, and Forecast for the entire scope of the planning items.</p> <p>Use the time scale to view the actuals for the past fiscal periods and planned costs for the current and future fiscal periods.</p>
Budget vs forecast	<p>View the Budget, Actuals, and Variance for the fiscal periods and Forecast values for the entire scope of the planning items.</p> <p>Using this mode, you can:</p> <ul style="list-style-type: none"> • Compare the latest forecasts with the approved budget at different time scales. • View the budget vs actual for past fiscal periods and budget vs planned for current and future fiscal periods at fiscal period level.
Budget allocation (funding role)	<p>View the Budget, Actuals, and Variance for the fiscal periods and Forecast values for the entire scope of the planning items.</p> <p>Using this mode, funding users can:</p> <ul style="list-style-type: none"> • View the latest forecast and enter the budget that can they be approved to the work item. • Analyze the variance for the past fiscal periods and work on budget allocation for future fiscal periods. • Compare latest forecast with approved budget and revise the budget, if necessary.
Planned vs actual	<p>Compare the planned costs with actual expense for the past and current fiscal</p>

Display modes value (continued)

Mode	Value
	periods, and view planned costs for the future fiscal periods.
Planned	View only planned costs for the full range and manage the planned costs using the inline editing feature.

Note:

- If you don't see the Budget allocation or Budget vs forecast display options, [enable the budget allocation property](#) and [configure the budget attribute](#) at instance level.
- To work on budget allocation using the Next Experience, [Activate a scheduled job to migrate budget of your planning items](#).

The last selected view is saved as user preferences.

Default display mode and access level for financial users

User role	Default mode	Role-level access
it_portfolio_manager	Budget Allocation	Allocate and approve budget, manage cost plans and expenses lines.
it_project_manager	Forecast	Manage cost plans and expense lines.
business_stakeholder	Forecast	View financial data.

Baseline view

Create a financial to capture a snapshot of the financial changes for your projects. You can create on-demand baselines manually or automatically at a required cadence using a scheduler job. For more information, see [Create a baseline](#)

Note:

Baselines created on the parent project include cost plans and expense lines from all of the child projects to calculate and give you a better breakdown of the financial performance of the projects and sub-projects.

[Compare baselines](#) to compare the difference in costs between latest status against a baseline or between any two baselines.

Note:

Each baseline is tagged with a number based on the order that they're created. The Current Financials baseline captures the financials details in real-time and is always represented with a flag icon ().

Financial baselines now capture the investment currency for customers using multicurrency.

A project baseline includes the following financial metrics in investment currency.

- Investment currency
- Total planned cost

- Planned benefit
- Planned return
- Budget cost

At the investment baseline level, a corresponding investment baseline is automatically created. This baseline captures:

- Planned cost
- Actual cost
- Planned benefit
- Actual benefit
- Total budget
- Capex, Opex, and breakdown of these fields
- Benefits, and so on

All values are populated along with their respective investment currency.

Cost plan baselines now store actual cost values in investment currency, along with the investment currency field. Benefit plan baselines capture benefit values in the investment currency, along with the associated currency. At the breakdown level (for example, fiscal period or monthly breakdowns), actual cost and actual benefit values are populated in investment currency where actuals exist.

Note:

Comparison of financial baselines using multicurrency is not yet supported.

You can view the planning item and investment baseline using the list view. Access the `pm_project_baseline` list to view project baselines, and `sn_invst_pln_invst_investment_baseline` to view the investment baselines.

The baselines comparison view helps you to understand the variances between the two baselines.

Name	Cost type	Full scope - EAC			FY23: M04			FY23: M05		
		EAC	EAC	Variance	Actuals	Actuals	Variance	Actuals	Actuals	Variance
Software costs	Software Capex	30,000	30,500	(500)	2,500	2,500	0	2,500	2,500	0
Labor costs	Labor Capex	96,000	99,200	(3,200)	8,000	8,000	0	8,000	8,000	0
Product Documen...	Other Opex	17,000	20,000	(3,000)	7,000	7,000	0	0	0	0
Travel costs	Other Opex	6,000	7,000	(1,000)	500	500	0	500	500	0
Hardware costs	Hardware Capex	64,500	64,500	0	5,500	5,500	0	5,500	5,500	0
Professional services	Other Opex	71,500	71,500	0	8,000	8,000	0	4,000	4,000	0
Total		285,000	292,700	-7,700	31,500	31,500	0	20,500	20,500	0

Use the widgets when you compare baselines to view:

- Two dedicated widgets for each baseline displaying the EAC.
- The third widget displays the total variance between the EAC values of the selected baselines.
- The fourth widget displays the top three variances contributing to the overall variance by cost type.

The widgets and the header rows are color-coded to help you identify the selected baselines.

Tip:

Switch between different baselines from the comparison view by selecting the name of a baseline from one of the widgets.

When you compare baselines, you get the list of cost plans with their associated costs types, EAC at full scope, and a breakdown view of actual expenses and planned costs.

By default, the time scale of the breakdown view is set to Month.

- Use the **Time scale** option to view the comparison breakdown view at monthly, quarter, and yearly levels.
- Select **Time scope** to filter fiscal periods, data in the widgets, and the comparison table.

The widgets and the header rows are color-coded to help you identify the selected baselines.

Tip:

Select the name of a baseline from the first or second widget to compare different baselines.

Let's take an example of the comparison view of two baselines: 2023-10-01, Baseline A, and Current Financials, Baseline B.

Example: How actuals, planned, and EAC are compared between two baselines captured at different timestamps

For a selected baseline, based on the creation date, the table shows Actuals values for the past fiscal periods from the created date and Planned values for the current and future fiscal periods.

Consider a planning item scoped from July 2023 to June 2024. Baseline A is created on 2023-10-01. If you compare the Current Financials baseline in December 2023 to the baseline captured in October 2023:

1. The baseline comparison view show Actuals vs Actuals columns from July 2023 to September 2023.

Name	Cost type	FY23: M07			FY23: M08			FY23: M09		
		Actuals	Planned	Variance	Actuals	Planned	Variance	Actuals	Planned	Variance
Professional services	External labor Capex	3,500	3,500	0	3,500	3,500	0	4,700	4,700	0
Travel costs	Other Opex	800	800	0	450	450	0	0	6,000	(6,000)
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	0	0	0	3,000	3,000	0	3,000	3,000	0
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	4,000	0	4,000	4,000	0
other costs	Other Capex									
Server costs	Hardware Capex									
Total		18,100	18,100	0	20,750	20,750	0	21,500	27,500	-6,000

2. Planned vs Actuals for October 2023 and November 2023.

Name	Cost type	FY23: M10			FY23: M11		
		Planned	Actuals	Variance	Planned	Actuals	Variance
Professional servi...	External labor Capex	3,000	3,000	0	3,000	4,000	(1,000)
Travel costs	Other Opex	450	500	(50)	450	600	(150)
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	3,000	3,500	(500)	3,000	3,000	0
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	4,000	0
other costs	Other Capex		0	0		0	0
Server costs	Hardware Capex					1,200	(1,200)
Total		20,250	20,800	-550	20,250	22,600	-2,350

3. Planned vs Planned from December 2023 to June 2024.

Name	Cost type	FY23: M12			FY24: M01			FY24: M02			FY24: M03		
		Planned	Planned	Variance	Planned	Planned	Variance	Planned	Planned	Variance	Planned	Planned	Variance
Professional servi...	External labor Capex	3,000	3,000	0	3,000	3,000	0	3,000	3,000	0	3,000	3,000	0
Travel costs	Other Opex	450	450	0	450	450	0	450	450	0	450	450	0
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	3,000	3,000	0	3,000	4,000	(1,000)	3,000	4,000	(1,000)	3,000	4,000	(1,000)
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	5,000	(1,000)	4,000	5,000	(1,000)	4,000	5,000	(1,000)
other costs	Other Capex		1,000	(1,000)									
Server costs	Hardware Capex		1,000	(1,000)									
Total		20,250	22,250	-2,000	20,250	22,250	-2,000	20,250	22,250	-2,000	20,250	22,250	-2,000

Note:

The columns are defined to calculate EAC, which is the sum of Actual costs until the last fiscal period and Planned costs from current to future fiscal periods.

Budget allocation

Portfolio managers can manage and approve the budget for projects. The approved budget helps project managers to plan and meet the expenses to execute work.

The screenshot shows the ServiceNow Project Workspace interface for a project named "Advanced AML (Anti-Money Laundering)". The interface includes a navigation sidebar with options like Planning, Details, Financials, RIDAC, Analytics, Docs, and Status Reports. The main content area displays a summary of budget vs. forecast vs. variance for various cost types (Capex, Opex) and a detailed table for "Capex (3)" items. The table columns include Expense type, Name, Cost type, Full scope Budget, Forecast, and Variance, and FY25 Budget, Forecast, and Variance. The total budget is \$230,000, and the total forecast is also \$230,000, with a total variance of 0.

Plan and approve the budget for a shorter planning cycle at monthly, quarterly, or yearly level using the lean budgeting and funding feasibility. Lean budgeting helps Portfolio managers to

track the value in return for the approved budget and to better plan the budget for future fiscal periods.

Note:

If the budget is allocated monthly, the total budget is rolled up to quarterly and yearly level. Similarly, if the budget is allocated at a quarterly or yearly level, the equal breakdown happens till monthly level.

For more information on how to allocate, approve, and handle budget for projects, see, [Manage budget of your planning items in Strategic Planning](#).

Tip:

In the budget allocation view, Portfolio managers review the EAC to understand the financial projections made by Project managers and use the **Copy cost as budget** option to allocate the entire planned cost as budget.

Choose the cost type as the attribute to allocate and approve the budget for individual cost types such as labor, non-labor.

Project managers can view the approved budget at the required time scale by switching to the Budget vs planned display mode. As the work progresses and the actuals are captured, you can compare the budget and actual costs using Budget vs planned display mode and reforecast the planned costs where the actuals are exceeding the budget using the inline edit feature at the required time scale.

Product managers can compare the latest cost with the approved budget by Capex or Opex, cost types, and for the required time scale at monthly, quarterly, or yearly level. The comparison view provides insights to Product managers to locate any variance at expense type or cost type, and at which fiscal period. Product manager can leverage this information to request for additional budget from the Portfolio manager.

You can [migrate the budget of existing active projects](#) from the Classic UI to Next Experience. Financials in the Next Experience has new budget data model that facilitates to store the budget at a detailed level by monthly breakdowns and cost types. You can migrate the budget for active projects and demands individually or by bulk using the scheduled job.

Note:

The migrated budget is captured in the `sn_invst_pln_invst_budget` table to enable the lean budgeting for required time scope.

Budget distribution logic

The budget allocation approach introduces data-aware budget distribution, prioritizing actuals for completed periods and planned costs for future periods. The system uses different distribution strategies depending on whether actuals or Estimate at Completion (EAC) values are available, and whether the fiscal period falls in the past, present, or future.

Budget allocation logic is divided into three focus areas: past fiscal periods, current fiscal periods, and future fiscal periods.

1. Past fiscal periods that have already ended.

- If actuals exist, the budget is distributed proportionally to actual spending. If the total budget amount equals the total actuals, the distribution exactly matches the actual values.
- If there are no actuals, the budget is distributed evenly across the past fiscal periods.

2. The current fiscal year is like a mid-year scenario where both past and future fiscal periods are available.

- For past or completed fiscal periods, the system distributes the budget proportionally matching the actual expenses. If there are no actual expenses, budget is allocated as zero (0).
- If planned costs exists for the current and future fiscal periods the remaining budget is distributed proportionally based on the planned costs.
- If planned costs doesn't exists for the current and future fiscal periods, budget is distributed evenly across the fiscal periods.

3. Future fiscal periods

- If planned costs exists, the remaining budget is distributed proportionally based on planned costs.
- If planned costs doesn't exists, the remaining budget is distributed evenly across the remaining fiscal periods.

Budget distribution based on financial records

Fiscal periods	Available financial data	Distribution method
Past fiscal	Actual expenses	Proportional to actuals
Past fiscal	No financial records	No budget allocation
Current year – past fiscals	Actual expenses	Allocate budget proportionate to actual values
Current year – remaining months	Planned costs exists	Allocate budget proportionate to planned costs
Current year – remaining months	No planned costs	Even distribution
Future fiscal periods	Planned costs exists	Allocate budget proportionate to planned costs
Future fiscal periods	No financial records	Even distribution

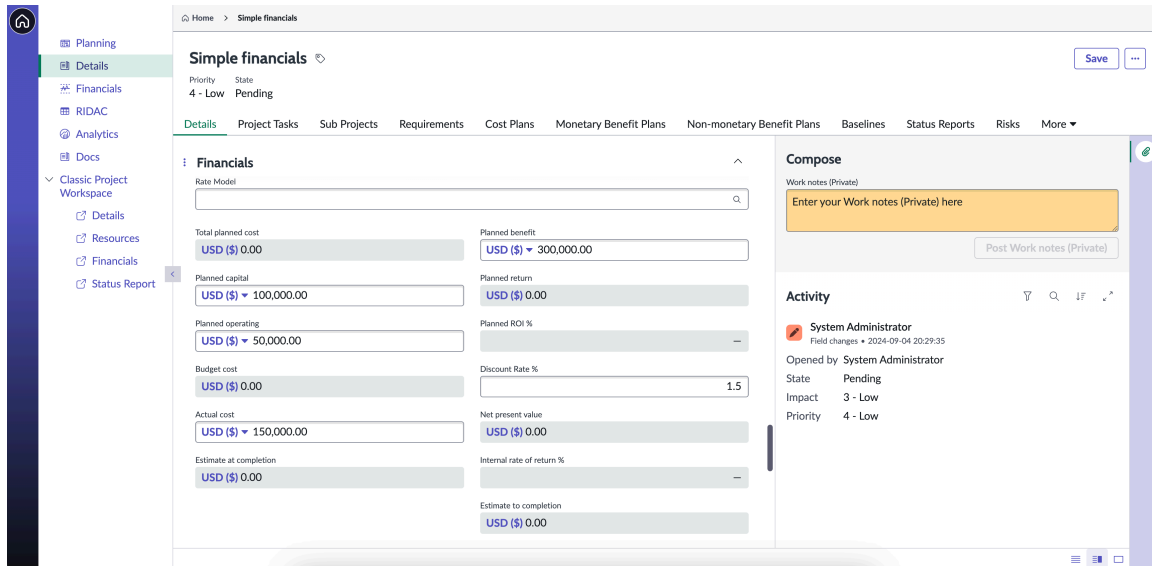

Benefit plans

Monetary benefit plans capture potential benefits accrued while executing a planning item. Non-monetary benefit plans capture the potential non-financial benefits accrued while executing a planning item. You can create and manage [monetary benefit plans](#) and [non-monetary benefit plans](#) to capture the potential benefits of your planning items.

Instead of switching to and fro from the financials record page to benefit plan tabs, you now have a seamless experience to manage all the cost plans and benefit plans from the Cost and benefits view and can leverage the new financials experience with the side panel and grids for quick forecasting and tracking of monetary benefit plans.

Simple financials

Simple financials gives you the ability to enter the preliminary high-level planned capex, opex, benefit, and so on from the Details page without capturing the costs plans from the Cost view. You can update the simple financials values as required until you have the planned and actual costs captured.

Using the baseline feature, you can capture these simple financial values in a baseline and compare them against any existing baseline. You can:

- Reforecast simple financials and compare them by selecting the Current Financials from the list of baselines.
- Capture the planned and actual expenses as the project progresses and compare any financial baseline with simple financials baseline to track the financial performance of the project.

Configure multicurrency for projects

Select investment currency as an additional currency, which can be different from your functional currency, to manage financial records of your projects.

Before you begin

- You can define investment currency for projects which do not have any financials records, such as cost plans, expense lines, benefit plans, and actual benefits. To define an investment currency for existing work, you should delete all the financial records and configure the investment currency.
- [Enable monetary benefit plans for projects](#)
- Role required: admin

About this task

Following are the current limitations for multicurrency.

- Multicurrency for cost plans that are bundled with project tasks. This feature is scheduled to be available starting with the January patch update.
- Financial baselines do not capture investment currency fields. This feature will be available with the March store release.

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and select a project.
2. Select the **Financials** tab.
3. Select **Currency** field, and select the **Edit investment currency option**.
Edit investment currency modal is displayed with an option to select investment currency.

4. Choose the suitable investment currency from the **Investment currency** list.
5. Select **Confirm** to save the investment currency selection.

Add, edit, or delete cost plans

Create a cost plan for a required duration to track your planned and actual expenses. Edit cost plans to adjust your planned expenses and delete any de-scoped forecasts.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Select **Financials** from the left menu.

Tip:

Create a [financial baseline](#) immediately after capturing the initial planned costs to have a snapshot of your planned costs. Use this baseline to compare it against the baselines from later dates, as the work progresses, to identify the variance between initial planned costs and actual expenses.

This helps you to plan for the future expenses and re-forecast the planned costs.

Manage budget of your projects using Project Workspace

Allocate, manage, and approve budget for your projects. Lean budgeting enables you to allocate budget for short planning cycles for different fiscal periods such as monthly, quarterly, or yearly breakdown level rather than allocating the budget to the complete duration of the planning item.

Before you begin

- As an Admin, enable the property to work on budgeting. For more information, see [Enable financial budget allocation for projects in Project Workspace](#).
- As an Admin, configure the attribute to allocate and approve budget by cost type or expense type. For more information, see [Configure budget attribute at instance-level to allocate budget](#).
- Role required: it_portfolio_manager

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Select **Financials** from the left menu.
3. Enable the **Budget allocation** toggle (Budget allocation).
4. You can manage the budget by one of the following ways for the selected time scale at monthly, quarterly, or yearly level.
 - Double-click each cell in the Budget column to manually enter the value.
 - Select **Copy cost as budget** from the Budget column options to copy the EAC as budget. You can always reforecast the budget for each cost type using the in-grid editing feature even if the EAC is copied as budget.

Note:

Unapproved budget values are indicated with  icon.

5. Select **Approve budget** (.

Approve budget confirmation window is displayed. The **Create a financial baseline for this budget approval** option is enabled by default which captures the latest budget and financial estimates.

 **Tip:**

The financial baseline created while approving the budget can be compared with the future baselines once the actual expenses are captured to track financial performance.

6. On the confirmation window, select **Approve** (.

Result

Budget widget is updated to reflect the latest approved budget. Project Manager can view the approved budget and compare it with the planned costs using the **budget vs cost** view by cost type.

Add or edit expense lines

Create or edit expense lines to capture the actual costs. You can associate the expense lines with a cost plan or create standalone expense lines to record unplanned expenses.

Before you begin

Role required: it_project_manager

About this task

An expense line is part of the project cost plans that can be associated with a specific source. You can create multiple expense lines for a cost plan. Only the expense lines that are in the processed state are considered for roll-ups on the work item.

For unplanned expense lines which aren't associated with any cost plan, the system automatically creates a cost plan or associates with an existing system-generated cost plan of the same expense type.

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Select **Financials** from the left menu.
3. Add an expense line using one of the following options.
4. On the Create expense line form, fill the fields.
For a description of the field names, see [Create expense line form](#).
5. Select **Save**.

 **Note:**

The expense lines created for sub-projects can be viewed in the Cost screen of the parent project.

Generate labor costs

Generate labor costs for projects and sub-projects based on the attribute-based resource assignments and the financial attributes configured in the planning attributes page.

Before you begin

When the distribution of effort for a resource assignment is adjusted without changing the total planned effort, the system automatically recalculates and generates labor costs to align

with the updated effort distribution. For example, consider a resource assignment of 100 hours distributed as 60 hours in January and 40 hours in February; now if you swap the efforts to make 40 hours in January and 60 hours in February. Now the system automatically adjusts the labor costs so that January reflects the cost of 40 hours and February reflects the cost of 60 hours, ensuring that costs accurately correspond to the revised effort distribution.

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Select **Financials** from the left menu.
3. Select **Generate labor costs** ([Generate labor cost](#)).
4. Select **Generate** on the Generate labor costs confirmation window.

i Note:

Alternatively, you can [activate a scheduled job](#) to automatically create baselines at the required cadence.

Create and compare financial baselines for your projects

Create and compare financial baselines to get a snapshot of the project expenses and compare the planned costs with the actual expenses.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Select **Financials** from the left menu.
3. Create or compare baselines.

💡 Tip:

You can migrate existing financials baselines of your projects or demands from Classic UI to Financials in Next Experience.

For more information on how to migrate financial baselines of demands, see [Migrate financial baselines of demands to Next Experience](#).

For more information on how to migrate financial baselines of projects, see [Migrate financial baselines of projects to Next Experience](#).

Create monetary benefit plans for your projects in Project Workspace

Create and manage monetary benefit plans to capture the potential benefits while executing your projects.

Before you begin

- [Enable monetary benefit plans for projects](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Create a monetary benefit plan using one of the options.
3. On the Benefit Plan form, fill the fields.
For a description of the field names, see [Benefit Plan form](#).
4. Select **Save**.

Edit monetary benefit plan

Edit a planned monetary benefit plan to revise the benefits, dates, offset, and so on, to maintain the updated financial records as your work progresses.

Before you begin

- [Create monetary benefit plans for your projects in Project Workspace](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Update a monetary benefit plan using one of the options.

Capture actual monetary benefits

Capture the actual benefit from the planned benefits to measure revenue and calculate the profits.

Before you begin

- [Create monetary benefit plans for your projects in Project Workspace](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Capture actual monetary benefits using one of the options.
3. **Optional:** You can change the previously captured planned benefit from the **Entered benefit** field.
4. Enter the actuals benefits resulted from the work execution in the **Actual benefit** field and select **Save**.

Manage non-monetary benefit plans for your planning items in Portfolio Planning

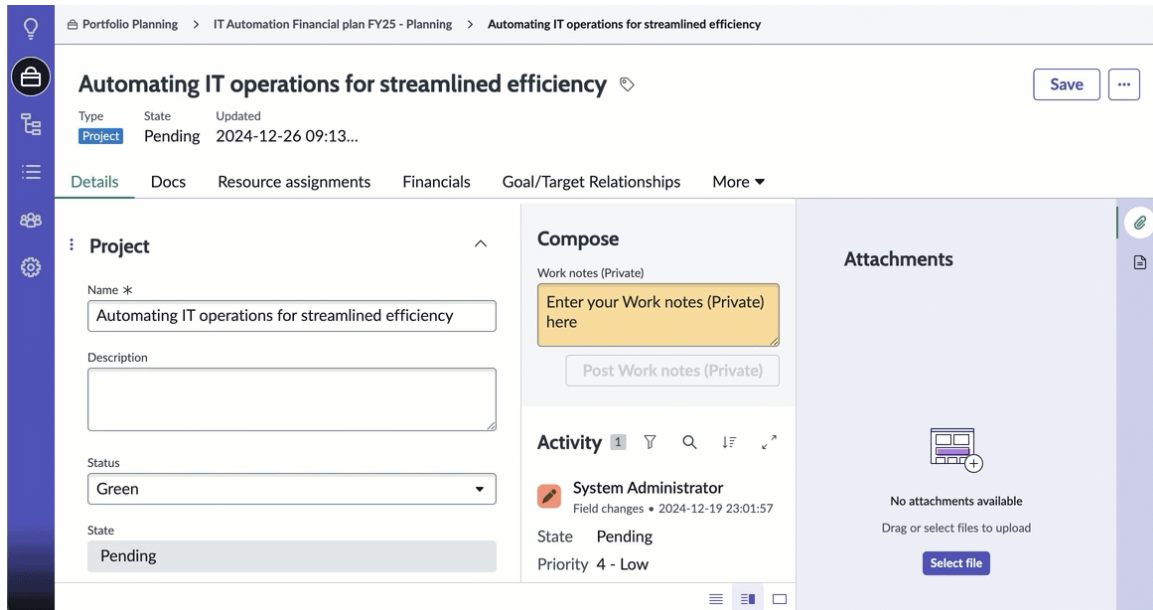

Create and manage monetary benefit plans to capture the potential benefits while executing your planning items.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Non-monetary Benefit Plans** related list.

4. On the Benefit Plan form, fill the fields.
For a description of the field names, see [Non-monetary benefit plans form](#).
5. Select **Save**.

Export financials as Excel or CSV file

Export the costs or baseline comparison data of your projects to share them with your stakeholders.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open a project.
2. Select **Financials** from the left menu.
3. Select the Export option ().
4. In the Export side panel, select **Excel** or **CSV** from the File type list and select the **Export** button ().

The financials data is download as an Excel or CSV file with name_ **fin**_mmddy naming convention. The breakdown of the naming convention:

- a. name - fetches the first 10 characters from the name of the planning item.
- b. fin - denotes that the file has financial data.
- c. mmddy - system date format when you're exporting this data.

For example, if you're downloading financials data for a planning item named Documentation on January 26, 2024, then the file name reads `documentat_fin_012624`.

Note:

You can export financials data from Cost view and Baselines comparison view.

Resource planning with Project Workspace

Use the Resource Management application to allocate and manage your resources in the Project Workspace.

Key benefits

Using Resource Management, you can create, plan, track, and monitor resource assignments at a project or task level in the Project Workspace. With Resource Management in Project Workspace, you can:

- Create an attribute-based resource assignment.
- Change the resource assignment dates, resources, efforts, and proposed allocations at any level of the project.
- View resource allocations using new heatmap modal. The allocations are color-coded to display the availability of the resources.
- View the primary attributes such as Group, Role, and Skill of each resource in the resource assignment pane. They are useful when you work on reassigning a task to a different user with the same primary attributes.
- Switch between **Hours**, **FTE**, or **Person Days** effort types to view resource allocations.

Resource assignment pane

The resource assignment pane displays a interface where you add resource assignments for your projects or project tasks.

Resource allocations and heatmap

The Resource allocation view combines a hierarchical task structure by resource with time-based and effort-based allocation metrics, such as hours, FTE, or person-days over weekly or monthly intervals.

Note:

Switch between different efforts such as hours, FTE, or person days to view a resource allocation heatmap based on the selected effort type.

Allocation heatmap modal gives you an overview of the resource utilization to identify the over allocated and the available resources. The allocations are color-coded to display the availability of the resources and help you to identify the availability of the resource for the filtered time frame. The new heatmap modal gives you the following insights for a resource such as the assigned tasks with their respective project owner, resource status, efforts for each task, total utilization percentage for the approved tasks, and the remaining capacity.

Very Over Utilized	150 +	%
Over Utilized	100 - 150	%
Full Utilization	100	%
Good Utilization	51 - 99	%
Under Utilized	0- 50	%

Heatmap breakdown

Allocation heatmap breakdown

Aidan Donaldson allocations for January month ✕

Aidan Donaldson is overallocated for the month of January 1,2025 by 16 hours. You may want to update Aidan Donaldson allocated hours for this month

Project	Task	Resource status	Task Effort	Utilization	Remaining capacity	Project owner
Client Referrals	Gather High L...	Approved	16 hours			System Administrator
Client Referrals	Deliverable: B...	Approved	16 hours			System Administrator
KT 2025 Q1	Inititating	Approved	32 hours			System Administrator
Total:			64 hours	34.78%	120 hours	
Client Referrals	Inititating	Pending	40 hours			System Administrator
Client Referrals	Deliverable: Pr...	Pending	16 hours			System Administrator
Client Referrals	Executing	Pending	72 hours			System Administrator
Client Referrals	Quality Gate 3...	Pending	8 hours			System Administrator
Total:			200 hours	108.70%	-16 hours	

[Got It](#)

From the above example, you can see the breakdown of the approved work items along with the rolled up efforts, Utilization percentage, and the Remaining capacity for the month of January 2025. The approved work is within the resource capacity as the remaining capacity is 120 hours. Resource manager can use these insights to decide and allocate the pending work items to another resource with available effort.

Within the Resource Allocation view, the Approved state is prioritized and listed first, followed by other statuses based on their order in the record list. Additionally, if a user has no capacity during a given period, the corresponding cell is displayed in red color.

Resource assignments in Project Workspace

Optimize project execution by assigning resources to tasks within the Project Workspace. You can create resource assignments for any project or project task, specifying the tasks to be performed and the resources to be allocated.

Resource assignments

Resource assignment is a process of allocating a resource or group of resources to a project task. When a resource assignment is initiated, a resource plan is auto-generated in the back-end of the project management system. This resource plan details the information of how resources would be allocated throughout the project. Resource assignments are approved by the resource manager to make sure that the allocation aligns with the overall resource strategy, considering factors such as availability, skills, and project priorities. Resource assignments remain dynamic and can be edited throughout the project life cycle. Resources can be assigned based on defined attributes such as skills, expertise, or other criteria relevant to the project or task.

Note:

Resource efforts calculations are driven by the `com.snc.resource_management.exclude_status_from_capacity` property. Admin can configure this property to calculate efforts for certain defined resource assignments only. For more information, see [Resource Management properties](#).

Edit the child resource assignments directly using the inline editing from the resource assignment pane.

Key features

With resource assignments, you can:

- Determine the resource engagement timing and allocate resources for specified durations, contributing to the creation of a timeline for task completion.
- Align task execution with the project plan, ensuring tasks are carried out in accordance with specified timelines and resource requirements.
- Initiate an approval process that is conducted by a resource manager and make sure it aligns with project targets and resource availability.

Related topics

[Create resource assignments using Project Workspace](#)

[Update resource assignment from Project Workspace](#)

[Resource plans](#)

Create resource assignments using Project Workspace

Create an attribute-based resource assignment in the Project Workspace application for any project or project task.

Before you begin

After a resource assignment is created, resources are allocated to the project and approved by the Resource Manager. You can edit the assignment throughout the project life cycle.

Role required: `it_project_manager`

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the **Resource assignments** toggle button.

Note:

If the `sn_pw.enable_resource_planning` property is set to true, then the **Resource assignment** toggle button and resource assignment pane are displayed in Project Workspace. The default value is false. You must have the `pps_admin` role to enable this property.

3. From the Planning pane, double-click the **Resource assignees** field for a project task.

You can assign the resources from both planning and resource assignment pane.

4. From the resource assignee list, select a user or group and press **Enter**.
When you create a resource assignment, the user or group allocation is based on the selected effort type. For example, when you add a user and the effort type is selected as hours, the allocations are displayed in hours.

A resource assignment record is created and auto-saved. The resource assignment form auto-populates the project or task information.

5. **Optional:** From the resource assignment pane, create a resource assignment for a project or task by selecting **Add resource**.
You can create a resource assignment for a project from the resource assignment pane only.
6. Select the expense type of the assignment based on the work as **Opex** or **Capex**.
A resource can use this information while capturing efforts using the time sheet portal. Once the time sheet is approved, an expense line is created for the project capturing the expense as capex or opex, based on the selected expense type.
7. View the resource allocations in the heatmap by enabling the **Allocation heatmap** toggle button.
You can switch from the week view to the month view based on your requirement.

What to do next

[Update resource assignment from Project Workspace](#)

Create a resource assignment for a user in Project Workspace

Use Project Workspace to create a user-based Resource assignment. User records store information about individuals who access your instance or application. These records can be assigned to groups and roles to determine what records and actions can be accessed by individuals.

Before you begin

Role required: admin or it_project_manager

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the **Resource assignments** toggle button.

Note:

If the `sn_pw.enable_resource_planning` property is set to true, then the **Resource assignment** toggle button and resource assignment pane are displayed in Project Workspace. The default value is false. You must have the pps_admin role to enable this property.

3. From the Planning pane, double-click the **Resource assignees** field for a project task.

You can assign the resources from both planning and resource assignment pane.

4. From the resource assignee list, select a user or group and press **Enter**.
When you create a resource assignment, the user or group allocation is based on the selected effort type. For example, when you add a user and the effort type is selected as hours, the allocations are displayed in hours.
A resource assignment record is created and auto-saved. The resource assignment form auto-populates the project or task information.

5. **Optional:** From the resource assignment pane, create a resource assignment for a project or task by selecting **Add resource**.
You can create a resource assignment for a project from the resource assignment pane only.
6. Select the expense type of the assignment based on the work as **Opex** or **Capex**.
A resource can use this information while capturing efforts using the time sheet portal. Once the time sheet is approved, an expense line is created for the project capturing the expense as capex or opex, based on the selected expense type.
7. View the resource allocations in the heatmap by enabling the **Allocation heatmap** toggle button.
You can switch from the week view to the month view based on your requirement.

[Update resource assignment from Project Workspace](#)

[Extend a resource assignment](#)

Create a resource assignment for a group in Project Workspace

Use Project Workspace to create a group and associate it to your resource assignment. You can associate a set of users who share a common purpose to a group.

Before you begin

Role required: admin or it_project_manager

About this task

Create group and assign roles to them. Users assigned to the group inherit the roles.

Procedure

1. Navigate to **All > User Administration > Groups**.
2. Create a group.

For more information on how to create a group, see [Create a user group](#) .
3. Assign the pps_resource role to a group required for group-based resource assignment.
For more information on how to assign a role to a group, see [Assign a role to a group](#) .
4. Add members to the group so that the users inherit all the roles assigned to the group.
For more information, see [Add a user to a group](#) .
5. Navigate to **Workspaces > Project Workspace** and open a project.
6. From the Planning pane, double-click the **Resource assignees** field for a project task.

You can assign the resources from both planning and resource assignment pane.
7. In the **Resource** field, select the group from step 2 and press **Enter**.

Result

A resource assignment record for the group is created and auto-saved.

Note:

When you select a group in the **Resource** field, the assignment is created in the Pending state. When an assignment type is set to group, an assignment is created for all the members of the group, and the allocation hours are split evenly for all the members of that group.

Create an attribute-based resource assignment

Create an attribute-based resource assignment in Project Workspace. You can pre-define attributes based on your requirement.

Before you begin

Role required: pps_admin or it_project_manager

Procedure

1. Create a planning attribute.

Note:

If the assignment is attribute-based, then the assignment is created in the Unassigned state. You should have the pps_admin role to configure the planning attributes.

2. Navigate to **All > Employee Profile > Employee Profiles**.

3. Create an employee profile.

For more information, see [Activate Employee Profile](#).

4. Navigate to **Workspaces > Project Workspace** and open a project.

5. From the Planning pane, double-click the **Resource assignees** field for a project task.

You can assign the resources from both planning and resource assignment pane.

6. From the resource assignee list, select a user or group and press **Enter**.

You can create new custom attributes, such as location, in addition to group, skill, and role, and can also leverage these custom attributes to create resource assignments.

Result

A resource assignment record for an attribute is created and auto-saved.

Note:

The **Primary group**, **Primary skill**, and **Primary role** attributes can be enabled for the Resource Management. You can create more attributes based on your requirement.

Update resource assignment from Project Workspace

Update a resource assignment that is associated with a project or project task.

Before you begin

Role required: it_project_manager

In resource assignments, any changes made to the status of group resource assignment roll down to all associated child resource assignments status. Similarly, any changes made to the status of child resource assignments automatically roll up to the corresponding group resource assignment status.

About this task

Before updating a resource assignment, verify the following to ensure accurate and effective resource allocation:

- **Resource availability:** Check that the resource has available capacity during the assignment period. Overallocated resources are indicated with a warning icon.
- **Primary attributes:** Verify the resource has the required primary attributes such as, skills or roles matching the project task requirements.
- **Existing allocations:** Review the resource's current assignments across all projects to avoid conflicts or overutilization.

- Group vs. individual: If updating a group resource assignment, note that status changes roll down to all child (individual) resource assignments. Similarly, individual status changes roll up to the group assignment.
- Assignment status: Verify the assignment is in the correct state (Requested, Assigned, or Approved) before making changes.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the **Resource assignments** toggle button.
3. On the resource assignment pane, double-click any cell to edit the entire row.
4. Edit the desired field, and select anywhere on the data grid to save the details.

The resource assignment is updated in the resource assignment pane.

i Note:

When a resource is added on an empty resource assignment, which has more than one Full-time equivalent (FTE) effort, then an additional row is created automatically and the resource assignment is auto-updated in both the rows.

Extend, edit, or delete the resource assignments using the row context menu in resource assignment pane.

Assign a resource using AI resource finder

Use AI resource finder to identify and assign a resource to an unassigned resource assignment.

Before you begin

Role required: `it_project_manager` or `resource_manager`

To use AI rationale, verify that resource fit analysis skill is active.

About this task

The AI resource finder uses generative AI to calculate AI rationale for available resources. Review the fit scores and availability before assigning a resource. Selecting a resource opens the existing assign resources modal where you can review allocations and distributions before confirming the assignment.

AI resource finder helps resource and project managers identify the best-fit resources for unassigned resource assignments in a project. The fit score indicates how well a resource matches a task based on the availability, past experience, similar kind of work and working on same projects. Resource managers review the AI-generated fit scores and rationale and decide which resource to assign to an unassigned assignment. The resource finder modal displays the following information for each resource:

- **Fit score:** Percentage match of a resource for the task. The Fit score is deterministic and is not generated using AI.
- **Rationale:** AI-generated explanation for the fit score.
- **Availability:** The availability of the resource for a task.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the Resource assignments toggle button. If the `sn_pw.enable_resource_planning` property is set to true, then the Resource assignment toggle button and resource assignment pane are displayed in Project Workspace. The default value is false. You must have the `pps_admin` role to enable this property.
3. Create a unassigned resource assignment by selecting **Add resource** and selecting an attribute.
4. From unassigned tasks pane, select the context menu row () for any task and select **Resource finder**.

Resource finder ✕

Task	Parent Item	Total effort	Assignment start date	Assignment end date

Manage resources from resource page in Project Workspace

View and manage all the resource assignments without navigating through individual tasks using the resource page in Project Workspace. Resources page show all project-associated resources and their assignments to support forecasting and visualization of resource demands.

Before you begin

Role required: it_project_manager, resource_user

About this task

When you select **Resources** page from the left menu, you are redirected to a page that displays the project associated resources and their resource assignments for better resource planning. You can also view how many tasks are assigned to each resource.

For example, Simon is a resource who is allocated to two project tasks. When you select Simon from the resource page, you can view all the project tasks to which Simon is assigned for a project.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. Open the resource page of the project by selecting **Resources** page from the left menu.
3. Edit the resource status, task effort, start date, end date, or other attributes of the resource assignment as required.
You can edit the row, reassign, extend, or open a resource assignment. You can create a new resource assignment directly from the resource page in the Project Workspace. You can select the unassigned tasks toggle to view all the unassigned resources that are not currently assigned to any task in that project. For sub-projects, you can select a sub-project and then select **Resources** to view the resources allocated to that sub-project.

Access, assign, and approve unassigned work in Project Workspace

View, assign and authorize resources directly from Project Workspace without navigating to Resource Management Workspace.

Before you begin

Role required: it_project_manager

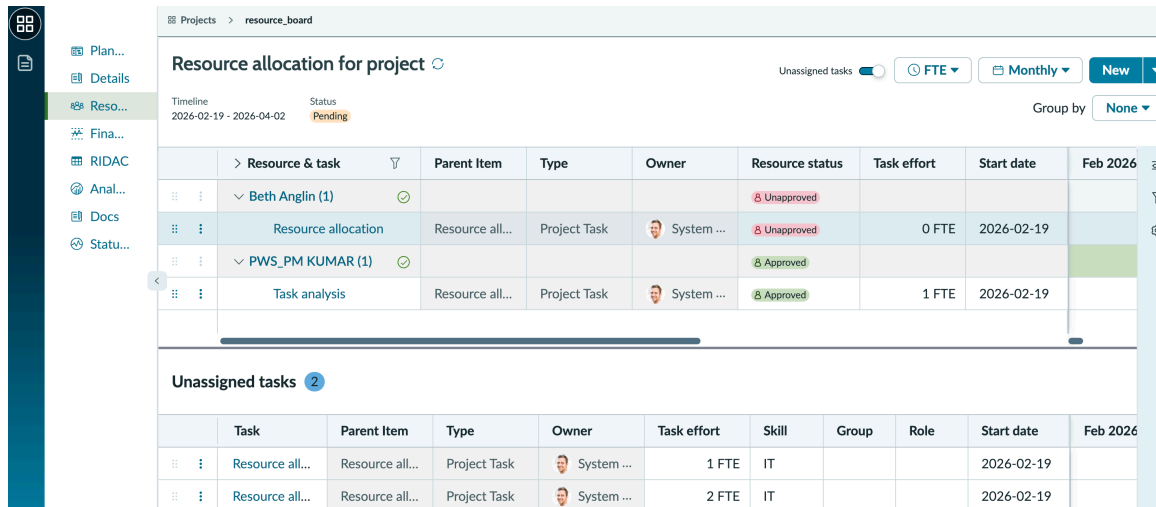

About this task

In Project Workspace, when you select **Resources** page from the left menu, you are redirected to a page that displays the project associated resources and their resource assignments for better resource planning. By embedding the resource page through interoperability, the Project Workspace application supports these actions:

- View assigned and unassigned work from the resource page.
- Assign unassigned work using automatic or manual effort distribution.
- Preview real-time effort allocations before assignment.
- Identify resource availability and over-utilization using visual indicators.
- Approve, unapprove, or reprioritize assignments by changing the resource status directly from the resource page.
- Extend or update assignments without leaving Project Workspace.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. Open the resource page of the project by selecting **Resources** page from the left menu.
3. Enable the Unassigned tasks toggle (**Unassigned tasks** ) to view the unassigned work requests in the lower pane.

The screenshot shows the 'Resource allocation for project' interface. The top pane displays a table with the following data:

Resource & task	Parent Item	Type	Owner	Resource status	Task effort	Start date	Feb 2026
Resource allocation	Resource all...	Project Task	System ...	Unapproved	0 FTE	2026-02-19	
Task analysis	Resource all...	Project Task	System ...	Approved	1 FTE	2026-02-19	

The bottom pane, titled 'Unassigned tasks', shows a table with the following data:

Task	Parent Item	Type	Owner	Task effort	Skill	Group	Role	Start date	Feb 2026
Resource all...	Resource all...	Project Task	System ...	1 FTE	IT			2026-02-19	
Resource all...	Resource all...	Project Task	System ...	2 FTE	IT			2026-02-19	

You can create resource assignments based on the primary attributes (Group, Skill, or Role). You can see a comprehensive view resource allocations and group them by primary group, skill, role, owner, and parent item.

4. From unassigned tasks pane, select the context menu row () for any task and select **Assign Work**.
5. You can assign work using one of the following ways.

Note:

Remaining efforts after equally distributing the work among the users is retained in the Unassigned tasks tray. Resource managers can again allocate these efforts.

6. Select the **Preview** button to see the real-time allocations before assigning the work.
7. Select the **Assign** button to assign work to the resources.
The assigned work is reflected in the top pane nested by resource view and will be in Pending state ().
8. Expand a resource row using the expand row icon () to view assigned tasks.
9. Double-click in the Resource status column and select **Approve** to confirm the assigned work so the resource can start working.
While assigning the work, you can easily identify if a resource is available () or overutilized (), even for the future periods, using the iconography.

10. You can change the status of any assigned assignments using one of the following options.

Result

The assigned work items are Approved () or Unapproved () and the status of the work assignments is rolled up to the resource level.

What to do next

- Reassign or unassign any assigned work from the Project Workspace. For more information, see [Reassign or unassign work using Resource Management Workspace](#).
- Split resource assignments at a specific date from the Project Workspace. For more information, see [Split resource assignments using Resource Management Workspace](#).

Move a resource assignment in Project Workspace

Move the resource assignment to a new start and end dates to accommodate changes in task scheduling or resource allocation. Shift assignments to balance workloads across resources and avoid over-allocation.

Before you begin

Role required: resource_user, resource_manager

About this task

- When you move an assignment to a new start and end dates, the initial requested or approved efforts are retained for the latest duration.
- When an assignment is moved, the Ready for review state is retained and the assignment remains accessible to resource managers for work allocation.
- You cannot move a resource assignment if actuals efforts are entered for the work.
- New assignment dates should be within the task duration dates.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the **Resource assignments** toggle button.

Note:

If the `sn_pw.enable_resource_planning` property is set to true, then the **Resource assignment** toggle button and resource assignment pane are displayed in Project Workspace. The default value is false. You must have the pps_admin role to enable this property.

3. Select a project task to view the assignments associated to the task.
4. From the resource assignment pane, select the row context menu () and then select **Move**.
5. From Move assignment modal, select a **New start date** using the date picker modal.
6. **Optional:** Change the assignment status using the **New status** list to one of the following available statuses.
Changing the status is restricted to the resource_manager role.
7. Select **Confirm**.
When you move the resource assignment for a group, the assignments are moved for all members of that group. You cannot move assignments for individual users within the group or for child resource assignments.

Extend a resource assignment

Extend the date of an allocated resource assignment and allocate resources for the extended period.

Before you begin

Role required: resource_manager

About this task

Assume that work on a project has started, but there's a need to extend the date of an allocated resource assignment because the project has been extended. In this scenario, you can extend the date of the allocated resource assignment. The new date by which the resource assignment is extended doesn't have any impact on the existing allocated hours. While extending the resource assignment, you can specify the new end date and the request type. Based on the request type selected, the required allocated hours are auto-filled.

For example, assume that you allocated 100 hours for 2 months, 50 hours for each month. Now, you want to extend the resource assignment by one month. For the extended month, allocation records are created based on the request type selected.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. Extend the resource assignment using one of the following options.

Result

- The assignment end date is updated and allocation is created based on resource's availability.
- The extended FTE or hours or person days is divided equally for the extended resource period.

Delete a resource assignment from Project Workspace

Delete a resource assignment from Project Workspace. Deleting an assignment also deletes all associated resource allocations.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. Enable the **Resource assignments** toggle to view the resource assignment pane.

- From the resource assignment pane, create a resource assignment for a project or task by selecting **Add resource**.
- From the resource assignment pane, select the row context menu () and then select **Delete row**.
The resource assignment is deleted from the resource assignment pane.

Update the resource allocation in a heatmap

Use the allocation heatmap capability in Project Workspace to view and update the resource allocation.

Before you begin

Role required: it_project_manager

About this task

The **Allocation heatmap** toggle button provides a detailed breakdown of the allocation of an individual resource. The allocation heatmap represents the total utilization of a resource for a week or month. By default, allocation information is displayed for the week. This information helps project managers to plan their resources effectively at the project or task level.

Integrate your ServiceNow® instance with your organization's Microsoft Teams to enable collaboration of your projects and resource allocations in Microsoft Teams. With the Microsoft Teams integration, you can communicate with the project team members and share real-time updates on the project and resource allocation status. For more information, see [Setting up PPM collaboration for Microsoft Teams](#).

Procedure

- [Create resource assignments using Project Workspace](#).
- View the resource allocations in the heatmap by enabling the **Allocation heatmap** toggle button.
You can switch from the week view to the month view based on your requirement.
- Edit the desired field and select anywhere on the data grid to save the details.
Work allocation is based on capacity. The allocations are color-coded to display the availability of the resources as shown here. These colors help to identify the availability of the resource for a particular task.

Very Over Utilized	150 +	%
Over Utilized	100 - 150	%
Full Utilization	100	%
Good Utilization	51 - 99	%
Under Utilized	0- 50	%

- Edit the resource allocation window by selecting the allocation hours cell.

Resource assignment - 1 resource task 2024-02-08 - 2024-02-08 Allocation heatmap Hours Week Add resource

						05-Feb-2024	
Resource	Effort	Start date	End date	Resource st...	Planned	Actual	
Aarav Booker	8 Hours	2024-02-08	2024-02-08	Pending	8		
Aarav Booker	10 Hours	2024-02-08	2024-02-08	Pending	10		
Ben Pineda	8 Hours	2024-02-08	2024-02-08	Pending	8		

Enable the **Show actuals** toggle to view the actuals of each resource. The actuals can't be edited from Project Workspace.

5. From the resource allocation window, view and track the assigned Project, Owner, Task, and Task effort of a resource.

The resource allocation is made according to the schedule of the resource, provided that the resource has a schedule.

The Allocation heatmap modal provides the **Resource status, Remaining capacity, and Utilization** columns to support resource managers in evaluating task efforts.

6. Send a direct message to the project owner on Microsoft Teams by selecting the Project Owner field.

Review Deepa Shah allocations for September 18th ✕

Deepa Shah total allocation for the week of September 18,2023 is 40 hours

Project/Type	Owner	Task	Task Effort
Upgrade Router Network	Aileen Mo...	Initiating	40 hours
		Total Allocation	40 hours
		Total Capacity	40 hours
		Remaining Capacity	0 hours
		Utilization	100%

Got It

Note: The **Project Owner** field can only be selected if your ServiceNow® instance is integrated with your organization's Microsoft Teams. Resource assignments on demands are visible in the allocation window both before and after they become projects.

Realign resource assignment to project task

Realign or synchronize the resource assignment dates with the project task dates. This synchronization helps to schedule and align the resource assignments with the timeline of project task.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All > Workspaces > Project Workspace** and open a project.
2. From the project planning pane, double-click the **Planned start date** or **Actual start date** of a project task.
3. Edit the field and select **Ok**.
4. From the project task row, select the row context menu and then select **Realign assignments to task**.

Alternatively, use the Resources not synced icon  to synchronize the resource assignments dates with the project dates at a project level. Realign assignments to task related link is available to perform the same action while using forms.

Result

The resource assignments dates are synchronized with the project task dates.

Enterprise residual risk	This field gets auto-populated with the risk scores when the risk assessor evaluates the enterprise residual risk.

Resource assignment form

Use this form to create resource assignments from Project Workspace.

Resource assignment form

Field	Description
Resource	Category of resource. To request any member of group or user, select the name from the resource list.
Effort Type	Type of effort selected during the creation of resource assignment. If you select any of the following choices, then a field is displayed for that choice. <ul style="list-style-type: none"> • Hours • FTE • Person days <p>For example, if you select Hours, then the Hours field is displayed.</p>
Effort	Effort of the resource assignment. <ul style="list-style-type: none"> • If you select Hours, the number of allocated hours for a selected resource is displayed. • If you select FTE, the number of units for the full-time equivalent value for a selected resource is displayed. By default resource assignment is created with 1 FTE (1FTE=8 hours) effort. • If you select Person days, the number of days for the selected resource is displayed.
Start date	Start date for the resource assignment. By default, this field shows the Planned start date of the associated project record or task record. If both planned and actual start dates are available on the project tasks, the actual dates are considered by default for resource assignment start date.
End date	End date for the resource plan. By default, the date is derived from the Planned end date of the associated project record or task record. Edit the default date,

Resource assignment form (continued)

Field	Description
	if necessary. If both planned and actual end dates are available on the project tasks, the actual end dates are considered by default for resource assignment.
Role	<p>Role associated with a role resource assignment.</p> <p>Note: You can define project-specific roles for the team members based on their skills and competencies.</p>
Group	<p>Group associated with the resource assignment.</p> <p>Note: When you select a group in the resource field, the assignment is created for all the members of the group. You can associate roles, skills, locations, and other attributes to groups, which then apply to users within a group. Groups can also be assigned as primary groups based on your requirements.</p>
Skill	Skills that the requested resources possess to allocate the resources to the resource assignment.
Resource status	<p>State of the resource assignment.</p> <p>Note: If the resource assignment is for a user or group, then the assignment is created in the Pending state.</p> <p>If the assignment is attribute-based, then the assignment is created in the Unassigned state.</p>
Employee Type	Type of employee. For example, internal or external resources.
Allocation status	Status of the resource allocation. This field is automatically set to Allocated .
Task	Task to which the assignment applies. If the resource assignment was created from a project task, the task number appears here.
Top task	Parent task for which the assignment is created.
Resource allocation	Allocation number of the resource.
Assignment type	<p>Type of resource assignment.</p> <ul style="list-style-type: none"> • Group • User
Allocation type	<p>Type of allocation.</p> <ul style="list-style-type: none"> • Monthly • Weekly

Resource assignment form (continued)

Field	Description
	For example, if you select Monthly , the allocation hours are split evenly for the month and if you select Weekly , the allocation hours are split evenly for the week.
Offset	Difference between actual or planned start date of project or task and resource assignment start date.

Project workspace classic - Legacy

Define, plan, track, and monitor your projects from a single location. View status reports and KPIs to take further actions for the project.

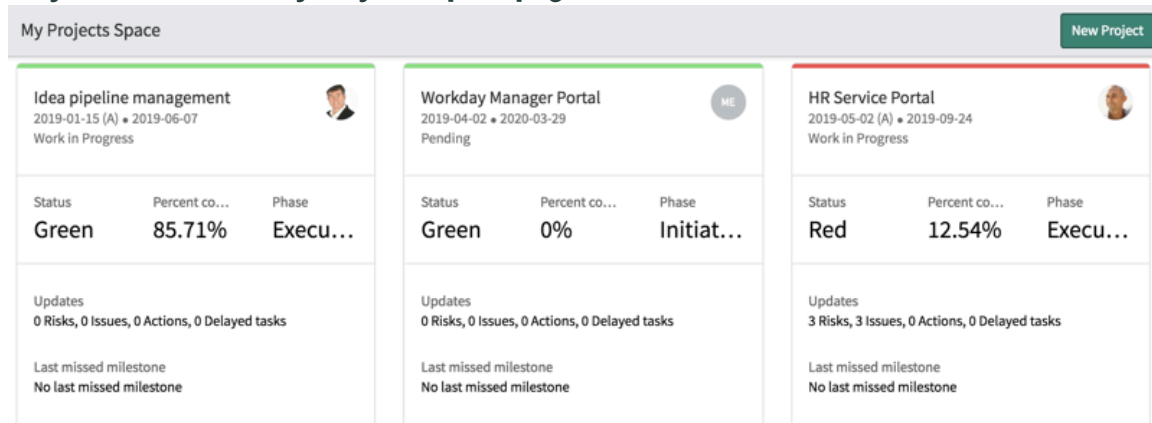

Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new [Project Workspace](#) with enhanced UI to help you efficiently manage your projects.

Projects in the My Projects Space page

The project workspace overview page — **My Projects Space** — displays projects as cards based on filter criteria. A maximum of the 200 most recently updated projects appear on the page. Clicking a card opens the project in the project workspace. You can [configure](#) the information that is displayed on a card.

Project cards on the My Projects Space page

The screenshot shows the 'My Projects Space' interface with a 'New Project' button in the top right. Three project cards are displayed, each with a header, a table of metrics, and an 'Updates' section.

Idea pipeline management			Workday Manager Portal			HR Service Portal

Last missed milestone No last missed milestone			Last missed milestone No last missed milestone			Last missed milestone No last missed milestone		

The components of the workspace are:

Banner icons

The following banner icons are available in project workspace:

Home

The home icon () enables you to return to the list of project cards on **My Projects Space** page.

Project choice list

The choice list displays the projects that you can select to open in project workspace. The projects in the choice list appear based on the filter criteria applied in **My Projects Space** page.

Project checklist

The checklist icon () helps you to build the checklist of activities that must be completed in a project.

Tabs in the project workspace

The project workspace comprises of the following tabs described at a high level:

Analytics

The **Analytics** tab provides analytics on project aspects such as open risks, open issues, and delayed milestones.

Details

The **Details** tab opens the project form and enables you to define important aspects of the project.

Planning

The **Planning** tab opens the project in the planning console. The tab also enables you to navigate to Project workbench and track your project in the workbench.

Resources

The **Resources** tab enables you to find resources, and create and manage the resources plans for the project and project tasks. The tab is available only to a project manager.

Financials

The **Financials** tab displays breakdowns of cost components of a project: planned cost, estimated returns, allocated budget, cost plans, and benefit plans. You can create baselines and compare baselines from this tab to track changes occurring during execution of project or demand.

Status Report

The **Status Report** tab displays the project status reports.

Project workspace example

The screenshot displays the Project Workspace interface with the following components:

Access the classic Project Workspace

Open the project workspace to display all your projects at a single location.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_user or it_project_manager

Procedure

1. Navigate to **All > Project > Projects > Project Workspace** to open **My Projects Space** page.
2. In the **My Projects Space** page, add filter criteria to display the required projects as cards.

i Note:

You can [configure](#) the information which is displayed on a card.

3. Click a project to open it in project workspace.
4. Click the required tab in project workspace to work in it.

Configure parameters displayed on project cards in classic Project Workspace

Configure the parameters that are displayed on a project card in **My Projects Space** page of classic Project Workspace. A card shows the project summary so that project managers can quickly gauge project status and health by looking at the card.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_pps_admin

About this task

The project workspace overview page **My Projects Space** displays the projects as cards based on the filter criteria. The cards have a color band at the top. The color of the band is based on the **Status** field in the respective project record. Each card further displays the following information about the project in three rows:

- Row 1 displays project name, state, project manager name, and important project dates. The displayed project dates are based on the current state of the project:
 - If the project state is Pending or Open, planned start date and planned end date are displayed.
 - If the project state is Work in Progress, actual start date and planned end date are displayed.
 - If the project state is Closed, actual start date and actual end date are displayed.
- Row 2 displays Status, Percent complete, and Phase columns from project [pm_project] table. The number of displayed columns in this row is fixed to 3, but the columns to be displayed can be configured in [pm_home_page_config] table.
- Row 3 displays the following project information based on the current state of the project.
 - Open risks, open issues, actions, and overdue tasks of the project under **Updates** heading.
 - Date and short description of the last missed milestone task under **Last missed milestone** heading.

The parameters displayed are derived from the records in [pm_home_page_card] table. In [pm_home_page_card] table, each project state is assigned some parameters to be displayed.

You can configure the information which is displayed in row 2 and row3 on a card.

Procedure

1. Navigate to **All > Project Administration > Project Workspace**.
2. Select a table for which you want to change the card configuration, for example, select `Project [pm_project]`.
3. Set the display columns for row 2 of the card in PM Home Page Configuration [pm_home_page_config] table.
 - a. Select the columns to be displayed in **Column-1**, **Column-2**, and **Column-3** fields.
 - b. Click **Update**.
The selected columns appear in row 2 of the project cards.
4. Set the parameters for row 3 of the card in PM Home Page Card [pm_home_page_card] table. In [pm_home_page_card] table, each project state is assigned the parameters that are required to be displayed on a project card in third row.
 - a. Click **New** in **PM Home Page Card** related list.
 - b. On the form, fill in the fields.

PM Home Page Card form

Field	Description
Order	Position at which the parameter appears in row 3 of the card.
State	Project state for which the parameter needs to be added.
Value	Section to be displayed for the selected state in row 3 such as Updates and Last missed milestone .
Content	JSON field to add the parameters to be displayed under the selected section for the selected state.

The following screenshot shows a JSON example of adding Risks, Issues, Actions, and Overdue tasks parameters under **Updates** heading for Open state.

c. Click **Submit**.

Note:

Use the same steps to change a display parameter assigned to a state.

The parameter is added or updated for the selected state. It appears under selected section in row 3 on the project cards for the state it was added.

View project analytics in classic Project Workspace

View the summary of a project in **Analytics** tab of classic Project Workspace.

Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_user

About this task

The **Analytics** tab is a PA dashboard which displays preconfigured widgets and reports to track the progress on various aspects of a project such as open risks, actual cost, and delayed milestones. The information in the reports is rolled up from the project form fields. For information about various widgets and reports for different project types, see [Project analytics widgets and reports](#)

Procedure

1. **Open** the required project in Project Workspace.
2. Click the **Analytics** tab to display its contents.
3. Review the displayed reports and take necessary actions, if required.

Project analytics widgets and reports

Widgets and reports that provide information for the project summary in the **Analytics** tab of the project workspace for Agile, Waterfall, and Hybrid projects.

Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Project widgets and reports

Widgets and reports provide information that enables you to view and track the progress of your Agile, Waterfall, and Hybrid project.

Note:

You must have the Agile Development 2.0 plugin installed to view the widgets and reports for your Agile and Hybrid projects.

Your system administrator can configure the widgets and reports in the dashboard to display project information on the **Analytics** tab. The following dashboards are available:

Project Execution Type	Dashboard Displayed	Description
Hybrid	Project Summary – Hybrid	Contains reports and widgets for hybrid projects.
Agile	Project Summary – Scrum	Contains reports and widgets for agile projects.
Waterfall	Project Summary – Waterfall Note: This dashboard was previously known as Project Manager Summary Dashboard.	Contains reports and widgets for waterfall projects.

The project execution type determines the dashboard displayed on the **Analytics** tab.

You can also embed a custom dashboard in the **Analytics** tab. Your system admin can modify the *PMViewDataUtils* script include and configure the variable value for the *dashboards_tabs* in the *getDashboardUrl* method. As a result, you can view the custom dashboard in Project Analytics. For example:

```
var dashboards_tabs =
{
    waterfall: {
        dashboard_sysId:
'5d4959dd878003008b9b3a0548cb0bd0',
        tab_sysId:
'1d99d5dd878003008b9b3a0548cb0bbd'
    },
    hybrid: {
        dashboard_sysId:
'96dc46c78700330047d84c2c59cb0bf1',
        tab_sysId:
'520d4ac78700330047d84c2c59cb0bab'
    },
}
```

```

        agile: {
            dashboard_sysId:
' f3dd4ec78700330047d84c2c59cb0b93&tab',
            tab_sysId:
' 52fd8ec78700330047d84c2c59cb0bae '
        },
        any_other_executionType: {
            dashboard_sysId:
' custom_dashboard_sys_id',
            tab_sysId:
' custom_dashboard_tab_sys_id'
        },
    };

```

The following widgets and reports for all project types are provided in the **Analytics** tab to help the project manager analyze the project.

Widgets and reports for Agile project

Name	Description
Stories Missing Acceptance Criteria	Number of stories in the project without acceptance criteria information.
Stories Missing Points	Number of stories in the project with the Points field blank.
Stories Acceptance Overdue	Number of stories in the project that are not in the Completed or Cancelled state after the sprint end.
Team-wise Sprint Status	Track the sprint-wise status of various scrum teams across the release. Click the team name to view sprint details.
Stories by State	Donut chart showing the number of stories in different stages of development such as Draft, Ready, and WIP. Click the appropriate state to view details of the stories.
Progress by Points	Track the progress of the project based on points. You can group and stack stories based on any combination of Epic, Assignment group, and State.
Progress by Stories	Track the progress of the project based on the number of stories. You can group and stack stories based on Epic, Assignment group, and state.

Widgets and reports for Waterfall and Hybrid project

Name	Description
Issues	Number of issues in the Pending, Open, and Work In Progress states included in the project.

Widgets and reports for Waterfall and Hybrid project (continued)

Name	Description
Actions	Number of action items in the Pending, Open, and Work In Progress states for the project.
Change Requests	Number of change requests in the Pending, Open, and Work In Progress states for the project.
Stories by State	<p>Pie chart showing the number of stories in different stages of development such as Draft, Ready, and WIP. Click the appropriate state to view the details for the stories.</p> <p>Note: This widget is applicable for Hybrid projects only.</p>
Tasks by State	Donut chart showing the number of project tasks in different stages of development such as Pending, Open, Work In Progress, and Closed Complete. Click the appropriate state to view the task details.
Project Member Allocation Details (Hrs)	Stacked bar chart showing allocated and actual hours of the resources assigned to the project.
Project Member Allocation Details – Monthly (Hrs)	Pivot chart showing the monthly allocated and actual hours for the resources assigned to the project.
Task Assignments	Track the state of various project tasks across the release based on the assigned users or group. Click the user or group name to view the details of the assigned tasks.
Resource Plans by State	Donut chart showing the number of resource plans grouped according to their current state.
Overdue Tasks and Milestones	<p>List of overdue project tasks and milestones, which are the tasks that satisfy either of the following conditions in the Project Task [pm_project_task] table:</p> <ul style="list-style-type: none"> • The value of the Planned start date is before today's date and the State value is Open or Pending. • The value of the Shadow field is set to false.
Upcoming Tasks (next 2 weeks) with no assignee	List of unassigned Open or Pending project tasks that are planned to start 14 days from the current date.

Common widgets

Name	Description
Phase	Current state of the project such as Initiating or Planning.
Status	Color indicator that signifies the status of the project.
Percent Complete	Percentage of the project that has been completed.
Time Elapsed	<p>Amount of time that has passed while working on the project from the actual start date to the planned end date.</p> <p>If the project is in the Open or Pending state, then the time elapsed is calculated based on the Planned start date and the current date.</p>
Risks	Number of risks in the Pending, Achieved, and Not Achieved states concerning the project.
Cost Trend Analysis	Line graph showing a comparison between the planned costs and actual costs on a monthly basis.
Monetary Benefit Trend Analysis	Line graph showing a trend of planned financial benefits on a monthly basis.
Non-monetary Benefit Plans	Breakdown of the number of non-monetary benefit plans for active projects along with its associated benefit plans.
Non-monetary Planned vs Actual Benefits	Comparison of total planned and actual non-financial benefits for active projects grouped by fiscal period.
Confirmed vs Allocated vs Actual Hours	Comparison of total confirmed, allocated, and actual hours for the project.
Time Cards – Pending Approval	Time cards for the selected project that are submitted but not yet approved.
Time Card – Exception Report	List of users who did not submit their time cards for the selected project, and time cards that are not yet approved for the selected project. The exception report is generated for users who are assigned to a task in progress, or hard-allocated to the project or task.

Define a project in classic Project Workspace

Define important aspects of the selected project such as duration, estimated cost, and the net value to the organization in classic Project Workspace.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_user

About this task

The **Details** tab in project workspace displays the [project form](#) for the selected project.

Procedure

1. [Open](#) the required project in Project Workspace.
2. Click the **Details** tab to display the project form.
3. Edit the project record as required.

Plan a project using planning console in classic Project Workspace

Perform the project planning such as create project schedule, make resource assignments, create baselines, and view critical path, using planning console in the classic Project Workspace.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_user or it_project_manager

About this task

The **Planning** tab in project workspace displays the selected project in [planning console](#).

Procedure

1. [Open](#) the required project in project workspace.
2. Click the **Planning** tab to display the project in planning console.

i Note:

If project workbench is already open in **Planning** tab, click the **Project Workbench** selection arrow on the banner and select **Planning Console**.

3. Plan the project using planning console features such as WBS hierarchy and Gantt chart. You can also perform several [tasks on the planning console](#) that you can perform on lists and forms, such as creating project tasks.

Track a project using project workbench in classic Project Workspace

As a project manager, track and manage a project in Project Workbench.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_manager

About this task

You can use the **Planning** tab in project workspace to displays the selected project in [project workbench](#).

Procedure

1. [Open](#) the required project in project workspace.
2. Click the **Planning** tab.
3. To display the project in project workbench, click the **Planning Console** selection arrow on the banner and select **Project Workbench**.
4. Track and manage all aspects of the project using project workbench.

Create and manage resource plans for a project in classic Project Workspace

As a resource requester, find the availability of the resources, and create and manage the resource plans for the project and project tasks in the project workspace.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_manager

About this task

The **Resources** tab in project workspace shows the resource plans for the selected project in an editable grid view. The tab consists of the following sections:

Resource grid

It is the top section on the page that enables you to:

- Create resource plans for the project or its tasks. You can create a resource plan at a group, role, or user level.
- View and manage all the resource plans for the open project and its tasks in one place.
- View resource allocations for each resource plan in a grid view.

Use the grid view in the tab to:

- Edit the planned and allocated hours inline without opening the record in a form.
- Group, hide, or show columns as per your requirement.
- Hide cancelled or completed resource plans.

- Request, confirm, or allocate a resource plan.
- Move a resource plan and its allocations to a future date for a group, role, or user resource plan.
- Replace a user with another user for a group, role, or user resource plan to accommodate situations like a user taking leave during a project.
- Request extension of an allocated resource plan.
- Shift allocation of a user to a future date for a group or role resource plan.
- Identify the resource plans created with specific members preference by viewing the **Resource plan created with specific members** icon () next to the resource plans.

Resource Finder

The section is available at the bottom of the page. The section is hidden by default. It can be made visible by clicking the resource finder icon () in the top right of the page. It enables you to:

- Search the resources and view their availability. You can search the resources by group, role, or user.
- Add resource plans for the searched resources to the project and its tasks.
- Search for resources and view their availability and utilization. You can search resources by group, role, or user.
- Add or confirm resource plans for the current resources.
- Configure the Actuals column using Detailed View.
- Filter resources in the Resource Finder by available, overallocated, or all resources.
- Identify resources that are created as specific members for a resource plan by viewing the **Member specified in the resource plan** icon () next to the resources.
- View the Resource Availability and Resource Capacity grids by clicking on a capacity or availability column.

You can view the user and resource allocation details in a pop-up window by selecting the **User** and **Allocated Hours** columns respectively in the **Resource Availability** grid.

When you select a resource plan in the resource grid section, the availability details of that resource are displayed in the resource finder section. For example, if a group resource plan is selected, the availability details of the group and its members are displayed in the Finder section. When you change the selection, the finder is automatically updated based on the current selection.

Procedure

1. [Open](#) the required project in project workspace.
2. Click the **Resources** tab.

- To [create a resource plan](#), click **New**.
- To view the allocations in weekly or monthly format in the grid, click **Week** or **Month** button. The selected option changes the grid view in both the resource grid and resource finder sections.

The time duration in the grid is displayed based on the earliest start date of the project or resource plans, and the last end date of the project or resource plans.
- To view the allocations in hours, FTE, or person days format in the grid, click **Hours**, **FTE**, or **Person Days** option in the list. The selected option changes the grid view in both the resource grid section and resource finder section.
- To [search the resources and create a resource plan for them](#), click the resource finder icon ().
- To show or hide certain columns from the grid view, click the configuration icon (). Hiding or displaying an item column does not update the table. Grouped columns cannot be hidden.
- To view the resource allocations at user level, expand a resource plan in the grid. The user level allocations are listed only for Group and Role resource plans.
- To edit the planned and allocated hours inline in the grid, double-click a row. You can update the planned hours for future period for resource plans in Requested, Confirmed, and Allocated state.
- To view and update resource plan details in a form, click the information icon () in the beginning of the resource plan row.
- To request a resource plan in the **Actions** column, click the actions icon () and select **Request**.
- To delete a resource plan in the **Actions** column, click the actions icon () and select **Delete**.
- To request all the resource plans created for the project in the **Actions** column, click the actions icon () in the project row and select **Request All**. The icon is enabled when at least one of the listed resource plans for the project is in the Planning or Rejected state.

View forecasts and manage financial plans for a project in classic Project Workspace

Use the **Financials** tab in Project Workspace to capture the costs and benefits of a project.

Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#)  article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_manager

About this task

The **Financials** tab provides a detailed breakdown of the cost components of a project. The total planned cost, budget cost, actual cost, and planned returns with their breakdowns are displayed in the form of read-only cards, while the cost plans, benefit plans, and their breakdowns are provided in an editable grid view. Using the grid view, you can:

- Group the plan level columns; configure, sort, expand, collapse, and freeze both the plan level and breakdown columns.
- Inline edit the breakdown values of a cost plan or benefit plan without opening the plan in a form. Inline edit is available only in the Monthly view.
- Create a cost plan and benefit plan for the project.

Procedure

1. **Open** the required project in [project workspace](#).
2. Click the **Financials** tab.
3. To create a cost plan:
 - a. Select **Cost Plans** from the list.
 - b. Click **New**.
4. To create a monetary benefit plan:
 - a. Select **Monetary Benefit Plans** from the list.
 - b. Click **New**.
5. To view the project costs and financial breakdown summary of a project for the selected fiscal year, select **Overview** from the list.
The **Overview** tab gives the financial summary for Planned Cost, Actual Cost, Variance (Planned vs Actual cost), Estimate At Completion, and Estimate To Completion.

Note:

If a project has a sub-project with a cost plan, the financials overview breakdown view is not enabled by default. To enable this view, a user with the `it_pps_admin` role should set the value of the `com.snc.project.rollup.cost` property to **true**.

- You can manage the financial summary view on the **Overview** tab.
 - a. Navigate to **All > System Definitions > Script Includes**.
 - b. Search for and select the **PmOverviewTabConsts** script.
 - c. Rearrange or remove the code from the **Script** and click **Update**.

You can drag the headers and drop them at the required position to rearrange the financial summary columns on the **Overview** tab. This arrangement resets after the current session ends or expires.

- The admin can configure the level at which the financials overview data is displayed for the fiscal year in the **Project related properties** page by navigating to **Project Administration > Settings > Preferences - Project**. If no value is specified, by default, the financials are displayed at the quarterly breakdown.

6. **Optional:** Review additional fields, view plan details, or reorganize the comparative data on the form.

- To create a baseline or compare the available baselines, click the baseline information icon () and then select **Create New Baseline** or **Compare Baselines** option, respectively.

In the Financial Baseline comparison screen, the top two rows show all the values in either functional currency or project currency. To display the values in project currency, click the configuration icon () and toggle the Show Widgets in Project Currency view.

The Financial Baseline Details pane indicates the Functional Currency and the Project Currency that has been selected.

The Financial Baseline grid shows the Functional cost, Cost in Project currency, Actuals, and Actuals in Project Currency. You can view the Project currency at the grid level. This view is helpful when there are cost plans of sub-projects that are in different project currency.

- To view a cost plan or benefit plan details on a form, click the information icon (i) available in the Name column of the grid.
- To view a cost plan or benefit plan details in yearly, quarterly, or monthly format, click the **Year**, **Quarter** or **Month** views respectively.
- To toggle viewing the widgets in the Financial Summary section, click the widgets icon (≡) and then select the **Show Widgets** option.

Select an individual widget name to display the widget. Clear the selection to hide the widget.

The selected field preferences are saved and are available when you reopen the **Financial** tab.

- To show or hide columns in the grid, click the configuration icon (≡) and select the field names.

You cannot hide the grouped columns. To reset to the default grid column layout, select the **Reset to defaults** option.

- To view the project costs in project currency, click the configuration icon (≡) and select the five widgets to show project currency amounts. The widgets are Total Planned Cost in Project Currency, Budget Cost in Project Currency, Actual Cost in Project Currency, Planned Return in Project Currency, and Benefit in Project Currency.

You can view both the functional and project currencies in the currency indicator.

In the Financial Summary grid view of the **Cost Plans** and **Benefit Plans** tabs, all items related to project currencies are configured in the column heads such as **Cost in project currency**, **Project currency**, and **Total actual cost in project currency**.

By default, you can view only the functional currency columns. To view the project currency columns, click the configuration icon (≡) and select the project currency column check boxes in the item columns.

The aggregated amount in the **Cost in project currency** field is clear if there are cost plans of sub-projects with different project currency.

Configure a widget for project financial metrics

Configure a widget to view and track the financial metrics of a project on the **Financials** tab of the Project Workspace page.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: pps_admin

Procedure

1. Navigate to **All > Project Administration > Widgets**.
2. Click **New**.
3. On the form, fill in the fields.

Widget form

Field	Description
Name	Unique name for the widget.
Scripted	Option for indicating the value on the widget is from a code script. By default, this option is selected and is read-only.
Show Label	Option for displaying either the label or the color indicator. If you clear the check box, the Color field appears and you can set the color.
Active	Option for indicating the status of the widget. Only active widgets can be shown on the Financials tab of the Project Workspace.
Parent widget	Widget that is the parent of the current widget. The current widget displays in the Child widgets related list of the selected widget. You can add a maximum of three child widgets for a parent widget.
Formatter required	Option for specifying whether a currency formatter is required for the widget.
Script	Code script that returns a requested metric value that is displayed on the widget. In the script, use the context and filter objects. The context object contains all of the project financial fields, such as capex_costs, opex_costs, and budget_cost. The following sample script returns the Estimate At Completion metric value of a project to appear on the widget. <pre>var context = JSON.parse(context); var filter = context.filters; var now_GR = new GlideRecord('pm_project'); gr.addEncodedQuery(filter['pm_project']); gr.query(); if(gr.next())</pre>

Field	Description
	<code>gr.getValue('forecast_cost');</code> Collapse
Short description	Description of the widget.

What to do next

Associate the widget to the Project table.

Associate a widget to the Project table

After you configure a widget, associate it with the Project table to show the financial data of a project.

i Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

You should [configure a widget](#) before you can associate it with the Project [pm_project] table.

Role required: pps_admin

Procedure

1. Navigate to **All > Project Administration > Widgets**.
2. Open a widget to associate with the Project table.
3. In the Widget associations related list, click **New**.
4. On the form, fill in the fields.

Widget association form

Field	Description
Association ID	Record to associate to the widget. To access the relevant records, you must select the Tables [sys_db_objects] table in the Table name list and the Project [pm_project] table in the Document list.
Association table	Table to associate to the widget. You must select Table [sys_db_objects] from the list.
Widget	Unique name of the widget.
Order	Position of the widget in relation to other widgets in the Financials tab of the Project Workspace. Widgets appear in numeric order with the smallest number listed first.

Field	Description
Display on card	Option to display the widget in the Financials tab.
Include by default	Option to show the widget by default in the Financials tab.

Request funds for a project in classic Project Workspace

Request funds for your project investment to work on project activities and meet the business goals.

Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#)  article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

You can request funds for your project if the following conditions are true:

- The Investment Funding (com.snc.investment_funding) plugin is activated.
- The funding entity for Project is available and is active.

Role required: it_project_manager

About this task

If you have added cost plans to your project, you can refer the total planned cost displayed on the column header of each period to determine the amount to request.

Procedure

1. Navigate to **All > Project > Projects > Project Workspace**.
2. Click a project for which you want to review or manage funds.
3. On the Project Workspace, click the **Financials** tab.
4. Click the **Funds** tab.
The Funds list shows funding sources if you have previously requested funds from them for your project.
5. Click the **Add New Source** link to select the funding source.
6. In the **Select a Source** pane, select one or more source investments from the list, and then click **Add Selected**.
The specified funding source is added in the Request Funds grid.
7. In the Request Funds grid, specify the amount in the **CapEx** and **OpEx** columns under **New/Modify Request** of the funding sources from which you want to request funds.
The state of all updated funding sources changes to Draft or Planning, which is indicated by highlighted cells.
8. Click **Request**.
9. In the Confirm request dialog box, verify your requests and add a comment if required.
10. Click **Request**

Enter actuals spent in a project in classic Project Workspace

Enter actual spends in your project to track the fund utilization.

Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#)  article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_manager

About this task

When you spend funds allocated to your project to complete your project activities, record that amount as actuals to review and track your project finances.

Note:

The actuals in the project record, that is calculated from the expense lines, does not reflect into the actuals of the Funds automatically. Since your actual spends might include labor costs and other expenses, you should enter it manually against the corresponding funding source in the Funds list.

Procedure

1. Navigate to **All > Project > Projects > Project Workspace**.
2. Click a project for which you want to review or manage funds.
3. On the Project Workspace, click the **Financials** tab.
4. Click the **Funds** tab.
5. In the Funds list, enter the actual amount spent in the project under the **Actual CapEx** and **Actual OpEx** columns for the corresponding funding source.

Note:

If you do not see the **Actual CapEx** and **Actual OpEx** columns in the list, select them from the configuration icon ()

Result

The entered amount is updated as actuals for the project.

View a project status report in classic Project Workspace

As a project manager, view the project status reports for a project using **Status Report** tab in classic Project Workspace.

Important:

Classic Project Workspace is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#)  article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Before you begin

Role required: it_project_manager

About this task

From the **Status Report** tab, you can:

- View and print the status reports available for a project.
- Create a status report.
- Save time when creating a status report by copying fields from existing status reports of the project.

Procedure

1. **Open** the required project in project workspace.
2. Select the **Status Report** tab.
The most recent status report created for the project is displayed.
3. To **create a status report**, click **Create new** button in the top right.
4. To copy an existing status report:
 - a. Select a status report from the choice list that you want to copy.
 - b. Select **Copy** from the choice list next to **Create new**.
The option copies the selected status report including all fields into the new report.
 - c. Select **Save**.
5. Select a status report from the choice list to view the contents of a **status report** available for the project.
The reports are listed in the choice list by their creation date.

Investment Portal

Completing projects and demands on time within budget is a challenge. Investment Portal gives you a comprehensive view of project and demand financials, deadlines, and other important metrics in an intuitive user interface that makes project and demand management more efficient.

Tracking and managing your investments (both projects and demands) and then creating investment reports and sharing them through email is time consuming and inefficient. To generate a report you must obtain the status of projects and demands from project and demand managers, produce the report, and then email it.

With Investment Portal you can create an investment board through filter definition, and share it with other stakeholders. You can save time on new investments by creating, cloning, or modifying boards as needed. Filtering makes it easy to surface information on the fly and for reporting.

Here are a few examples showing how Investment Portal can make managing and reporting more efficient:

- If you are launching an application store, you can monitor overall program progress and surface projects that are creating bottlenecks.
- For a new business application you can review and edit the investment roadmap for the next few weeks, months, or years.
- For a key strategic initiative, you can review what was accomplished in the previous year and plan for the next eighteen months.

Investment Portal is divided into the following sections:

Banner icons

You can edit, copy, delete, bookmark, and share your investment board with other members and groups using the banner icons on the header of Investment Portal. See [Track your key investments](#) for more information. _____

Investment widgets

You can view important metrics like total cost, actual cost, and budget with investment widgets that can be [configured](#).

Key tabs

You can track important aspects of your projects and demands in one location using the following tabs.

- **Overview:** A high-level summary of your projects and demands. The information in the grid is based on the project and demand form fields.
- **Timeline:** Key milestones in a Gantt view. Gantt view provides an overview of projects using graphical elements such as lines and bars to show dependencies and lengths of tasks.

The Work Breakdown Structure (WBS) in the tab displays only milestones and key milestones.

- **Financials:** A detailed breakdown of project and demand costs in yearly, monthly, and quarterly formats, and based on cost plans associated to your projects and demands.

The tab is displayed only to the user who has the `it_project_manager` role.

i Note:

Investment Portal's loading time directly depends on number of demands or projects and their related entities like cost plans and breakdowns, that match with the defined query. Typically, the board's performance is optimal with approximately 50 projects or demands, with each project containing 10 to 15 cost plans.

The application doesn't restrict the number of records being fetched. So, users are recommended to define the query in such a way that optimal number of records are fetched to ensure that the performance is not affected.

View all your investment boards in one location

Display all your important investment boards in a single location using the My Investment views page.

When you open the Investment Portal module, you start in the My Investments Views page where you can:

- [Create investment boards using filter conditions.](#)
- [View widgets on an investment board.](#)
- Search for an investment board by the name or owner.

- View boards in different color bands based on the applied filter, such as portfolio or program. For example, the green color band on the card, in the following screen shot, indicates that the projects and demands are filtered by a portfolio.
- Drill down an investment board to review its projects and demands in terms of cost, schedule, and scope.

Tabs

Access investment boards more quickly by using tabs.

- **Recent:** Recently accessed investment boards.
- **Bookmarked:** Bookmarked investment boards.
- **Created by me:** Investment boards you own.
- **Shared to me:** Investment boards that are shared with you.

Investment board

Key details of an investment board include:

- **Row 1:** Name, owner, and type of the board.
- **Row 2:** Some out-of-box investment metrics. The number of metrics displayed in this row is fixed, but you can [configure](#) which metrics are displayed,

Example of an investment board

IT Apps			Row 1
System Administrator • Project Portfolio Management			
Demands	Projects	Cost	Row 2
121	93	\$102.33 M	

Related topics

[Investment Portal](#)

Create an investment board

View the projects and demands that are important to you by creating a personalized investment board using filter criteria you define.

Before you begin

Role required: it_project_manager, it_project_user, or sn_ppm_finance_read

Procedure

1. Navigate to **All > Project > Investment Portal**.
2. On the My Investment Views page, select **New**.
3. In the Create new window, fill in the fields

For more information, see [Investment board form](#).

Note:

Using **Tags** as a filter criteria might not fetch all the required tabs to work on investments.

4. Select **Create** to create the form.

Result

Once your investment board is created, it opens up in the Investment Portal page.

Note:

By default, the investment board contains those widgets that have **Include by default** check box **selected**. You can add or remove widgets from your investment board by using [Widget Configuration](#).

Resource Management Workspace

The ServiceNow® Resource Management Workspace helps Resource Managers have a centralized view of all work across all resources.

Get started

Troubleshoot and get help

- Ask or answer questions in the [Strategic Portfolio Management forum on the ServiceNow Community](#) ↗
- [Search the Known Error Portal for known error articles](#) ↗
- [Contact Customer Service and Support](#) ↗

Exploring Resource Management Workspace

Learn about the features, functionalities, and business value that the Resource Management Workspace provides.

This provides a centralized view of the resource allocation and requests. As a Resource manager, you get a dedicated workspace to view the team's allocation and breakdown of the work assigned to the resources.

Resource Management Workspace provides a centralized view of the resource allocations and resource requests. This workspace eases resource management problems and is designed to cover a wider set of use cases.

Features and benefits

Feature	Benefit
Persistent card view	Create focused view to view and work on resource allocations.
Resource allocation view	Breakdown view of resource allocations at weekly or monthly level.
Allocate the unassigned work	Filter the unassigned tasks to view and allocate the work.
Integration with Microsoft Teams	Effortlessly collaborate with the task owner for additional insights.
Approve work for resources	Move the assigned work status to Approved, Unapproved, or Pending to allocate the prioritized work.
Iconography	Identify overallocated resources and reassign to maintain allocations within the resource bandwidth.
Heatmap modals	Breakdown view of the assigned work and efforts.

Resource Management Workspace overview

The Resource Management Workspace provides a centralized view for managing resource allocations and work assignments.

Resource Management Workspace main interface

The screenshot displays the 'KT Demo' workspace interface. It features a top navigation bar with 'Home' and 'KT Demo' links, and a 'Unassigned tasks' filter set to 'FTE'. Below the navigation is a main table with columns for 'Resource', 'Parent Item', 'Resource status', 'Type', 'Owner', 'Task effort', 'Start date', 'End date', 'Group', 'Role', 'Skill', 'Priority', and monthly workload from June 2024 to November 2024. The table lists various tasks such as 'Interface Errors', 'RA0001047', 'RA0001102', and 'Development of Torque Vect...'. A secondary table at the bottom, titled 'Unassigned tasks', lists tasks like 'Global benefits management', 'Leave mana...', 'Simplified access to employ...', 'HR Knowledge base', 'Vehicle-to-Everything (V2X)', 'Talent Management', and 'HR Analytics & Dashboards'.

The workspace is organized into the following areas:

- Resource board: Create filtered views to focus on specific teams, roles, or skills. For more information, see [Create a resource card](#).
- Resource allocation view (top tray): Displays assigned work for each resource with weekly or monthly allocation breakdown and availability indicators.
- Unassigned tasks (bottom tray): Shows pending resource requests that needs to be assigned. For more information, see [Assign unassigned work](#).

Resource finder

Resource managers often spend significant time manually searching for the right person to staff an unassigned assignment. The AI Resource Finder removes this guesswork by using Now Assist skills to analyze your resource pool and recommend the best-fit candidates, ranked by a fit score and accompanied by a plain-language rationale explaining each recommendation.

Resource finder uses the Resource fit analysis skill, which considers multiple dimensions simultaneously: whether the resource's planning attributes (such as role and skills group) align with what the assignment demands, how much capacity the resource has during the assignment period, and how the resource's historical allocation patterns compare to the requested effort.

The output of this matching process is two-fold:

- Fit score - a percentage that represents how closely a resource matches the requirements of an assignment. The score blends attribute alignment, temporal availability, and workload balance into one number so you can compare candidates at a glance.
- Rationale - a short explanation of why the Resource fit analysis considers them a good fit. The rationale references specific factors like availability windows, complementary pairing opportunities, and attribute matches.

a expressed as a percentage, and a rationale that explains the reasoning in plain language. For example, a resource might receive a 30% fit score with a rationale noting that the person is available only in April and July, and suggesting they be paired with another resource to cover the May and June gap. The score gives you a quick ranking; the rationale gives you the context to act on it.

The Resource finder lets you compare each resource's available capacity against the requested effort for the assignment. Effort values respect the unit and cadence based on user preference such as hours, FTE, or person days on a weekly or monthly basis.

The availability heatmap uses color coding to make this comparison instant. A green cell means the resource has enough capacity to meet the requested effort for that period. A red cell means they fall short. For example, if the requested effort is 1 FTE per month and a candidate shows 1 for April and 0 for May, April appears green and May appears red helping you to immediately see the gap without doing any mental math.

Advantages of using Resource finder

- Quickly staff an unassigned assignment: Resource managers use the Resource finder option from the unassigned assignment's three-dot menu. The AI insights presents a ranked shortlist which the resource manager can reviews the rationale, confirm availability, and assigns the best fit within a single modal flow.

- Handle partial availability with resource pairing: Resource Finder surfaces the real-time availability through its rationale, which suggests pairing two resources to cover the complete period. For example, one resource covers April and July while another covers May and June.
- Balancing workloads: resource board indicator in the Resource finder highlights which candidates already belong to the manager's boards, making it easier to redistribute work within the existing team before pulling in resources from other groups.

Getting started

Follow these steps to begin using the workspace.

1. [Configure the workspace](#) to enable the required features and permissions.
2. [Create a resource card](#) to define your filtered view of resources.
3. [View and assign unassigned work](#) to available resources.
4. [Manage resource allocations](#) to adjust and approve assignments.

Configure Resource Management Workspace

Configure Resource Management Workspace.

Configuration workflow

1. Install the Resource Management Workspace product from ServiceNow Store.

For more information, see [Install Resource Management Workspace](#).

2. Define custom statuses for resource assignments.

For more information, see [Define custom statuses for resource assignments](#)

Guided setup for Resource Management Workspace

Guided Setup provides a sequence of tasks to help you with the required configuration on your ServiceNow instances. After [installing Resource Management Workspace](#), navigate to **All > Resource > Resource Management Guided Setup**.

Install Resource Management Workspace

Install the Resource Management Workspace application from the ServiceNow Store.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Resource Management Workspace application using the filter criteria and search bar.

You can search for the application by its name or ID (sn_rm_ws). If you cannot find an application, you may have to request it from [ServiceNow store](#) .

3. Click **Install**.
4. In the Application installation dialog box, review the application dependencies.

If your application requires other applications, install them first if they are not already installed. Installing your application also automatically installs the dependent applications or plugins if they are not installed already.

5. If you want to install demo data, select **Load demo data.**

Demo data includes sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

Note:

If you don't install the demo data for a store application during installation, you cannot request it later.

6. Click **Install.**

Result

The Resource Management Workspace application is installed in your instance.

Define custom statuses for resource assignments

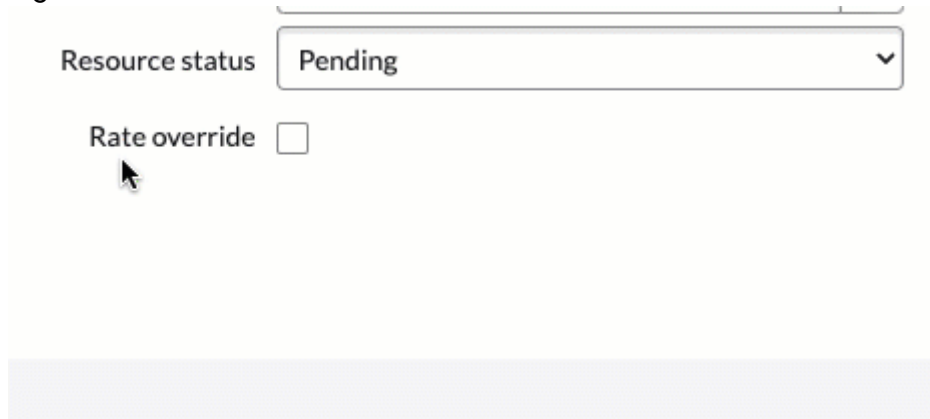

Define and assign custom statuses for resource assignments to mark the assignments based on your organization requirements.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field and open the **Resource Assignment** [sn_plng_att_core_resource_assignment] table.
3. Select the **Show List** Related Link.
4. Open any resource assignment from the list.
5. Right-click on the Resource status label and select **Show Choice List**.

6. Select a status field to open the record.

7. Enter the custom status label in the **Label field and enter the value in the **Value** field.**

Tip:

Following the naming convention (capitals) displays a consistent format in the UI.

8. Right-click on the header and select **Insert and stay**.

Important:

Selecting **Save** or **Update** overwrites the selected resource status in Step 4.

Use resource assignments

The Resource Management Workspace is presented as a new approach to assigning resources to outcomes. Resource Management Workspace integrates with Project Workspace, Strategic Planning, and Portfolio Planning enabling the portfolio stakeholders to create resource assignments for their work.

Advantages and benefits of Resource Management Workspace

- **Assigning resources to outcomes:** facilitates the process of allocating people to achieve specific outcomes for a task.
- **Planning attributes:** acts as a common currency between capacity planning, resource assignments, and financials.
- **Diversified handling:** manage the inevitable changes to support your organization and priority changes during your planning cycle.
- **Granular allocation:** split or move an assignment to effectively handle the granular changes for your work.
- **Allocation spread:** toggle between the monthly or weekly view of resource allocation which caters to various planning and reporting needs.
- **Grouping of assignments:** group the resource board view using primary attributes such as group, role, or skill to reassign any existing work to a different user.
- **Enhanced insights:** get a deeper, informative, and more insightful details into the allocation details using the heatmap view.
- **Better integration:** prevent errors and ensure better practices by locking down resource assignments with recorded actuals, preventing modifications or deletions to maintain historical work data.
- **Clear alerts:** notify a stakeholder or a resource user using the alert icons which indicate any over allocations or change in assignment status.
- **Streamline communication:** capture the required or additional information in the notes to establish a seamless communication between resource manager and resource requester.

Using Resource Management Workspace

Create custom resource board views of persistent portfolios to view the current resource allocation and resource requests for all of your resources and work.

Resource assignments from different planning workspaces are pulled into this dedicated view for Resource Managers to give you an overall work view. Resource Managers can access the dashboard to view the assignment details at high level and [create resource cards](#) to build persistent portfolios and view the resource allocations.

Quickly create multiple portfolios using resource cards and navigate between these cards to work on the resource requests. Use the advanced condition builder to customize these portfolios based on the teams, attributes, groups, and so on, to view the resource allocation.

Tip:

Save the filter query and the conditions that you build to revisit and work on the resource allocations.

Overview dashboard

Resource Management Workspace overview dashboard provides a high-level interactive resource assignment details that help Resource managers to focus on where to prioritize the efforts, identify conflicts, and review the upcoming or pending assignments. Using this dashboard, Resource managers can view the data around their resources and work for efficient resource forecast planning.

The Overview dashboard is crafted to reduce the effort of navigate between different resource boards to view the unassigned work, pend activities, and prioritize day-today tasks.

Note:

When you navigate to Resource Management Workspace, the Overview dashboard is the landing page. You can navigate to resource cards using the side navigation menu.

You can edit the dashboard based on:

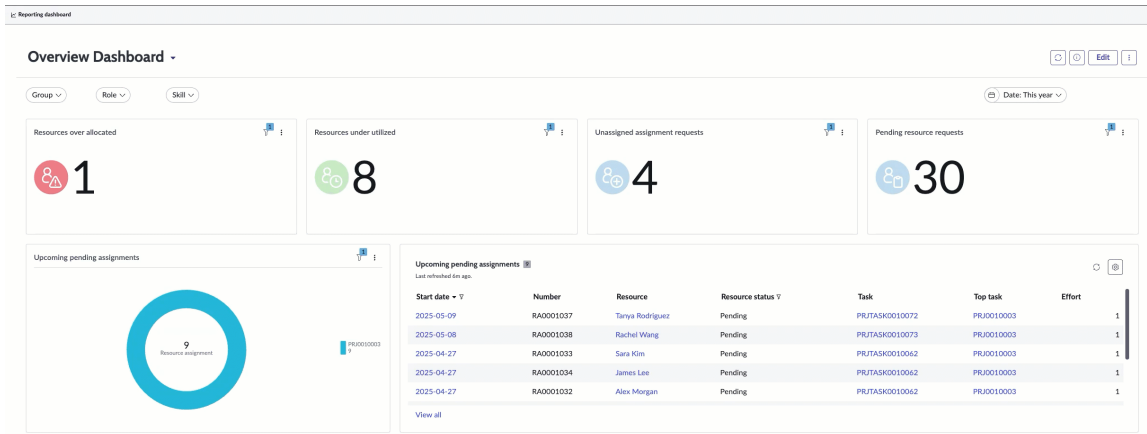

- Primary attributes and date range selection.
- Add and edit widgets to the dashboard.

The interactive dashboard creates a resource board for any selected data helping you to directly access the customized board view from the dashboard. For example, if you select the Unassigned tasks widget, this creates and navigates you to a resource board view with the list of unassigned tasks from the widget.

On the board view, you can get the drill down view of all the assigned assignments to the users. The timeline range in the board view matches with the date range of the dashboard.

By accessing these custom boards, Resource managers can assign and approve the assignments in reduced turn-around time, and enhancing productivity.

Dashboard widget details

Widget title	Description
Resources over allocated	Number of over-allocated users.
Resources under utilized	Number of users with available bandwidth.
Unassigned assignment requests	Number of unassigned tasks.
Pending resource requests	Total number of requests in Pending state.
Upcoming pending assignments	<p>Number of assignments starting by next month.</p> <p>There are two views for this widget. A pie chart and a list view.</p> <p>Selecting Pie chart navigates you to the resource board view.</p> <p>Selecting the table values.</p> <ul style="list-style-type: none"> Start date - opens resource assignment record view. Resource - opens to resource details page. Task - opens project task details in record view. Top task - opens the top task details in record view. <p>Select View all to see the simple list view of assignments.</p>
Assignments ending soon	Number of assignments ending from current date to next month.
Ready for review	Number of assignments that are in ready for review state.
Overdue assignments	Number of assignments with past end dates.
Unapproved assignments	Number of unapproved assignments.
Utilization percentage	Average of the utilization % of the users based on the selected primary attributes.

Dashboard widget details (continued)

Widget title	Description
	Example: You can select a primary group to view the average utilization % of the entire group. This helps Project Managers to better plan the resource requests. Resource Managers can use this data while approving the assignments.
Assignments status	Breakdown view of the resource assignments based on the status.
Total efforts	Bar chart displaying the monthly breakdown view of allocated hours vs capacity. Select the chart to get the drill down view of the resource allocations in the resource board.
Total resource work by type	Displays the allocated hours based on the task type. Example: Operation work, Project Task, and so on.
Role allocation	Bar chart displaying monthly breakdown view of the total number of allocated hours based on the user roles. Select the chart to get the drill down view of the resource allocations in the resource board.

Resource board

Using this intuitive workspace, Resource Managers can:

- View the number of tasks assigned to a resource.
- Understand the type or state of the assignment, and track the changes made to assignments.

Indicator	Description
	Indicates that the resource allocation is within the available bandwidth.
	Indicates that the resource is over allocated for the available bandwidth.
	Indicates the work assignment is made for a group.
	Indicates changes to start or end date, allocated hours, and so on, to the approved resource assignments.

Indicator	Description
	<p>Note: When these changes are made, the status of the assignment is moved to pending, indicating resource manager about the review required for the changes made. Once the changes are reviewed and the assignment is either approved or unapproved, this icon is no longer displayed.</p>

- Understand of the status of the assigned tasks rolled up to resource level using the Resource status column.
- View the primary attributes such as Group, Role, and Skill of each resource in the top tray. These come in handy while working on reassigning a task to different user with the same primary attributes.
- View the priority and state of the project, demand, or epic in the Priority and State columns in the resource board and allocate resources to priority or high-risk planning items.
- View the actual hours vs allocated hours for a task.

Enable the **Show actuals** toggle () from the settings side panel () to view the efforts captured for a task via time cards. Approved time cards are reflected in the resource board view as actual hours.

- Get insights about the resource allocations using the new heatmap modal.
- View or hide requested work in the lower tray using **Unassigned tasks** toggle.
- Filter unassigned work to view the custom requests.
- Edit the task effort for any group allocations and approve it in the top-tray using the inline editing feature.

Note: If you edit the allocations for any approved group assignment, a confirmation window appears. Once approved, the state is changed to Pending.

- [Assign the unassigned tasks](#).
- [Approve or unapprove](#) the assigned tasks.
- [Split a resource assignment](#) into two for one resource at the required date.

Once you access these resource cards, you get a similar view as the following example with extensive

The screenshot shows a 'KT Demo' resource board. The top section displays a list of tasks with columns for Resource, Parent Item, Resource status, Type, Owner, Task effort, Start date, End date, Group, Role, Skill, Priority, and a monthly effort breakdown (Jun 2024 to Nov 2024). The bottom section shows 'Unassigned tasks' with columns for Task, Parent Item, Type, Owner, Task effort, Group, Role, Skill, Start date, End date, and monthly effort breakdown.

insights.

Tip: You can filter out or add required columns in the top and bottom tray of the resource board view using **Column config** () settings.

Personalize your resource board view

You can customize the resource board to personalize your view. These user preferences are saved to give you the same view every time.

- View or hide unassigned tasks

Use the **Unassigned tasks** () toggle to view or hide the unassigned tasks in the bottom tray.

The Unassigned tasks view, in the bottom tray, facilitates you to build a custom filter condition to view unassigned requests with details such as duration, breakdown view of requested efforts, requested work item and its parent item, owner or requester of the task. Use the filter condition builder to get a custom or focused view of the unassigned tasks.

The 'Filter unassigned work' dialog box includes a 'Filter Overview' section and an 'Editor' section. The editor allows building a filter by adding conditions with fields, operators, and values. The example filter is: 'Created on This quarter or Resource is Abel Tuter (Architec)'. There are 'Undo', 'Redo', and 'Filter' buttons.

- Change effort type

Switch between **Hours**, **FTE**, or **Person Days** effort types to view resource allocations based on the required effort type.

- Group By

Customize the view of your resource boards using the **Group By** feature to regroup the resources depending on your organization needs. You can group by **Primary Group, Primary Role, Primary Skill, Owner, or Project**.

- View or hide columns

Use the column config option () to view or hide any columns on the top tray or bottom tray of the resource board.

Data grid filtering

Quick filters help you filter and build a personalized view to narrow down datasets instantly without refreshing the page or running complex queries on your resource board. You can filter lists, reference fields, strings, dates, and boolean values.

Resource allocations and heatmap view

The resource allocation view in the top tray provides you with a nested view of the assigned work items rolling up to resource level and the resource allocation breakdown view based on the time-frame (weekly or monthly) and by work efforts (hours, FTE, or person days).

Select the arrow () icon to get details at the individual task level (epics, demands, and so on) assigned to the resources. This helps you to get a breakdown view to understand:

- Work assigned to a specific resource.
- The amount of time a resource is allocated to an individual task.

Tip:

Switch between different efforts such as hours, FTE, or person days to view a resource allocation heatmap based on the selected effort type.

You can edit the resource assignments using the inline editing feature in the top-tray.

The **Resource status** column helps you to easily identify any Pending () or Unapproved () work items assigned to a resource.

Note:

The status of the assigned work is rolled up to the resource level and the resource card level. If there are any pending or unassigned work items in the top tray, the rolled up status at resource level and card level shows Pending.

Define custom statuses to calculate and view resource capacity in the allocation heatmap modal.

Allocation heatmap modal gives you an overview of the resource utilization to identify the over allocated and the available resources. The allocations are color-coded to display the availability of the resources and help you to identify the availability of the resource for the filtered time frame.

The new heatmap modal gives you the following insights for a resource such as the assigned tasks with their respective project owner, resource status, efforts for each task, total utilization percentage for the approved tasks, and the remaining capacity.

Very Over Utilized	150 +	%
Over Utilized	100 - 150	%
Full Utilization	100	%
Good Utilization	51 - 99	%
Under Utilized	0- 50	%

Allocation heatmap breakdown

Aidan Donaldson allocations for January month ✕

Aidan Donaldson is overallocated for the month of January 1,2025 by 16 hours. You may want to update Aidan Donaldson allocated hours for this month

Project	Task	Resource status	Task Effort	Utilization	Remaining capacity	Project owner
Client Referrals	Gather High L...	Approved	16 hours			System Administrator
Client Referrals	Deliverable: B...	Approved	16 hours			System Administrator
KT 2025 Q1	Initiating	Approved	32 hours			System Administrator
Total:			64 hours	34.78%	120 hours	
Client Referrals	Initiating	Pending	40 hours			System Administrator
Client Referrals	Deliverable: Pr...	Pending	16 hours			System Administrator
Client Referrals	Executing	Pending	72 hours			System Administrator
Client Referrals	Quality Gate 3...	Pending	8 hours			System Administrator
Total:			200 hours	108.70%	-16 hours	

Got It

From the preceding example, you can see the breakdown of the approved work items along with the rolled up efforts, Utilization percentage, and the Remaining capacity for the month of January 2025. The approved work is within the resource capacity as the remaining capacity is 120 hours. A Resource manager can use these insights to decide and allocate the pending work items to another resource with available effort.

Important:

Resource efforts calculations are driven by the `com.snc.resource_management.exclude_status_from_capacity` property. Admin can configure this property to calculate efforts for certain defined resource assignments only. For more information, see [Resource Management properties](#).

Using the `com.snc.resource_management.exclude_status_from_capacity` property, Resources managers can customize to view the resource assignments with a specific state in their workspace and what to view in the total allocation modal. For example, you can view resource assignments in either Approved, Unapproved, and Pending resource assignments, or the ones in Approved and Pending states only.

Once the property is set up, work items in a specific states to show up in the full capacity and full allocation rollup of a resource. The new allocation modal displays the allocation breakdown and the rollup values of the work items for the configured states.

When you group a resource board using the Group by option, the heatmap allocation modal for a group gives the following insights.

ATM Card Team allocations for January month ✕

ATM Card Team is allocated for the month of January 1,2025 a total of 360 hours out of their total capacity of 920 hours. They have 560 remaining hours, you may want to consider adding tasks to fully utilize their capacity

	Total Allocation	Remaining effort	Utilization
Total approved	128 hours	792 hours	13.91%
Total approved and pending	352 hours	568 hours	38.26%
Total approved, pending and unapproved	360 hours	560 hours	39.13%

[Got It](#)

For example, when you group a resource board by Primary Group to view the allocation heatmap modal of a group for January 2025, the following modal is displayed. This modal gives insights into the total overall allocation of different types of Resource statuses.

Note:

The efforts in the allocation modal are displayed in Hours.

Group resources on resource board

The resource board provides a comprehensive list of resources, which are fetched depending on various resource attribute types, projects, and work items. You can group these resources to gain an accurate perspective on specific attributes, owner, or the parent items associated with the projects. You can group the resources by **Primary Group**, **Primary Role**, **Primary Skill**, **Owner** of the task, or **Parent Item** of the work.

If you group the resource board by **Primary Group**, you see the list of primary groups that the resources are associated with and a drop-down of the list of resources in that group and the work item they're working on. In this view, you also get the rolled up values of the efforts at resource level and group level. The rolled up values can be viewed at a monthly or weekly breakdown.

Resource Managers can use this information to plan the resources and manage assignments.

Tip:

Grouping the resources based on the primary attributes helps Resource Managers to easily reassign the work as the primary attributes should match to reassign work. For more information on how to reassign a work, see [Reassign or unassign work using Resource Management Workspace](#).

The screenshot displays the ServiceNow Resource Management Workspace for 'KT 2024'. The top section is a Gantt chart showing resource allocation over time from 2024-09-30 to 2025-04-06. Resources are listed on the left, including Analysts, Alejandro Proust, Alejandro Mascall, Alene Raback, Peter N, and Scott W. Tasks are shown as bars with their duration and status (e.g., Pending, Approved). The bottom section is a table of unassigned tasks.

Create a resource card

Create a custom resource card to view resources and unassigned tasks, and work on resource mapping for your persistent and focused portfolios.

Before you begin

Role required: resource_user, resource_manager, it_project_manager

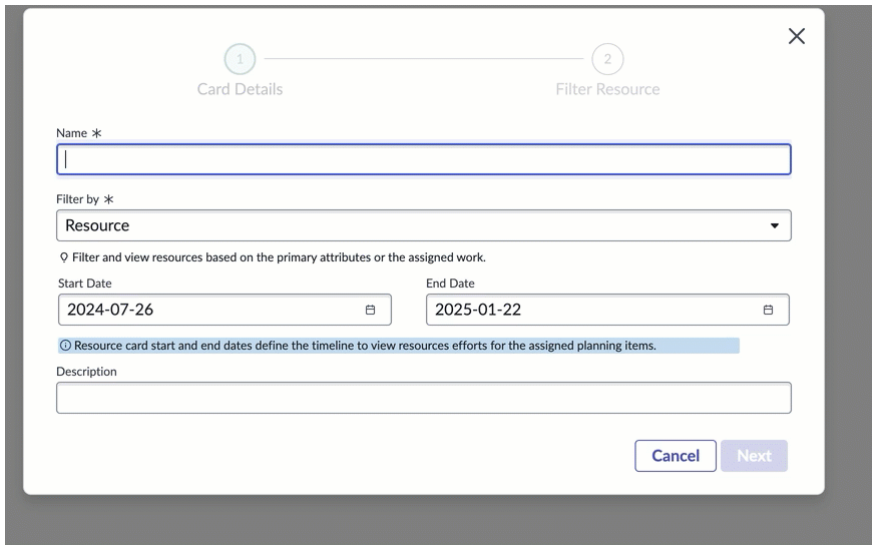

Procedure

1. Navigate to **Workspaces > Resource Management Workspace**.
2. Select the Resource cards icon () from the menu.
3. Select the **New Resource Card** button ().
4. Enter the following details.
By default, the date range is set to six months from today's date. Maximum date range is 3 years from the selected start date.
5. Select **Next**.
6. Create filter condition to view a custom set of resources.
The default condition is set to show all active users.

Tip:

Save a filter condition using the **Save filter** option () and name the filter to easily identify it later. Next time you create a resource card, you can select one of your saved filters from the **Use existing filter** list and customize it further.

7. Select **Confirm**.

Note:

You can edit the card details and filter condition using the edit icon () on the resource board.

Result

A resource board view with the list of resources matching the filter condition with their work allocations, projects they're working on, and the assignment status is displayed.

Resource	Task	Parent Item	Resource status	Type	Owner	Task effort	Start date	End date	Group	Role	Skill	Priority	Jun 2024	Jul 2024	Aug 2024	Sep 2024	Oct 2024	Nov 2024

Ashley Travis																			

What to do next

Enable the **Unassigned tasks** toggle and build a filter condition to view unassigned tasks in the Unassigned tasks bottom tray.

For more information on how to filter and view unassigned work, and handle resource assignments, see [Assign and approve unassigned work using Resource Management Workspace](#).

Create resource assignments and operation resource assignments in Resource Management Workspace

Create and assign resource assignments and operation resource assignments from Resource Management Workspace.

Before you begin

Role required: resource_user, resource_manager, It_project_manager

Procedure

1. Navigate to **Workspaces** > *Resource Management Workspace*.
2. Select the Resource cards icon () from the menu and open a resource card.
3. Create resource assignments using one of the following options.
4. Select **Submit**.

Result

Resource assignment is created. You can filter and view this assignment in the lower tray of Unassigned tasks.

If an assignment is made for a resource from the resource board and if it's within the selected date range, the assignment shows up nested under the selected resource in real-time.

View unassigned tasks using Resource Management Workspace

Filter unassigned tasks to view custom requests to match with your organization's priorities and planning, and assign them to resources.

Before you begin

- Create resource assignments, or migrate your existing resource plans from Classic to Next Experience. For more information, see [Create resource assignments using Resource Management Workspace](#), [Create resource assignments using Project Workspace](#), or [Migrate resource plans to resource assignments](#).
- Role required: resource_user, resource_manager

Procedure

1. Navigate to **Workspaces** > *Resource Management Workspace*
2. Select the Resource cards icon () from the menu and open a resource card.
3. Enable the Unassigned tasks toggle (**Unassigned tasks** ) to view the unassigned work requests in the lower tray.
Project Managers create resource requests based on the primary attributes (Group, Skill, or Role).
4. In the bottom tray, select **Filter** () to filter the unassigned work and get a custom view of what you want to see.

You can use the attributes such as resource groups, teams, roles, skills, projects, time frame, and so on, to work with advanced filters.

Tip:

Use the condition builder to build a filter and work on priority requests.

Example: This is a condition to filter the unassigned work requests created for a specific user.

Filter unassigned work X

Use existing filter | 0 results matching criteria

Filter Overview >

Editor
Build a filter by adding conditions that contain a field, operator, and value(s).

Created on This quarter X

and Resource is Abel Tuter (Architec X

5. Select Filter.

The unassigned work matching the filter condition is displayed in the Unassigned tasks tray.

Resource	Task	Task effort	Start date	End date	Group	Role	Skill	Priority	Jun 2024	Jul 2024	Aug 2024	Sep 2024	Oct 2024	Nov 2024

Assign unassigned work using Resource finder

Assign resource using the AI suggestions which match the skill-set and primary attributes requirements.

Before you begin

Role required: resource_user, resource_manager

About this task

The AI resource finder uses generative AI to calculate AI rationale for available resources. Review the fit scores and availability before assigning a resource. Selecting a resource opens the existing assign resources modal where you can review allocations and distributions before confirming the assignment.

AI resource finder helps resource and project managers identify the best-fit resources for unassigned resource assignments in a project. The fit score indicates how well a resource matches a task based on the availability, past experience, similar kind of work and working on same projects. Resource managers review the AI-generated fit scores and rationale and decide which resource to assign to an unassigned assignment. The resource finder modal displays the following information for each resource:

- **Fit score:** Percentage match of a resource for the task. The Fit score is deterministic and is not generated using AI.
- **Rationale:** AI-generated explanation for the fit score.
- **Availability:** The availability of the resource for a task.

For more information regarding how the Resource finder works and the resources are mapped, see [Resource finder](#).

Procedure

1. Navigate to **Workspaces > Resource Management Workspace**.
2. Select the Resource cards icon () from the menu and open a resource card. Alternatively, you can view unassigned tasks using the Unassigned assignment requests widget from the overview dashboard.

3. From unassigned tasks pane, select the context menu row () for any task and select **Resource finder**.

Resource finder ✕

Assign and approve unassigned work using Resource Management Workspace

Filter the unassigned work to view priority requests and assign them to resources. Quickly connect with the requester via Microsoft Teams to get additional insights and approve the assigned work using the inline editing feature.

About this task

The assign logic provides you with the flexibility and control for users when assigning work to resources. It addresses the following goals:

- **Efficiency:** Quickly allocate unassigned tasks to available resources.
- **Personalization:** Enables users to configure how effort is distributed—either automatically or manually.
- **Transparency:** Get a preview of the real-time breakdown of effort allocation before assigning the work to resources.
- **Flexibility:** Manual distribution supports custom selection of resources, which helps Resource managers manage work allocations based on the availability and remaining capacity of the resources.
- **Fairness:** Distributes work equally among the resources maintaining a balanced work.

Before you begin

- [Create an active employee definition](#)  for resources to view their allocation details on the Resource Management Workspace.
- [Create a resource card](#).
- Role required: resource_user, resource_manager

Procedure

1. Navigate to **Workspaces** > *Resource Management Workspace*
2. Select the Resource cards icon () from the menu and open a resource card. Alternatively, you can view unassigned tasks using the Unassigned assignment requests widget from the overview dashboard.
3. In the Unassigned tasks tray, select the Row context menu for any task () and select **Assign Work**.
4. You can assign work using one of the following ways.

Note:

Remaining efforts after equally distributing the work among the users is retained in the Unassigned tasks tray. Resource managers can again allocate these efforts.

5. Select the **Preview** button to see the real-time allocations before assigning the work.
6. Select the **Assign** button to assign work to the resources. The assigned work is reflected in the top tray nested by resource view and will be in Pending state ().
7. Expand a resource row using the chevron icon () to view assigned tasks.
8. Double-click in the Resource status column and select **Approve** to confirm the assigned work so the resource can start working.

While assigning the work, you can easily identify if a resource is available () or overutilized () , even for the future periods, using the iconography.

9. You can change the status of any assigned assignments using one of the following options.

10. **Optional:** You can select the owner's name to collaborate with them over Microsoft Teams to get additional insights regarding the work.

Result

The assigned work items are Approved () or Unapproved () and the status of the work assignments is rolled up to the resource level.

What to do next

If no tasks appear in the Unassigned tasks tray, verify the following:

1. Verify the resource requests exist. Project Managers must create resource requests (resource assignments with status Requested) on project tasks. Navigate to the project and verify resource requests exist on the Resource Assignments related list.
2. Check if primary attributes match. The resource card filter must match the primary attributes (Group, Skill, or Role) defined in the resource requests. Open your resource card and verify the filter criteria aligns with existing requests.
3. Check if the employee profiles are generated. Ensure [employee profile definitions](#)  have been generated for the resources in your view.
4. Request state is correct. Only resource requests in **Requested** state appear as unassigned. Requests that are already Assigned, Approved, or Cancelled don't show.
5. Check the date range. Verify the resource card's date range overlaps with the resource request dates. Requests outside the visible time frame will not display.
6. Confirm the permissions. Confirm you have the resource_manager role, which is required to view and manage unassigned work.

Move a resource assignment

Move a resource assignment to a different start and end dates depending on the availability of the resource.

Before you begin

Role required: resource_user, resource_manager

About this task

- The resource assignment dates honor the task dates. The start and end dates of the resource assignments should be within the task start and end dates.
- When a resource assignment is moved beyond the task dates, the allocations outside the dates are cleared.
- You cannot move a resource assignment if actual efforts are captured for the work.

Use the **Show actuals** toggle () from the settings () side panel to view the efforts captured for an assignment via time cards.

Procedure

1. Navigate to **Workspaces** > *Resource Management Workspace*.
2. Select the Resource cards icon () from the menu and open a resource card.
Alternatively, you can access a resource board by accessing a widget from the overview dashboard.

3. Select the chevron icon () for drill down view of the tasks assigned to resources.
4. In the top tray, select the row context menu () for the required task and select **Move**.
5. In the move assignment modal, you can either enter or select the new start date using the date picker modal from the **New start date** field.
6. **Optional:** Change the assignment status using the **New status** list.
7. Select **Confirm**.

Example: Moving a resource assignment

Let's consider a resource assignment for Website Overhaul task is assigned to Grace Lee. The task duration is from August 01, 2025 to August 31, 2025. The assignment duration is from August 01, 2025 to August 20, 2025. Now, when you move the assignment start date to August 15, 2025; the new assignment dates will honor the task dates and will auto-assign the work from August 15, 2025 to August 31, 2025. The remaining efforts of the resource are cleared and the cleared capacity is shown as available.

Reassign or unassign work using Resource Management Workspace

Reassign or unassign any assigned work from the Resource Management Workspace. You can group the resource board by primary attributes to identify the resources with same primary attributes.

Before you begin

- When you reassign work, the primary attributes of both the resource should match. For more information about mapping primary attributes to resources, see [Map primary attributes to resources](#).
- You can reassign a work item for the period for which actual hours are not captured.
- You cannot reassign a work item if it has associated actual hours captured for the entire duration.
- You cannot unassign a work item if it has any associated actual hours captured.
- You cannot unassign an assignment if it has any associated actual hours captured.
- You cannot reassign or unassign group resource assignments.

Role required: resource_user, resource_manager

Procedure

1. Navigate to **Workspaces** > *Resource Management Workspace*
2. Select the Resource cards icon () from the menu and open a resource card.
3. Select the chevron icon () to expand the resource view in the top tray.
4. To reassign any assigned work:
 - a. Select the row context menu () for the required work item.
 - b. Select **Reassign work**.

Tip:

[Group the resource board](#) by the primary attributes to drag and drop the resource assignments to another resource to completely reassign work.

- c. On the Reassign work window, enter the name of the resource in the **User** field to whom you want to reassign the work and duration using the **Start month** and **End month** date picker.

5. Select Update.

Note:

Use the reassign feature to assign a partial or fraction of a task among resources without overlapping the assignment dates.

The selected work item will be reassigned to the selected resource.

6. To unassign any assigned work:

a. Select the row context menu () for the required work item.

b. Select **Unassign work**.

The selected work item will be moved to Unassigned task tray.

Result

The reassigned tasks are assigned to the selected resource and unassigned tasks are moved to the Unassigned tasks tray.

Example: Reassigning work

Consider a development task spanning from January 1, 2024 to September 30, 2024 which is assigned to Tom, a developer who has the following primary attributes.

- Primary Group - Development
- Primary Skill - Java
- Primary Role - Java Developer 1

Tom has actual hours captured from January 1, 2024 through March 31, 2024 and will be unavailable for next 2 months.

As a resource manager, you can either reassign this task in it's entirety starting from April 1, 2024 till September 30, 2024 to Raj, who has the same primary attributes. Or reassign the task from April 1, 2024 to May 31, 2024 to Raj, leaving the rest of the assignment to Tom.

The actual hours captured by Tom are retained even though the task is reassigned. Raj can capture the actuals hours for the assigned period after completing the work.

What to do next

You can allocate the unassigned work and approve the reassigned work. For more information, see [Assign and approve unassigned work using Resource Management Workspace](#).

Split resource assignments using Resource Management Workspace

Splitting a resource assignment at a specific date creates a resource assignment for the same user.

Before you begin

- When you split a resource assignment, a new assignment is created from the selected date. Both the assignments are assigned to the same user retaining the state of the assignment.
- When you split a resource assignment, a new assignment is created from the selected date. Both the assignments are assigned to the same user with Approved state.
- If a resource assignment has actuals captured for a certain duration, you can split the work only at the dates where there are no actuals captured.
- Role required: resource_user, resource_manager

About this task

When to use split or reassign for assignments.

Use Split when you need to divide a single resource's assignment into two time periods with different allocation levels, effort distributions, or tracking granularity. For example, split an assignment when a resource needs to reduce their allocation after a project milestone. Use Reassign ([Reassign or unassign work using Resource Management Workspace](#)) when you need to transfer work from one resource to another.

Procedure

1. Navigate to **Workspaces** > *Resource Management Workspace*.
2. Select the Resource cards icon () from the menu and open a resource card.
3. Select the chevron icon () to expand the resource view in the top tray.
4. In the top tray, select the row context menu () for the required work item and select **Split**. Split modal appears providing you with the insights related to the task such as name of the task, name of the resource, start date, and end date.
5. On the Split modal, select a date to split the resource assignment using the date picker.
6. Select **Split**.

Result

The resource assignment is split at the selected date and a copy of the resource assignment with new dates are displayed under the assignments of the selected resource.

Example: Split resource assignment

Consider a resource assignment named *Implement GenAI in docs* assigned to Abel Tuter from July 16 through December 02. If you split the resource assignment at September 09, there will be two resource assignments with the same name and state assigned to Abel Tuter.

One resource assignment ranges from July 16 to September 09, and the other assignment ranges from September 10 to December 02.

> Resource > task		Parent Item	Type	Owner	Resource status	Task eff...	Start date	End date	Jul 2024	Aug 2024	Sep 2024	Oct 2024
Abel Tutor (4)					Pending				112	176	168	184
Implement GenAI in docs		Implementat...	Project Task	System ...	Approved	480 Hours	2024-09-10	2024-12-02			120	184
Implement GenAI in docs		Implementat...	Project Task	System ...	Approved	320 Hours	2024-07-16	2024-09-09	96	176	48	

Here, you can see an overlap of efforts for Implement GenAI in docs in month of September because the split is happening from September 10.

Manage resource allocations in Resource Management Workspace

Manage resource allocations to change efforts, start and end dates, extend and so on to adjust resources based on their availability and the priority of the tasks.

Before you begin

Role required: resource_user

Date handling for allocation changes

When you extend or modify resource allocations, the system uses the following date logic:

- **Projects:** The allocation dates are bounded by the project task's planned start and end dates. If the task has actual dates, those take precedence over planned dates.
- **Demands:** The allocation dates are bounded by the demand's planned start and end dates. If no end date is set on the demand, the allocation can be extended indefinitely.

You cannot extend an allocation beyond the parent record's end date without first updating the project task or demand dates. If the allocation dates exceed the parent boundaries, the system may truncate the allocations or display a warning.

Procedure

1. Navigate to **Workspaces > Resource Management Workspace**.
2. Select the Resource cards icon () from the menu and open a resource card.
3. Select the chevron icon () to expand the resource view in the top tray.
4. Edit the following allocation details in the resource board drill-down view.

Export resource portfolio view to Excel or CSV format

Export your resource portfolio view in Resource Management Workspace as Microsoft Excel or CSV format to review or share the resource status with stakeholders, even if they don't have access to your instance.

Before you begin

Role required: resource_user, resource_manager, it_project_manager

Procedure

1. Navigate to **Workspaces > Resource Management Workspace**.
2. Select the Resource cards icon () from the menu and open a resource card.
3. Select the More Actions menu () and select **Export**.
4. In the Export resource board window, select a required format from the **File type** list to export the resource portfolio.

- **Excel** - Exports the resource portfolio in Microsoft Excel format.
- **CSV** - Exports the resource portfolio in CSV format.

5. Select the **Export** () button.

Result

The resource portfolio view is exported with `export_file` as the file name in the selected format.

Manage resource assignments from Project Workspace

Optimize project execution by assigning resources to tasks within the Project Workspace. You can create resource assignments for any project or project task, specifying the tasks to be performed and the resources to be allocated. Use the Resource Management application to allocate and manage your resources in the Project Workspace.

Resource assignments

Resource assignment is a process of allocating a resource or group of resources to a project task. When a resource assignment is initiated, a resource plan is auto-generated in the back-end of the project management system. This resource plan details the information of how resources would be allocated throughout the project. Resource assignments are approved by the resource manager to make sure that the allocation aligns with the overall resource strategy, considering factors such as availability, skills, and project priorities. Resource assignments remain dynamic and can be edited throughout the project life cycle. Resources can be assigned based on defined attributes such as skills, expertise, or other criteria relevant to the project or task.

Note:

Resource efforts calculations are driven by the `com.snc.resource_management.exclude_status_from_capacity` property. Admin can configure this property to calculate efforts for certain defined resource assignments only. For more information, see [Resource Management properties](#).

Edit the child resource assignments directly using the inline editing from the resource assignment pane.

Using Resource Management, you can create, plan, track, and monitor resource assignments at a project or task level in the Project Workspace. With Resource Management in Project Workspace, you can:

- Create an attribute-based resource assignment.
- Change the resource assignment dates, resources, efforts, and proposed allocations at any level of the project.
- View resource allocations using new heatmap modal. The allocations are color-coded to display the availability of the resources.
- View the primary attributes such as Group, Role, and Skill of each resource in the resource assignment pane. They are useful when you work on reassigning a task to a different user with the same primary attributes.
- Switch between **Hours**, **FTE**, or **Person Days** effort types to view resource allocations.

i Important:

Resource efforts calculations are driven by the `com.snc.resource_management.exclude_status_from_capacity` property. Admin can configure this property to calculate efforts for certain defined resource assignments only. For more information, see [Resource Management properties](#).

Key features

With resource assignments, you can:

- Determine the resource engagement timing and allocate resources for specified durations, contributing to the creation of a timeline for task completion.
- Align task execution with the project plan, ensuring tasks are carried out in accordance with specified timelines and resource requirements.
- Initiate an approval process that is conducted by a resource manager and make sure it aligns with project targets and resource availability.

Key benefits

Using Resource Management, you can create, plan, track, and monitor resource assignments at a project or task level in the Project Workspace. With Resource Management in Project Workspace, you can:

- Create an attribute-based resource assignment.
- Change the resource assignment dates, resources, efforts, and proposed allocations at any level of the project.
- View resource allocations using new heatmap modal. The allocations are color-coded to display the availability of the resources.
- View the primary attributes such as Group, Role, and Skill of each resource in the resource assignment pane. They are useful when you work on reassigning a task to a different user with the same primary attributes.
- Switch between **Hours**, **FTE**, or **Person Days** effort types to view resource allocations.

Create resource assignments using Project Workspace

Create an attribute-based resource assignment in the Project Workspace application for any project or project task.

Before you begin

After a resource assignment is created, resources are allocated to the project and approved by the Resource Manager. You can edit the assignment throughout the project life cycle.

Role required: `it_project_manager`

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the **Resource assignments** toggle button.

i Note:

If the `sn_pw.enable_resource_planning` property is set to true, then the **Resource assignment** toggle button and resource assignment pane are displayed in Project Workspace. The default value is false. You must have the `pps_admin` role to enable this property.

3. From the Planning pane, double-click the **Resource assignees** field for a project task.

You can assign the resources from both planning and resource assignment pane.

4. From the resource assignee list, select a user or group and press **Enter**.
When you create a resource assignment, the user or group allocation is based on the selected effort type. For example, when you add a user and the effort type is selected as hours, the allocations are displayed in hours.
A resource assignment record is created and auto-saved. The resource assignment form auto-populates the project or task information.
5. **Optional:** From the resource assignment pane, create a resource assignment for a project or task by selecting **Add resource**.
You can create a resource assignment for a project from the resource assignment pane only.
6. Select the expense type of the assignment based on the work as **Opex** or **Capex**.
A resource can use this information while capturing efforts using the time sheet portal. Once the time sheet is approved, an expense line is created for the project capturing the expense as capex or opex, based on the selected expense type.
7. View the resource allocations in the heatmap by enabling the **Allocation heatmap** toggle button.
You can switch from the week view to the month view based on your requirement.

What to do next

[Update resource assignment from Project Workspace](#)

Related topics

[Delete a resource assignment from Project Workspace](#)

[Update the resource allocation in a heatmap](#)

[Realign resource assignment to project task](#)

Update resource assignment from Project Workspace

Update a resource assignment that is associated with a project or project task.

Before you begin

Role required: it_project_manager

In resource assignments, any changes made to the status of group resource assignment roll down to all associated child resource assignments status. Similarly, any changes made to the status of child resource assignments automatically roll up to the corresponding group resource assignment status.

About this task

Before updating a resource assignment, verify the following to ensure accurate and effective resource allocation:

- **Resource availability:** Check that the resource has available capacity during the assignment period. Overallocated resources are indicated with a warning icon.
- **Primary attributes:** Verify the resource has the required primary attributes such as, skills or roles matching the project task requirements.
- **Existing allocations:** Review the resource's current assignments across all projects to avoid conflicts or overutilization.

- Group vs. individual: If updating a group resource assignment, note that status changes roll down to all child (individual) resource assignments. Similarly, individual status changes roll up to the group assignment.
- Assignment status: Verify the assignment is in the correct state (Requested, Assigned, or Approved) before making changes.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the **Resource assignments** toggle button.
3. On the resource assignment pane, double-click any cell to edit the entire row.
4. Edit the desired field, and select anywhere on the data grid to save the details.

The resource assignment is updated in the resource assignment pane.

i Note:

When a resource is added on an empty resource assignment, which has more than one Full-time equivalent (FTE) effort, then an additional row is created automatically and the resource assignment is auto-updated in both the rows.

Extend, edit, or delete the resource assignments using the row context menu in resource assignment pane.

Delete a resource assignment using Project Workspace

Delete a resource assignment from Project Workspace. Deleting an assignment also deletes all associated resource allocations.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. Enable the **Resource assignments** toggle to view the resource assignment pane.
3. From the resource assignment pane, create a resource assignment for a project or task by selecting **Add resource**.

Update resource assignments using Project Workspace

Use the allocation heatmap capability in Project Workspace to view and update the resource allocation.

Before you begin

Role required: it_project_manager

About this task

The **Allocation heatmap** toggle button provides a detailed breakdown of the allocation of an individual resource. The allocation heatmap represents the total utilization of a resource for a week or month. By default, allocation information is displayed for the week. This information helps project managers to plan their resources effectively at the project or task level.

Integrate your ServiceNow[®] instance with your organization's Microsoft Teams to enable collaboration of your projects and resource allocations in Microsoft Teams. With the Microsoft Teams integration, you can communicate with the project team members and share real-time

updates on the project and resource allocation status. For more information, see [Setting up PPM collaboration for Microsoft Teams](#).

Procedure

1. [Create resource assignments using Project Workspace](#).
2. View the resource allocations in the heatmap by enabling the **Allocation heatmap** toggle button.
You can switch from the week view to the month view based on your requirement.
3. Edit the desired field and select anywhere on the data grid to save the details.
Work allocation is based on capacity. The allocations are color-coded to display the availability of the resources as shown here. These colors help to identify the availability of the resource for a particular task.

Very Over Utilized	150 +	%
Over Utilized	100 - 150	%
Full Utilization	100	%
Good Utilization	51 - 99	%
Under Utilized	0- 50	%

4. Edit the resource allocation window by selecting the allocation hours cell.

Resource assignment - 1 resource task 2024-02-08 - 2024-02-08 ↻ Allocation heatmap 🕒 Hours 📅 Week Add resource

						05-Feb-2024	
Resource	Effort	Start date	End date	Resource st...	Planned	Actual	
⋮ Aarav Booker	8 Hours	2024-02-08	2024-02-08	Pending	8		
⋮ Aarav Booker	10 Hours	2024-02-08	2024-02-08	Pending	10		
⋮ Ben Pineda	8 Hours	2024-02-08	2024-02-08	Pending	8		

Enable the **Show actuals** toggle to view the actuals of each resource. The actuals can't be edited from Project Workspace.

5. From the resource allocation window, view and track the assigned **Project, Owner, Task, and Task effort** of a resource.

The resource allocation is made according to the schedule of the resource, provided that the resource has a schedule.

The Allocation heatmap modal provides the **Resource status, Remaining capacity, and Utilization** columns to support resource managers in evaluating task efforts.

6. Send a direct message to the project owner on Microsoft Teams by selecting the **Project Owner** field.

Review Deepa Shah allocations for September 18th

Deepa Shah total allocation for the week of September 18,2023 is 40 hours

Project/Type	Owner	Task	Task Effort
Upgrade Router Network	Aileen Mo...	Initiating	40 hours
		Total Allocation	40 hours
		Total Capacity	40 hours
		Remaining Capacity	0 hours
		Utilization	100%

Got It

Note:

The **Project Owner** field can only be selected if your ServiceNow[®] instance is integrated with your organization's Microsoft Teams. Resource assignments on demands are visible in the allocation window both before and after they become projects.

Related topics

[Create resource assignments using Project Workspace](#)

Realign resource assignment to project task using Project Workspace

Realign or synchronize the resource assignment dates with the project task dates. This synchronization helps to schedule and align the resource assignments with the timeline of project task.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All > Workspaces > Project Workspace** and open a project.
2. From the project planning pane, double-click the **Planned start date** or **Actual start date** of a project task.
3. Edit the field and select **Ok**.
4. From the project task row, select the row context menu and then select **Realign assignments to task**.

Alternatively, use the Resources not synced icon to synchronize the resource assignments dates with the project dates at a project level. Realign assignments to task related link is available to perform the same action while using forms.

Result

The resource assignments dates are synchronized with the project task dates.

Notes	Enter details about the assignment to help resource manager or project manager with insights and additional information.

Resource Management classic

The ServiceNow[®] Resource Management application enables resource requesters, such as project managers or change managers, to create resource plans, request resources, and analyze resource availability and utilization.

Important:

Resource plans in Resource Management will no longer be available for new customers from future releases. Existing customers are encouraged to work on resource assignments which offers more flexibility in assigning and managing the work.

- New customers: [Use Resource Management Workspace](#) or [Project Workspace](#) to request resources for any work. Resource managers can use Resource Management Workspace to [assign, approve, and manage the resource assignments](#).
- Existing customers:
 - If you already have resource management and working with resource plans, you can continue using it, but we encourage you to migrate and start using resource assignments.
 - For more information on migrating from resource plans to resource assignments, see [migrate your resource plans and operational resource plans to resource assignments](#) and starting using the Resource Management Workspace to continue managing your work.

Resource Managers are encouraged to use the [Resource Management Workspace](#) to assign, approve, and manage resource assignments. Resource Management Workspace is a dedicated workspace view for Resource Managers where you get insights about unassigned tasks, heatmap view of resource bandwidth, custom view to handle priority resource assignment requests, and so on.

Resource Management will not be enhanced for performance or functionality.

Resource managers use the application to allocate resources to tasks. The Resource Management application can be used in conjunction with any task on the platform, including project tasks, incidents, problems, or changes.

Watch this four-minute video to learn about the purpose of Resource Management application, creating resource plans, requesting and allocating resources, and analyzing resource availability and capacity for maximum resource utilization.

Introduction to Resource Management including the purpose, resource planning, resource request and allocation, and resource availability and capacity analysis for maximum resource utilization.

With the Resource Management application:

- Resource requesters can create resource plans that specify group or user resources required by tasks. They can verify resource availability and change their resource plans prior to requesting resources.
- Resource managers can view availability, existing allocations, and utilization for the requested resources and make allocations based on resource availability.
- Resource managers can change resource plan dates, resources, requested hours and proposed allocations for resource utilization and availability.

The Resource Management application is activated as part of the [PPM Standard](#).

Resource management process

The resource plan is the key to understanding how resource management works.

i Important:
Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged to work on resource assignments which offers more flexibility using Resource Management Workspace or Project Workspace.

For more information about migrating from resource plans to resource assignments, see [Migration of resource plans, operational resource plans, and cost plans](#).

Which approach applies to you?

Resource Plans vs. Resource Assignments

Criteria	Resource Plans (classic)	Resource Assignments (current)
When to use	You're an existing customer who has not yet migrated to resource assignments.	You're a new customer, or an existing customer who has migrated or is migrating to resource assignments.
Workspace	Classic Resource Management modules (Resource > Resource Plans)	Resource Management Workspace or Project Workspace
Key features	Group-based allocation, request/confirm/allocate workflow	Direct resource assignment, auto/manual distribution, inline approval, heatmap views
Documentation	Resource Plans topics in this section	Resource Management Workspace documentation

For detailed migration guidance, see [Migrate from resource plans to resource assignments](#).

A user with the resource_user role can be a resource requester. Project managers are used as resource requesters in many examples because they typically have the resource_user role and work on the planning for a project's execution.

A resource requester [creates a resource plan](#) to request user or group resources for tasks. Any type of task, such as a change request, a task in the Agile scrum process, or a project task can be added to a [resource plan](#).

After a resource plan is submitted, a resource manager reviews the plan, confirms the resources, and finally allocates resources for the plan. Once the resource plans are approved, the resources begin work.

Resource plans

Resource plans are the key element in resource management.

i Important:

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged to work on resource assignments which offers more flexibility [Create resource assignments and operation resource assignments in Resource Management Workspace](#) using Resource Management Workspace or Project Workspace.

Resource requesters, such as project managers, [create resource plans](#) to ask for resources, track effort, and track costs. Resource managers modify and approve resource plans before the plans are used.

All resource plans for a task appear on the **Resource Plan** related list of the Project task form, where resource requesters can access them.

Resource plans progress through several states.

Resource plan states

State	Description
Planning	<p>Planning is the default state when a resource requester creates a resource plan. Any plan in this state can be edited. Requested Allocations are created when a resource plan is in Planning state.</p> <p>When a resource requester asks for a change to a plan that was already submitted, the plan reverts to the Planning state.</p>
Requested	<p>Resource requester submits a resource plan for resource managers review by selecting Submit. The resource plan then moves into the Requested state. Resource managers confirm and allocate resources or reject the plan, and finally close the plan.</p> <p>The resource requester can request a group, specific users in a group, or a specific user to work on the selected task. After you submit the plan for review, a resource manager can confirm, and then allocate some or all the requested users.</p> <p>If the task requires more than one user or groups, multiple resource plans can be created for the given task.</p>

Resource plan states (continued)

State	Description
Rejected	Resource manager can reject a resource plan by selecting Reject . The resource plan then moves into the Rejected state. Rejected plans stay in that state until changes are made and the requester can re-request the resources.
Confirmed	After the plan is requested, the resource manager can block/confirm the resources for future projects and demands. The resource plan then moves into the Confirmed state. Only a resource manager can modify the plans in Confirmed state. Soft allocations are created when the resource plan moves to the Confirmed state.
Allocated	After the plan is confirmed, the resource manager can review the plans, view availability, change resource preferences and perform the resource allocation. The resource plan moves into the Allocated state. A resource manager can only cancel, complete, or modify it. Soft allocations are converted to hard allocations when the resource plan moves to the Allocated state. i Note: You can also set a plan to the Allocated state directly from the Requested state using Confirm and Allocate option.
Completed	After all associated tasks and projects are complete or canceled, an Allocated resource plan can be completed. This deletes all the resource allocations for the resource plan post the completion date.
Canceled	A plan can be canceled if the allocations are no longer required. This removes all past and future allocations. A canceled resource plan can be brought back to the Planning state if it has no past allocations. Resource plans in Planning, Requested, Confirmed, or Allocated state can be canceled.

i Note:
When a resource requester wants to change a plan that was already submitted for review (in Requested or Confirmed state but not yet allocated), the requester can [request a change](#). The plan then moves back to the Planning state.

Resource Management supports time zones, which are important in the My Calendar and Resource Workbench modules.

Modifications in Confirmed or Allocated state

Only a resource manager can modify a resource plan in the Confirmed or Allocated state.

The effects of modification in header area on a resource plan form in Confirmed state are:

- All soft [allocations](#) are deleted.
- Requested allocations are re-created with changed values.
- Resource plan moves back to the Requested state.

The effects of modification in header area on a resource plan form in Allocated state are:

- All resource allocations (soft and hard) are deleted.
- Requested allocations are re-created with changed values.
- Resource plan moves back to the Requested state.

The resource manager can also modify or delete the past dated resource allocations for Allocated resource plans if no actual hours are recorded for those resource allocation records. When a user submits a time card, upon approval of the time card, actual hours are updated for an allocation record.

Note:

The resource plan does not move back to the Requested state if the changes are made to allocation records only.

Request type

You can request a resource plan using one of the following options:

- Hourly: The request is in terms of the number of hours the resources are necessary.
- FTE: The request is in terms of an equivalent value that represents full-time work. When the request type is FTE, planned hours are calculated as: $\text{Average Daily FTE} * \text{number of working days in resource plan} * \text{the FTE value}$. The average daily FTE hours are specified in User and Group records. If there is no value specified at User or Group record, the average daily FTE hours is taken from the *Default Average Daily FTE* property.

The number of working days is calculated based on the users schedule for a user resource or the default schedule for group resources. The default schedule is taken from the Default Schedule Name property.

For example, say that the average daily FTE for a group is 40 hours, the resource plan period is from September 1 to September 10, and the FTE is 0.5.

Assuming 8 working days during the plan period, planned hours = $40 * 8 * 0.5 = 160$ hours.

Note:

Capacity is not derived from FTE, but from schedules. Both FTE and schedules must be in synchronization with each other.

- Person days: The request is in terms of person days. When the request type is person days, planned hours are calculated as: $\text{Total number of person days} * \text{Average Daily FTE Hours/Hours Per Person Day}$.

For example, say the Average Daily FTE Hours/Hours Per Person Day for a group is 8 hours, and the person days is 3. Then, planned hours = $8 * 3 = 24$ hours.

Resource plan costs

Resource plan costs can be tracked directly in the [resource plan](#) record. Resource plan costs are divided into planned, allocated, and actual.

If the **Rate override** option in a resource plan is selected, the hourly rate for calculating the corresponding resource plan cost is derived from the rate specified in the **Resource rate** field.

If a [rate model](#) is associated to the project or demand, the hourly rate is derived from the rate model. Whenever the hourly rates in the associated rate model change, you must [recalculate the resource costs](#) of the resource plan to reflect the new rates.

If rate model is not available, the hourly rate for calculating the corresponding resource plan cost is derived from labor rate card.

Projects and Demands can have multiple resource plans. The aggregated costs for all resources plans roll up to the **Planned Cost** and **Allocated Cost** fields and the **Resource Cost** section of both projects and demands.

Create a resource plan

You can create a resource plan from the Resource Management application for any task such as demand, project, project task, incident, problem, or change. You can edit and adjust the plan until you submit it for approval.

Before you begin

i Important:

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged [migrate your existing resource plans](#) to work on resource assignments which offers more flexibility [Create resource assignments and operation resource assignments in Resource Management Workspace](#) using Resource Management Workspace or Project Workspace.

Role required: resource_user, resource_manager, it_project_manager, demand_manager, admin

Procedure

1. Create a resource plan using one of the following options.

Option	Description
From Resource tab in project workspace	<ol style="list-style-type: none"> a. Open a project record in project work space. See Access the new Project Work space. b. On the Resources tab, click New.
From a project form	<ol style="list-style-type: none"> a. Navigate to Project > Projects > Project Workspace. b. Open a project record. c. In the Resource Plan related list, click New.
From a demand form	<ol style="list-style-type: none"> a. Navigate to Demand > Demands > All. b. Open a demand. c. In the Resource Plans related list, click Manage. d. On the Resource Plans page, click New.
From a project task	<ol style="list-style-type: none"> a. Navigate to Project > Projects > Project Workspace. b. Open a project record.

Option	Description
	<p>c. Click the Details tab.</p> <p>d. In the Project Tasks related list, open a task.</p> <p>e. In the Resource Plan related list, click New.</p>
<p>From an existing resource plan</p>	<p>a. Open the resource plan record that you want to copy.</p> <p>b. In the related links, click Copy Resource Plan.</p> <p>i Note: When you create a resource plan from an existing resource plan, all fields are copied to the new resource plan. The new plan is created in the Planning state.</p>

2. On the Resource Plan form, fill the fields.
For a field descriptions of the field names, see [Resource Plan form](#).

3. Click **Save** on the form header.
The resource plan is saved and placed in the Planning state.

4. Review update the values in the Resource Plan form tabs.
For a field description of the field names, see [Resource Plan form tabs](#).

i Note:
If the assigned rate model is removed or replaced, or the hourly rates in the rate model are changed, the cost fields on the associated resource plans are not recalculated automatically. You must [recalculate the resource costs](#) of the resource plan to reflect new rates from the rate model.

However, if any of the fields affecting the cost are updated on the resource plan, the rate model is invoked for getting the hourly rates. For example, extending a resource plan by modifying the end date of the resource plan invokes the rate model as there can be new rates available.

Result

- The resource plan is saved and placed in the Planning state.
- When the resource plan is created from resource grid, the plan appears as top row in the resource plan list of the project or demand. The plan has one of the following prefixes:
 - [G] for a resource plan created for a group.
 - [R] for a role resource plan created for a role.
 - [U] for a user resource plan created for a user.

The prefix is based on the type of resource selected in the **Resource type** field.

- The resource plan which is created last appears at the top in the resource plan list of the project or demand.

What to do next

Use the [Resource Plan related links and lists](#) to work on the resource plans, workbenches, or to modify the existing request allocations.

Use Resource Finder to analyze resource availability

Search and analyze resource availability using the Resource Finder, so that you can create resource plans for a project or demand.

Before you begin

Role required: it_project_manager, it_demand_manager, or resource_manager

About this task

In the Resource Finder, search for the resources that you need, and create a plan for the selected resources.

- Steps 1 and 2 take you to the resource finder.
- Step 3 provides guidance on different options to filter and analyze the resources availability. Choose the options that suit your needs.
- Step 4 shows how to create resource plan for the selected resources.

Procedure

1. Open the Resource Plans page for a project or demand.
2. Select the project or demand in the resource grid section and click the resource finder icon .

The resource finder section opens at the bottom of the page. A list of up to 50 records are displayed initially. If you have more than 50 resources, you can load them by clicking **Get More**.

3. Use the following options to filter and analyze the capacity of the resources.

Option	Description
Display available or over allocated resources	Using the Show/Hide menu to filter resources by available or over allocated.
Perform a simple search	Search the resources by group, role, or user attributes, by selecting the search criteria.
Build your own search criteria	<p>Use the advanced search to add your filter conditions.</p> <p>For example, select Search by group, click Advanced, then click the Advanced search filter icon . Here you can add conditions to filter this group further.</p> <p>Note: While adding filters, ensure that you do not add an AND condition for different values of the same attribute. For example, do not filter the user group with conditions for Skill X AND Skill Y.</p>

Option	Description
View the availability of the resources for an extended duration	<p>Use the options from the date range selector.</p> <p>From the Zurich release onwards, you can select a custom date range.</p> <p>The value of the property <i>Maximum time duration in Resource Finder in months</i> determines the maximum duration for which the resource details are displayed in the resource finder.</p>
Analyze the resources list	<p>Use the Configuration menu to analyze different constraints such as the capacity, availability, actual hours, and others for different time periods.</p> <p>By default, only the Availability hours are displayed. To view other details, select Detailed View , and select the required columns from the Configuration menu .</p> <p>Displaying the requested hours for a user group or role helps you understand immediately if you need to fulfill any resource requests and to do so, if you have enough capacity for that user group or role.</p> <p>The Requested column would not be available in the Configuration menu under the following conditions.</p> <ul style="list-style-type: none"> ○ Filtering the resource list further using simple or advanced filters ○ Using the resource finder in the availability view ○ Using the show available or show over allocated options from the Show/Hide menu <p>Even if the column is already enabled, but any of the above conditions are later met, the Requested column is disabled automatically.</p> <p>All non-project events created for a user from the calender appear as Operational Work for the user in Resource Finder.</p>
Update the capacity of a resource	Right-click on the user and select Update Capacity .

4. Select the resources you want to create resource plans for and select **Add New Plan.**

Result

- The resource plan is created in the Planning state with zero planned hours.
- The resource plan appears as a row at the top in the resource plan list of the project or demand. Based on the type of resource selected in finder, the resource plan has one of the following prefixes:
 - [G] for a resource plan created for a group.
 - [R] for a role resource plan created for a role.
 - [U] for a user resource plan created for a user.

Note:

The resource plan that is created last appears at the top in the resource plan list of a project or demand.

What to do next

- Update the planned hours for the resource plan using the resource grid.
- To view and update more details for the resource plan, click the information icon in the beginning of the resource plan row.
- You can now [request the resource plan](#).

Create an operational resource plan

Create an operational resource plan and allocate a certain portion of your team capacity for operational work, such as administration, meeting, or training.

Before you begin

Important:

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged [migrate your existing resource plans](#) to work on resource assignments which offers more flexibility and [Create resource assignments and operation resource assignments in Resource Management Workspace](#) using Resource Management Workspace or Project Workspace.

Role required: resource_user, resource_manager, it_project_manager, demand_manager, admin

About this task

Create a resource plan for an operational work type such as Meeting, Training, Admin work, or Phone call.

For more information on operational resource plans, see [Operational Resource Plan - All That You Need to Know](#) .

Procedure

1. Navigate to **All > Resource > Resource Plans > Create New Operational Plan**.
2. On the Resource form, fill in the fields.
For a description of the field names, see [Resource form](#).
3. Select **Save**.

Related topics

[Map a time card category with operational work types](#)

Request resources

After you create a resource plan, request resources from the resource manager.

Before you begin

Role required: it_project_manager, resource_user

About this task

Note:

If the resource type in the resource plan is a group, you can request resources only if that group has active members.

Procedure

1. Navigate to **All > Resource > Resource Plans > All**.
2. Open a resource plan that is in the Planning state.
3. Select **Request**.

Result

The resource plan moves to the Requested state and is ready for review by the resource manager.

Confirm a resource plan

As a resource manager, you can confirm or block the resources after a resource plan is requested. The resource plan must be in the Requested state to be confirmed.

Before you begin

Important:

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged [migrate your existing resource plans](#) to work on resource assignments which offers more flexibility and [Create resource assignments and operation resource assignments in Resource Management Workspace](#) using Resource Management Workspace or Project Workspace.

Resource managers can [view and assign the unassigned resource assignments](#) using Resource Management Workspace.

Role required: resource_manager

About this task

You can modify or [cancel a resource plan](#) that is in the Confirmed state.

For a resource plan with the resource type as group, you can confirm resources only if the specified group has active members.

Procedure

1. Navigate to **All > Resource > Resource Plans > Requested**.
2. Open the resource plan that you want to confirm and select **Confirm**.

Result

The resource plan moves to the Confirmed state and [soft allocations](#) are created.

Confirm and allocate a resource plan

After the resource plan is requested, as a resource manager, you can directly allocate the resources. To confirm and allocate, the resource plan must be in the Requested state.

Before you begin

Important:

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged [migrate your existing resource plans](#) to work on resource assignments which offers more flexibility and [Create resource assignments and operation resource assignments in Resource Management Workspace](#) using Resource Management Workspace or Project Workspace.

Resource managers can [assign and approve the unassigned resource assignments](#) using Resource Management Workspace.

Role required: resource_manager

About this task

Modify or [cancel](#) a resource plan that is in the Allocated state.

If the resource type in a resource plan is a group, you can request resources only if that group has active members.

Procedure

1. Navigate to **All > Resource > Resource Plans > Requested**.
2. Open the resource plan (Requested) that you want to confirm and allocate, and select **Confirm and Allocate**.

Result

The resource plan automatically moves to the Allocated state from the Requested state. Soft allocations are converted to [hard allocations](#) when the resource plan moves to the Allocated state.

Any errors or warnings during allocations are logged in the Resource Plan Logs related list on the Resource Plan form. The log is generated if a resource is allocated over 24 hours for a given day. You can review these logs to take correct actions for further resource allocation.

Request a change to a resource plan

Request a change to the resource plan to modify a resource plan after you've submitted it for review.

Before you begin

Role required: resource_user

About this task

You can change the resource plans that are in the Requested or Confirmed state. To change the form fields of the plan, you first must request a change to the resource plan. However, you can adjust the requested allocations directly on the plan without requesting for a change. These adjustments are rolled-up to the resource plan.

Procedure

1. Navigate to **All > Resource > Resource Plans > All**.
2. Open a resource plan that is in the Requested or Confirmed and select **Request Change**.

Result

The resource plan moves back to the Planning state and has the form fields enabled to make the required changes.

Recalculate costs of a resource plan of a project or demand

Recalculate the resource costs of an individual resource plan for a project or demand whenever the hourly rates change in the associated rate model.

Before you begin

Ensure the following setup:

- The project or demand must have an active rate model assigned.
- The resource plan must be in either Planned, Requested, Confirmed, or Allocated states.

Role required: resource_manager

About this task

To update the costs of all the resource plans of a project or demand in one go, you can use the **Recalculate Resource Costs** option from the [project form](#) or [demand form](#).

Procedure

1. To open a resource plan of a project or demand, perform one of the following actions.
 - Navigate to **Project > Projects > All**, and open a project.
 - Navigate to **Demand > Demands > All**, and open a demand.
2. From the **Resource Plans** related list, open a resource plan for which you want to recalculate the costs.
3. On the Resource Plan form, select the **Recalculate Resource Cost** related link.
4. In the Recalculate Resource Costs dialog box, specify the recalculation period in the **Start date** and **End date** fields.

By default, the **Start date** field has the current date and the **End date** field has the end date of the resource plan.
5. To recalculate the planned cost, select the **Include planned costs** option.

The **Include planned costs** option is available for a resource plan in the Confirmed or Allocated state. The option isn't selected by default.
6. Select **OK**.

Result

- Recalculates the selected resource costs based on the latest hourly rates derived from the rate model associated with the project or demand.
- Updates the recalculated resource costs on the respective cost fields on the resource plan form and the **Resource Plans** related list of the associated project or demand.
- Reflects the revised values on the respective cost fields of associated project or demand.

Update cost plan related to a resource plan

If a resource plan is associated to a project, project task, or demand and has a related cost plan, then a requester or a resource manager can update the related cost plan after updating the resource plan.

Before you begin

Role required: resource_user or resource_manager or it_project_manager or it_demand_manager

About this task

If a resource plan does not have a related cost plan, the **Update Cost Plan** related link is not displayed for the resource plan.

Procedure

1. Save the updates to the resource plan.
2. Click the **Update Cost Plan** related link.

The cost plan associated to a resource plan is automatically updated as soon as the **Planned cost** in the resource plan is updated. The planned cost on resource plan gets updated when there is a change in:

- Planned hours
- User
- State
- Start and end dates

Result

The cost plan associated to the resource plan is updated as follows:

- If the resource plan is in Planning or Requested state, planned hours is updated in the cost plan.
- If the resource plan is in Confirmed/Allocated state and the Confirmed/Allocated hours are less than planned hours, then the higher of the planned cost and Confirmed/Allocated cost is updated in the cost plan.
- If the resource plan is in Confirmed/Allocated state and the Confirmed/Allocated hours are equal to or more than planned hours, then the Confirmed/Allocated cost is updated in the cost plan.

Cost from resource plan will be interfaced to the unit_cost field on the Cost Plan [cost_plan] table.

Complete a resource plan

After all associated tasks and projects are complete or canceled, a resource manager can move the resource plan to the **Complete** state, which closes it.

Before you begin

The resource plan to be completed must be in the Allocated state.

Role required: resource_manager

About this task

Project and demand managers can [complete resource plans from a project, project task, planning console, or demand](#).

Procedure

1. Navigate to **All > Resource > Resource Plans > Allocated**.
2. Open the resource plan that you want to complete.
3. Verify all the information on the form.

i Note:

The **Actual Hours** and **Actual Cost** fields show the time spent on plan tasks and the resource costs. These fields are derived from time card information and can't be edited on the resource plan.

4. **Optional:** Add notes.
5. Select **Complete**.
6. In the **Confirm** dialog box, select the completion date of the resource plan and select **Yes**.

By default, the system date or resource plan end date, whichever is earlier, is populated in **Completion Date**.

i Note:

The **Completion Date** can't be earlier than the resource plan start date.

Result

- The resource plan moves to the Completed state.
- If the completion date is earlier than the resource plan end date, the end date of the resource plan is updated with the completion date. If the completion date was entered later than the resource plan end date, the resource plan end date is retained.
- All the requested and resource allocations for the resource plan post the completion date are deleted. If there are any actual hours logged against an allocation, that allocation record isn't deleted. But the allocated hours become zero and the actual hours are retained. The available and allocated hours for the resources are also updated in the aggregate tables.

Example:

Example 1: A resource plan of Allocation type **Monthly** from 1 November to 31 January is completed on 15 December. On completion,

- the resource allocation entry for January is deleted from the [Resource_Allocation] table.
- the resource allocation end date for December is updated to the completion date of the resource plan.
- the entries in the [Resource_Allocation_Daily] table for the December month post the completion date are deleted.

Example 2: If the same resource plan has Allocation type as **Planned Duration**, no allocations are deleted, and the end date of the allocation is updated to the completion date.

Complete a resource plan from a project, planning console, or demand record

If a project or a project task is marked Closed, the project manager can complete the associated Allocated resource plans. Similarly, the demand manager can complete the resource plans for a Closed or Deferred demand.

Before you begin

The resource plan to be completed must be in the Allocated state.

Role required: it_project_manager or it_demand_manager

About this task

When a project or a project task moves to Closed Complete, Closed Incomplete or Closed Skipped state, the system prompts a message on the project and project task forms, and in the planning console for completing the Allocated resource plans if the following conditions is met.

- Corresponding resource plan is in the Allocated state.
- Resource plan start date is less than or equal to the project or task actual end date.

A similar message for completing the resource plans appears on the Demand form when a demand moves to Closed or Deferred state.

Procedure

1. Open a project, task, or demand record in the Closed state.

Option	Description
<p>Open a Closed project record</p>	<p>a. Navigate to Project > Projects > Project Workspace.</p> <p>b. Open the project record in the Closed state.</p> <p>c. Select the Details tab to display the project form.</p>
<p>Open a Closed project task record</p>	<p>a. Navigate to Project > Projects > Project Workspace.</p> <p>b. Open the required project record.</p> <p>c. In the Project Tasks related list, open the project task record in the Closed state.</p>
<p>Open a Closed project in Planning Console</p>	<p>a. Navigate to Project > Projects > Project Workspace.</p> <p>b. Open the project record in the Closed state.</p> <p>c. Select the Planning tab to display the project in planning console.</p>
<p>Open a Closed or Deferred demand record</p>	<p>a. Navigate to Demand > Demands > All.</p> <p>b. Open the demand record in the Closed or Deferred state.</p>

The message for completing the associated resource plans appears at the top of the record.

Message for completing a resource plan

 There are resource plans in 'Allocated' state. [Click here to view and complete these plans.](#)

Note:

In the Planning Console, irrespective of the Closed state of the project tasks, the message appears only when the project is in Closed state.

2. To open the list of resource plans to be completed, select the link in the message.

Note:

In Planning Console, alternatively right-click the project and select **Complete Resource Plans**.

- The list contains only those resource plans for the record that should be completed.
- If the list is opened from the message link on a Project form, the resource plans for the project and project task are listed.
- If the list is opened from the message link on a Project task form, only the resource plans for the project task are listed.

3. In the list, select the resource plan to be completed, and select **Complete**.

4. In the **Confirm** dialog box, select the completion date of the resource plan and select **Yes**.

By default, the system date or resource plan end date, whichever is earlier, is populated in **Completion Date**.

Note:

The **Completion Date** cannot be earlier than the resource plan start date.

Result

- The selected resource plan moves to the Completed state.
- If the completion date is earlier than the resource plan end date, the end date of the resource plan is updated with the completion date. If the completion date was entered later than the resource plan end date, the resource plan end date is retained.
- All the requested and resource allocations for the resource plan that are past the completion date are deleted. If there are any actual hours logged against an allocation, that allocation record is not deleted. But the allocated hours become zero and the actual hours are retained. The available and allocated hours for the resources are also updated in the aggregate tables.

Cancel a resource plan

If a resource plan is no longer needed, you can cancel it which also cancels its past and future allocations.

Before you begin

The resource plan to be canceled must be in the Planning, Requested, Confirmed, or Allocated state.

Role required: resource_user, resource_manager

About this task

Project and demand managers can also [cancel resource plans from a project, project task, planning console, or demand](#).

Procedure

- 1.** Navigate to **All > Resource > Resource Plans > All**.
- 2.** Open the resource plan record that you want to cancel.
- 3.** On the form header, select **Cancel**.

Result

- The resource plan moves into the Cancelled state.
- All past and future allocations for the resource plan are also canceled. If there are any actual hours logged against an allocation, that allocation isn't deleted. But the allocated hours become zero and the actual hours are retained.

What to do next

If you want to make changes and use the plan again, edit a canceled plan. To move the resource plan back to Planning state, select **Re-plan**.

i Note:

The state of a resource plan can be changed back from Cancelled to Planning, only if it has no past allocations.

Cancel a resource plan from a project, planning console, or demand record

If a project or a project task is marked Closed, the project manager can cancel the associated future resource plans. Similarly, the demand manager can cancel the future resource plans for a Closed or Deferred demand.

Before you begin

The resource plan to be canceled must be in Confirmed, Planning, or Requested state. An Allocated resource plan can be canceled if the resource plan start date is later than the project, task, or demand end date.

Role required: it_project_manager or it_demand_manager

About this task

When a project or a project task moves to Closed Complete, Closed Incomplete or Closed Skipped state, the system prompts a message on the project and project task forms, and in the planning console for canceling the resource plans if one of the following conditions is met.

- Corresponding resource plan is in Confirmed, Planning, or Requested state.
- Resource plan is in Allocated state with start date later than the project or task end date.

A similar message for canceling the resource plans appears on the demand form when a demand moves to Closed or Deferred state.

Procedure

1. Open a project, task, or demand record in the Closed state.

Option	Description
<p>Open a Closed project record</p>	<p>a. Navigate to All > Project > Projects > Project Workspace.</p> <p>b. Open the project record in the Closed state.</p> <p>c. Click the Details tab to display the project form.</p>

Option	Description
<p>Open a Closed project task record</p>	<p>a. Navigate to All > Project > Projects > Project Workspace.</p> <p>b. Open the required project record.</p> <p>c. In the Project Tasks related list, open the project task record in the Closed state.</p>
<p>Open a Closed project in Planning Console</p>	<p>a. Navigate to All > Project > Projects > Project Workspace.</p> <p>b. Open the project record in the Closed state.</p> <p>c. Click the Planning tab to display the project in planning console.</p>
<p>Open a Closed or Deferred demand record</p>	<p>a. Navigate to All > Demand > Demands > All.</p> <p>b. Open the demand record in the Closed or Deferred state.</p>

The message for canceling the associated resource plans appears at the top of the record.

Message for canceling a resource plan

Note:

In the Planning Console, irrespective of the Closed state of the project tasks, the message appears only when the project is in Closed state.

2. To open the list of resource plans to be canceled, click the link in the message.

Note:

In the Planning Console, alternatively right-click the project and select **Cancel Resource Plans**.

- The list contains only those resource plans for the record that can be canceled.
- If the list is opened from the message link on a Project form, the resource plans for the project and project task are listed.
- If the list is opened from the message link on a Project task form, only the resource plans for the project task are listed.

3. In the list, select the resource plan to be canceled, and click **Cancel**.

Result

- The selected resource plan moves to the Canceled state.
- All past and future allocations for the resource plan are canceled. If there are any actual hours logged against an allocation, that allocation is deleted. In this case, Allocated hours become zero and the actual hours are retained as is.

Delete a resource plan

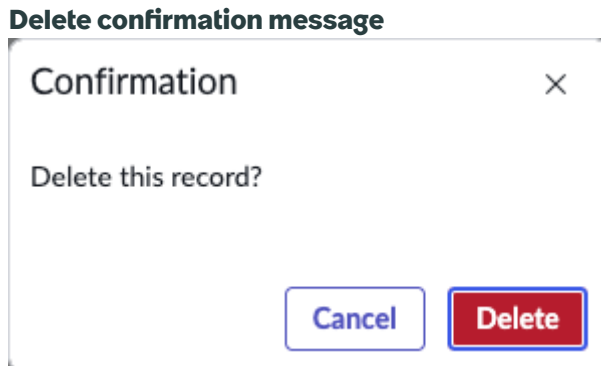

Deleting a plan also deletes all associated resource allocations.

Before you begin

Role required: resource_user or resource_manager

Procedure

1. Navigate to **All > Resource > Resource Plans > All**.
2. Open a resource plan and select **Delete** on the form header.
A confirmation message appears.

3. Select **Delete**.
The resource plan and all the associated allocations are removed.

Extend a resource plan

You can extend the date of an allocated resource plan and allocate resources for the extended period.

Before you begin**Important:**

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged [migrate your existing resource plans](#) to work on resource assignments which offers more flexibility and start using Resource Management Workspace.

Resource requester can [extend an assigned or unassigned resource assignment](#) using Resource Management Workspace.

Role required: resource_manager

About this task

Assume that work on a project has started, but there is a need to extend the date of an allocated resource plan because the project has been extended. In this scenario, you can extend the date of the allocated resource plan. The new date by which the resource plan is extended does not have any impact on the existing allocated hours. While extending the resource plan, you can specify the new end date and the request type. Based on the request type selected, the required allocated hours are auto-filled.

For example, assume that you allocated 100 hours for 2 months, 50 hours for each month. Now, you want to extend the resource plan by one month. For the extended month, allocation records are created based on the request type selected.

Procedure

1. Navigate to **All > Resource > Resource Plans > All**.
2. Open a resource plan and select **Extend Resource Plan**.
3. Select **OK**.
4. In the Extend resource plan dialog box, fill in the fields.
For a description of the field names, see [Extend resource plan form](#).

Result

- The end date of the resource plan is updated.
- The **Extension** field displays the state as Allocated.
- For the extended period, allocation records are created based on the request type selected.
- Number of requested FTE or hours or person days is divided equally for each allocation period and is pre-filled in each allocation record.
- Extending the resource plan invokes the rate model for getting the hourly rates.

Request extension of an allocated resource plan

As a project manager, you can request the extension of an allocated resource plan.

Before you begin

Important:

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged [migrate your existing resource plans](#) to work on resource assignments which offers more flexibility and start using Resource Management Workspace.

Resource requester can [extend a resource assignment](#) using Resource Management Workspace.

Role required: it_project_manager, resource_user

About this task

Assume that a project, which has resources allocated, gets delayed by one month. As a project manager, you can request for the extension of the resource plan if you need resources for the period. This option is available only when the resource plan is in the Allocated state.

Procedure

1. Navigate to **All > Resource > Resource Plans > All**.
2. Open a resource plan and select **Request Extension**.
3. On the Request Extension form, fill the fields.
For a description of the field values, see [Request Extension form](#).

Result

The end date of the resource plan is updated and the **Extension** field is set to **Requested**.

What to do next

[Allocate resources for the extended period](#).

Allocate resources for the extended period

As a resource manager, you can allocate resources for the extended period.

Before you begin

Role required: resource_manager

About this task

After a project manager submits a request to extend the allocated resource plan, the resource manager receives a message at the top of the resource plan. The resource manager then reviews and allocates resources for the extended period.

Procedure

1. Navigate to **All > Resource > Resource Plans > All**.
2. Open the resource plan.
3. Confirm the extension in one of the following ways.
 - From the Resource Allocation related list, review and update the value for the **Requested Hours, FTE, or Person Days** fields.
 - Select **Allocated** in the **Extension** field.

Result

Resources are allocated for the extended period.

Any errors or warnings during allocations are logged in the Resource Plan Logs related list on the Resource Plan form. The log is generated if a resource is allocated over 24 hours for a given day. You can review these logs to take correct actions for further resource allocation.

Reduce the duration of a resource plan

Reduce the duration of an allocated or confirmed resource plan and deallocate resources in one action without having to do it individually for each resource.

Before you begin

Important:

Resource plans in Resource Management will no longer be available for new customers from future releases.

You're encouraged [migrate your existing resource plans](#) to work on resource assignments which offers more flexibility and start using Resource Management Workspace.

Resource requester can [move an assigned or unassigned resource assignment](#) using Resource Management Workspace.

Role required: resource_manager

About this task

You can reduce an allocated or confirmed resource plan only if the resource plan's end date is later than the current date.

You can reduce the duration of an operational resource plan only if its state is allocated.

Procedure

1. Navigate to **All > Resource > Resource Plans > All**.
2. Open a resource plan and select **Reduce**.

Reducing the resource plan end date releases all resources by deleting resource allocations after the new end date.

If no actuals are posted for the future in the resource plan, then all the allocated or confirmed hours of the resources will be released when you reduce the resource plan.

If actuals are posted for the future, then the resource plan end date is updated to the future date on which actuals are present, and all allocated or confirmed hours of all the resources from the date on which actuals are present to the original end date are released.

3. Enter the new end date of the resource plan in the **End date** field.

4. Select **Yes** in the confirmation message.

Result

- The end date of the resource plan is updated to the new reduced end date.
- The state of the resource plan remains the same.
- If no actuals are posted for the future in the resource plan, all allocated or confirmed hours of the resources are released.
- If actuals are posted for the future, then the resource plan end date is updated to the future date on which actuals are present, and all the allocated or confirmed hours of all the resources from the date on which actuals are present to the original end date are released.

Example: Resource allocation concerning actuals

Say a resource plan was created for 1 FTE from January 1, 2021, to December 31, 2021, and on March 1, 2021, the resource plan end date was updated to March 1, 2021. Then, all the allocated or confirmed hours of the resources on this plan between March 1, 2021, to December 31, 2021, would be released. If actuals are posted for the future, for example, May 25, 2021, then the resource plan end date will be updated to May 25, 2021, and all confirmed or allocated hours between March 1, 2021 to December 31, 2021 will be released.

Time zones in resource plans

Time zones are important in resource management when the users and groups doing the resource tasks are located in different locations.

Users maintain their time in the [My Calendar](#) module and resource managers use the resource workbench or resource plan to assign tasks to various users.

All users are assigned a schedule. If a user schedule changes, all time calculations change automatically. The schedules can be floating or time zone-specific.

- A floating schedule is the same in any time zone. For example, if a resource manager in Amsterdam sets a floating schedule for 08:00–17:00, a user in San Jose sees the schedule as 08:00–17:00.
- When a schedule is defined in a specific time zone, users in different time zones see the schedule with their own time zone applied. For example, if the resource manager sets a time zone-specific schedule for 08:00–17:00 in Amsterdam, the San Jose user sees the schedule as 23:00 of the previous day to 07:00 on the current day because the San Jose time zone is nine hours behind the Amsterdam time zone.

Associate a time card with a resource plan

If one resource is allocated to identically named tasks in two resource plans, use the following procedure to specify the resource plan the time card should be allocated to.

Before you begin

Role required: resource_manager

About this task

- A resource plan can be associated with a time card only if the resource plan contains [hard allocations](#) for the user.
- If a resource plan isn't associated manually to a time card, then a resource plan is auto-associated. The auto-association is done based on the selected **Task** in the time card.

Procedure

1. Navigate to the **All > Time Cards > All**.
2. Select a time card.
3. Configure the form to add the **Resource plan** field.
4. In the **Resource plan** field, select the plan to which the time card should be allocated.

Only resource plans that contain the selected task are listed.

Time Card with Resource Plan

5. Select **Update**.

Migration of resource plans, operational resource plans, and cost plans

Migrate resource plans to resource assignments and the associated cost plans to attribute-based labor costs of your projects or demands and easily work on resource allocations using Project Workspace.

Tip:

Resource Managers are encouraged to view the [Resource Management Workspace boot camp](#) to learn about Resource Management Migration to the Next Experience.

Resource plans to resource assignments

Migrate all the resource plans of a project or demand to attribute-based resource assignments depending on the [planning attributes](#) to easily manage your projects on Next experience using [Project Workspace](#) and [Capacity Planning](#).

Group, Skill, and Role are the primary attributes enabled for Resource Management depending on which the resource plans are migrated to resource assignments.

i Important:

Resource plans in Planning, Requested, Confirmed, Allocated, Rejected, and Completed states are only migrated to Resource assignments. Resource plans in Canceled and In-progress states aren't migrated.

Let us see how the status of the resource plans is mapped to the status of resource assignments.

Status mapping between resource plans and resource assignments

Resource plan status	Resource assignments status
Planned or Requested	Unassigned
Allocated	Approved
Confirmed	Approved
Completed	Approved
Canceled or In-progress	Resource plan isn't migrated
Rejected	Unapproved

Migrating requested efforts of resource plans

When a resource plan is migrated, a corresponding resource assignment is created based on the primary attributes from the resource plan. Resource assignments don't support custom selection of allocation type and allocation spread.

Resource assignments only support even spread of resource allocations by default.

The efforts of the resource plan in requested state are also migrated to resource assignments. For example, if a resource plan is in Requested state with 20 additional hours requested, but not yet approved, the new migration flow accounts for these requested 20 hours and the total efforts are reflected in the migrated resource plan. See the following screenshots for more details.

Existing resource plan in requested state

The screenshot displays the 'Resource Plan' interface for RPLN0001048. Key details include:

- Name: RPLN0001048 - TestUser1
- Start date: 2026-01-01
- End date: 2026-04-14
- Number: RPLN0001048
- Task: PRJ0010088
- State: Allocated
- Extension: Requested

Resource Details summary:

- Request type: Hours
- Planned hours: 170
- Confirmed / Allocated hours: 150
- Actual hours: 0
- Planned cost: \$8,500.00
- Confirmed / Allocated cost: \$7,500.00
- Actual cost: \$0.00

Resource Allocations table:

Number	Resource	Start date	End date	Person Days	FTE	Confirmed/Allocated hours	Booking type
RALLOCO001834	TestUser1	2026-01-01	2026-01-31	6.5	0.3	52	Hard
RALLOCO001836	TestUser1	2026-02-01	2026-02-28	5.88	0.29	47	Hard
RALLOCO001838	TestUser1	2026-03-01	2026-03-31	6.38	0.29	51	Hard
RALLOCO001839	TestUser1	2026-04-01	2026-04-14	0	0	0	Hard

Monthly aggregates of migrated resource plan with requested allocations

Category	FTE	Hours	Person Days	Month starts on	Parent category	Domain	Task	User
Project Allocated	0.29	47	5.88	2026-02-01	Allocated	global	PRJ0010088	TestUser1
Project Allocated	0	0	0	2026-02-01	Allocated	global	PRJ0010090	TestUser1
Project Allocated	0.3	52	6.5	2026-01-01	Allocated	global	PRJ0010088	TestUser1
Project Allocated	0	0	0	2026-01-01	Allocated	global	PRJ0010090	TestUser1
Project Allocated	0.11	20	2.5	2026-04-01	Allocated	global	PRJ0010088	TestUser1
Project Allocated	0.29	51	6.38	2026-03-01	Allocated	global	PRJ0010088	TestUser1
Project Allocated	0	0	0	2026-03-01	Allocated	global	PRJ0010090	TestUser1

With the migration of resource plans:

- Resource plans in Planning or Requested states, resource assignments are created based on the planned dates and planned duration with their default state as Unassigned.
- Allocation type is set to planned duration.
- Allocation spread is always Even.
- Existing resource allocations are deleted and created again to accommodate resource allocations with the resource name and planned duration.
- The allocated costs and allocated hours are copied to planned costs and planned hours.
- Actual hours for the resource plan in Confirmed and Allocated states are retained with the resource plans.

Note:

Only one resource assignment is created for every unique combination of primary attributes, Group, Skill, and Role, and one for every user if the resource plans are created with selected member preferences. After migration, if you create resource assignments with any of the existing combinations, the available resource assignments are updated with the new requests.

Allocation contour while migrating to resource assignments

The existing contour of allocations in resource plans is maintained while migrating to resource assignments.

Maintaining the existing contour ensures that the planned effort, timing, and effort distribution remain consistent before and after migration. By carrying forward the same allocation contours, you can continue managing ongoing work without disruption, maintaining accurate capacity and utilization insights, and trust that financial and resource plans reflect your original intent. This seamless transition helps you adopt the workspace experience confidently, without the need to replan or manually adjust allocations.

Example: Migration of Resource plans to Resource assignments

Resource plans in different states.

1 to 35 of 35

Operational resource plans to operational resource assignments

Operational resource plans also follow the same logic to migrate operational resource plans to operational resource assignments.

Important:

Operational resource plans in Allocated and Completed states are only migrated as Operational resource assignments.

After migration, the Request type of operational resource plans is changed to Hours.

Example: Migration of Operational resource plans to Operational resource assignments

Operational resource plan in Allocated state created for Demo GroupA.

Number	Resource	Start date	End date	Person Days	FTE	Confirmed/Allocated hours	Booking type
RALLO0003508	Demo Resource1	2024-01-01	2024-12-31	12.5	0.05	100	Hard
RALLO0003509	Demo Resource2	2024-01-01	2024-12-31	12.5	0.05	100	Hard
RALLO0003510	Demo Resource3	2024-01-01	2024-12-31	12.5	0.05	100	Hard
RALLO0003511	(empty)	2024-01-01	2024-12-31	37.5	0.15	300	Hard

After migration, we will have the following Operational resource assignments for every member of the group.

Note:

The parent-child mapping is retained and you may see an additional resource assignment with an empty resource.

Number	Resource	Group	Role	Skill	Effort type	Effort	Start date	End date	Resource status	Operational work type
RA0001254	Demo Resource1	Demo GroupA	(empty)	(empty)	% Capacity	4.77	2024-01-01	2024-12-31	Approved	KTLO
RA0001256	Demo Resource3	Demo GroupA	(empty)	(empty)	% Capacity	4.77	2024-01-01	2024-12-31	Approved	KTLO
RA0001255	Demo Resource2	Demo GroupA	(empty)	(empty)	% Capacity	4.77	2024-01-01	2024-12-31	Approved	KTLO
RA0001253	(empty)	Demo GroupA	(empty)	(empty)	% Capacity	4.77	2024-01-01	2024-12-31	Approved	KTLO

Migration of cost plans to attribute-based cost plans

When resource plans of a project or demand are migrated to resource assignments, the corresponding financial cost plans based on the resource plans will be migrated to new attribute-based labor costs. Migrate resource plans related link trigger migrates the cost plans along with resource plans migration.

Every resource plan has an associated a cost plan with Labor capex as the cost type. While migrating, the **planning attributes** of the resource plans are analyzed to create attribute-based cost plans for the unique combination of the three **planning attributes enabled for financials** (Employee type, Expense Type, and Role). After migration, there will be no one-to-one association between resource assignments and attribute-based cost plans.

Note:

If a resource plan isn't associated with either Employee Type or Role, the migrated cost plans costs are consolidated into a single cost plan.

The planned costs are moved to the new attribute-based cost plans while the actual costs remain on the existing cost plan records. The **rate model** values associated with project or a demand are considered to generate attribute-based labor costs.

Example: Migration of cost plans to attribute-based cost plans

Cost plans associated with a resource plan.

Project Tasks												
Sub Projects	Requirements	Resource Plans (1)	Cost Plans (1)	Monetary Benefit Plans	Non-monetary Benefit Plans	Project Budget	Baselines (1)	Status Reports	Risks	Issues	Decisions	Actions

							Sum	601,600				

Migrate resource plans and cost plans for projects and demands

Migrate resource plans and cost plans of your projects or demands to resource assignments and attribute-based cost plans and work on the resource allocations and project financials using Project Workspace.

Before you begin

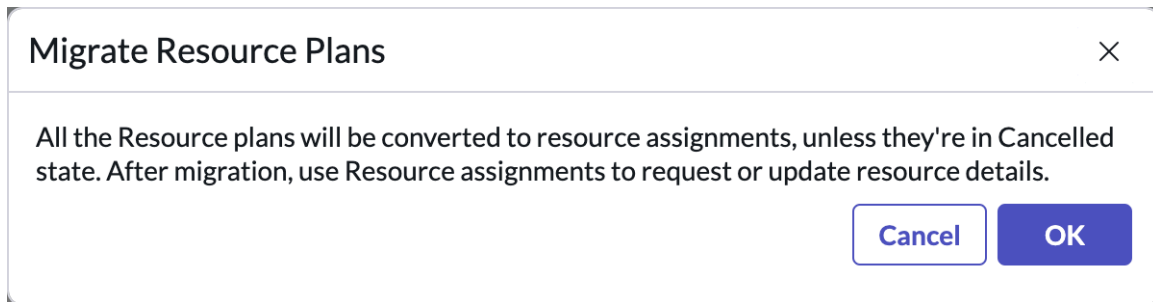

- Learn more about [Migration of resource plans, operational resource plans, and cost plans](#).
- Ensure the project or demand have resource plans and cost plans.
- Role required: resource_user

Procedure

1. Use one of the following options to open a project or a demand.
 - To open a project, navigate to **All > Project > Projects > All** and open a project.
 - To open a demand, navigate to **All > Demand > Demands > All** and open a demand.
2. Select the **Migrate resource plans** related link.

Note: This selection triggers the migration of resource plans and cost plans simultaneously.

3. In the Migrate Resource Plans confirmation window, select **OK**.

💡 Tip:

You can [Activate a scheduled job to migrate resource plans and cost plans.](#)

Result

Resource plans are migrated to resource assignments, cost plans are migrated to attribute-based cost plans. Refresh the project page to view the resource assignments in Resource assignments related list.

What to do next

Create resource assignments to manage resource efforts.

Enable attribute-based resource assignments

Enable the property to work on attribute-based resource assignments to request efforts for your planning items.

Before you begin

- If a project, demand, or a task has at least one attribute-based resource plan, Resource plans related list is hidden.
- If a project, demand, or a task has at least one resource plan without any attribute-based resource assignments, Resource plans related list is visible.
- If a project, demand, or a task has no resource plans and the `sn_pw.enable_resource_planning` property is enabled, Resource assignments related list is available, else, Resource plans related list will be available.
- If a project, demand, or a task has at least one attribute-based resource assignment, **New** and **Manage** options are hidden for Resource plans.
- If a project, demand, or a task has at least one resource plan without any attribute-based resource assignments, **New** and **Manage** options are available for Resource plans.
- If a project, demand, or a task has no resource plans and the `sn_pw.enable_resource_planning` property is enabled, **New** and **Manage** options are hidden for Resource plans, else, they will be available.

Role required: admin

Procedure

1. Navigate to **All > System Properties > All**.
2. Filter the name field to locate and open **sn_pw.enable_resource_planning**.
3. Change the scope of the instance to **Project Workspace**.
4. Clear the Value field and enter **true**.
5. Select **Update**.

Create resource assignments

Create resource assignments to request a portion of team or resource capacity for project or demand.

Before you begin

- [Migrate resource plans and cost plans for projects and demands](#)
- Set the resource planning property to true to create work with only resource assignments. For more information, see [Enable attribute-based resource assignments](#).
- Role required: resource_user, resource_manager, it_project_manager, demand_manager, admin

Procedure

1. Use one of the following options to open a project or a demand.
 - To open a project, navigate to **All > Project > Projects > All** and open a project.
 - To open a demand, navigate to **All > Demand > Demands > All** and open a demand.
2. On the **Resource assignments** related list, select **New**.
3. On the Resource assignment form, fill the fields.
For a description of the field names, see [Resource assignment form](#).
4. Select **Submit**.

Tip:

You can edit the child resource assignments from the list view.

Migrate operational resource plans

Migrate the required Operational resource plans to attribute-based Operational resource assignments.

Before you begin

Role required: resource_manager, it_project_manager, demand_manager, admin

Procedure

1. Navigate to **All > Resource > Resource Plans > All Operational Plans**.
2. Select the list of operational resource plans to migrate.
3. Select **Migrate resource plans** from the **Actions on selected rows...** list.
Operational resource plans are migrated to Operational resource assignments. You can view the list of Operational resource assignments at **All > Resource > Resource Assignment > Operational Resource Assignments**.

Tip:

You can [Activate a scheduled job to migrate resource plans and cost plans](#).

Create operational resource assignments

Create operational resource assignments to allocate a portion of team or resource capacity for operational work such as administration work, meetings, trainings, and so on.

Before you begin

Role required: resource_user, resource_manager, it_project_manager, demand_manager, admin

Procedure

1. Navigate to **All > Resource Assignment > Create Operational Resource Assignments**.
2. On the Resource Assignment form, fill in the fields.
For a description of the field names, see [Resource assignment form](#).
3. Select **Submit**.

Result

Operational resource assignment is created. You can navigate to **All > Resource Assignment > Operational Resource Assignments** view the list of operational resource assignments.

Activate a scheduled job to migrate resource plans and cost plans

Activate the Migrate Resource Plans scheduled job to migrate resource plans, operational resource plans, and cost plans of your projects and demands to resource assignments and attribute-based cost plans.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Migrate Resource Plans** scheduled job.
3. Select **Active** option to activate and schedule the job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#).
5. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.
Alternatively, you can [migrate resource plans](#) and [migrate operational resource plans](#) for required projects and demands.

Create requested allocations for a resource plan

Requested Allocations are automatically created when a resource plan is submitted and is in Planning state. If required, the resource requester can create new requested allocations for a resource plan in Planning or Rejected state. Resource managers can create requested allocations for the plans in Requested state.

Before you begin

Role required: resource_user

About this task

A requested allocation doesn't have an allocation for a named resource. It only details the start date, end date, and the planned hours.

To specify the breakup of resource requirements for monthly or weekly Allocations types, you can modify the requested allocations. For example, if you've requested 100 hours of a resource from January to February, but you want 20 hours in January and 80 hours in February. You can specify these details on the Requested Allocations form.

Procedure

1. Navigate to **All > Resource > Resource Plans > Planning** or **Rejected**.
2. Open a resource plan.
3. In the **Requested Allocations** related list, select **New**.
4. On the Requested Allocation form, fill in the fields.
For a description of the field values, see [Requested Allocation form](#).
5. To save the record and return to the resource plan, select **Submit**.

Example:

If a resource is requested from September 1 to Nov 30 for 360 hours, requested allocation records are created as follows:

Case 1: Plan duration allocation type

For a plan duration [allocation type](#), the following requested allocation records would be created:

Start date	End date	Planned hours
Sep 01 (Resource plan start date)	Nov 30 (Resource plan end date)	360

Case 2: Monthly allocation type

For a monthly allocation type, hours are proportionally distributed based on working days as follows:

- Total working days for the planned duration = 65 days
- Hours to allocate per working day = $360 / 65 = 5$ hours

The following requested allocation records would be created:

Start date	End date	No. of working days	Planned hours
Sep 01	Sep 30	22	$22 * 5 = 110$
Oct 01	Oct 31	21	$21 * 5 = 105$
Nov 01	Nov 30	22	$22 * 5 = 110$

For a weekly allocation, requested allocation records created similar to monthly. Three allocation records, one for each month are created.

Resource allocation

After resource requesters create a resource plan, resource managers can confirm the resources to move the plan to the Confirmed state. Resource managers can then allocate resources to the plan and move it to the Allocated state.

Based on calendar and schedule information, resource managers view resource availability and select the resources under their management that can be confirmed and allocated to specific tasks.

Soft and hard allocations

When a resource plan moves to the Confirmed state, resource allocations corresponding to **requested allocations** are created automatically. The **Booking type** for these allocations is **Soft**. Soft allocations are like temporary allocations for the requested users and do not create any calendar events.

When the plan is moved to the Allocated state, the **Booking type** changes from **Soft** to **Hard**. For a hard booking, the resource is assigned to the plan and is not available for other plans during the allocated times. The booked time also appears on the user calendar. If the requested resource cannot be allocated for the entire allocation duration, the allocation record booking type remains as soft.

Any errors or warnings during allocations are logged in the Resource Plan Logs related list on the Resource Plan form. You can review these logs to take correct actions for further resource allocation.

Note:

The resource property `com.snc.resource_management.allocation_interval_minutes` enables the creation of soft and hard allocations with a decimal value.

Calculation of hours for soft allocations

Case 1: Proportional distribution

For example, the requested allocation for a group with two resources when the **Members preference** value is set to **All members** or **Specific members** is as follows:

Start date	End date	Planned hours
October 03	October 07	40

The **planned hours** on the Resource Plan form are proportionally distributed among all the requested allocations based on number of working days for each requested allocation record.

Resource	Resource time-off	Available capacity (hours)	Soft Allocation hours
Resource 1	2 days	$3 * 8 = 24$	$24 * 0.625 = 15$
Resource 2		$5 * 8 = 40$	$40 * 0.625 = 25$

The following calculations are used:

- Total available capacity = Available capacity User 1 + Available capacity User 2 = $24 + 40 = 64$ hours
- Hours to allocate per hour of available capacity = $\text{Planned hours} / \text{total available capacity} = 40 / 64 = 0.625$ hours

Note:

Multiple soft allocations could be created for one requested allocation for group resource plans.

Case 2: Most available resource requested first

For example, the requested allocation for a group with three resources when the **Members preference** value is set to **Any member** is as follows:

Start date	End date	Planned hours
October03	October 07	40

The system finds the most available resources in the specified time frame and creates soft allocations for these resources.

Resource	Available hours	Soft Allocation hours
Resource 1	24	10
Resource 2	30	30
Resource 3	20	

Resource 2 is the most available resource. The system creates soft allocations for resource 2 first until it consumes all available hours from resource 2. The system then moves to the next most available resource, and so on. Once available hours for all resources are consumed, and the planned hours are still left over after allocating across all members (from most available to least available), the remaining hours are equally distributed among all resources.

Calculation of hours for hard allocations

Case 1: Even spread

Selecting **Even** as hard allocation spread type creates resource events for the resource by splitting the hours evenly across all working days. The Smart Even Load allocation spread takes the availability of resources into account while allocating and only applies hours evenly where possible. If a resource is over-allocated for a day, it bypasses that day and resumes allocations to succeeding days until the resource plan is fulfilled.

For example, for a resource requested for 20 hours in a week, the even spread hard allocation is as follows:

Day of the week	Monday	Tuesday	Wednesday	Thursday	Friday
Available hours	6	6	6	6	Time-off
Allocated hours	5	5	5	5	0

Case 2: Front load

Selecting **Front load** as the hard allocation spread type fills up all available resource slots from the start date of the allocation. Once the resource is fully allocated between start and end dates, the remaining hours are filled from the start date up to 24 hours.

For example, for a resource requested for 20 hours in a week, the front load spread hard allocation is as follows:

Day of the week	Monday	Tuesday	Wednesday	Thursday	Friday
Available hours	6	6	6	6	Time-off
Allocated hours	6	6	6	2	0

Event creation during hard allocation

You can control the minimum unit for an event by modifying the Calendar Event Duration (minutes) (*com.snc.resource_management.allocation_interval_minutes* property). The default is 60 minutes.

Resource allocations use this property to create allocations with a decimal value. Use the following table to verify you set the property value correctly.

Scheduled hours of the user	Calendar Event Duration value
0.5	30
0.25/0.5/0.75	15
0.2/0.4/0.6/0.8	12
0.1, 0.2, and so on	6

Example: 4 hours for 1 week, with an allocation interval of 60 minutes

Creates a 60-minute block from Monday through Thursday.

Monday	Tuesday	Wednesday	Thursday	Friday
60 mins	60 mins	60 mins	60 mins	

Example: 4 hours for 1 week, with an allocation interval of 30 minutes

If the value of this property is set to 30 minutes, and 4 hour needs to be allocated to the user, the allocation is divided into the two 30-minute blocks when the user is available. This setting creates a 60-minute block from Monday through Wednesday and 30-minute blocks for Thursday and Friday.

Monday	Tuesday	Wednesday	Thursday	Friday
30 mins+30 mins	30 mins+30 mins	30 mins+30 mins	30 mins	30 mins

Note:

If the scheduled hours are not divisible by the Calendar Event Duration property, then there will be a loss of few hours for each day. For example, the per day scheduled hours per day are 8.5 and the property value is set to 60. Then, the maximum allocated hours for each day will be 8, resulting in a loss of 0.5 hours per day.

Time-off handling

Resource events from a resource plan are not created for the days where the resource has marked time-off or engaged in other events (such as training and meetings). An

administrator can manage the resource capacity and allocation with the property, `com.snc.resource_management.exclude_events_from_schedule`, to specify:

- Which events must be excluded for capacity calculations. For example, if a resource has time-off between Monday and Wednesday, the weekly capacity for the resource is calculated as 16 hours (as opposed to 40 hours).
- When the system must not create allocations. For example, if a resource is in training on Friday, the resource is not allocated for a task on Friday.

Over-allocation

Over-allocated resources are allowed. Over-allocating resources creates overlapping events in the user calendar within the user's scheduled hours. However, a maximum of 24 total hours can be allocated in any given day. Overlapping events appear overlapped in the calendar in the weekly view. In the monthly view, overlapping events appear above or below another event.

For example, a user has a schedule that specifies the daily work day from 08:00 to 17:00. Event 1 is in the user's calendar from 08:00 to 14:00. If an additional five hours are added for the same day for Event 2, an event is created for the three hours of free time (14:00 to 17:00). An overlapping event is also created for the remaining two hours, starting at the beginning of the day (08:00 to 10:00).

Create a resource role

Define project-specific roles for team members based on their skills and competencies.

Before you begin

Role required: `resource_manager`

Procedure

1. Navigate to **All > Resource > Resources > Resource Roles**.
2. Select **New**.
3. On the Resource Role form, fill the fields.
For a description of the field names, see [Resource Role form](#).
4. Select **Submit**.

User resources and group resources

When allocating resources, a resource manager might need to work with an administrator to add users to a group with `pps_resource` role.

Resource Manager view

The Resource Manager view in **Resource > Resources > Users** lists only the users who have the `pps_resource` role. In addition to some of the fields displayed in the User Administration > [Users](#)  form, the Resource Manager View > Users form also displays the following fields, which are editable only by a user with `resource_manager` role:

- **Location**
- **Schedule**
- **Timesheet Policy**

- **Average Daily FTE Hours/Hours Per Person Day**

Note:

Use the Update Resource Capacity related link to specify a date range. User capacity is populated in all aggregate tables based on the schedule of the user.

The Resource Manager view in **Resource > Resources > Groups** lists only the groups with the pps_resource role. When a resource manager creates a new group from this view, the pps_resource role is added by default to the group record. Although resource managers have write access to several fields, the only fields that they should edit are **Average Daily FTE Hours/Hours Per Person Day** and **Hourly rate**.

Update the resource capacity

From the Resource Manager view, update the capacity of a user for a specific duration. Based on the schedule of the user and the specified duration, the capacity of the user is accordingly populated in all resource aggregate tables.

Before you begin

Role required: resource_manager

About this task

Use the **Update resource capacity** related link in the following scenarios:

- If a user is newly added and you want to update the capacity for the user.
- If the schedule of an existing user is changed and you want to update the capacity of the user.

The scheduled job that is used for this action is Update resource capacity.

Capacity is generated for only the date range between employment start date and employment end date specified in the employee profile in the HR application. This information is available when the Employee Profile plugin is installed. If the start and end date are unavailable for an employee, manually specify these dates.

Also, if an employee is available after the year has begun, then the capacity is generated from the current year's beginning, to ensure that missing capacity is accounted for. For example, if the employee's capacity is available from March 1, 2022 to June 1, 2022, then the updated capacity is generated from January 1, 2022 to June 1, 2022.

Capacity and availability for terminated resources is automatically updated to 0 when you run the Resource Termination Handler job when the termination date is after the date on which the job is run. If resources are booked for a time period beyond the user's termination dates, those bookings are also updated to 0 in the resource plan.

Use the **Update resource capacity** related link in the following scenarios:

- If a user is newly added and you want to update the capacity for the user.
- If the schedule of an existing user is changed and you want to update the capacity of the user.

The scheduled job that is used for this action is Update resource capacity.

Before updating capacity for a new hire: Ensure the following are configured for the user before running the capacity update:

1. **Employment dates:** Set the employment start date (and optionally end date) in the user's employee profile. Capacity is only generated within these dates. If the Employee Profile plugin is not installed, manually specify these dates on the user record.
2. **Schedule:** Assign a work schedule to the user. The capacity calculation is based on the user's schedule (for example, a standard 8-hour workday schedule). Without a schedule, capacity values may be incorrect.
3. **PPS resource role:** Ensure the user has the `pps_resource` role so they appear in resource plans and capacity views.

Capacity is generated for only the date range between employment start date and employment end date specified in the employee profile. If an employee is available after the year has begun, capacity is generated from the current year's beginning to ensure missing capacity is accounted for.

Capacity and availability for terminated resources is automatically updated to 0 when you run the Resource Termination Handler job.

Procedure

1. Navigate to **All > Resource Management > Resources > Users**.
2. Select a **User ID**.
3. Select the **Update Resource Capacity** related link.
4. In the window, provide a start date and end date.

Note:

You can't select a start date that is before the employment start date or an end date that is after the employment end date when the Employee Profile plugin is installed.

5. Select **OK**.

Update the resource aggregates

From the Resource Manager view, you can update the resource aggregates for a specific time frame.

Before you begin

Role required: admin

About this task

You can use the **Update Resource Aggregates** related link in the following scenarios:

- If you notice a discrepancy in aggregates and want to generate correct data.
- If you want to synchronize aggregates with the Resource Allocation Daily [resource_allocation_daily] entries for a specific time frame.

Procedure

1. Navigate to **All > Resource Management > Resources > Users**.
2. Select a **User ID**.
3. Select the **Update Resource Aggregates** related link.
4. In the window, provide a start date and end date.
5. Select **OK**.

Create allocations

Resource managers can create allocations using the Resource Allocations related list.

Before you begin

Role required: resource_manager

Procedure

1. Navigate to **All > Resource > Resource Plans > Requested**.
2. Open a resource plan.
3. In the **Resource Allocations** related list, select **New**.
4. On the Resource Allocation form, fill the fields.
For a description of the field values, see [Resource Allocation form](#).
5. Select **Submit** to save the record and return to the resource plan.

What to do next

In the resource plan form, select **Confirm** or **Confirm and Allocate** to move the resource to the **Confirmed** or **Allocated** state.

Reject a resource plan from the Resource Plan form

Resource managers can reject plans from the Resource Plan form or from the Resource Workbench.

Before you begin

Role required: resource_manager

Procedure

1. Navigate to **All > Resource > Resource Plans > Requested**.
2. Open the plan to reject.
3. **Optional:** Add a description of the reason for the rejections in the **Notes** field.
4. Select **Reject**.

Resource schedules

Understand the default schedules used in Resource Management and learn how to create your own custom schedules.

Resource management uses a default schedule named Resource Management Schedule. The Resource Management Schedule has the following characteristics:

- Weekly on Weekdays
- Monday through Friday 08:00-12:00
- Monday through Friday 13:00-17:00

While planning a resource request for a resource plan, the user's schedule is considered to calculate planned and requested hours, if all users in that resource plan have the same schedule and that schedule is different from the resource management schedule.

Default schedule

The schedule assigned to each user can be understood using the following information on the user profile.

- Value provided in the **Schedule** field.
- Schedules provided in the Schedules related list, with the **Context** field set to Resource Management.

This related list can be seen in the Resource Manager view of the user profile.

If there are no entries in the Schedules related list, the value provided for the **Schedule** field is used to determine the resource schedule. If the Schedule field is empty too, then the schedule specified in the *Default Schedule Name* (*com.snc.resource_management.default_schedule*) property is applied as the resource schedule. To understand how to modify this property value, see [Specify the default resource management schedule](#).

Custom schedules for resources

Check the default schedule associated to a resource and apply custom schedules to those resources who require it.

If custom schedules are necessary, work with your administrator to create them. An administrator can create a schedule as per your requirements and assign it to the user. This custom schedule can also be assigned to other users as appropriate.

The value specified for the **Schedule** field on a user profile overrides the schedule specified in the *Default Schedule Name* property.

Note:

The **Time zone** field of a schedule is recommended to be set to **Floating**.

If necessary, the administrator can create a hierarchy of schedules. This is useful if you want users to have a primary schedule such as Monday-Friday 8:00-17:00 and a secondary schedule such as Saturday-Sunday 12:00-16:00. See [Custom schedule hierarchy](#).

Custom schedule hierarchy

To create a schedule hierarchy for any user, use the Schedules related list. Create a schedule and within the new schedule, define the type, dates, and repeat schedule using the Schedule Entries related list.

For example, Alene's usual schedule is 8-5 weekdays, which is specified in the **Schedule** field of their user profile. On top of the usual work, Alene also has to attend a site check every Saturday. The schedule for this appointment can be created from the Schedules related list.

Custom schedule hierarchy example

The screenshot shows the ServiceNow interface for a Resource Manager. The user profile for 'Rosie Mathews (Resource Mgr)' is displayed. The 'Schedule' field is highlighted with a red box and contains the value 'B-5 weekdays'. Below the profile, there is a table of related schedules. The table has columns for 'Schedule' and 'Context'. The first row shows 'Weekends' with a context of 'Resource Management'.

Schedule	Context
Weekends	Resource Management

Schedule entry within a custom schedule

The screenshot shows the 'Schedule - Weekends' configuration page. The 'Name' field is 'Weekends', 'Time zone' is 'US/Pacific', and 'Application' is 'Global'. Below the configuration, there is a table of 'Schedule Entries'. The table has columns for 'Name', 'Repeats', 'Repeat every', 'Start date time', and 'End date time'. The first row shows 'Saturday & Sunday' with 'Every week on Sat' repeats, a repeat every of '1', and start/end dates of '2009-09-12 00:00:00' and '2009-09-13 23:59:59' respectively.

Name	Repeats	Repeat every	Start date time	End date time
Saturday & Sunday	Every week on Sat	1	2009-09-12 00:00:00	2009-09-13 23:59:59

Specify the default resource management schedule

Choose the default schedule to be applied to your resources.

Before you begin

Role required: it_pps_admin

About this task

The base system uses Resource Management Schedule. You can change the default schedule at any time by using the *Default Schedule Name* property.

Procedure

1. Navigate to **All > System Scheduler > Schedules > Schedules**.
2. Review the schedules and copy the Name of the schedule that you want to use.
3. Navigate to **Project Administration > Settings > Properties - Resource**.
4. In the **Default Schedule Name** property field, paste the name of the schedule that you identified in step 2.

Resource events

A resource event is a block of time that a resource spends on a task.

Each time a resource manager makes an allocation, the system creates one or more resource events for that resource. The resource events appear on the user's personal calendar.

When a booking changes from soft to hard, resource events are created for the resource.

Resource events and schedules

Schedules classify time as work time and non-work time and can be associated with resources and with projects.

The [My Calendar](#) module shows the user's work schedule and non-work time.

When a resource manager makes an allocation, the following takes place automatically:

- The schedule associated with the specified resource is analyzed.
- The allocation type changes to **Hard** and calendar events are created for individual resources within the users' schedule. The hours are spread depending upon the [hard allocation spread](#) type.

Use the Calendar Event Duration property to control the default minimum unit for an event. See [Resource Management properties](#) for examples.

Note:

Over-allocation is allowed, starting with the Geneva release. However, no more than 24 hours can be allocated to a user during a given day. See [Resource allocation](#) for more information.

Resource event modifications

Resource events that aren't part of a resource plan can be modified.

You can only modify events you created for yourself in the "My Calendar" module. If a resource manager added an event to your calendar, then only the resource manager can modify the event.

Resource managers can modify an event that is part of a resource plan by deleting the event and creating a one. For example, a resource manager allocates a resource to a task on a resource plan and then wants to change the task work type to *Phone Call*. The resource manager must delete the event and then create another event with the work type set to *Phone Call*.

Modify a resource event that is part of a resource plan

You can modify a resource event that is part of a resource plan.

Before you begin

Role required: resource_manager

Procedure

1. Navigate to **Resource > Resource Plans > All**.
2. Select a plan **Number**.
3. In the **Resource Allocations** related list, select an allocation **Number**.
4. On the Resource Event form, update the fields.

For a description of the field names, see [Resource Event form](#).

A resource event

The screenshot shows the 'Resource Event' form for 'HQ Relocation'. The form includes the following fields and controls:

- Name:** HQ Relocation
- Type:** Task
- When:** 2015-09-18 (calendar icon), 09:30:00, To 12:30:00, 2015-09-18 (calendar icon), All day
- Repeats:** Does not repeat (dropdown menu)
- Task:** (empty search field with magnifying glass and info icons)
- User:** Elly Morocco (search field with magnifying glass and info icons)
- Buttons:** Update, Delete

Modify a self-created resource event

You can modify a resource event that you created.

Before you begin

Role required: none

Procedure

1. Navigate to **All > Resource > Calendar > My Calendar**.
2. Double-click an event that has not been assigned to a resource plan.
3. Modify the event, as necessary.
4. Select **Update**.

Change the resource event color

Each event type is represented with a color. PPS admin can change the colors at any time.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All > Project Administration > Settings > Resource Event Colors**.
2. Click an **Event Type**.
3. Specify a different **Color**.
4. Click **Update**.

Resource Management reports

Resource Management reports provide the resource requester and resource managers with resource allocations, availability, and utilization.

i Important:

Resource Management reports is deprecated starting Zurich release. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support Knowledge Base.

Alternatively, resource managers are encouraged to use the interactive Overview Dashboard in the Resource Management Workspace. For more information about dashboards, see [Overview dashboard in Resource Management Workspace](#).

You can generate reports for the following types of information:

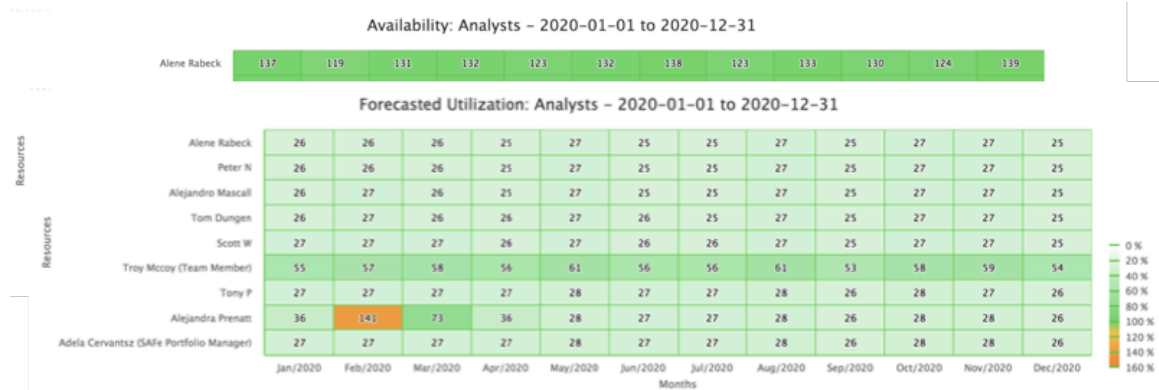

Availability

Total time that the resources are available after both **Soft and hard allocations**. Availability is capacity minus allocation.

Forecasted Utilization

Percentage of forecasted resource time utilization. It is calculated as sum of allocated and confirmed hours, divided by the total capacity.

Committed Utilization

Percentage of committed resource time utilization. It is calculated as allocated hours divided by the total capacity.

Allocation

Resource capacity, allocations, availability, and utilization.

Allocation: Analysts - 2020-01-01 to 2020-12-31

Allocation details

A tabular breakdown of all allocation requests (soft bookings), committed allocations (hard bookings), availability, capacity, and actual hours.

If the actual hours for a resource is greater than the allocated hours, the actual hour's cell is highlighted and a message is displayed on mouse hover.

Allocation Details: Analysts - 2020-08-26 to 2021-08-25

Resource	Aug/2020						Sep/2020						Oct/2020					
	Capacity	Requested	Confirmed	Allocated	Actuals	Available	Capacity	Requested	Confirmed	Allocated	Actuals	Available	Capacity	Requested	Confirmed	Allocated	Actuals	Available
Adela Cervantsz (SAFE Portfolio Manager)	32	0	0	0	0	32	176	0	30	66	0	80	176	0	30	69	0	77
Alejandra Prenatt	32	6	0	0	0	32	176	30	30	66	0	80	176	30	30	69	0	77

View availability, utilization, and allocation reports

You can view resource reports that focus on resource availability, utilization, and allocations.

Before you begin

Role required: admin, resource_user, or resource_manager

i Important:

Resource Management reports is deprecated starting Zurich release. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support Knowledge Base.

Alternatively, resource managers are encouraged to use the interactive Overview Dashboard in the Resource Management Workspace. For more information about dashboards, see [Overview dashboard in Resource Management Workspace](#).

Procedure

1. Navigate to **All > Resource > Resource Reports > Resource Reports**.
2. On the Resource Reports form, Fill the fields.
For a description of the field names, see [Resource Reports form](#).
3. Select **Run** to view the report.

Edit a resource management report

Resource management reports show resource allocation details in different formats for different time periods. Configure and use these reports according to your business requirements.

Before you begin

Role required: resource_user or admin

i Important:

Resource Management reports is deprecated starting Zurich release. It will be hidden and no longer available for installation but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) [🔗](#) article in the Now Support Knowledge Base.

Alternatively, resource managers are encouraged to use the interactive Overview Dashboard in the Resource Management Workspace. For more information about dashboards, see [Overview dashboard in Resource Management Workspace](#).

About this task

You can update the report settings like the aggregation type, request type, and calendar type for new reports. For example, you can edit the Resource - Group Allocation Details Monthly (Hrs) report to view the allocation details in terms of FTE instead of hours. You can also choose to view the charts associated with the reports by group bars or stack bars.

Procedure

1. Navigate to **All > Resource > Resource Reports > Reports-New**.
The following reports are displayed.
 - a. Select the **Edit** button.
 - b. Configure the report by updating the field values in the **Configuration** tab.
 - c. Select **Run** to run the report, or select **Save** to run it later.
2. **Optional:** Select **Create a report** to create report.

My Calendar

Any user with the resource_user role can open My Calendar to view, add, and modify their planned work, actual work, operational work, administrative tasks, and personal activities.

After a user adds an event to the calendar, the time blocks for that event appear as red, indicating busy, on the resource console and the resource availability dashboard.

Resource managers view users' calendars to determine who has open time to complete tasks, and can add tasks to any resource's personal calendar. For every event that is created on a user's calendar, a record is created in the User Calendar Event [user_calendar_event] table. Resource events are chunks of busy time for the user. Users and resource managers can sometimes modify these records. See [Resource event modifications](#).

The calendar uses time zones. Time is displayed to users in their local time zone according to user preferences. See [Time zones in resource plans](#).

Each resource event is represented with a specific color. PPS admin can change these colors. See [Change the resource event color](#)

Note:

Although a user can add tasks, such as incidents, to their calendar, the user isn't added to the task's **Assigned to** field.

Add events to your calendar

Add tasks, events, and appointments to your calendar.

Before you begin

Role required: pps_resource or resource_manager

About this task

To create an event that repeats daily, weekly, or monthly, see [Create repeatable events](#).

Procedure

1. Navigate to All > Self-Service > My Calendar.

The calendar appears in the week view by default, highlighting today's schedule. The user's off-duty schedule in gray.

2. Change the view as necessary.

- Select Day, Week, or Month.
- Use the forward or back arrows to navigate between days, weeks, and months.

- Select a date using the calendar icon .
- Select **Today** to reset your calendar view to show today's calendar.

3. Open the Add Event form by double-clicking an empty cell on the calendar.

4. On the New event form, fill the fields.

For a description of the field names, see [New event form](#).

5. Select Submit.

Result

- When you add a calendar event, the resource aggregate daily, weekly, and monthly tables are updated. The resource aggregate daily table isn't enabled by default. To generate daily aggregates and store them in this table, create the `com.snc.resource_management.generate_daily_aggregates` property and set its value to true.
- All the non-project events created for you from the calendar appear as Operational Work for you in [Resource Finder](#).

Create repeatable events

Events can be set to repeat on a regular schedule, such as every day, week, or month.

Before you begin

Role required: resource_manager

About this task

You can create events even if the timeslot is booked by some other event.

Procedure

1. Navigate to **All > Self-Service > My Calendar**.
2. Double-click an empty cell on the calendar.
3. On the New event form, fill the fields.
For a description of the field names, see [New event form](#).

New event
✕

Name

Type

* Task

When To All day

Please set the schedule greater than one minute to obtain optimal performance.

Repeats

Every day

* Repeat every

* Repeat until

Note: Dates in the When and To field should be the same.

4. Click **Submit**.

View a user calendar

View the calendar of a user to check availability.

Before you begin

Role required: resource_manager

About this task

You can view a calendar for a specific user, and not for all users in a group.

Procedure

1. Navigate to **All > Resource > Resources > Users**.
2. Do one of the following options.

Option	Description
From the User list	Right-click a user name in the Users list and select View Calendar .
From the User form	Select a User record to open the User form, and then select the View Calendar related link.

Add events to a user calendar

Resource managers can add events to user calendars.

Before you begin

Role required: resource_manager

Procedure

1. Navigate to **All > Resource > Resources > Users**.
2. Do one of the following.

Option	Description
From the User list	Right-click a user name in the Users list and select View Calendar .
From the User form	Select a User record to open the User form, and then select the View Calendar related link.

The calendar for that user opens in a new window or tab.

3. Open the **Add Event** form by selecting an empty white cell on the calendar.
4. On the form, fill the fields.
For description of the field names, see [Add events to your calendar](#).

Result

- When you add a calendar event, the resource aggregate daily, weekly, and monthly tables are updated. The resource aggregate daily table isn't enabled by default. To generate daily aggregates and store them in this table, create the `com.snc.resource_management.generate_daily_aggregates` property and set the value to true.
- All the non-project events created for a user from the calendar appear as Operational Work for the user in [Resource Finder](#).

Delete events

You can delete events you created at any time.

Before you begin

Role required: resource_user

About this task

You can't delete any events added to your calendar by a resource manager.

Procedure

1. Navigate to **All > Self-Service > My Calendar**.
2. Find the event to delete.

Use the icons above the calendar to locate the appropriate day, week, or month.

3. Double-click the event.
4. Select **Delete**.
5. Select **OK**.

Result

When you delete a calendar event, the resource aggregate daily, weekly, and monthly tables are updated accordingly. The resource aggregate daily table isn't enabled by default. To generate daily aggregates and store them in this table, create the `com.snc.resource_management.generate_daily_aggregates` property and set the value to true.

Use Resource Diagnostics to detect corrupt resource data

The Resource Diagnostics feature uses the Application Diagnostics Tool to detect corrupt data for a resource, such as duplicate aggregates for users, or dailies without a top task.

Before you begin

Role required: pps_admin

Procedure

1. Navigate to **All > Resource > Resource Diagnostics**.
2. On the Application Diagnostics Tool page, select **Resource Management**.
3. Select one or multiple diagnostic scans.
4. Select **Run Diagnostics**.
5. View results of the scan.
It lists the duplicate aggregate for users or project-related resource allocation dailies without a top task, if any.

What to do next

Add your own [diagnostic scans](#) and [fix scripts](#).

Add diagnostic features for resource

Create diagnostic features to evaluate an application feature and organize various diagnostic scans for an application. The diagnostic features appear in the target application and list all the diagnostic scans associated with the diagnostic feature for that application.

Before you begin

Role required: adt_admin

About this task

A diagnostic feature can consist of a single or multiple diagnostic scans. These diagnostic scans execute the scripts, that they're mapped with, to detect data corruption or invalid data. You can then create diagnostic scans with scripts and execute these scans to check resources for any corrupt or invalid data. If a fix script is associated with a scan, you can use it for fixing the corrupt or invalid data.

You can also define fields for users to create a specific filter condition. The diagnostic scripts use the results of these filter conditions as inputs for detecting any corrupt or invalid data.

You can check for the existing features under the **Features** module. If you don't find one matching your needs, create a diagnostic feature and associate it with an application.

Procedure

1. Navigate to **All > Application Diagnostics Tool > Features**.
2. Select **New**.
3. On the Diagnostics Feature form, fill the fields.
For a description of the field names, see [Diagnostics Feature form](#).
4. Define user input values for specifying filter conditions in the **Diagnostics Inputs** section.

The fields in this section are displayed in the application as condition builder. For a description of the field names, see [Diagnostics Inputs form](#).

5. Select **Submit**.

What to do next

Create diagnostic scripts and add fix scripts to use with the diagnostic feature. For more information, see [Add diagnostics and fix scripts for resource](#).

Add diagnostics and fix scripts for resource

Add existing or new diagnostic scripts to scan the data in your application for any corruption. You can also attach fix scripts to rectify the corrupt or invalid data identified by the diagnostic script.

Before you begin

Role required: adt_admin

About this task

You can create multiple diagnostic scripts to check various aspects of data. The results of the filter conditions, that you specify in a diagnostic feature, is used as an input for the diagnostic script while executing. You can also use the result of one script in subsequent scripts.

Procedure

1. Navigate to **All > Application Diagnostics Tool > Scripts**.
2. Select **New**.
3. On the Diagnostics Scripts form, fill the fields.
For a description of the field names, see [Diagnostics Scripts form](#).
4. **Optional:** If you want to include a script for fixing the corrupt or invalid data identified by the diagnostic script, select the **Has Fix script** check box.
5. Use **Fix script Access Roles** to move required roles to the Selected list.
The users with the selected roles can access the diagnostic script.
6. In the **Fix script** section, add the actual code for the fix script.
7. Select **Submit**.

Create diagnostic scan and map scripts for resource

Create a diagnostics scan and map diagnostic feature with diagnostic and fix scripts. You can create a diagnostic scan to execute diagnostic scripts to check the health of data in your application. Use the fix scripts to rectify any corrupt or invalid data that the diagnostic scan identifies.

Before you begin

- Role required: adt_admin
- Create diagnostic features. For more information, see [Add diagnostics features for resource](#).
- Create diagnostic and fix scripts. For more information, see [Add diagnostics and fix scripts](#).

About this task

After creating diagnostic features, diagnostic scripts, and fix scripts, map the diagnostic features and scripts to create a diagnostic scan. You can map multiple scripts with each diagnostic scan and define the order of their execution.

Procedure

1. Navigate to **All > Application Diagnostics Tool > Diagnostics**.
2. Select **New**.
3. On the Diagnostics form, fill the fields.
For a description of the field names, see [Diagnostics form](#).
4. Search for and select diagnostic scripts to map with the diagnostic scan in the **Diagnostics and Script Mappings** section.
5. Select **Submit**.

Resource Management reference

Reference information to provide additional details about Resource Management such as the fields, user roles, tables, and guidelines.

Resource Management properties

The Resource Management application provides several properties to control allocations, schedules, and other settings.

You need the PPS admin role to access the Resource properties.

To manage resource properties, navigate to **Project Administration > Settings > Properties – Resource**.

Resource management properties

Property	Description	Default value
Maximum number of daily resource allocation records that should be considered in synchronous mode for confirmation and allocation. (<i>com.snc.resource_management.plan.auto_async_on_threshold</i>)	<p>Determines the maximum number of daily resource allocation records that should be considered in synchronous mode during confirmation and allocation. The property improves the system performance when the number of daily allocation records is more than the value set in the property.</p> <p>The default value is 2600 which implies that the number of daily records considered for confirmation or allocation in synchronous mode is 2600. The value is equivalent to confirming or allocating 10 users on a group resource plan for 1-year duration (260 working days) or 5 users for 2-year duration, and so on. If the group resource plan contains 11 users for 1-year duration, the number of daily records are 2860. Thus</p>	2600

Resource management properties (continued)

Property	Description	Default value
	<p>the confirmation and allocation of the resource plan in this case is in asynchronous mode.</p> <p>If you always want to confirm and allocate the resource plan in synchronous mode, set the value of the property to a higher number based on your requirements.</p> <p>Note: If the property <code>com.snc.resource_management.run_state_changes_async</code> is set to true, the confirmation and allocation of resource plans is always considered in asynchronous mode.</p>	
Show Week/Month toggle on resource grid interface (<code>com.snc.resource_management.show_week_month_toggle</code>)	Shows the toggle button for switching between week and month in the resource grid.	Yes
Maximum time duration in Resource Finder in months(<code>com.snc.resource_management.max_dur_resource_finder</code>)	The maximum duration for which the resource details should be shown in the resource finder.	24
Use budget reference rates to calculate the Resource requested/allocated cost to derive hourly rate from Labor rate cards (<code>com.snc.resource_management.requested_or_allocated_cost_for_upgrade_use_budget_reference_rates</code>)	<ul style="list-style-type: none"> When the property is set to Yes, the budget reference rates [itfm_fx_rate] are used to calculate the resource requested or allocated cost. When the property is set to No, exchange rates [fx_rate] are used to calculate the resource requested or allocated cost. For upgraded customers, the property is by default set to No. 	Yes
Maximum number of days for which a resource plan can be created (<code>com.snc.resource_management.plan.max_duration</code>)	Restricts the maximum number of days for which a resource plan should be created.	3660
Default Schedule Name (<code>com.snc.resource_management.default_schedule</code>)	The schedule on the instance that the Resource Management application uses by default.	Resource Management Schedule
If resource_management_reporting for a resource/group has value of	The value that determines when the availability of the resource is shown as green on the resource report. Green signifies that the resource is not being fully utilized and is probably available to have the work allocated.	50

Resource management properties (continued)

Property	Description	Default value
percentage_allocation less than this value the color is shown as green. (<i>com.snc.resource_management.percentage_allocation_normal</i>)		
If resource_management reporting for a resource/group has value of percentage_allocation less than this value and greater than the com.snc.resource_management.percentage_allocation_normal, then color is shown as orange. (<i>com.snc.resource_management.percentage_allocation_warning</i>)	The value that determines when the availability of the resource is shown as orange on the resource report. Orange signifies the resource does not have much availability.	90
Average Daily FTE Hours/Hours Per Person Day (<i>com.snc.resource_management.average_daily_fte_hours_per_person_day</i>)	The average daily full-time equivalent in hours or number of hours per person day. This value is used as the equivalent of a full-time day if no value is specified in the Average Daily FTE Hours/Hours Per Person Day field on the user or group resource record. Note: Capacity is not derived from FTE, but from schedules. Both FTE and schedules must be in synchronization with each other.	8 (hours)
Calendar Event Duration (Minutes) (<i>com.snc.resource_management.calendar_event_interval_minutes</i>)	The default duration for a calendar event. Resource allocations use this property to create allocations with a decimal value. For example, a user is available for three blocks of time: two 30-minute blocks and one 60-minute block. • If the value of this property is set to 30 minutes, and 1 hour needs to be allocated to the user, the allocation is divided into the two 30-minute blocks when the user is available. • If the value of this property is set to 60 minutes, the allocation is given to the 60-minute block. Note: When you are changing the default value, enter a value which results a finite value when divided by 60. For example, 6, 12, 15, 30 and so on.	60 (minutes)

Resource management properties (continued)

Property	Description	Default value
<p>First Day of Week (Monday = 1, Sunday = 7) (<i>com.snc.resource_management.first_day_of_week</i>)</p>	<p>Determines which day of the week is the first day. The resource workbench uses this value to calculate the week number.</p> <p>For example, a resource is requested from October 14 (Wednesday) to October 21 (Wednesday).</p> <p>If the value of this property is set to 2 (Tuesday), the allocation is made and presented in the workbench in two blocks:</p> <ul style="list-style-type: none"> • From Wednesday October 14 to Saturday October 15. • Tuesday October 20. 	1 (Monday)
<p>Perform Resource Confirmation/ Allocation/ Cancellation in asynchronous mode (<i>com.snc.resource_management.run_state_changes_async</i>)</p>	<p>Uses asynchronous mode when confirming, allocating, or canceling resource plans to improve application performance.</p> <p>Because resource confirmation and allocation create calendar events for each resource in a group and also consider each resources schedule, the confirmation, and allocation process can take an excessively long time to complete.</p> <p>In asynchronous mode, the application uses an event manager to handle errors that might occur when processing the state of the resource plan. If the property is enabled:</p> <ul style="list-style-type: none"> • The state of the resource plan changes to Confirmation in Progress / Allocation in Progress / Cancellation in Progress. • If the confirmation, allocation, or cancellation does not work, the Confirm, Allocate, or Cancel UI actions appear so you can reprocess the action. If an allocation is only partially completed, you can click the Allocate UI action again to remove all previously created events for the plan and reprocesses the action. <p>Enable this property if you encounter errors or longer processing times when handling confirmations, allocations, or cancellations. This might occur if there are more than 25 members in a group or if the duration of the resource plan exceeds 6 months.</p>	No
<p>Comma-separated list of resource event types which will be excluded from</p>	<p>Specifies which events must be excluded for capacity calculations of the resources and when the system must not create events.</p>	time_off

Resource management properties (continued)

Property	Description	Default value
user's schedule to calculate available capacity and to avoid making resource allocations on the days having these events (time_off, meeting, and so on) (<i>com.snc.resource_management.exclude_events_from_schedule</i>)	The events to be entered must be from the Category field in the time card table.	
Show soft allocations in calendar for (<i>com.snc.resource_management.calendar_show_soft_allocations</i>)	Shows the following options: <ul style="list-style-type: none"> • Resource Managers: When selected, soft allocations can be seen in the calendar by the resource managers only. • Everyone: When selected, soft allocations can be seen in the calendar by all users who have the PPS Resource role. 	Resource Managers
Number of records fetched at a time in Resource Grid (<i>com.snc.resource_management.number_of_records_to_fetch_at_a_time</i>)	The number of records that are fetched in resource grid in one server call. For example, if there are 100 projects in an allocation board, only 30 are fetched in the first call. When the user scrolls down, a call is made to fetch the next 30 projects. Similarly, when the user expands a project containing, say 100 resource plans, only 30 resource plans are fetched in the first call. Upon scrolling, the next 30 plans are fetched, and so on.	30
Do not allow resource plan dates to be outside the Project/ Demand dates (<i>com.snc.resource_management.do_not_allow_resource_plan_dates_outside_project</i>)	Restricts the entry of resource plan dates that go beyond the project or demand dates to avoid discrepancies between project or demand dates and resource plan dates. If this property is enabled, the resource plan start and end dates must be within the project or demand dates when you create, extend, shift, move, or change the state of a resource plan from requested to confirm or allocate.	No
Limit the number of users retrieved for a group or role in Resource Finder search (<i>com.snc.resource_management.number_of_users_to_fetch_in_finder_at_once</i>)	Sets the maximum number of users that must be displayed for a group or role while searching for users in Resource Finder	50
Allocate more than 24 hours of effort	Allocates more than 24 hours of efforts for a resource per a day.	No

Resource management properties (continued)

Property	Description	Default value
a day per resource (<i>com.snc.resource_management.allocate_more_than_24hours_per_day</i>)		
Exclude resource assignments in specific states from capacity calculation (<i>com.snc.resource_pending_approved_and_in_status_from_availability</i>)	Excludes the resource assignments with defined statuses from calculating resource availability and aggregates. You can enter comma separated values such as <i>Pending,approved,and_in</i>	This field is left empty.

Resource Plan form

Field descriptions for the resource plan form fields.

Resource Plan form

Field	Description
Number	Automatically generated identification number for the plan.
Resource type	Category of resource. To select a group, select Group . To select an individual user, select User . To select a resource by role, select Role .
Group	Specific group resource to associate with the plan. If you select Role in the Resource type field, then the Group list contains groups only for the selected role.
User	Specific user resource to associate with the plan. This field appears if you select User in the Resource type field.
Role	Specific resource role that you want to associate with the plan. This field appears if you select Role in the Resource type field.
Members preference	Specific members, any member, or all members from the selected group or role. The default is All members . This field appears only when the Group or Role option is selected in the Resource type field. <ul style="list-style-type: none"> To request all members of a group or role, select All members. The requested time gets split among all members of the selected group or role proportionally depending on their capacity. Before making the hard allocation, if all members are not required, the resource manager can select only the desired members of the group or role. To request specific members of a group or role, select Specific members, and then select members from the Members list. The requested time gets split among the selected members of the selected group or role proportionally depending on their capacity. To select any member of a group or role, select Any member. Resources that are most available during the plan duration are requested first. Soft allocation is created only for these resources on confirmation.

Resource Plan form (continued)

Field	Description
	<p>For more information about the effect of members preference on the calculation of hours for soft and hard allocations, see Resource allocation.</p> <p>Note: This field is not available by default on the form when opened from the resource grid. If required, you can configure these fields. If the resource plan is created from the list view, the fields are already available.</p>
Skills	<p>Specific skills the requested resources should possess to allocate them to the resource plan.</p> <p>This field appears if you select Group or Role in the Resource type field, and All members or Any member in the Members preference field.</p> <p>For more information, see Skills Management.</p>
Request type	<p>Type of request. To specify a request in hours, select Hours. To specify a request in full-time equivalents, select FTE.</p>
FTE	<p>Number of units for the full-time equivalent selection.</p> <p>This field appears if you select FTE in the Request type field.</p> <p>For more information, see Resource plans.</p>
Planned hours	<p>Estimated number of work hours required to complete all resource plan work.</p> <p>Note: If all users in a resource plan have the same schedule and that schedule is different from the resource management schedule, then the user's schedule is considered to calculate planned hours,</p>
Name	<p>Descriptive name for the plan. If you do not enter a name, the name becomes the Number + Short description. If the short description for the task is empty, the plan number is used.</p>
Task	<p>Task to which the plan applies. If the resource plan was created from a project task, the task number appears here.</p>
Start Date	<p>Start date for the resource plan. By default, this field shows the Planned start date of the associated project record or task record. Edit the default date, if necessary.</p> <p>Note: The start date of the resource plan cannot be before the project or demand start date if the Do not allow resource plan dates to be outside the Project/Demand dates property is enabled.</p>
End Date	<p>End date for the resource plan. By default, the date is derived from the Planned end date of the associated project record or task record. Edit the default date, if necessary.</p>

Resource Plan form (continued)

Field	Description
	<p>i Note: The end date of the resource plan cannot be after the project or demand start date if the Do not allow resource plan dates to be outside the Project/ Demand dates property is enabled.</p>
Allocation spread	<p>Type of hard allocation. The value in this field determines the manner in which the allocated hours are spread while creating hard allocations. Select either option:</p> <ul style="list-style-type: none"> • Even: Create resource events for the resource by splitting the hours evenly across all working days for the allocation duration. • Front load: Create resource events for the resource by filling up all available slots of the resource from the start date of the allocation. <p>For example, if a resource is requested for 30 hours in Week 10:</p> <ul style="list-style-type: none"> • Selecting Even equally divides 30 hours to all weekdays, that is, 6 hours per day for a five-day work week. • Selecting Front load first consumes all available hours on Monday, then move on to Tuesday, and so on, until all 30 hours are allocated. If the resource is not available for 30 hours in Week 10, Front load over-allocates by filling up the remaining hours from start date up to 24 hours per day. <p>i Note: This field is not available by default on the form when opened from the resource grid. If required, you can configure these fields. If the resource plan is created from the list view, the fields are already available.</p>
State	<p>State of the resource plan. The plan starts in the Planning state.</p> <p>i Note: This field is not available by default on the form when opened from the resource grid. If required, you can configure these fields. If the resource plan is created from the list view, the fields are already available.</p>
Rate override	<p>Option for overriding the hourly rate derived from the rate model or the labor rate card.</p> <p>When the option is selected,</p> <ul style="list-style-type: none"> • The planned, confirmed, and allocated costs of the resource plan is derived from the rate specified in the Resource Rate field. • When the user submits the time card for the resource plan, the rate specified in the Resource Rate field is used to calculate the actual cost of the resource plan. <p>The option is enabled only if the resource plan is in the Planned state.</p> <p>By default, the option is not selected.</p>
Resource rate	<p>Hourly rate of resource that overrides the hourly rate returned from the rate model to calculate the planned and actual costs of the resource plan.</p>

Resource Plan form (continued)

Field	Description
	This field appears when the Rate override option is selected. If you clear the Rate override check box, the resource rate value is also cleared and removed from all calculations. On selecting the Rate override check box again, the previous resource rate is not retrieved.

Note:

The **Members Preference**, **Allocation spread**, and **State** fields are not available by default on the form when opened from the resource grid. If required, you can configure these fields. If the resource plan is created from the list view, the fields are already available.

Resource Plan form tabs

Use the resource plan form tabs to create a resource plan.

Resource details tab fields

Field	Description
Resource type	Type of resource selected during the creation of resource plan.
Group	Group associated with the resource plan.
Role	Role associated with a role resource plan.
User	User associated with a user resource plan.
Skills	Skills that the requested resources possess to allocate them to the resource plan. Note: This field is only available for resource plans with all or any members preference.
Members preference	Specific members, any member, or all members from the selected group or role.
Members list	Resources selected as specific members for specific members preference resource plan.
Confirmed/Allocated users	Resources that are confirmed/allocated by the resource manager for resource plans. By default, this field is displayed for specific members preference type of resource plans.

Request Details tab fields

Field	Description
Request type	Type of request selected during the creation of resource plan.

Request Details tab fields (continued)

Field	Description
	<ul style="list-style-type: none"> If you select FTE in the Request Type field, the FTE field is displayed. If you select Person Days in the Request Type field, the Person days field is displayed.
Planned hours	Estimated number of work hours required to complete all resource plan work.
Confirmed/Allocated hours	Confirmed or allocated hours rolled up from resource allocations.
Actual hours	Actual hours rolled up from time card entries.
FTE	Number of units for the full-time equivalent selection.
Demand currency	Type of currency associated with the demand task when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and Demand Currency view is enabled. For more information, see the Multicurrency in Demand Management topic.
Project currency	Type of currency associated with the project or project task when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and Project Currency view is enabled. For more information, see the Multicurrency in Project Management topic.
Planned cost	<p>Amount in Planned hours multiplied by the hourly rate of the specified user or group resource. This amount is a first-draft estimate of the resource plan cost.</p> <p>The hourly rate is derived from one of the following sources:</p> <ul style="list-style-type: none"> If the Rate override option is selected, the hourly rate specified in the Resource rate field is used. If a rate model is populated on the project or demand to which the resource plan is associated, the hourly rate is derived from the rate model. If the resource plan is assigned to a specific user and the time sheet policy of the user is set for multiple rate types, the planned cost is determined using the labor rate card with the default rate type. If the default rate type is inactive, the system rate is used to determine the planned cost.

Request Details tab fields (continued)

Field	Description
	<ul style="list-style-type: none"> • If the resource plan is assigned to a specific user and the time sheet policy of the user is not set for multiple rate types, the planned cost is determined using the labor rate card with no rate type. Otherwise, the system rate is used. • If the hourly rate is in non-functional currency, budget reference rates are used. <p>Note: Setting up rates for resources would provide more accurate forecast and plan costs for resource plans.</p> <p>Planned cost is rolled up from Requested Allocations for plans in the Planning or Requested state and from Resource allocations for plans in the Confirmed or Allocated state. While requesting resources from a group, if a resource role is specified, the planned cost is calculated from the hourly rate of the specified role.</p>
Planned cost in demand currency	Planned cost of a resource plan associated to a demand or demand task in the demand currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Demand Currency view is enabled. The Planned cost in demand currency value is derived by multiplying planned hours with the hourly rate of the specified user or group resource, and then converting the result to the demand currency based on the budget reference rates.
Planned cost in project currency	Planned cost of a resource plan associated to a project or project task in the project currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Project Currency view is enabled. The Planned cost in project currency value is derived by multiplying planned hours with the hourly rate of the specified user or group resource, and then converting the result to the project currency based on the budget reference rates.
Confirmed/Allocated cost	Amount of confirmed or allocated hours multiplied by the hourly rate of the confirmed or allocated resources. Provides a more accurate estimation of the cost of the plan that is confirmed or allocated.

Request Details tab fields (continued)

Field	Description
	<ul style="list-style-type: none"> • If the Rate override option is selected, the hourly rate specified in the Resource rate field is used. • If a rate model is populated on the project or demand to which the resource plan is associated, the hourly rate is derived from the rate model. • If rate model is not available, labor rate card determines the hourly rate. • If no labor card is found for the user, the hourly rate is taken from the following time card property: Default hourly rate used when processing time cards if we can't get a rate from labor rate cards (in system currency).
Confirmed/Allocated cost in demand currency	Confirmed or allocated cost of a resource plan associated to a demand or demand task in the demand currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Demand Currency view is enabled. The Confirmed/Allocated cost in demand currency value is derived by multiplying the confirmed or allocated hours with the hourly rate of the confirmed or allocated resources, and then converting the result to the demand currency based on the budget reference rates.
Confirmed/Allocated cost in project currency	Confirmed or allocated cost of a resource plan associated to a project or project task in the project currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Project Currency view is enabled. The Confirmed/Allocated cost in project currency value is derived by multiplying the confirmed or allocated hours with the hourly rate of the confirmed or allocated resources, and then converting the result to the project currency based on the budget reference rates.
Actual cost	Based on the same time cards used for the Actual hours, the actual cost is calculated using the hourly rate of each user and the hours worked. Used to inform resource requesters and resource managers of actual costs based on the actual hours that user resources added on their approved time cards.

Request Details tab fields (continued)

Field	Description
	<p>The hourly rate is derived as:</p> <ul style="list-style-type: none"> • If the Rate override option is selected, the hourly rate specified in the Resource rate field is used. • If a rate model is populated on the project or demand to which the resource plan is associated, the hourly rate is derived from the rate model. • If the time sheet policy of a user is set for multiple rate types, the actual cost is determined using the labor rate card with the default rate type. • If the default rate type is inactive, the system rate is used to determine the actual cost. • If the time sheet policy of a user is set for multiple rate types, the actual cost is determined using the labor rate card with no rate type. Otherwise, the system rate is used.
Actual cost in demand currency	<p>Actual cost of a resource plan associated to demand or demand task in the demand currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Demand Currency view is enabled. The Actual cost in demand currency value is derived by multiplying the hourly rate of each user with the hours worked, and then converting the result to the demand currency based on the exchange rates.</p>
Actual cost in project currency	<p>Actual cost of a resource plan associated to a project or project task in the project currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Project Currency view is enabled. The Actual cost in project currency value is derived by multiplying the hourly rate of each user with the hours worked, and then converting the result to the project currency based on the exchange rates.</p>

Allocation Config tab fields

Field	Description
Allocation type	<p>Type of resource distribution across the project that determines the type of allocation records. The value in this field determines how the planned hours are distributed across</p>

Allocation Config tab fields (continued)

Field	Description
	<p>resource plan duration among requested resources:</p> <ul style="list-style-type: none"> • Weekly: Create week-long allocations up to the end of the planned end date. • Monthly: Create month-long allocations up to the end of the planned end date. (Default value.) • Plan Duration: Create one allocation for each user for the entire duration of the resource plan. <p>For example, if a resource is requested from January 1 to March 31, the following records would be created for each type:</p> <ul style="list-style-type: none"> • Monthly: 3 allocation records, one for each month. • Weekly: 14 allocation records, one for each week with Monday being the first day of the week. • Plan duration: Only 1 record for the entire duration of the resource plan.
Allocation spread	Type of hard allocation selected during the creation of the resource plan.

Notes tab field

Field	Description
Notes	Other correspondence and notes about the resource plan.

Resource assignment form

Description for the resource assignment form fields.

Resource assignment form

Field	Description
Resource	<p>Specific user resource to associate with the plan.</p> <p>Note: If you select a specific resource, the Group, Role, and Skill planning attributes associated to the resource are auto populated.</p>
Group	Group of resources to associate with the plan.

Resource assignment form (continued)

Field	Description
Role	Role of the resources to associate with the plan.
Skill	Skill of the resources to associate with the plan.
Effort type	Type of the effort to associate with the plan. Select Hours to request defined set of hours or select % Capacity to request certain percentage of the resource capacity.
Effort	Amount of effort type required.
Operational work type	Type of operational work: KTLO, Admin, Meeting, Training, Out of office, External labor, Time off, Appointment, and Phone call.
Rate model	Rate model assigned to the operational resource plan. The rate model is used to derive hourly rates for the resource plan. If you change or remove the rate model assigned to an operational resource plan, the cost fields on the plan are re-calculated.
Start date	Date when the operational resource plan starts.
End date	Date when the operational resource plan ends.
Resource status	Status of the resource assignment.

Resource Plan related links and lists

Use the resource plan related links and list to clone the resource plan details, view resource workbench, update cost plans, recalculate resource costs, or work on the modifying the request allocations.

Related Links

Field	Description
Copy Resource Plan	Copies the opened resource plan into a new resource plan.
Update Cost Plan	If you are using Project Portfolio Management, resource plans automatically create cost plans for a project or demand . Whenever you update the resource plan, click Update Cost Plan to keep the cost plan up-to-date . Note: The cost plan associated to a resource plan is also automatically updated when the resource plan is updated.

Related Links (continued)

Field	Description
Recalculate Resource Cost	Recalculates the resource costs of the resource plan whenever the hourly rates change in the rate model to keep the costs up-to-date.

Related Lists

Requested Allocations	<p>List of requested allocations for the resource plan.</p> <p>The number of requested allocation records created depends on the value of the Allocation type field. For example, if a resource is requested from January 1 to March 31, the following requested allocation records are created for each type:</p> <ul style="list-style-type: none"> • Monthly: 3 allocation records, one for each month. • Weekly: 14 allocation records, one for each week with Monday being the first day of the week. • Plan duration: Only 1 record for the entire planned duration.
Resource Allocations	List of resources allocated to the plan.
Resource Plan Logs	Lists any error or warnings that might occur during resource allocation.

Resource form

Use the resource form to create an operational resource plans.

Resource form

Field	Description
Number	Automatically generated identification number for the operational resource plan.
Resource type	Resource category. To select a group, select the Group option. To select an individual user, select the User option. To select a resource by role, select Role .
Group	<p>Group for which the operational resource plan is created.</p> <p>If you select Role in the Resource type field, then the choice list displays the groups for the selected role.</p>
User	User for whom the operational resource plan is created. This option appears if you select User in the Resource type field.
Role	Specific resource role that you want to associate with the plan. This option appears if you select Group or Role in the Resource type field.

Resource form (continued)

Field	Description
	If you select Group in the Resource type field, then the choice list displays the roles for the selected group.
Members preference	<p>Specific members or all members from the selected group or role. The default is set to All members. This field appears only when the Group or Role option is selected in the Resource type field.</p> <ul style="list-style-type: none"> • If the All members option is selected, the resource plan includes all members of the selected group or role. Time is proportionally divided among the selected group or role members, depending upon their capacity. Before making the hard allocation, if all members are not required, as a resource manager, you can select only specific members from the group or role. • If the Specific member option is selected, a request is made for the specified members. The requested hours are proportionately split among specified users of the group or role, based on their available capacity.
Skills	<p>Specific skill(s) that you want to associate with the plan. This field appears only when the All members option is selected in the Members preference field.</p> <p>For more information on skills management, see Skills Management .</p>
Request type	Type of request: Hourly or % Capacity . To estimate the work in hours, select the Hourly option. To estimate the work in percentage of capacity, select the %Capacity option.
Planned hours	Estimated number of hours required to complete the operational work.
Confirmed/Allocated hours	Hours of a resource confirmed or allocated for operational work.
Actual hours	<p>Hours spent on a planned operational task.</p> <p> Note: When you submit a time card, upon approval of the time card, actual hours are updated for an allocation record of an operational resource plan.</p>
Name	Descriptive name for the operational resource plan.
Operational work type	Type of operational work: KTLO, Admin, Meeting, Training, Out of office, External labor, Time off, Appointment, and Phone call. The default is KTLO .
Rate model	<p>Rate model assigned to the operational resource plan. The rate model is used to derive hourly rates for the resource plan.</p> <p>If you change or remove the rate model assigned to an operational resource plan, the cost fields on the plan are re-calculated.</p>
Start date	Date when the operational resource plan starts.
End date	Date when the operational resource plan ends.
Allocation type	Resource distribution type that determines the type of allocation records. The value in this field determines how the planned hours are distributed across the

Resource form (continued)

Field	Description
	<p>resource plan duration, among requested resources. Select any of the following options:</p> <ul style="list-style-type: none"> • Weekly: Creates week-long allocations up to the end of the planned end date. • Monthly: Creates month-long allocations up to the end of the planned end date. Monthly is the default value. • Plan Duration: Creates one allocation for each user for the entire duration of the resource plan. <p>For example, if a resource is requested from Jan. 1st to Mar. 31st, the following records are created for each type:</p> <ul style="list-style-type: none"> • Monthly: 3 allocation records, one for each month. • Weekly: 14 allocation records, one for each week with Monday being first day of the week. • Plan Duration: Only 1 record for the entire duration of the resource plan.
Allocation spread	<p>Type of allocation spread. The value in this field determines the manner in which the allocated hours are spread while creating hard allocations:</p> <ul style="list-style-type: none"> • Even: Creates resource events for the resource by splitting the hours evenly across all the working days for the allocation duration. • Front Load: Creates resource events for the resource by filling up all the available slots of the resource from the start date of the allocation. <p>For example, if a resource is requested for 30 hours in week 10, then:</p> <ul style="list-style-type: none"> • Selecting Even equally divides 30 hours between all weekdays, which is 6 hours per day for a five-day work week. • Selecting Front Load consumes all the available hours on Monday, moves on to Tuesday, and so on, until all the 30 hours are allocated. If the resource is not available for 30 hours in week 10, it over-allocates by filling up the remaining hours from the start date up to 24 hours per day.
State	<p>A plan starts in the Planning state. The plan moves to the Requested state after its submission.</p>
Planned cost	<p>Amount, in <i>Planned Hours</i>, multiplied by the hourly rate of the specified user or group resource. Planned cost is a first draft estimate of the resource plan cost.</p> <p>Planned cost is rolled up from Requested Allocations for plans in the Planning or Requested states and from resource allocations for plans in the Allocated state.</p> <p>The hourly rate is derived from one of the following sources:</p> <ul style="list-style-type: none"> • Rate model, if it is populated on the operational resource plan. • Labor rate card, if rate model is not available. • System property <code>com.snc.time_card.default_rate</code> if all the other conditions fail.

Resource form (continued)

Field	Description
	<p>Note: When requesting resources from a group, if a resource role is specified, the planned cost is calculated from the hourly rate of the specified role.</p>
Confirmed/ Allocated cost	<p>Amount of confirmed or allocated hours multiplied by the hourly rate of the confirmed or allocated resources. Provides a more accurate estimation of the cost of the plan that is confirmed or allocated.</p> <p>The hourly rate is derived from one of the following sources:</p> <ul style="list-style-type: none"> • Rate model, if it is populated on the operational resource plan. • Labor rate card, if rate model is not available. • System property <i>com. snc. time_card. default_rate</i> if all the other conditions fail.
Actual cost	<p>Amount of actual hours multiplied by the hourly rate of the specified resource.</p> <p>Note: When you submit a time card, upon approval of the time card, actual cost is updated for an allocation record of an operational resource plan.</p>
Notes	Additional correspondence and information.

Related Links

Field	Description
Copy Resource Plan	Copies the opened resource plan to create a new resource plan.

Related Lists

Field	Description
Requested Allocations	<p>List of requested allocations for the resource plan.</p> <p>The number of requested allocation records created depends on the value in the Allocations type field. For example, if a resource is requested from Jan first to Mar. 31st, the following requested allocation records are created for each type:</p>

Related Lists (continued)

Field	Description
	<ul style="list-style-type: none"> • Monthly: 3 allocation records, one for each month. • Weekly: 14 allocation records, one for each week with Monday being the first day of the week. • Plan Duration: Only 1 record for the entire planned duration of the resource plan.
Resource Allocations	List of resources allocated to the plan.

Extend resource plan form

Use the Extend resource plan fields to extent a resource plan for a project.

Extend resource plan fields

Field	Description
New end date	Date until which you want to extend the resource plan.
Request type	Type of request. Options include: FTE, Person Days, or Hours.
FTE or Person Days or Hours	<p>Number of units to request resources.</p> <p>The field appears when you select one of the options in the Request type field. Based on the selected request type, specify the unit.</p> <p>For more information, see Request type.</p>

Request Extension form

Use the Request Extension form to request extension of an allocated resource plan.

Request Extension form

Field	Description
Extend until	Date until which you want to extend the resource plan and request for resources.
Request type	Type of request. Options include: FTE, Person Days, or Hours.
FTE or Person days or Hours	<p>Number of units to request resources.</p> <p>The field appears when you select one of the options in the Request type field. Based on the selected request type, specify the unit.</p> <p>For more information, see Request type.</p>
Notes	Other correspondence and information about the resource plan that the project manager wants to communicate with the resource manager.

Requested Allocation form

Use Requested Allocation form to create a request for resource plans in Planning or Rejected state.

Requested Allocation form

Field	Description
Start date	Start date for the requested allocation record.
End date	End date for the requested allocation record.
FTE	<p>Number of units for the full-time equivalent selection for the requested allocation record.</p> <p>If a resource is requested as FTE, then the planned hours for each requested allocation record are calculated first. A total of all hours is then rolled up as planned hours on the resource plan. See Resource plans for an explanation of FTEs.</p> <p>Note: Capacity isn't derived from FTE, but from schedules. Both FTE and schedules must be in synchronization with each other.</p>
Resource plan	Resource plan number to which the requested allocation record is attached. This field automatically populates if the requested allocation record is accessed from a resource plan.
Planned hours	<p>Number of hours to allocate to the requested allocation record.</p> <p>By default, the Resource Plan form on the resource plan form are proportionally distributed among all the requested allocations based on the number of working days for each requested allocation record. However, it's possible to override the planned hours or the FTE.</p>
Planned cost	<p>Estimated cost of resource.</p> <p><code>Planned cost = Planned hours * hourly rate</code></p> <p>The hourly rate is derived from one of the following sources:</p> <ul style="list-style-type: none"> • Resource rate from the resource plan, if the Rate override option is selected. • Rate model, if it's populated on the project or demand to which the resource plan is associated. • Labor rate card for user resource plans. • Role rate when resource is requested by resource role, if the role has a rate. • Group hourly rate if role doesn't have a rate or if the role is null. • System property <code>com.snc.time_card.default_rate</code> if all the other conditions fail. <p>Planned costs roll up to the Planned cost field on the resource plan.</p>
Planned cost in project currency	Planned cost of a project task in project currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Project Currency view is enabled.

Requested Allocation form (continued)

Field	Description
Planned cost in demand currency	Planned cost of a demand task in demand currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and Demand Currency view is enabled.

Resource Role form

Use the Resource Role form to create roles for project team members.

Resource Role form

Field	Description
Name	Name of the resource role. Note: The resource role name must be unique. Do not create duplicate roles.
Hourly rate	Hourly rate for the resource role used for calculating the task cost based on time worked.
Description	Detailed description of the resource role.

Resource Allocation form

Use the Resource Allocation form to resource allocations.

Resource Allocation form

Field	Description
Start date	Start date for the resource allocation. The start and end dates must fall within the dates of the resource plan.
End date	End date for the resource allocation.
Resource	Resource to be allocated. The lookup results are filtered by the group, role, or user selected on the resource plan.
Confirmed/Allocated hours	Number of hours that the system confirms or allocates to the resource when the resource plan is confirmed or allocated. Confirmed and allocated hours roll up to the Confirmed/Allocated hours field on the resource plan.
FTE	Number of units for the full-time equivalent selection. This option appears if you selected FTE for the Request type field on the resource plan.
Person Days	Number of units for the person days selection.

Resource Allocation form (continued)

Field	Description
	<p>This option appears if you selected Person Days for the Request type field on the resource plan.</p>
Planned cost	<p>Planned cost of the resource.</p> <p>$\text{Planned Cost} = \text{Planned hours} * \text{hourly rate}$ The hourly rate is derived from one of the following sources:</p> <ul style="list-style-type: none"> • Resource rate from the resource plan, if the Rate override option is selected. • Rate model, if it is populated on the project or demand to which the resource plan is associated. • Labor rate card, if rate model is not available. • System property <i>com.snc.time_card.default_rate</i> if all the other conditions fail. <p>Planned costs roll up to the Planned cost field on the resource plan.</p> <p>The field is not visible on the form by default. Configure the form to add this field if it is not visible.</p>
Confirmed/ Allocated cost	<p>Cost of the resource.</p> <p>$\text{Confirmed/Allocated Cost} = \text{Confirmed/Allocated hours} * \text{hourly rate}$</p> <p>The hourly rate is derived from one of the following sources:</p> <ul style="list-style-type: none"> • Resource rate from the resource plan, if the Rate override option is selected. • Rate model, if it is populated on the project or demand to which the resource plan is associated. • Labor rate card, if rate model is not available. • System property <i>com.snc.time_card.default_rate</i> if all the other conditions fail. <p>Confirmed and allocated costs roll up to the Confirmed/Allocated cost field on the resource plan.</p> <p>The field is not visible on the form by default. Configure the form to add this field if it is not visible.</p>
Confirmed/ Allocated cost in demand currency	<p>Confirmed/Allocated cost of a demand task in demand currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and Demand Currency view is enabled.</p>
Confirmed/ Allocated cost in project currency	<p>Confirmed/Allocated cost of a project task in project currency when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and Project Currency view is enabled.</p>

Create New form

Use the Create New form to create allocation boards.

Create new form

Field	Description
Name	Unique name for the allocation board.
Type	<p>Level from which you want to filter resources.</p> <ul style="list-style-type: none"> • Demands/Projects: When selected, resources are filtered from demands and projects. • Group: When selected, resources are filtered from a group. • Group manager: When selected, all resources with pps_resource role are filtered. • Portfolio: When selected, resources are filtered from a portfolio. • Program: When selected, resources are filtered from a program. • Resource Plan: When selected, resources are filtered through the filter criteria and are not bound to any particular group, role, manager, portfolio, or program. • Role: When selected, resources are filtered from a role. • User manager: When selected, all resources with pps_resource role are filtered. <p>Depending on the value in Type field, a field appears to select the name of the record. For example, if Type is Group, a field Group appears where you can select the name of the group.</p>

Resource Event form

Use the Resource Event form to update resource even which is part of resource plan.

Resource Event form

Field	Description
Name	The name of the event.
Type	<p>The type of event:</p> <ul style="list-style-type: none"> • Time off • Appointment • Meeting

Resource Event form (continued)

Field	Description
	<ul style="list-style-type: none"> • Phone call • Task
When/To	The start and end date of event.
All day	If the event is an all-day event as specified by the schedule.
Repeats	If the event repeats Daily, Weekly, Monthly, or Does not repeat.
Task	The task associated with this event.
User	The user associated with the event.

Resource Reports form

Use the Resource Reports form to generate the resource reports.

Resource Reports form

Field	Description
Report Type	<p>The type of report that you want to view. You can select from the following options:</p> <ul style="list-style-type: none"> • Availability - view the availability of an entity for selected time period. • Forecasted Utilization - view the forecast utilization of an entity for selected time period. • Committed Utilization - view the confirmed utilization of an entity for selected time period. • Allocation - view allocations for selected time period. • Allocation Details - view the allocation details of the entity for selected time period.
Entity Type	<p>The entity that you want to view the report for. You can select from the following options:</p> <ul style="list-style-type: none"> • User • Group • Demand • Project • Program • Portfolio • Other Task

Resource Reports form (continued)

Field	Description
	<p>Note: If you select Allocation in the Report Type field, only User and Group are available.</p>
User	The user that you want to view the report for. This field is displayed only if you select User in the Entity Type field.
Group	The group that you want to view the report for. This field is displayed only if you select Group in the Entity Type field.
Group by	The option to filter the report for the selected group by Roles or Members . This field is displayed only if you select Availability or Forecasted Utilization or Committed Utilization in the Report Type field, and Group in the Entity Type field.
Members	The group member from the selected group that you want to view the report for. This field is displayed only if you select Group in the Entity Type field and Members in the Group by field.
Role	The resource role from the selected group that you want to view the report for. This field is displayed only if you select Group in the Entity Type field and Roles in the Group by field.
Demand	The demand that you want to view the report for. This field is displayed only if you select Demand in the Entity Type field.
Project	The project that you want to view the report for. This field is displayed only if you select Project in the Entity Type field.
Program	The program that you want to view the report for. This field is displayed only if you select Program in the Entity Type field.
Portfolio	The portfolio that you want to view the report for. This field is displayed only if you select Portfolio in the Entity Type field.
Other Task	The task (other than a demand, project, program, or portfolio) that you want to view the report for. This field is displayed only if you select Other Task in the Entity Type field.
Resource Plan	The resource plan that you want to view the report for. This field is not displayed if you select User or Group in the Entity Type field.

Resource Reports form (continued)

Field	Description
Start Date and End Date	The start and end dates time frame to view the report.
Zoom level	The zoom level that you want to view the report for. You can select from the following options: <ul style="list-style-type: none"> • Weekly: Displays data for each week during the selected time period. • Monthly: Displays data for each month during the selected time period.
Report Unit	The unit in which capacity, availability, or allocation of a resource is displayed. <ul style="list-style-type: none"> • Hours: Displays the capacity, availability, or allocation of a resource in hours. • FTE: Displays the capacity, availability, or allocation of a resource in FTE. • Person days: Displays the capacity, availability, or allocation of a resource in person days. <p>This field is displayed only when the Report Type field value is Availability, Allocations, or Allocation Details.</p>

New event form

use the New event form to add tasks, events, and appointments to your calendar.

New event form

Field	Description
Name	Enter a descriptive name for the event.
Type	Select a type from list. <ul style="list-style-type: none"> • Time off: Personal time off. • Appointment: A type of administrative task. • Meeting: A work-related meeting. • Phone call: A work-related phone call. • Task work: A task in the ServiceNow system, such as an incident or a change that you're assigned to.
Task	Select the reference lookup icon and select the task that needs to be done.

New event form (continued)

Field	Description
	<p>This field appears only if you selected <i>Task</i> as the type of activity.</p> <p>Note: This action does not add you to the Assigned to field on the task form.</p>
When	<p>Choose the start and end date and time, or select the <i>All day</i> option.</p> <div style="background-color: #e1f5fe; padding: 10px; border: 1px solid #cfe2f3;"> <p>Important:</p> <p>When you select <i>All day</i> for a Time off event, the system allocates 24 hours for that day, not the standard 8-hour work schedule. To book time off for only your working hours (for example, 8 hours), specify the exact start and end times instead of selecting <i>All day</i>.</p> </div> <p>The allocated hours for an event are calculated based on the duration between the start and end times you specify. To align time off with your work schedule, see Resource schedules.</p> <p>Do not use this field to set repeatable events.</p>
Repeats	<p>Select the frequency that the activity repeats, such as Daily, Weekly, Monthly, or select Does not repeat if this event is a non-repeating event.</p> <p>For example, if you have a task that you want to work on Monday and Friday, set a weekly repeatable event for Monday and Friday. See Create repeatable events.</p>
Repeat every	<p>Enter a number that represents the frequency.</p> <p>This field appears only if you selected <i>Daily</i>, <i>Monthly</i>, or <i>Yearly</i> in the Repeats field.</p>
Repeat on	<p>Select the days of the week to repeat the activity.</p> <p>This field appears only if you selected <i>Weekly</i> in the Repeats field.</p>
Repeat until	<p>Select an end date.</p>

New event form (continued)

Field	Description
	This field appears only if you select <i>Daily</i> , <i>Monthly</i> , or <i>Yearly</i> in the Repeats field.

Diagnostics Feature form

Use the diagnostics Feature form to create a new diagnostic feature for a resource.

Diagnostics Feature form

Field	Description
Name	Name of the diagnostic feature. This name appears in the application to which this diagnostic feature belongs.
Active	Option for activating the diagnostic feature.
Application	Search for and select the application with which you want to associate this diagnostic feature.
Roles	Move desired roles to the Selected list. The users with the selected roles can access the diagnostic feature.
Description	Details of the diagnostic feature. The description is displayed in the application to which the diagnostic feature belongs. It enables the user to understand the diagnostic scans executed in the feature.

Diagnostics Inputs form

Use the Diagnostics Inputs form fields to specify a filter condition for a user.

Diagnostics Input fields

Field	Description
Label	Name of the label for the input fields.
Field Type	Select Reference field type.
Table	Name of the table on which the query specified in the condition should run.
Key	An identifier for the user input condition. If a user specifies multiple conditions, this key acts as a unique identifier for each condition. You can use this key as the input for the <i>scanContext</i> section of the diagnostic script.

Diagnostics Scripts form

Use the Diagnostic Scripts form to scan the data in your application for any corruption.

Diagnostics Scripts form fields

Field	Description
Name	Name of the diagnostic script. Use a name that clearly explains the objective of the script. The script name also enables you to identify the correct script while mapping the script to a feature when creating a diagnostic scan.
Description	Details of the diagnostic script. The description enables the user to understand the functions of the script.
Diagnostic script	The actual code for the diagnostic script.

Diagnostics form

Use the Diagnostic form to create a diagnostics scan and map diagnostic feature with diagnostic and fix scripts.

Diagnostics form fields

Field	Description
Name	Name of the diagnostic scan. This name appears in the application to which this diagnostic scan belongs.
Active	Option for activating the diagnostic scan.
Order	The order in which this diagnostic scan appears in the application.
Feature	Search for and select the diagnostic feature with which you want to associate this diagnostic scan.
Roles	Move desired roles to the Selected list. The users with the selected roles can access the diagnostic scan.
Description	Details of the diagnostic scan. The description is displayed in the application to which the diagnostic scan belongs. It enables the user to understand the diagnostic scans.

Portfolio Management

With the ServiceNow® Portfolio Management application, you can create portfolios which are collections of related programs, projects, and demands. You can then perform financial planning and monitor the status and progress of these portfolios.

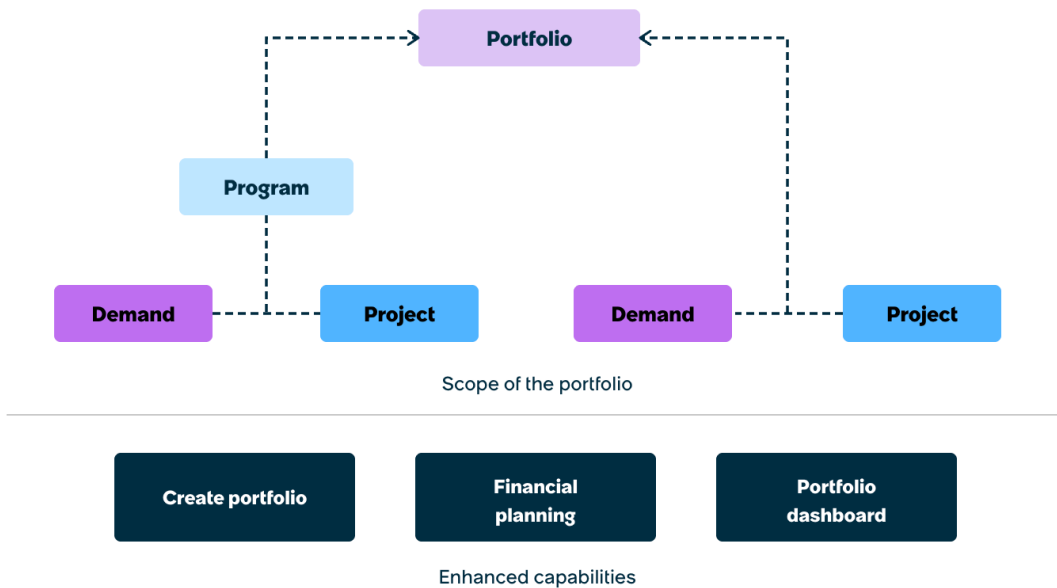

Watch this four-minute video to learn about the portfolio structure, creating a portfolio and program, setting up a stakeholder registry. Information about the portfolio structure, creating a portfolio and program, setting up a stakeholder registry, and the portfolio workbench.

You must have the `it_portfolio_manager` role to manage a portfolio. The Portfolio Management application provides these capabilities to the portfolio manager:

- Create a portfolio by adding related programs, projects, and demands.
- Perform annual portfolio planning by selecting demands, projects, and programs.
- Track the progress and status of all the programs, projects, and demands that are part of the portfolio. You can track the costs, resources, schedules, risks, and issues.

The following diagram provides an overview of Portfolio Management.

Overview of Portfolio Management

Scenario-based Portfolio Planning

Install the [Scenario Planning for PPM](#) application from ServiceNow Store to help the portfolio managers do a scenario-based portfolio planning with different combinations of demands and projects. You can Compare multiple scenarios in a portfolio and fund only those demands and projects that add financial value to the organization.

Create a portfolio

Create a portfolio to manage related programs, projects, and demands.

Before you begin

- Create demands, programs, and projects to include as part of the portfolio.
- Role required: it_portfolio_manager or admin

Procedure

1. Navigate to **All > Project > Portfolios > Create New**.
2. Enter a unique **Name** that summarizes the programs, projects, and demands included in this portfolio.
3. Enter a **Description** for the portfolio that adequately explains the various programs, projects, and demands attached to it.
4. Enter the name of the **Portfolio Manager**.
5. Select **Create Portfolio**.

Result

The portfolio is created and the form reopens with additional fields, related links, and related lists.

What to do next

Fill in the following related links and lists to complete the portfolio:

Portfolio form Related links

Field	Description
Demand Workbench	Link to open Demand Workbench.
Portfolio Target	Link to open the Portfolio Target dialog box for you to enter the CAPEX and OPEX target for each fiscal year. This target amount is split equally among the fiscal periods. The portfolio target is included in the Portfolio Target related list.
Portfolio Planning	Link to open Portfolio Planning Workbench for scenario planning. This related link is available when Scenario Planning for PPM is installed in your instance. For more information, see Scenario Planning for PPM .
Analytics Portfolio	Link to open the PMO Dashboard. The dashboard generates graphical reports for the portfolio.

Portfolio form Related lists

Field	Description
Demands	List of demands that are part of the portfolio. To create a demand, select New . To add existing demands to the portfolio, select Edit .
Projects	List of projects that are part of the portfolio. To add existing projects to the portfolio, select Edit .
Programs	List of programs that are part of the portfolio. To create a program, select New . To add existing programs to the portfolio, select Edit .
Risks	List of risks that are part of the portfolio. The program, project, and demand risks are also displayed in this list. To create a risk, select New .
Issues	List of issues that are part of the portfolio. The portfolio, program, project, and demand issues are also included in this list. To create an issue, select New .

Portfolio form Related lists (continued)

Field	Description
Cost Plans	List of cost plans of projects and demands that are part of the portfolio.
Monetary Benefit Plans	<p>List of monetary benefit plans of projects and demands that are part of the portfolio.</p> <p>To create a monetary benefit plan, open the project or demand record and select New in the Monetary Benefit Plans related list.</p>
Non-monetary Benefit Plans	<p>List of non-monetary benefit plans of projects and demands that are part of the portfolio.</p> <p>To create a non-monetary benefit plan, open the project or demand record and select New in the Non-monetary Benefit Plans related list.</p>
Portfolio Target	<p>List of portfolio capital and operational expense target for different fiscal years. The values are displayed from the <code>project_funding</code> table. Set these values in the Portfolio Target window on the portfolio form. You can create targets for different financial periods.</p> <p>Note: The PPS admin can also set the portfolio target by navigating to Project Administration > Enter Portfolio Target.</p>
Planning & Budgeting	According to the fiscal years, lists projects and demands that are part of the portfolio. You can include or exclude a project or demand from the portfolio budget plan.

Open a portfolio status list

Open the status list of a portfolio to see the projects that are included in it.

Before you begin

Role required: `it_portfolio_manager`

Procedure

1. Navigate to **Project > Portfolios > All**.
2. Open a portfolio.
3. Select the **Portfolio Status** related link.
The list of portfolio status records opens.
4. If necessary, you can select a different project associated with the current portfolio.

Scenario Planning for PPM

The Scenario Planning for PPM application provides a central location for portfolio managers to create and track the roadmap for project execution for a given fiscal year. Optimize your budget and resource usage by creating and comparing different scenarios for your project and demand roadmap or resources.

A scenario is a collection of demands and projects that serves as a planning instance for the selected fiscal year to support funding decisions.

Eligible demands and projects in the portfolio are collected into a default or existing scenario of the planning cycle. You use the default or existing scenario as a basis to create additional scenarios. A demand or project can belong to more than one scenario in the current planning cycle but it cannot belong to more than one portfolio. For more information, see [Create planning scenarios](#).

Features

The Scenario Planning for PPM provides the following capabilities to portfolio managers:

- Plan your portfolio based on resource capacity for a single year or multiple years.
- Break down your multiple year portfolio planning in smaller planning windows for continuous tracking and planning adjustment.
- Allocate budget to demands and projects in your portfolio from Investment Funding.
- Create scenario-based plans for portfolios.
- Apply filters to refine your list of selected demands and projects in your portfolio.
- Experiment with different combinations of demands and projects in planning scenarios.
- View details of demands and projects that are not aligned with your strategic goals.
- Edit the way demands and projects are funded for each scenario.
- Compare different scenarios to assess outcomes of various project and demand combinations.
- Confirm a planning scenario that best aligns with your organizational objectives as your current portfolio plan.
- Override a previously confirmed planning scenario based on changing priorities and environment.
- View budget details such as actual and planned costs, projects, and demands not aligned to goals and strategies, and actual costs for the projects.
- View resource utilization and allocation.
- View demands and projects with over-allocated resources.

Install Scenario Planning for PPM

Install the Scenario Planning for PPM application from ServiceNow Store applications. Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

Before you begin

Complete the following setup checklist for a smooth installation and configuration.

Setup checklist

Setup tasks	Description
Verify that the PPM Standard plugin (com.snc.financial_planning_pmo) is activated.	Navigate to Subscription Management > Subscriptions in your instance. The list displays the subscriptions that your organization has purchased.
Verify that the Investment Funding for PPM (com.snc.investment_planning_pmo) plugin is activated. Note: This plugin needs to be activated only when you want to retrieve the target amount for a portfolio for annual type of planning from Investment Funding.	Navigate to Subscription Management > Subscriptions in your instance. The list displays the subscriptions that your organization has purchased.

Role required: admin

About this task

Activate the PPM Standard plugin (com.snc.financial_planning_pmo) in your ServiceNow instance before you install Scenario Planning for PPM. For more information see, [Activate PPM Standard \(Project Portfolio Management\)](#).

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the application using the filter criteria and search bar.

You can search for the application by its name (Scenario Planning for PPM) or ID (sn_pw_scenario). If you cannot find an application, you may have to request it from ServiceNow store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. Click **Install**.
4. In the Application installation dialog box, review the application dependencies.

Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If there are any plugins or applications that need to be installed, you must install them before you can install Scenario Planning for PPM.

5. **Optional:** If demo data is available and you want to install it, click **Load demo data**.

(Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

i Important:

If you don't load the demo data during installation, it's unavailable to load later.

6. Click **Install**.

Related topics

[List of plugins \(Zurich\)](#) 

Components installed with Scenario Planning for PPM

Several types of components are installed with the installation of the Scenario Planning for PPM application, including tables and demo data.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#) .

Tables installed with Scenario Planning for PPM

Table	Description
Portfolio Scenario [sn_pw_scenario_pm_portfolio_scenario]	Stores portfolio planning scenario information such as name of the scenario, state of the scenario, fiscal year, and name of the portfolio to which the scenario belongs.
Portfolio Scenario Funding [sn_pw_scenario_pm_portfolio_scenario_funding]	Stores the funding information about the portfolio planning scenarios. The funding information includes the name of the scenario, operating budget, capital budget, total budget, and whether a demand or project is selected for execution.
Scenario Planning Configuration [sn_pw_scenario_pm_portfolio_scenario_configuration]	Stores the portfolio planning configuration information such as planning type and scope.
Portfolio Planning Window [sn_pw_scenario_pm_planning_window]	Stores the planning window information of a portfolio for multi-year and resource capacity-based planning.

Annual and multi-year resource capacity-based planning

Plan your portfolios using scenarios for a single fiscal year or multiple years after analyzing utilization of resources against available capacity. Include demands and projects in all portfolios or a single portfolio to evaluate, prioritize, and select demands and projects that match your business objectives.

Plan your portfolio and select demands and projects that you want to execute within the target budget. Create scenarios to analyze your portfolio's alignment with the organization's business objectives. The Scenario Planning for PPM application enables you to evaluate multiple sets of forecast scenarios and analyze investments consistently.

Annual financial and resource capacity-based planning

Plan your portfolio for a single fiscal year. You can select all your portfolios or a single portfolio for planning. After selecting your portfolio, you can create multiple scenarios to evaluate the demands and projects based on total cost, resource usage and capacity, and strategic objectives.

In the annual planning, you create scenarios with different combinations of demands and projects from a specific portfolio or all portfolios for a specific financial year. Based on your selection of demands and projects, analyze the resource allocation for the selected demands and projects derived from the associated resource plans. After analyzing the resource availability and capacity, modify your selection of demands and projects in different scenarios and confirm a scenario that maximizes your returns and add financial value to the organization.

i Important:

The default configuration is **Annual Financial and Resource Capacity Based Planning** and **single selected portfolio** for new installation or upgrade. You can change the planning configuration to plan for multiple years and all portfolios.

Investment funding integration

Integrate Scenario Planning for PPM with Investment Funding to retrieve the target amount for a portfolio or all portfolios from a top-level investment fund for annual financial and resource capacity-based planning. If you are planning for a single portfolio, the target amount of that portfolio is retrieved from the **New Fund** column for that portfolio investment and fiscal period in a top-level investment. If you are planning for all portfolios, you can configure the funding entity for which the organization must be funded, and then the investment planner can add funds for that particular entity in a top-level investment. For example, if your organization is a business unit, you can enable that business unit as the funding entity, and all the funds allocated to that business unit are set as the target for your organization.

i Note:

When you upgrade Scenario Planning for PPM to 2.3.0 or later version, the legacy Investment Funding must be upgraded to ServiceNow Store for the integration to work. For detailed instructions on upgrading from legacy Investment Funding to the ServiceNow Store application, see [Upgrading legacy Investment Funding to Store application](#).

Multi-year, resource capacity-based planning

Multi-year planning enables you to plan your portfolio using a planning window ranging from three to 24 months. If your portfolio consists of demands and projects spanning more than one year or if you are planning for a longer duration, you can plan your portfolio in smaller planning windows. The multi-year planning enables you to analyze resource usage for different demands and projects during the selected planning window and adjust your priorities to accommodate any changes to budget, resources, or business environment.

In the multi-year planning, you create scenarios similar to the annual planning, but for a specified planning window for a specific portfolio or all portfolios. Based on your selection of demands and projects, analyze the resource allocation for the selected planning window. After analyzing the resource availability and capacity, modify your selection of demands and projects in different scenarios and confirm a scenario that maximizes your returns and add financial value to the organization.

Configure the scenario planning type and scope

Configure the scenario planning type and select the scope of portfolios to determine the way you want to plan and work on your portfolios. You can also specify using Investment Funding for funding demands and projects in your portfolios.

Before you begin

i Important:

Modifying the planning type and scope deletes all your existing scenarios and confirmed plans.

Role required: it_pps_admin

About this task

The option to use Investment Funding for funding your portfolios is available only when you activate the Investment Funding plugin.

Procedure

1. Navigate to **All > Project > Portfolios > Configure Planning**.
2. Open the scenario planning configuration record.
3. Configure the planning type and scope.
4. **Optional:** If you want to enable selection of demands and projects that are in completed or inactive state, select **Allow Selection of Completed Projects**.
5. **Optional:** If you want to retrieve the target amount from Investment Funding, select **Investment Funding Integration**.

i Note:

This option is available only when the Investment Funding for PPM (com.snc.investment_planning_pmo) plugin is active and planning type is selected as **Annual Financial and Resource Capacity Based Planning**.

- If the planning scope is **Single Selected Portfolio**, the target amount of that portfolio is retrieved from the **New Fund** column for the selected portfolio investment. For more information, see [Allocate funds to an investment](#).
- If the planning scope is **All Portfolios**, specify a source to retrieve the target amount.
 - a. Select a funding entity from the Funding Entity list from which your demands and projects will be funded.
 - b. Select the transaction table for the selected funding entity from the Funding Record list.

6. Click **Update**.

Result

The scenario planning configuration is updated and all scenario plans and confirmed plans are deleted. The configuration changes also updates the Portfolio Planning Workbench to enable you to do scenario planning based on the updated planning type and scope.

Impact of modifying the scenario planning type and scope

Modifying the planning type and scope impacts the demands and project selection in your planning scenarios and portfolio planning. You can change the planning type and scope at any time during portfolio planning.

Changing the planning type

Changing the planning type affects your portfolio planning regardless of whether the portfolio has any confirmed plan or planning scenarios in it at the time of this change.

From annual financial planning to multi-year, resource capacity based planning

This change in the planning type has the following impact on your confirmed plans and planning scenarios:

- Deletes all scenarios and scenario funding records.
- A default scenario is created with the current month as starting month and a default of 3-month planning window.

From multi-year, resource capacity based planning to annual financial planning

This change in the planning type has the following impact on your confirmed plans and planning scenarios:

- Deletes all scenarios and scenario funding records.
- If you were previously using annual planning, the target budget is retrieved. If not, the current fiscal year is set as default and you must set the target budget.

Changing the planning window

Changing the planning window effects all the users involved in planning and has the following impact on your portfolio planning:

- The new planning window applies to all scenarios and the confirmed plan of every portfolio.
- A demand or project outside of the selected planning window cannot be selected or deselected. However, the value of **Planned** check box for the project or demand will not change. These demands and projects continue to be related to the scenario.
- When you confirm a scenario, only the demands and projects that fall in the planning window are confirmed, the demands and projects outside the planning window are not confirmed.

Changing the planning scope

Changing the planning scope from a single selected portfolio to all portfolios has the following impact on your confirmed plans and planning scenarios:

- In case of annual planning, creates a portfolio planning record in the Tracking state if a confirmed plan exists for any of the portfolios.
- In case of annual planning, creates a confirmed plan for all the fiscal years with at least one confirmed plan for any of the portfolios.
- In case of multi-year planning, your confirmed plans for the portfolios are retained.
- Deletes all existing scenarios and scenario funding records.

Set target budget for a fiscal year

When planning for a portfolio or all portfolios, start by selecting the fiscal period for the demands and projects that you want to work with. You then set the target amounts for both operating and capital expenses of portfolios when Scenario Planning is not integrated with Investment Funding.

Before you begin

Role required: it_portfolio_manager or it_pps_admin

About this task

Internal groups typically provide the target amount for a fiscal year. The target for the planned fiscal year can be 110% of the amount spent in the last year based on actual expenditure. The target is the starting point for planning projects for the next fiscal year.

Note:

The PPS admin can set the portfolio target by navigating to **Project Administration > Enter Portfolio Target**.

If Scenario Planning is integrated with Investment Funding, the target amount is retrieved from the top investment fund allocated for a single portfolio or all portfolios.

For information on how to configure the investment funding settings for a single portfolio or all portfolios, see [Configure the scenario planning type and scope](#).

For information on creating a top level investment and allocating funds, see the [Create a top-level investment](#) topic.

Procedure

1. Navigate to Portfolio Planning Workbench from either of two starting points.
2. In the Portfolio Planning Workbench **Fiscal Year** choice list, select the year that you want to perform the planning for.
You can perform financial planning for only one fiscal period at a time.
3. Set or update the target budget amount.
 - If you're planning for the selected fiscal year for the first time, select **Set Target**.
 - If you have already set the target budget amount for the selected fiscal year and you want to change the amount, select **Edit Target**.
4. In the Set Target dialog box, enter the amounts for **Capex Target** and **Opex Target**.
5. Select **Save**.

Result

The portfolio capital and operational expense target for different fiscal years are updated in the **Portfolio Target** related list on the portfolio record.

What to do next

Start creating scenarios for portfolio planning. For more information, see [Create planning scenarios](#).

Create planning scenarios

Create planning scenarios with different combinations of projects and demands in your portfolio. Experiment with different scenarios to plan your budget expenditure for a fiscal year.

Before you begin

Ensure that you have set the target budget for the fiscal year for which you want to create a planning scenario for annual type of planning. For more information, see [Set target budget for a fiscal year](#). Setting of target is not required for multi-year resource capacity type of planning.

Role required: it_portfolio_manager

About this task

You can create up to four planning scenarios with different combinations of projects and demands for execution. For example, you might create a scenario A and select all the projects and demands with your standard resource allocation. If you're aware that a risk might affect the business outcome, you can create a scenario B with a reduced number of projects and demands to see whether that strategy might mitigate or avoid the risk. For more information about defining scenarios, see [Scenario Planning for PPM](#).

Procedure

1. Navigate to the Portfolio Planning Workbench from either of two starting points.
2. In the Planning Portfolio Workbench, create a scenario for annual financial and resource capacity based planning or multi-year resource capacity based planning.
 - For annual planning, perform the following steps:

- a. Select the fiscal year for which you want to create a planning scenario.
- b. Click the **Start Planning** button on the Welcome page.
A default planning scenario is created with all active demands and projects for the selected fiscal year.

Note:

If a portfolio plan exists for the selected fiscal year, the Portfolio Planning Workbench displays it as the current plan.

- c. Click the create scenario icon ().
- d. In the Create Scenario dialog box, enter a name and short description for the scenario.
- e. In the Copy Data From list, select the source for copying data.

The available options are:

- **None:** Creates a scenario with no projects or demands selected.
 - **Ongoing projects funded last year:** Creates a scenario using projects funded during the previous year and continuing in the current year selected. This option is available only if an existing approved plan for the previous year exists. This is the default option when you create an initial scenario for a given fiscal year.
 - **A list of other scenarios:** Creates a scenario using projects and demands selected from another existing scenario. This option is available if other scenarios exist for the same portfolio for the same fiscal year.
 - **Confirmed Plan:** Creates a scenario with projects and demands selected from the existing approved plan. This option is available only if a confirmed plan exists for the current fiscal year.
- f. Click **Save**.
 - For multi-year planning, a default plan is automatically created with the current month as the starting month, and the planning window period as configured in the Scenario Planning Configuration page. To create a new scenario, perform the following steps:

- a. Click the create scenario icon ().
- b. In the Create Scenario dialog box, enter a name and short description for the scenario.
- c. In the Copy Data From list, select the source for copying data.

The available options are:

- **None:** Creates a scenario with no projects or demands selected.
- **Ongoing projects funded last year:** Creates a scenario using projects funded during the previous year and continuing in the current year selected. This option is available only if an existing approved plan for the previous year exists. This is the default option when you create an initial scenario for a given fiscal year.

- **A list of other scenarios:** Creates a scenario using projects and demands selected from another existing scenario. This option is available if other scenarios exist for the same portfolio for the same fiscal year.
- **Confirmed Plan:** Creates a scenario with projects and demands selected from the existing approved plan. This option is available only if a confirmed plan exists for the current fiscal year.

d. Click **Save**.

Result

The planning scenario is created and displayed in a new tab.

What to do next

Select [projects and demands for execution](#) in the planning scenario.

Select demands and projects for portfolio planning

After you create a planning scenario, select the demands and projects to include in budget planning. You can view all the demands and projects for the selected fiscal year or planning window with their planned cost and priorities to finalize them for execution.

Before you begin

You should have at least one planning scenario. For more information, see [Create planning scenarios](#).

Role required: it_portfolio_manager

About this task

You can perform a what-if analysis by including or excluding demands or projects and their planned cost for annual type of planning. The planned cost is derived from all the cost plans created for a project or demand. It is the total of all the costs from all cost plans for a given project or demand in the fiscal year or planning window.

You can perform a what-if analysis by including or excluding demands or projects and their planned cost, budget, and utilization for multi-year resource capacity type of planning.

Procedure

1. Navigate to Portfolio Planning Workbench from either of two starting points.
2. In the Portfolio Planning Workbench, click the scenario for which you want to include or exclude demands and projects.
The projects and demands from the selected portfolio appear on the **Timeline View**.
3. **Optional:** Compare and evaluate the relative standing of demands using the **Bubble Chart** tab.

(Optional) Right-click a demand and select **Select for execution** from the context menu to include a demand in portfolio planning. For more information, see [Demand workbench bubble chart](#). You can search for specific demands by applying filters using the Filter() icon.

Note:

The **Bubble Chart** tab is not available for Multi-year Resource Capacity Based Planning configuration.

4. Include or exclude demands and projects from planning in the **Timeline View** tab by selecting or clearing the check boxes next to each project or demand.
You can search for specific demands and projects in the timeline by applying filters using the Filter() icon.
The number of selected project and demands is updated in the **Selected Items** section of the **Overview** tab.
5. **Optional:** Review the external dependencies between the selected projects in your portfolio.
For more information, see [Review external dependencies between projects](#).
6. Review the information in the Overview section on the right, and the **Resources** tab to evaluate and adjust your selection of the demands and projects to be included in the plan.
Review the following sections in the **Overview** tab:
 - Total budget versus the targets that you entered in the **Set Target** stage in the **Budget vs. Target** section for annual type planning. If the total budget is more than the target cost, an exception icon () is shown with the total planned cost.
 - Total planned cost for all the projects and demands for multi-year type planning in the **Total Planned Cost** section.
 - Potential benefit amount that would accrue on execution of the selected demands and projects in the **Benefit Amount** section.

 **Note:**

For multi-year resource capacity type planning, the total value of planned cost and benefit for the entire duration of the projects or demands is displayed irrespective of the selected planning window.

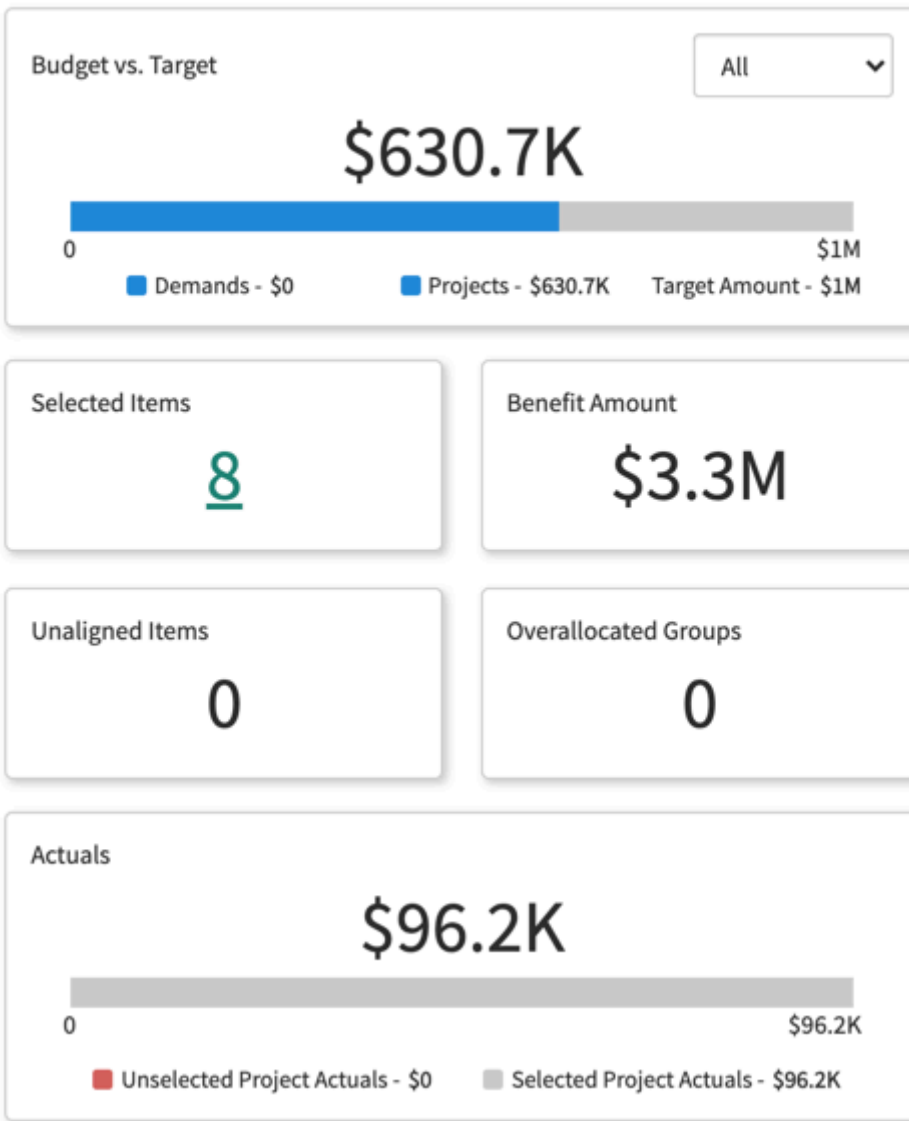

- Strategic alignment of your portfolio by viewing the number of demands and projects that are not associated with any organizational strategy or goal in the **Unaligned** section.
- Number of assignment groups where, for any quarter of the selected fiscal year, the number of requested hours is greater than the total hours capacity in the **Overallocated Groups** section.
- Review how much in actuals have been spent on the projects selected for execution and the rest of the projects in your portfolio in the **Actuals** section.

 **Note:**

For multi-year resource capacity type planning, the actuals value is displayed in the widget without the selected and unselected project actual legends.

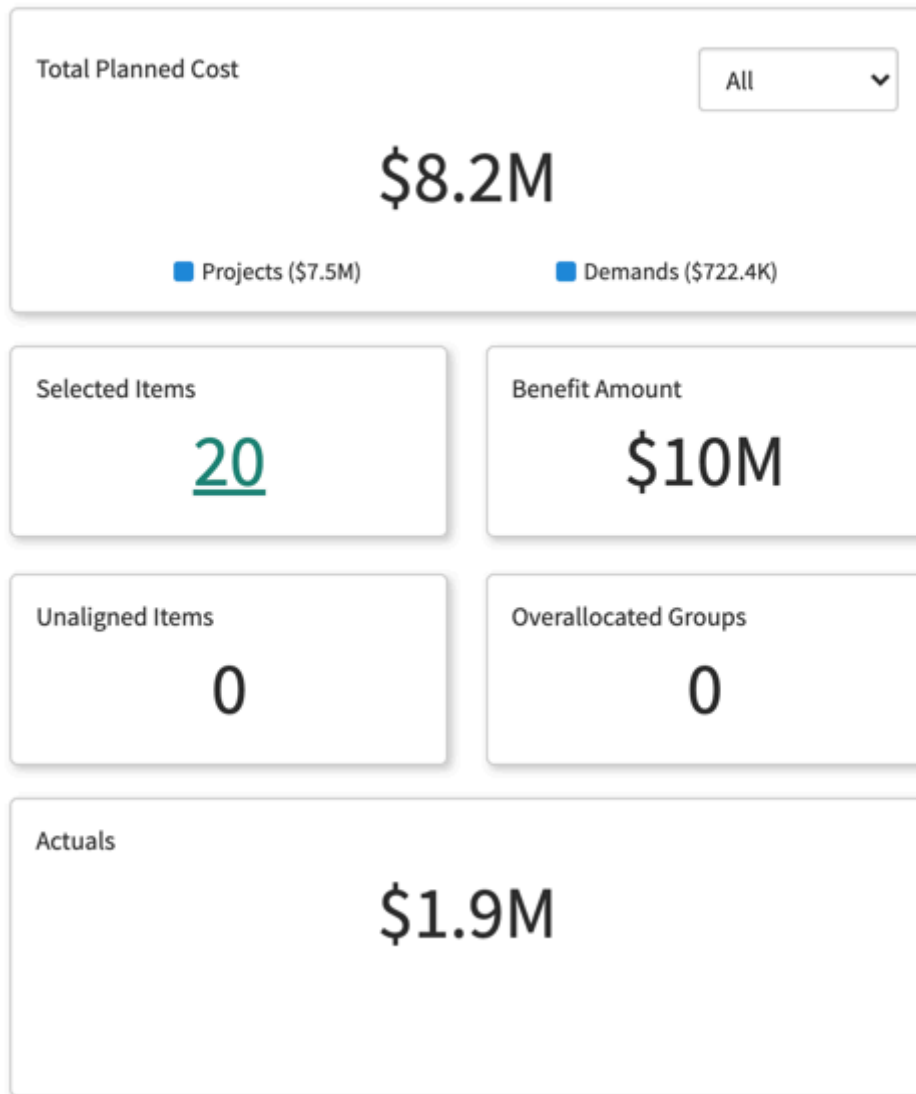

The following image shows an example of how the portfolio information is displayed in the Overview section for annual type planning.

Overview

The following image shows an example of how the portfolio information is displayed in the Overview section for multi-year type planning.

Overview

Review the following sections of the **Resources** tab:

View percentage of utilization for all the resources requested by the selected demands and projects of the portfolio in a heat map. You can view the percentage utilization of all resource groups or overallocated resource groups in months or quarters.

Tip:

Click any cell in the heat map to view the project or demand associated with the selected resource group.

The following image shows an example of how the resource information is displayed in the heat map.

	Month	All Groups				
Analysts	31	34	33	55	105	162
Architects	0	0	0	5	7	33
Core R&D group	0	0	0	0	0	10
Database Atlant...	0	0	0	0	0	15
Java Developers	0	0	0	16	30	28
Network	5	4	4	9	10	10
Technical Suppo...	0	0	0	8	11	16
	Oct 2020	Nov 2020	Dec 2020	Jan 2021	Feb 2021	Mar 2021

Tip:

To bring the planned cost within the target budget and the resource utilization within 100%, consider deselecting a few low-priority demands or projects. Deselected demands and projects could then be moved over to a different fiscal period

7. Optional: Review the capex and opex budget for individual projects and demands directly using **Capex Budget** and **Opex Budget** columns and revise it if necessary.

Note:

Click the Show or hide columns (⚙️) in the **Timeline View** tab and add the **Capex Budget** and **Opex Budget** columns if these columns are not visible.

8. Optional: Update the name and short description by clicking the edit icon (✎) and making the modifications.

9. Optional: Delete the scenario by clicking the delete icon (🗑️).

10. Optional: Convert the selected scenario to become the current plan by clicking **Confirm**.

11. Optional: Create more planning scenarios to compare them.

12. Optional: Manually refresh the cost and resource widgets after a demand or a project is selected or cleared for execution by clicking the Refresh icon (🔄).

What to do next

Compare planning scenarios to analyze different combinations of projects and demands and select a scenario that best aligns with your organizational goals. For more information, see [Compare planning scenarios](#).

Review external dependencies between projects

Review the external dependencies between projects in a portfolio to track projects that are dependant on each other more closely.

Before you begin

Role required: it_portfolio_manager

Open demands and projects in the timeline view of the Portfolio Planning Workbench.

About this task

As a portfolio manager, you may want to know the projects which are dependent on each other so that these projects can be tracked more closely.

For example, project B is dependent on project A (external soft dependency) and you want to make sure that project A is executed on time so that the schedule of project B is not affected. The

Dependencies column shows that there is an outgoing external dependency from project A and an incoming external dependency to project B. You can the use the incoming dependency to determine whether a delay in project A will affect project B.

Procedure

1. Click the show or hide columns in gantt icon () in the timeline view and add the **Dependencies** column if it is not visible.
The number of incoming and outgoing external dependencies are displayed, if any.
2. Click the external dependency in **Dependencies** column for the project.
3. In the **Dependencies** pop-up dialog, click a tab to review the dependency:

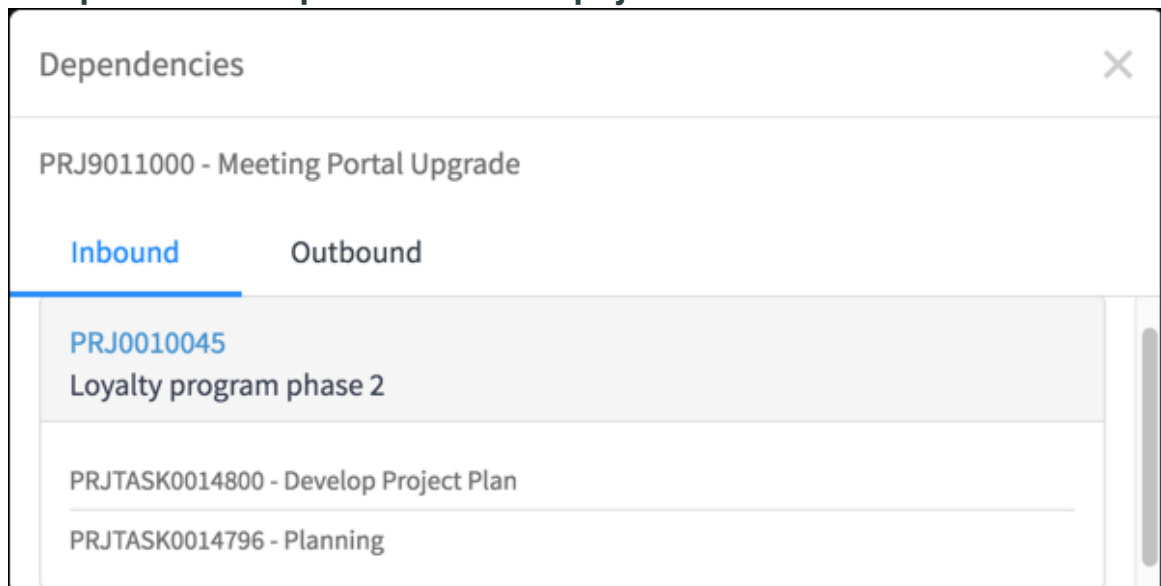

Inbound tab

Tasks that have an incoming dependency from a project are listed.

Outbound tab

Tasks with an outgoing dependency to the project are listed.

Example of external dependencies between projects

4. Click the project number in a tab to open and review the linked project in the planning console view.

Rank demands and projects

Rank demands and projects to prioritize demands and projects for their approval and execution within a portfolio.

Before you begin

Role required: it_portfolio_manager

About this task

By default, the Rank By Score list ranks demands and projects based on system-generated scores. Rank of a demand or project is specific to a fiscal year. A project can be ranked as third in FY17 but ranked sixth in FY18.

Procedure

1. Navigate to Portfolio Planning Workbench from either of two starting points.
2. **Optional:** Adjust the rank automatically or manually.

Example:

The following table explains manual adjustment of ranks.

Scenario for edit rank	Rank update	Rank before manual edit	Rank after manual edit
If initial rank is 0 or blank and other ranks are present, then after edit, the successive ranks get incremented by 1.	<ul style="list-style-type: none"> • Initial rank: 0 • Edited rank: 2 	<ul style="list-style-type: none"> • Task_1: 0 • Task_2: 1 • Task_3: 2 • Task_4: 3 	<ul style="list-style-type: none"> • Task_2: 1 • Task_1: 2 • Task_3: 3 • Task_4: 4
If initial rank > edited rank, then after edit, the successive ranks get incremented by 1.	<ul style="list-style-type: none"> • Initial rank: 4 • Edited rank: 1 	<ul style="list-style-type: none"> • Task_1: 1 • Task_2: 2 • Task_3: 3 • Task_4: 4 	<ul style="list-style-type: none"> • Task_4: 1 • Task_1: 2 • Task_2: 3 • Task_3: 4
If initial rank < edited rank and there is no gap in rank sequence, then after edit, the previous ranks get decremented by 1.	<ul style="list-style-type: none"> • Initial rank: 1 • Edited rank: 3 	<ul style="list-style-type: none"> • Task_1: 1 • Task_2: 2 • Task_3: 3 • Task_4: 4 	<ul style="list-style-type: none"> • Task_2: 1 • Task_3: 2 • Task_1: 3 • Task_4: 4
If initial rank < edited rank and there is a gap in rank sequence, then after edit, the successive ranks get incremented by 1.	<ul style="list-style-type: none"> • Initial rank: 1 • Edited rank: 4 	<ul style="list-style-type: none"> • Task_1: 1 • Task_2: 2 • Task_3: 4 • Task_4: 5 	<ul style="list-style-type: none"> • Task_2: 2 • Task_1: 4 • Task_3: 5 • Task_4: 6

Compare planning scenarios

Compare various planning scenarios with your current or default plan to assess different combinations of projects and demands in your portfolio for execution. You can perform a what-if analysis and determine the planning scenario that optimally achieves the target budget and uses your resources.

Before you begin

Ensure that you have created up to four planning scenarios and selected projects and demands for execution. For more information, see [Create planning scenarios](#) and [Select demands and projects for portfolio planning](#).

Role required: it_portfolio_manager

Procedure

1. Navigate to Portfolio Planning Workbench from either of two starting points.
2. In the **Plan** tab of the Portfolio Planning Workbench, click **Compare Scenarios**.
The Compare Scenarios page displays all the planning scenarios.
3. Compare different aspects of the scenarios such as costs, number of projects and demands, benefit amount, and actuals for the selected projects and demands.
4. Compare the variance between the scenarios for costs, number of projects and demands, benefit amount, actuals for the selected projects and demands, and so on.
The variance value for different fields is displayed in red or green color. For example, if the planned cost of a scenario is greater than the planned cost of the confirmed plan, the planned cost variance is displayed in red. Or if the benefit amount of a scenario is greater than the benefit amount of the confirmed plan, the benefit amount variance is displayed in green.

What to do next

Confirm a scenario that best aligns with your organizational objectives, optimally achieves your target budget, and uses your resources. For more information see, [Confirm a planning scenario](#).

Confirm a planning scenario

Select and confirm a scenario to allocate budget and resources for executing the selected demands and projects in a fiscal year.

Before you begin

Ensure that you have created up to four planning scenarios and selected projects and demands for execution. For more information, see [Create planning scenarios](#) and [Select demands and projects for portfolio planning](#).

Role required: it_portfolio_manager

Procedure

1. Navigate to Portfolio Planning Workbench from either of two starting points.
2. In the Project Planning Workbench, confirm a scenario as your current plan for the fiscal year using one of the following options:
 - Select a scenario and click **Confirm**.
 - Click **Compare Scenarios** and, in the Compare Scenarios page, click **Confirm Scenario**.
 - If you are overriding an already confirmed plan, click **Override**.

3. In the Confirm dialog box, set additional options to be performed on the selected demands and projects after the planning scenario is saved.

Note:

When a confirmed plan exists, the name of the dialog box is Override Selection rather than Confirm.

- If the **project property Create project(s) on confirming demands from portfolio workbench** is set to false, you can choose to approve all the selected demands after the save by selecting **Approve all selected demands (if not approved already)**.
- If the **project property Create project(s) on confirming demands from portfolio workbench** is set to true, you can choose to convert the selected demands to projects after the save by selecting **Convert all the selected demands to projects**.
- Confirm the resources for selected demands and projects by selecting **Confirm resources for selected demands or projects**.
- If the confirmed and allocated resource plans associated with the demands and projects that are newly unselected do not have any actual hours associated with them, then select **Unconfirm the resources for the unselected demands and projects (only those resources where there is no actual hours/cost captured will be unconfirmed)** to change the state of such resource plans to requested. If the confirmed and allocated resource plans have actuals associated with them, a notification is sent to the project or demand managers specifying that they need to manually release such resources.
- Delete all the unconfirmed working scenarios after confirmation of the selected scenario by selecting **Delete all working scenarios**. This option is selected by default.

4. Click **Save**.

Result

Budget is allocated to selected demands and projects. The remaining demands and projects are removed from execution. However, resources already confirmed for the unselected demands and projects are not removed automatically.

Track the progress of a portfolio

After confirming a scenario to complete planning of your portfolio, track the progress of the portfolio. You can also monitor the status of cost, resource, schedule, and scope for the selected fiscal period or planning window for the portfolio.

Before you begin

Role required: it_portfolio_manager

Procedure

1. Navigate to Portfolio Planning Workbench from either of two starting points.
2. In the Portfolio Planning Workbench, click the **Track** tab.
The status of projects and demands is displayed in the **Timeline View** tab with a Gantt chart over time and a **KPIs** tab.
3. Track the progress of your portfolio by reviewing the status of key parameters in the **Timeline View** tab.

- Details such as planned and actual costs, variance, planned and end dates, and priorities for the selected demands and projects.
 - Identify the projects that are dependent on each other by viewing external dependencies between projects in a portfolio. For more information, see [Review external dependencies between projects](#).
 - Track the current status of an individual project by viewing the latest project status report by selecting the **Status Report** option.
 - Track the progress of project tasks in an individual project in your portfolio using the **Planning Console** option. This option is available in the context menu for a project.
- 4.** Check status information such as the overall health, schedule, cost, resources, and scope of all selected projects in the portfolio in the **Project KPIs** tab. The most recent status report created for a project populates this information. Point to a status indicator to view comments entered by the project manager for that KPI.

Note:

A grey X icon () next to any project KPI indicates that the project manager has not entered any comments for that aspect in the status report.

- 5.** Review cost and resource-related information in the **Cost (Budget vs. Actual)** and **Resource (Allocated vs. Actual)** charts.
- View the comparison of actual costs from all selected projects in the portfolio with the planned cost shown in the **Cost (Budget vs. Actual)** chart. The actual cost for projects is derived from the expense lines.

Note:

The **Cost (Budget vs. Actual)** graph is not available for multi-year type planning.

- You can view only Capex or Opex or both by selecting the respective option from the list.
 - Check how the allocated resources are being used by viewing the comparison of actual resource time spent on all project tasks with the resource hours allocated to execute the selected projects and demands in the portfolio shown in the **Resource (Allocated vs. Actual)** chart. The actual time spent is taken from processed time cards for the projects.
- 6.** Track the risks, issues, decisions, actions, and the project change requests across all selected projects in the portfolio by going to the **Risks, Issues, Decisions, Actions, and Changes** tabs.

Portfolio Dashboard

Portfolio Dashboard provides a central location to a portfolio manager to generate different graphical reports of the portfolios.

From Madrid release onward, the portfolio manager dashboard has been deprecated and replaced with the PMO dashboard. Use the PMO dashboard to gain insights about your portfolios. For more information, see [PMO Dashboard](#).

Access the Portfolio Dashboard

View different graphical reports on the PMO Dashboard.

Before you begin

Role required: it_portfolio_manager

Procedure

Navigate to **Project > Portfolios > Portfolio Dashboard**.
The PMO Dashboard is displayed.

Program Management

A program helps you to logically group related projects or demands under a single entity. The ServiceNow® Program Management application helps you to manage related projects and demands in coordinated way which is not possible when projects and demands are managed independently.

The `it_program_manager` role is essential to be able to manage programs. The Program Management application provides the following capabilities to the program manager:

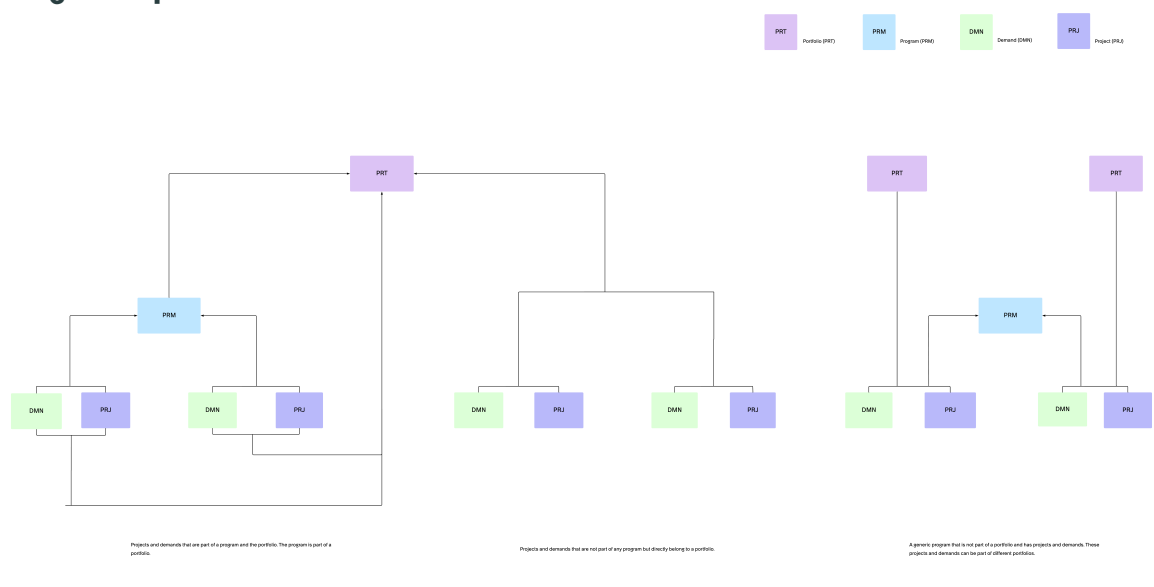

- Create a program by adding related projects and demands.
- Create tasks specific to the program. These tasks are essential for completion of the program but are outside the scope of projects.
- Define key milestones, anticipated risks, and issues for the program.
- Monitor the progress and status and of all the projects and demand that are part of the program. Program manager can track the costs, resources, and schedules.

When you create a program, consider:

- A program can be part of a portfolio or can be a generic standalone program that is not part of any portfolio.
- A program cannot be part of multiple portfolios.
- A project or demand cannot be part of multiple programs.
- You can have projects and demands that can directly be part of a portfolio and not part of a program.

The following diagram illustrates how you can implement programs.

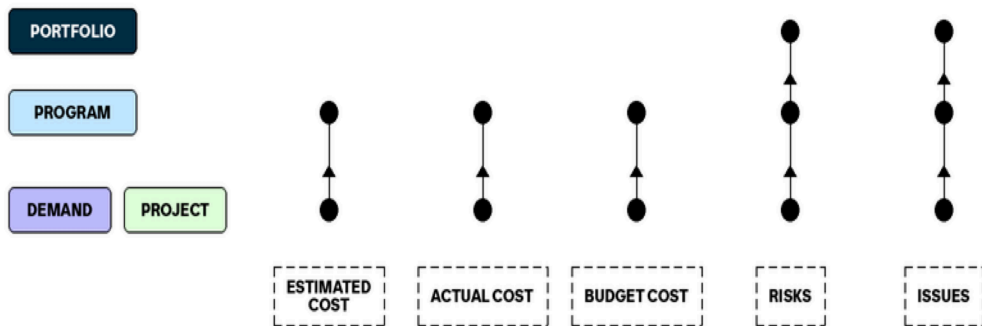

Program implementation

Basics of Program Management

When you create a program, you can add multiple projects or demands to it. If you have created cost plans for the projects and demands, certain values are rolled up from the cost breakdown of program. At the same time, the risk and issues of the projects and demands are also included with the program. The following diagram illustrates how information in the program is related to the projects and demands that are part of the program.

Information population in program

If you have created cost plans for the projects and demands, these values are rolled up from the cost breakdown of program.

Program contains risks and issues of program, project and demand. Portfolio contains risks and issues of the portfolio, program, project, and demand.

Project workbench provides graphical charts to view and monitor the progress of the program and the projects and demands that are part of it. You can also view the progress of a program, projects, and demands against a timeline with the details of milestones and key milestones.

The project manager dashboard provides a central location to a program manager to generate different graphical reports of programs and the program financials.

Creating programs: approval and business case workflow

Programs in ServiceNow® follow a different creation pattern than projects:

Why programs don't typically come from demands

- Demand workflow: demand → approval → convert to project
- Program workflow: strategic initiative → executive approval → create program directly
- Programs are strategic multi-project containers decided at executive/portfolio level, not operational demands. They represent multi-year transformations such as digital transformation and cloud migration, rather than single deliverables.

Recommended program approval workflow

1. Strategic planning phase: Create Initiative planning item in Strategic Planning for the strategic program
2. Business case development: Attach business case document to Initiative; define scope, budget (\$1M+), timeline (2-5 years)
3. Executive approval: Present Initiative with business case to steering committee or executive sponsor for approval

4. Program creation: After approval, create Program record in PPM with reference to approved Initiative
5. Project breakdown: Create constituent projects under the program (these can come from demands)

Alternative: Demand-based program creation (if needed)

If your organization requires formal demand intake for programs:

1. Create Demand with **Category** as Program Request.
2. Attach program business case to Demand.
3. Route through demand approval workflow.
4. After approval, manually create Program (no automatic conversion like demand→project).
5. Link Program to source Demand via reference field.

Program vs Project decision criteria:

- Use Program when: Multi-project initiative, \$1M+ budget, 2+ year duration, cross-organizational scope
- Use Project when: Single deliverable

Create a program to manage projects and demands

Create a program to manage related projects and demands. Define the duration, estimated cost, benefits, and ROI to the organization.

Before you begin

Role required: it_program_manager

Procedure

1. Navigate to **All > Project > Programs > Create New.**
2. On the Program form, fill in the fields.

Program form

Field	Description
Program Name	Name of the program.
Program manager	Program manager assigned to the program.
Number	System-generated number with a configurable prefix.
Portfolio	Portfolio to which the program belongs. If you do not select a portfolio for the program, the program becomes a global program. You can associate the projects and demands in a global program with any portfolio.
Priority	Priority associated with the program.

Field	Description
Status	Status of the program. This information rolls up from the status of all the projects that are part of this program.
State	<p>Current state of the program.</p> <p>Default states: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, Closed Skipped.</p> <p>Note: Set the state of the program to Closed manually. The program state does not roll up to a Closed state when program tasks, projects, and demands move to Closed state.</p>
Phase	Current phase of the program such as Initiating, Planning, and Executing.
Business Unit	The business unit to which this program belongs.
Investment Type	<p>Investment type of the program.</p> <p>The default available options are Cost Reduction, End User Experience, Legal and Regulatory, Revenue Generating, Service Sustaining, and Strategic Enabler.</p>
Impacted Business Units	Business units of the organization that this program affects.
Strategies	<p>Strategic objectives of the organization that the program fulfills. A program can fulfill multiple strategic objectives.</p> <p>Note: Leave this field empty if the program does not fulfill any strategic objective.</p>
Goals	<p>Goals associated to the selected strategy. A program can fulfill multiple goals.</p> <p>If you do not select a strategy, then the Goals list displays all goals in the system.</p> <p>Note: Leave this field empty if there are no goals associated with the program.</p>
Description	Detailed description of the program.

Dates section of the Program form

Field	Description
Planned start date	<p>Intended program start date. If the start date of associated program tasks, projects, and demands is earlier than the program start date, the start date is adjusted to an earlier date.</p> <p>Removal of a demand or project from the program does not affect the planned start date of the program.</p>

Field	Description
Planned end date	<p>Intended program end date. The end date extends based on the end date of the program tasks, projects, and demands.</p> <p>Removal of a demand or project from the program does not impact the planned start date of the program.</p> <p>You can adjust the program end date manually, based on the start and end date of the associated program tasks, projects, or demands.</p> <p>Note: If a demand with end date later than the program end date is added, the Planned end date field becomes read only.</p>
Planned duration	Expected duration of this program. The planned duration changes based on the changes in planned start or end date of the program.
Actual start date	Date on which the program actually starts.
Actual end date	Date on which the program actually ends.
Actual duration	Actual duration of the program from program start to program closure.

Financials section of the Program form

Field	Description
Total planned cost	<p>Estimated cost of the program.</p> <p>If there is operational expenditure and capital expenditure associated to the program, then planned cost is sum of operational expenditure and capital expenditure, which is in functional currency.</p>
Planned capital	Capital expenditure (Capex) for the program. If there are no cost plans associated to the program, the Capital expense field is editable. Select a currency type and enter a value.
Planned operating	Operational expenditure (Opex) for the program. If there are no cost plans associated to the program, the Operational expense field is editable. Select a currency type and enter a value.
Budget cost	Budgeted cost for this program.
Actual cost	Actual cost of the program.

Field	Description
	The value rolls up from the cost plan breakdowns from projects and demands in the program.
Planned benefit	Planned benefit value for the program. This value rolls up from the benefit plan breakdowns of the program. You can also enter the value manually. Select a currency from the Currency Type list and enter a value.
Planned returns	Planned returns is based on the difference between planned benefit and planned cost.
Planned ROI%	The result is derived from the values in the Planned return and Planned cost fields. The formula is: $\text{planned return} / \text{planned cost} \times 100$.
Score	The program score is based on the individual scores of the following attributes: risk score , value score , and size score , which in turn are calculated based on risk, planning ROI%, and estimated cost attributes (on a program) respectively. Note: You can configure the formula for score calculation.
Risk	Risk associated with the program.

3. Click Submit.

What to do next

Use the following related links and lists:

Program form related links

Field	Description
PMO Dashboard	Access the PMO dashboard to view comprehensive reports of the projects and demands in the program.
Program Budget	Allows you to allocate the budget to the program.
Program Workbench	Access the Program workbench to view details of the projects, demands, and program tasks associated with the program.
Status Report	View the most recent program status report or create a new program status report.

Program form related lists

Field	Description
Program Tasks	<p>View the list of all associated program tasks.</p> <p>To create a new program task, click the New button. For more information, see Create a program task.</p>
Projects	<p>View the list of projects included in the program.</p> <p>To create a new project, click New. For more information, see Define a project.</p> <p>To add existing project to the program, click Edit.</p> <p>If you want to create parent-child relationships between projects to establish project hierarchies select the parent project in the Parent field. This organizes large initiatives into manageable subprojects while maintaining consolidated visibility.</p> <p>The subproject now rolls up to the parent project. Progress, costs, and timelines contribute to parent project metrics.</p> <p> Tip:</p> <p>Use project hierarchies when large initiatives require multiple work streams. Parent project = program-level view; subprojects = tactical execution.</p>
Demands	<p>View the list of demands included in the program.</p> <p>To create a new demand, click New. For more information, see Create a demand.</p> <p>To add existing demand to the program, click Edit.</p>
Risks	<p>View the list of risks associated with the projects and demands of the program or the program itself.</p> <p>To create a new risk, click New.</p>
Issues	<p>View the list of issues associated with the projects and demands of the program or the program itself.</p> <p>To create a new issue, click New.</p>

Program form related lists (continued)

Field	Description
Cost plans	View the list of all cost plans for projects and demands that are part of the program.
Benefit Plans	View the list of all benefit plans for projects and demands that are part of the program.
Program Budget	View the program budget according to fiscal years. Click the amounts in the list to revise them.
Program Status Reports	View the list of status reports for the program. To generate a new status report, click New . For more information, see Create a program status report .

Create a program task

You can create program tasks from the Program form related lists.

Before you begin

Role required: it_program_manager

About this task

Procedure

1. Navigate to **Project > Programs > All**.
2. Select the program from the list.
3. In the Program Tasks related list, click **New**.
4. Fill out the form fields (see table).
There are a few fields that are populated after the task is created.
5. Click **Submit**.

Result

The new task appears in the **Program Task** related list on the Program form.

Program Task form

Field	Description
Short description	[Required] A brief description of the program task.
Number	A system generated number with a configurable prefix.
State	The current state of the program. The states include: <i>Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, Closed Skipped</i> .
Planned start date	The estimated date and time for the program task to start.
Planned end date	The estimated date and time for the program task to end.

Program Task form (continued)

Field	Description
Planned duration	The estimated length of time (from start time to end time) of the program task.
Assigned to	The user assigned to the program task.
Milestone	A milestone is a program task with a duration of zero (0). Use milestones to mark key dates in your program, such as key decision points or approvals.
Key milestone	You can define a milestone as a key milestone to track the program progress. For example, you can create key milestone for completion of deliverables such as a program plan. A key milestone is visible on the program timeline.
Description	A detailed description of the program task.
Additional comments (Customer visible)	Enter information that you want the users to see.
Work notes	Enter work notes about the milestones, impediments, or changes as the program progresses. Note: Users with the business stakeholder role for PPM can view this field. For more information, see Business stakeholder role for PPM .

Fields populated and updated after the task is created

Field	Description
Actual start date	The date that this program started. This date is populated after you update the program state to <i>Work in Progress</i> .
Actual end date	The date that this program ended. This date is populated after you update the program state to <i>Closed Complete</i> .
Actual duration	The actual duration of the program from program start to program closure. As with planned duration, the actual duration shows total program time.

Allocate budget to a program

Set the budget of a program according to the fiscal years.

Before you begin

Role required: it_portfolio_manager

Procedure

1. Open the program form.
2. In the related links, click **Program Budget**.
The **Program Budget** dialog box opens.
3. Select the year for which you want to set the budget for the program.
4. Enter the amounts for **Capex Budget** and **Opex Budget**.

The **Total Budget** is updated with the sum of capex and opex amounts.

5. Click **OK**.

Result

The program budget for the selected year appears in the **Program Budget** related list. You can click the amounts in the list to revise them.

Create a program status report

Create a program status report periodically to view a status rollup of the projects in the program. When you create a status report, the status for different aspects of the program is rolled up from the project status reports of all projects.

Before you begin

Ensure that the **Show on Program Status Report** option in the Project form for all the projects that you want to include in the status report is selected.

Role required: it_program_manager

Procedure

1. Navigate to **Project > Programs > All**.
2. In the program list, open a program record.
3. In the **Program Status Reports** related list, click **New**.
4. On the form, fill in the fields.

Note:

Changing the status for any aspect in the Program Status Report form also updates the corresponding fields in the Program form.

Program Status Report form

Field	Description
Program	Name of the program.
Status Date	Date until which you want to generate the status report. Default value is the current date.
Number	System-generated ID number for the status report with a configurable prefix.

Read-only fields rolled up from the Program form

Field	Description
State	Current state of the program such as Pending, Open, or Work in Progress.
Percent complete	Percentage of the program completed.
Planned start date	Planned start date of the program.
Planned end date	Planned end date of the program.
Actual start date	Actual start date of the program.
Actual end date	Actual end date of the program.

Field	Description
Planned cost	Estimated cost of the program.
Actual cost	Actual cost of the program.

Overall Status section of the Program Status Report form

Field	Description
Overall health	Overall health of the program rolled up from the latest status report of each project in the program. The status is indicated using red, green, and yellow colors as the default.
Executive Summary	Brief summary and analysis of the program.
Comments	Comments about the overall status.
Last Week's Achievements	Description of key tasks completed or any significant progress in the program in the last week.
Key Activities planned	Next planned activities for the program.

Schedule section of the Program Status Report form

Field	Description
Schedule	Status of the program schedule rolled up from the latest project status report of each project in the program. The status is indicated using red, green, and yellow colors by default.
Comments on Schedule	Information related to the program schedule.

Cost section of the Program Status Report form

Field	Description
Cost	Status of the program cost rolled-up from the latest project status report of each project in the program. The status is indicated using red, green, and yellow colors by default.
Comments on cost	Information related to the program cost.

Resources section of the Program Status Report form

Field	Description
Resources	Status of resources rolled-up from the latest project status report of each project in the program. The status is indicated using red, green, and yellow colors by default.
Comments on Resources	Additional information related to program resources.

Scope section of the Program Status Report form

Field	Description
Scope	Status of the program scope rolled up from the latest project status report of each project in the program. The status is indicated using red, green, and yellow colors by default.
Comments on Scope	Information related to the program scope.

5. Optional: Select a different status color to override the rolled-up color for various aspects of the program or select **None** if you do not want the status of an aspect to appear in the program status report.

(Optional) Selecting **None** displays a grey X icon () for that program aspect on the program status report.

The override color that you set is not retained from one report to next. When the next program status report is generated, it takes the color from the associated projects.

6. Select **Submit.**

View program status reports

Program status reports provide the up-to-date at-a-glance progress of all the projects in the program in several categories.

Before you begin

Role required: it_program_manager

About this task

Use the **Program Status Report** related list to view the program status reports created for the program. If no report is listed, [create a program status report](#).

Procedure

1. Navigate to **Project > Programs > All**.
2. In the program list, open a program record.
3. Select the **Status Reports** related link.
4. Select a status report from the top-left corner of the page to view its contents.
5. Review the program status in the report.

Program status report

Section	Description
Overview	Provides general overview information about the program: <ul style="list-style-type: none"> ○ Program Name: Name of the program. ○ Program Manager: The program manager. ○ Portfolio: The portfolio to which the program belongs. ○ Business Unit: The business unit to which the program belongs. ○ Investment Type: Investment type of the program.

Section	Description
	<ul style="list-style-type: none"> ○ Impacted BU: Business units of the organization that this program affects. ○ State: Current state of the program. ○ Phase: Current phase of the program, for example, Initiating, Planning, and Executing. ○ % Complete: Percentage of the program completed. ○ Planned Start Date: Planned start date of the program. ○ Planned End Date: Planned end date of the program. ○ Planned Cost: Estimated cost of the program. ○ Actual Start Date: Actual start date of the program. ○ Actual End Date: Actual end date of the program. ○ Actual Cost: Actual cost of the program. <p>This information rolls up from the Program form.</p>
Summary	<p>Information about the overall health of the program from the most recent status entered by the program manager for the project.</p> <ul style="list-style-type: none"> ○ Executive Summary: Brief summary and analysis of the program. ○ Last Week's Achievements: Progress of the program in the previous week. ○ Key Activities Planned: Next planned activities for the program.
Current Status	<p>Status of program related to overall health, schedule, cost, resources, and scope that is rolled up from the latest project status reports of all projects in the program.</p> <p>If there are multiple project status reports for each of these projects, the values from the latest project status report of each project are aggregated and rolled up to the program status. For more information, see Program Status Report form.</p> <p>Different colors indicate the status of above aspects. The rolled-up color for the final status is in the order red, yellow, and green by default. If there are projects in red, yellow, and green, then the program status is red. If there are projects only in yellow and green, then the program status is yellow.</p> <p>The following image illustrates the color codes for the program status rolled up</p>  <p>from the project.</p> <p>Note: A grey X icon (⊗) for any program aspect means that the program manager has excluded that aspect from the status report.</p>
Project KPI	<p>Status of the Key Performance Indicators for overall health, schedule, cost, resources, and scope for each project in the program. Only projects for which the Show on Program Status Report option in the project form is selected are listed.</p> <p>The value of these KPIs roll up and are shown in the Current Status section of the program status report.</p>

Section	Description
	<p>Note:</p> <p>A grey X icon () next to any project KPI means that the project manager has excluded that aspect from the status report.</p>

6. Optional: If you need a printed copy of the report, click the print icon () in the header of **Status Report** tab.

Example: Program status report

Overview		
Program Name	Program Manager	Portfolio
HR Digital Transformation Program	George Tukis (Program Manager)	HR
Business Unit	Investment Type	Impacted BU
State	Phase	% Complete
Work in Progress	Initiating	5.07
Planned Start Date	Planned End Date	Planned Cost
2019-09-23	2022-01-07	\$3,205,096.70
Actual Start Date	Actual End Date	Actual Cost
2019-09-23		\$25,500.00

Summary
<p>Executive Summary</p> <p>The objective of the Human Resources are Human Resource Planning, Recruitment and Selection, Training and Development, Career Planning, Transfer and Promotion, Risk Management, Performance Appraisal and so on.</p> <p>This program has been started to put a light on all the Human Resources functions and also to enhance and enable the organisations HR process for better employee engagement and streamlined process</p>
<p>Last Week's Achievements</p> <ul style="list-style-type: none"> • Approved web content for the program website • Approved Gate 0 checklist • Drafted RFP
<p>Key Activities Planned</p>

Program workbench

The program workbench is a central location for viewing details of a program and the projects and demands that are part of the program.

The program manager role can use the program workbench to view and monitor the progress of the program and the projects and demands. Program workbench provides information for only tracking the program.

You can track the progress of demands and projects, and monitor the status of cost, resource, schedule, and scope for the selected fiscal period for the program.

Note:

- Program workbench is based on Service Portal which means that you can configure, customize, and extend it as per your requirements and organizational workflow. For more information, see [Service Portal](#)  documentation.
- Program workbench does not support mobile device.

The program workbench comprises of the following components:

Fiscal period: A choice list on the top-right to select the fiscal year for which you monitor the program.

Timeline View: Shows a list of all the selected demands and projects that are part of the program, and a Gantt chart of all projects and demands over time.

You can:

- configure the colors of the program items in Gantt chart with [Dashboard Configuration](#) settings.
- select the zoom level in Gantt chart calendar to **Auto Fit**. The Gantt view fits in one page to view entire timeline in one go without using the scrollbar.
- review the external dependencies between projects in a program.
- select the show/hide icon () to show or hide columns.

Note:

- A demand is included in the timeline view only if the **Expected Start** and **Due Date** fields are populated and if the demand is in qualified or approved state.
- Admin can [customize](#) which columns appear in the column filter list when the show/hide columns icon () is clicked in the timeline view.

Project KPI: The tab displays the most recent status of project KPIs such as overall health, schedule, cost, resources, and scope of all the projects in the program. This information is populated from the most recent [status report](#) created for the projects.

You can:

- click the name of a project in the tab to open the latest status report created for the project.
- point to a status indicator for a project KPI to view the comments entered for the KPI for that project.

Cost (Planned vs. Actual): The chart displays the actual costs from all projects in the program compared to the approved budget. The actual cost for projects is derived from the [expense lines](#).

Note:

An expense line can be created manually for a project when a specific expense is incurred. For example, if hardware is procured for a project, an expense line can be created for the amount spent on procuring the hardware. If you receive an item using ServiceNow Procurement, an expense line is created automatically. For resource hours, the expense lines are created automatically when the time cards for the project are approved.

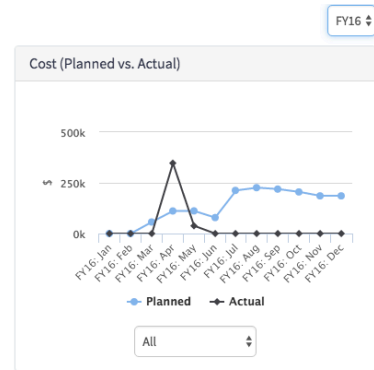

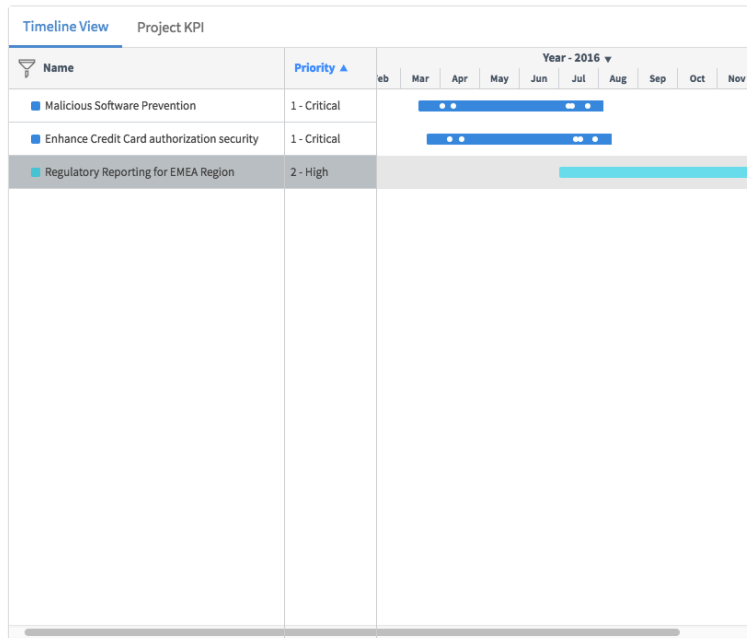

The display settings for the chart can be modified by selecting any of the following from the choice list:

- **Capex:** Displays the cost chart for capital expense only.
- **Opex:** Displays the cost chart for operating expense only.
- **All:** Displays the cost chart for both capital and operating expenses.

Resource (Allocated vs. Actual): The chart displays the actual resource time spent on all project tasks versus the resource hours allocated to execute the projects and demands in the program. The actual time spent is taken from processed time cards for the projects.

Program Workbench Example 1

Security Enhancements - FY16

Program Workbench Example 2

Security Enhancements - FY16

Name	Overall	Schedule	Cost	Resources	Scope
Enhance Credit Card authorization security	✓	⚠	❗	✓	✓
Malicious Software Prevention	✓	⚠	❗	⚠	✓

Access the program workbench

When you access the program workbench, it displays a list of all the programs.

Before you begin

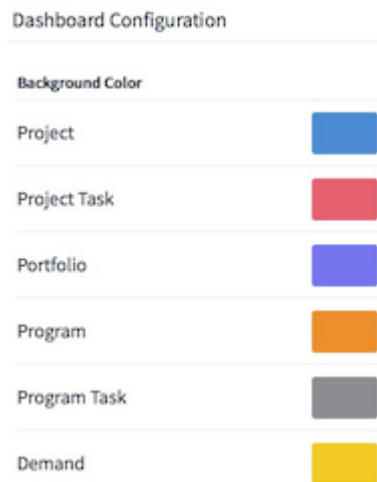

Role required: it_program_manager

About this task

You can access the program workbench in one of the following ways.

Procedure

1. Click the **Program Workbench** related link on the Program form.
2. Navigate to **Project > Programs > Workbench** and click the configuration icon () and select the colors for projects, tasks, programs, and so on.
The workbench uses these colors to display the items in the program in the Gantt chart in timeline view.

3. Click the program that you want to open.
The programs that are displayed in the workbench depend on how you launched the program workbench.
 - All programs are available in the workbench using the navigation menu option.
 - Only the associated program displays using the program form.

Program Dashboard

The PMO dashboard provides a central location to a program manager to generate different graphical reports.

From Madrid release onward, the program manager dashboard has been deprecated and replaced with the PMO dashboard. Use the PMO dashboard to gain insights about your programs. For more information, see [PMO Dashboard](#).

Access the Program Dashboard

View different graphical reports for your programs on the PMO Dashboard.

Before you begin

Role required: it_program_manager

Procedure

Navigate to **Projects > Programs > Program Dashboard**.
The PMO Dashboard is displayed.

Rate Models

Use a rate model to derive date-effective, criteria-driven hourly rates for calculating planned and actual resource costs for a project or demand.

Unlike labor rates, which are based on the user attribute only, a rate model can derive hourly rates based on up to ten attributes. These attributes can be selected from predefined entities such as projects, demands, users, and roles.

Starting March 2026 release, you can create rate models for resource assignments based on the primary attributes mapping to meet with the organizational requirements.

Rate lines

A rate model is a collection of multiple rate lines. A rate line is a unique combination of different criteria values that defines the hourly rate for a resource, group, or role for a specific date range. For the same set of criteria, you can create multiple rate lines with different rates for different date ranges provided that the dates don't overlap.

Rate model processing

To derive hourly rates from a rate model for the resource plans and time cards of a project or demand, associate the rate model with the project or demand.

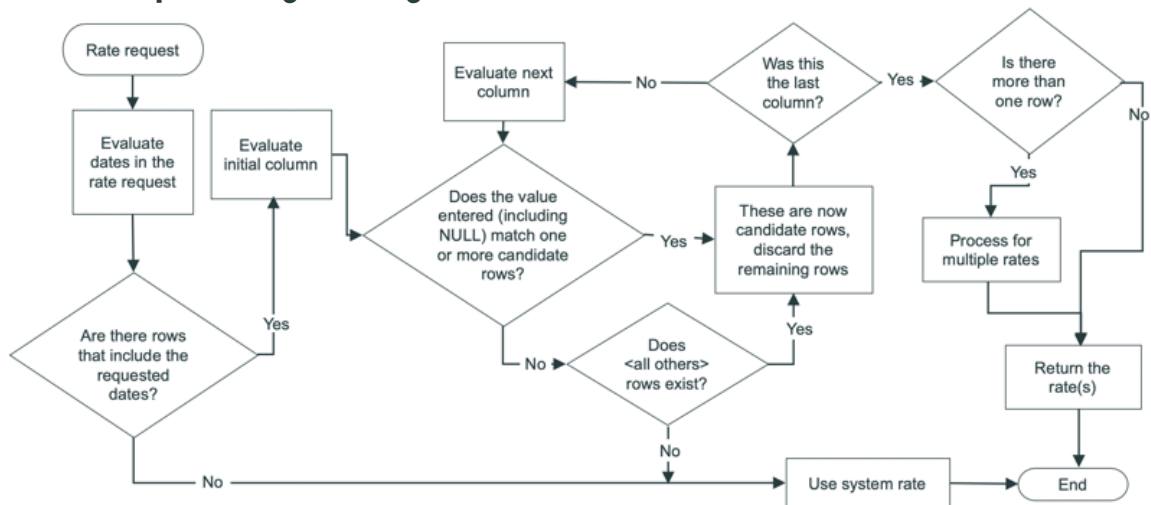

Note:

A project or demand without a rate model uses the labor rate cards associated with rate type to find a rate for the time cards.

The rate model associated with a project or demand evaluates the rate lines to find and return the hourly rate that matches the requested criteria. The rates are derived from the rate model during resource planning or allocation, and during time card processing.

The rate is returned in the functional currency specified in the matching rate line.

Rate model processing flow diagram

The following video describes how to set up a rate model and the evaluation method to find and return the hourly rate for a request. Video explaining how to work with rate models

When a rate is requested, the rate model uses the following process.

1. Finds the rate lines in the requested date range and discards the remaining rate lines.
2. Evaluates the identified rate lines to find values matching the requested value in the first criteria column and discards the remaining rate lines.

If the requested value is empty, it checks for rate lines containing NULL.

If no exact match is found, it checks for the rate line having the value `All other (*)`.

The evaluation is repeated for the other criteria columns in order of priority until all criteria columns are processed.

3. Returns the rate if one or more rate lines match the request.
 - If a single rate line is found, the corresponding rate is returned.
 - If multiple rate lines are found, the system determines the number of hours in the request that applies to each rate.
 - For example, say the rate requested is for resource allocation from July 1 to July 30. The rate model has one rate from July 1 to July 15 and a different rate from July 16 to July 30 for the same set of criteria. The rate model applies the first rate to the requested hours for July 1–15 and the second rate to the requested hours for July 16–30.

If no rate lines match the request, then the request uses the [default rate card](#).

Create or modify a rate model

Create or modify a rate model that can be linked to a project or demand to determine planned costs and actuals for their resource. The rate model provides date-effective, criteria-driven hourly rates for these investments.

Before you begin

- Choose the attributes to define the criteria in a rate model to derive hourly rates.
- Define the [budget reference rates](#) for the non-functional currency for the required time periods.
- Role required: `pps_admin` or `it_rate_model_admin`

Procedure

1. Create a rate model.

2. On the form, fill in the fields.

Rate Model form

Field	Description
Name	Unique name for the rate model.
Active	Option for indicating the status of the rate model. Only active rate models can be assigned to a project or demand.

Field	Description
Default	<p>Option for setting the rate model as the default.</p> <p>You can set only one rate model as default.</p> <p>A default rate model is automatically associated to new projects and demands.</p>
Rate model context	<p>Context set for the rate model.</p> <p>Read-only system field.</p>
Currency	<p>Default currency for the rate lines in the rate model.</p>
Rate type	<p>Option for enabling the rate type attribute on rate lines in the rate model.</p> <p>When selected, Rate type is added as one of the attributes along with other defined attributes. For more information, see Rate type in labor rate card.</p>
Description	<p>Short description for the rate model.</p>

3. Click **Submit.**

What to do next

[Add attributes from a set of predefined entities](#) to define the criteria for rate model to derive resource cost.

Define criteria of a rate model

Set the criteria of a rate model by adding attributes from a set of predefined entities to derive resource hourly rates based on the criteria.

Before you begin

Role required: pps_admin or it_rate_model_admin

About this task

A rate model consists of one or more rate lines. Each line contains a unique combination of criteria values and the hourly rate of a resource. You define the criteria by adding up to 10 attributes from the following entities:

- Demand
- Group
- Project
- Project task
- Resource
- Resource Assignment
- Resource plan
- Role

You can select attributes of type String, Reference, Number, Boolean, and Choice.

Procedure

1. Open a rate model by performing one of the following actions:
 - Navigate to **All > Project Administration > Rate Model > All**.
 - Navigate to **All > Time Sheets > Rate Model > All**.
2. In the **Rate Model Attributes** related list, click **New**.
3. On the form, fill in the fields.

Rate Model Attributes form

Field	Description
Entity	Entity from which the attribute is used to define the criteria.
Attribute	List of attributes from the selected entity to define the criteria.
Priority	<p>Unique number that determines the order in which attributes in a rate model are evaluated to derive the hourly rate.</p> <p>An attribute with the lowest priority is evaluated first.</p> <p>Note: Two attributes cannot have the same priority.</p>
Name	<p>User-friendly name for identifying the attribute.</p> <p>The default name populated is based on the selected entity and attribute. For example, if you select Resource in the Entity field and Location in the Attribute field, then the default name is Resource/Location.</p>

4. Click **Submit**.

What to do next

[Create rate lines to define the hourly rates for resources.](#)

Create a rate line

In a rate model, create a rate line to define an hourly rate based on a set of criteria for a given date range.

Before you begin

- [Define criteria and add rate model attributes](#)
- Role required: pps_admin or it_rate_model_admin

About this task

Before creating or updating a rate line, note the following points:

- Rate lines with the same set of criteria values cannot have overlapping dates.
- A criteria field can be empty.
- All criteria fields on the form have a value `All other (*)` that, if selected, is considered by the rate model if no exact match exists for that criteria.
- To use a non-functional (non-default) currency in a rate line, ensure that the corresponding [budget reference rate](#) is available.

Procedure

1. Open a rate model by performing one of the following actions:
 - Navigate to **All > Project Administration > Rate Model > All**.
 - Navigate to **All > Time Sheets > Rate Model > All**.
2. On the Rate Model form, click the **View Rate Lines** related link.
3. On the Rate Lines form, click **New**.
4. On the form, fill in the fields.

Rate Lines form

Field	Description
Rate Model	Rate model the rate line belongs to.
Start date	Start date of the time period in which the rate is applicable.
End date	End date of the time period in which the rate is applicable.
Criteria fields	<p>Fields corresponding to the rate model attributes added to define the criteria. The number of fields may vary.</p> <p>For example, if you have added Group and Location as rate model attributes, they are available as fields on the form where you can specify their values.</p>
Rate	<p>Applicable rate and currency of the rate line.</p> <p>By default, the currency of the rate model to which the rate line belongs is selected as the currency. You can select a rate currency, which can be different from the rate model currency. Rate lines with the same set of criteria values and currency must not have overlapping dates.</p> <p>A project or demand manager can track the resource cost for projects or demands in the corresponding project or demand currency by installing the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin and enabling the Project Currency</p>

Field	Description
	view or Demand Currency view for resource plans. For more information, see the Create a resource plan topic.
Rate Type	Labor rate type applicable for the rate line. The field appears if the Rate type check box on the Rate Model form is selected.
Rate in functional currency	Rate in the default currency configured in the Financial Management application. This field is not editable.

5. Click **Submit.**

Result

Rate lines that represent resource hourly rates based on defined attributes are created.

Export rate lines to a file

Export rate lines to a Microsoft Excel or CSV file to quickly update or add new rate lines and import them back into the rate model.

Before you begin

Before exporting rate lines, define the criteria of the rate model by adding attributes to it. The downloaded export file includes columns corresponding to the selected attributes and the following default columns:

Role required: pps_admin or it_rate_model_admin.

About this task

Besides [creating rate lines](#) one at a time, you can add multiple rate lines into a rate model using the export and import rate lines functions.

- Rate Model
- Number
- Start Date
- End Date
- Currency
- Rate
- Rate Type

 Note:

The **Rate Type** column is available only if the **Rate type** check box is selected for the rate model.

The number of criteria columns depends on the number of attributes added in the rate model.

Procedure

1. Open a rate model by performing one of the following actions:
 - Navigate to **All > Project Administration > Rate Model > All**.
 - Navigate to **All > Time Sheets > Rate Model > All**.
2. On the Rate Model form, select the **View Rate Lines** related link.
3. Select the more actions icon (⋮) and then select the **Export to CSV** option.
A dialog box might prompt you to save or open the export file. By default, the file has the same name as the rate model. However, you can specify a different file name. Save the file either as a CSV file or Microsoft Excel (.XLSX) file.

Note:

Depending on your browser setting, the browser might automatically save the file to your Download folder.

4. Open the downloaded file using your preferred application.
Enter new rate lines or update the existing ones and save the file either as a CSV file or Microsoft Excel (.XLSX) file.

Result

All rate lines in the rate model are exported to the file. If there is no rate line in the rate model, the file is an empty template containing only the column names in the first row.

What to do next

[Import rate lines](#) from the file into a rate model.

Import rate lines into a rate model

Use the import rate lines function to quickly add multiple rate lines from an export file into a rate model.

Before you begin

Set the `glide.import_set_row.dynamically_add_fields` system property to true.

Role required: pps_admin or it_rate_model_admin

About this task

After adding or updating rate lines in a file created using the [export function](#), you can import the rate lines from the file into the rate model.

Note:

Rate lines fail to import in the following circumstances:

- Overlapping effective dates for the same set of criteria values.
- Criteria values with no matching data in the system. For example, a rate line might have Business Analyst as the **Role** criteria but that role does not exist in the system.
- Rates in non-functional (non-default) currency but no corresponding [budget reference rates](#) for the required period exist in the system.

Procedure

1. Import rate lines from an import file into the rate model in one of the following ways:
 - Navigate to **All > Project Administration > Rate Model > Import Rate Line**.
 - Navigate to **All > Time Sheets > Rate Model > Import Rate Line**.
 - Navigate to **All > Time Sheets > Rate Model > All**, open a rate model record, and click the **Import Rate Line** related link.
2. Click **Choose File** to select the import file.
3. **Optional:** If you are importing from an Excel file containing multiple sheets, enter the sheet number that contains the data to import in the **Sheet number** field.

Note:

If you are importing from a CSV file, then the data from the last saved CSV file is considered for import irrespective of the specified sheet number.

4. **Optional:** If the import file has a header row, enter the row number that has the header information in the **Header row** field.
5. Click **Submit**.
6. Click **Run Transform** to import the data.
For more information, see [Run an import](#) .

Result

- New rate lines are appended to the rate lines list in the rate model.
- Existing rate lines in the rate model are updated with the latest values.

Time Card Management

The Time Card Management feature enables time card users such as task assignees to report and track their time for the assigned tasks.

https://player.vimeo.com/video/1107432259?h=08347ba78f&badge=0&autoplay=0&player_id=0&app_id=58479

Watch this three-minute video to learn about setup of the time tracking feature, entering time and approvals.

Time Card Management works with the Task table to record time worked on various task types, such as projects, incidents, problems, and change requests.

With the Time Card Management feature:

- The time card users can record the time worked on a task using [time cards](#) and [time sheets](#). They can submit their time cards and time sheets for approval.
- Time cards and time sheets are routed for approval based on the **Non-project time approver** and **Project time approver** fields in the user time sheet policy. User managers with time card approver role can also log time and [submit the time sheet of their resources](#)
- The time card approvers can perform the following tasks:
 - Review and approve or reject the time cards in a submitted time sheet.
 - Recall the approved time sheets or time cards to return them to the users for corrections.

- Use dashboards to view reports of time card and time sheet exceptions, and categorize time reported by the users.
- Delegate another time card approver to process time sheets from your resources when you might not have time or will be unavailable. Note the following points for delegation:
 - You cannot delegate approval only for an individual resource.
 - The delegated time card approver cannot further delegate your time sheet approvals.

The `project_manager` and the `resource_manager` roles contain the `timecard_approver` role in the base system. However, the `timecard_approver` role can also be used independently without these roles.

- The time card admin can create and manage [time sheet policies](#), and can also approve or reject by exception and process the time sheets. Time card admin can also create or edit time cards of any users if the time cards are in Pending or Rejected state.

Note:

The [Time Card Management plugin](#) is required to use time cards. Some of the procedures require the project management feature, which activates time cards automatically. For more information, see [Project Management](#) (`com.snc.financial_planning_pmo`).

Domain separation in Time Card Management

[Domain separation](#) provides complete data isolation for domain-specific users. Time card Management is domain separation compliant at the **Data only** level.

Activate Time Card Management

Administrators can activate the Time Card Management plugin (`com.snc.time_card`). The plugin also activates the Performance Analytics - Content Pack - Project Portfolio Suite Dashboards plugin (`com.snc.pa.time_card`). However, you need a Performance Analytics license to use the dashboards.

Before you begin

Role required: admin

About this task

Note:

The Time Card Management plugin also gets activated as part of [PPM Standard](#) plugin (`com.snc.financial_planning_pmo`).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#).

Time sheet policies

Time sheet policies contain the policies to which a time sheet, or a time card must adhere.

By default, the Default time sheet policy is available with the system. As a Time card admin, you can create multiple time sheet policies based on different requirements and workflows in your organization. For example, specify a time sheet policy for each department or team and assign appropriate users to them.

Time sheet policies also provide an ability to specify appropriate approval workflow for project and non-project tasks.

A time sheet policy can be [set as a default policy](#). The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy. Only one time sheet policy can be set as a default policy.

Navigate to **Time Sheets > Administration > Time Sheet Policies** to view the list of timesheet policies.

Create a time sheet policy

As a time card administrator, you can create a time sheet policy to define the requirements for time card users to record their time worked. The time card approvers must review and process time sheets under the applicable time sheet policy.

Before you begin

Role required: timecard_admin

Procedure

1. Navigate to **All > Time Sheets > Administration > Time Sheet Policies**.
2. Click **New**.
3. On the form, fill in the fields.

Time Sheet Policy form

Field	Description
Name	Unique name of the policy.
Allow blank time cards	Option to enable submission of blank time cards for approval. By default, this option is not selected.
Auto create time card on	Option to create a time card automatically when you update a planned task, if the following conditions are true:

Field	Description
planned task update	<ul style="list-style-type: none"> ○ You are a time card user ○ You are assigned to the task through Assigned to or Additional assignee list field ○ The task is not in a pending state. <p>By default, this option is not selected.</p>
Auto fill time card with time worked entries	<p>Option to fill in time cards automatically when you enter time in the Time worked field on the Task form.</p> <p>If a time card does not exist for the task, one is created when the time worked is updated if the following conditions are true:</p> <ul style="list-style-type: none"> ○ You are a time card user. ○ You are assigned to the task through the Assigned to or Additional assignee list field. <p>By default, this option is not selected.</p>
Auto create time cards every week	<p>Option to generate time cards automatically every week through a scheduled job for all users assigned to the time sheet policy. The time cards are generated based on the planned task assignments and hard-allocated resource plans of the users.</p> <p>By default, this option is selected.</p>
Update actual hours and cost in resource plan/reports	<p>Option to update actual hours and actual cost of the associated resource plan based on the hours entered in the approved time card.</p> <p>When selected, you can associate a resource plan related to the selected task with the time card in the following ways:</p> <ul style="list-style-type: none"> ○ If the task has multiple resource plans, you can select the appropriate plan. ○ If the task has one resource plan, that plan is selected by default. <p>The hours from the time card entry and the hourly resource rate are used to update the Actual hours and Actual cost values of the associated resource plan.</p> <p>Note: If the task has no resource plan, the associated records update the corresponding project.</p> <p>By default, this option is not selected.</p>
Allow recall	<p>Option to enable the recall action on a time sheet or time card after it is approved and processed.</p> <p>By default, this option is selected.</p>

Field	Description
Recall period allowed (days)	<p>Number of days within which you can recall a time sheet or time card.</p> <p>This field appears when the Allow recall option is selected.</p> <p>The default value is 30.</p>
Week starts on	<p>Start day of the week for the time sheet.</p> <p>The default value is Sunday.</p> <p>Note: For more information on filtering Time Sheets using this field, see KB0852458 article in Now Support Knowledge Base.</p>
Maximum hours per day	<p>Maximum number of hours that can be entered each day in a time sheet.</p> <p>The default value is 24.</p> <p>Setting this field to -1 enables the resource to enter:</p> <ul style="list-style-type: none"> ○ A value from 0 through 24 for the hours worked each day ○ A negative value, to correct the previously entered timecards.
Maximum hours per week	<p>Maximum number of hours allowed in a week in a time sheet.</p> <p>The value for total hours for a week in a time sheet is the sum of hours entered per day of that week. If set to -1, the total hours per week allowed is up to 168 (24 x 7) hours.</p> <p>The default value is 40.</p>
Non-project time approver	<p>Type of approval required when you submit a time card that has a non-project task assigned.</p> <ul style="list-style-type: none"> ○ Auto: Time card is auto-approved when submitted. ○ User Manager: Time card is routed to the user manager for approval when submitted. <p>The user manager has the time card approver role and is also selected as the manager of the time card user on the User form.</p> <ul style="list-style-type: none"> ○ None: A user with the timecard_admin role can approve time cards when submitted.
Project time approver	<p>Type of approval required when you submit a time card that has the project task.</p> <ul style="list-style-type: none"> ○ Auto: Time card is auto-approved when submitted. ○ Project Manager: Time cards for a project task are routed to the respective project manager for approval when submitted. The project manager is picked from the task against which you are submitting time.

Field	Description
	<ul style="list-style-type: none"> ○ User Manager: Time cards are routed to the user manager for approval when submitted. ○ Both: Time cards are routed to both the user manager and project manager for approval when submitted. <p>A time card remains in the Submitted state when only one of the approvers approves the time card.</p> <ul style="list-style-type: none"> ○ None: A user with the time_card admin role can approve time cards. <p>Note:</p> <ul style="list-style-type: none"> ○ The project manager and the user manager can view only those time cards that are routed to them for approval. ○ If the user manager or the project manager changes while the time card is still not approved, the system automatically updates the approver of the time card. ○ If the name of the project manager or the user manager is not populated on the respective form, a user with the time_card admin role can approve time cards.
Allow multiple rate types	<p>Option to provide a rate type in a time card to be used during expense line generation.</p> <p>When this option is selected, the Rate type field displays on the Time Card form to enable the selection of a rate type.</p> <p>For more information, see Rate type in labor rate card.</p>
Default rate type	<p>Rate type used by default for the time card.</p> <p>If you select none, the Standard rate type option is used.</p> <p>This field appears when the Allow multiple rate types check box is selected.</p>
Default Policy	<p>Option to set the time sheet policy as the default. The default policy is a global time sheet policy that applies to all users who are not assigned to any other time sheet policy.</p> <p>Only one time sheet policy can be set as the default.</p> <p>A time sheet policy set as the default policy cannot be deleted. You must first set another policy as the default policy.</p>

4. Click Submit.

What to do next

- [Set the time sheet policy as the default policy](#), if required.
- [Assign the time sheet policy to users](#).

Set a time sheet policy as default policy

As a time card administrator, you can set a time sheet policy as the default policy. The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy.

Before you begin

Role required: timecard_admin

About this task

Only one time sheet policy can be set as a default policy.

Procedure

1. Navigate to **All > Time Sheets > Administration > Time Sheet Policies**.
2. Open the time sheet policy record.
3. Click the **Set as default** related link.

Note:

The related link appears only for a time sheet policy which is not already set as the default policy.

Result

The **Default Policy** option on the [record form](#) is selected to indicate that the current time sheet policy is set as the default policy. The **Default Policy** option on the earlier default time sheet policy is cleared.

You cannot delete a default time sheet policy. You must first mark another policy as the default policy to delete the current default policy.

Assign a time sheet policy to a user

As a time card administrator, you can assign a time sheet policy to a user.

Before you begin

Role required: timecard_admin

About this task

You can assign only one time sheet policy to a user.

Procedure

1. Navigate to **All > Time Sheets > Administration > Time Sheet Policies**.
2. Open the time sheet policy record.
3. In the **Users** related list, click **Edit**.
4. On the Edit Members form, move the users to the **User List**.
5. Click **Save**.

Result

The selected users appear on the **Users** related list. The time sheet policy is assigned to the selected users.

Create a project time category

A time card admin or a project manager can create subcategories to define specific activities in the projects. The time card users can use these project subcategories to report time for a specific activity in a project.

Before you begin

Role required: timecard_admin, it_project_manager

Procedure

1. Navigate to **All > Time Sheets > Administration > Project Time Categories**.
2. Click **New**.
3. Fill in the fields.

Project time category form fields

Field	Description
Name	Unique name for the project time category.
Description	A description of the type of project activity.

4. Click **Submit**.

Create a rate type

You can create rate types using the Rate Types feature.

Before you begin

Role required: timecard_admin

About this task

The rate type functionality is used to categorize different types of work. For example, Standard versus Overtime. It can also instruct down-stream, third-party product about the nature of the work performed.

For example:

- A user works extra time during the day and must differentiate standard time from overtime.
- A technician may be paid at a higher rate based on different types of work involved in the execution of a task.
- An appliance repair task may be billed at one rate for the first hour and a different rate for the remaining hours.
- A service call may last four hours during which specialized equipment is used for one hour. The company must capture the use of the specialized equipment for purposes ranging from additional billing to legal compliance or warranty tracking.

Procedure

1. Navigate to **All > Time Sheets > Administration > Rate Types**.
2. Click **New** and fill the form.
3. Click **Submit**.

Result

- The rate type is displayed in the **Rate Types** list.
- The rate type if active is also displayed in the **Rate Type** field in the Labor Rate Cards form, Time Worked form, Time Card form, and Time Sheet Portal.

Time Sheet Portal

Time Sheet Portal categorizes and displays all your assigned tasks in a single view for a given week. The portal enables you to record time spent on tasks on a day-to-day basis and submit the time sheet in a single action.

Time Sheet Portal works with the Task table to record the time that you spend on various task types, such as projects, incidents, problems, and change requests. It provides a complete breakdown of the time you enter for the task, task categories, and days in a week. It enables you to:

- Generate time cards for assigned projects or project tasks.
- Copy time cards from a previous time sheet.
- Search and create a time card for a task that is not displayed in the assigned tasks list.
- Edit, delete, or add notes to a time card.
- Submit, approve, reject, and recall a time sheet.
- View notifications for the submitted, rejected, and recalled time sheets or time cards.

Time Sheet Portal comprises of the following sections:

Header

The Time Sheet Portal header:

- Displays a date range of the time sheet for the selected week and provides options to navigate to the time sheet of previous or next week.
- Provides a calendar along with the date range. Clicking a date in the calendar displays the time sheet for the week of the selected date.
- Provides a link to navigate to the time sheet for the current week when a different time sheet is being viewed.
- Provides an option under **My Time Sheet** that enables you to open and [edit the time sheets of your resources](#). The option is available only for a user manager.
- Provides an option to view the time sheet in the Form view using time sheet form view icon ()

- Displays the notifications for the submitted, rejected, and recalled time sheets under the show notifications icon (🔔). Each entry displays the number of time cards and their state. Click on a notification item to open the time sheet.

Notifications

Submitted - 12 - 18 May 2019
Submitted Time Cards : 1 • Time Sheet State : Submitted

Rejected - 28 April - 4 May 2019
Rejected Time Cards : 2 • Time Sheet State : Rejected

Recalled - 14 - 20 April 2019
Recalled Time Cards : 2 • Time Sheet State : Recalled

Tasks

The **Tasks** tab displays your assigned tasks as cards. Each card provides information about a task, such as short description, state, last updated date and time, and priority. Tasks are derived from the following filter conditions:

- All your assigned incidents, problems, or change requests that are active.
- All your assigned incidents, problems, or change requests that are closed in the selected week.
- All tasks for which you are hard-allocated during the selected week.
- All your assigned projects or project tasks that are active during the selected week. Project or project tasks are derived from the following conditions:
 - A project or project task that has started and its actual start date is before the end of the selected week.
 - A project or project task has closed and its actual end date is after the week has begun.
 - When there are no actual dates for a project, planned dates of the project must occur within the selected week.
- All active stories assigned to you.
- All active scrum tasks assigned to you or closed in the selected week.
- All active test plans assigned to you.
- All active defect and enhancements assigned to you or closed in the selected week.

Note:

If the Customer Service Management plugin (com.sn_customerservice) is activated, your assigned tasks that are active and closed in the selected week are also derived from the following tables:

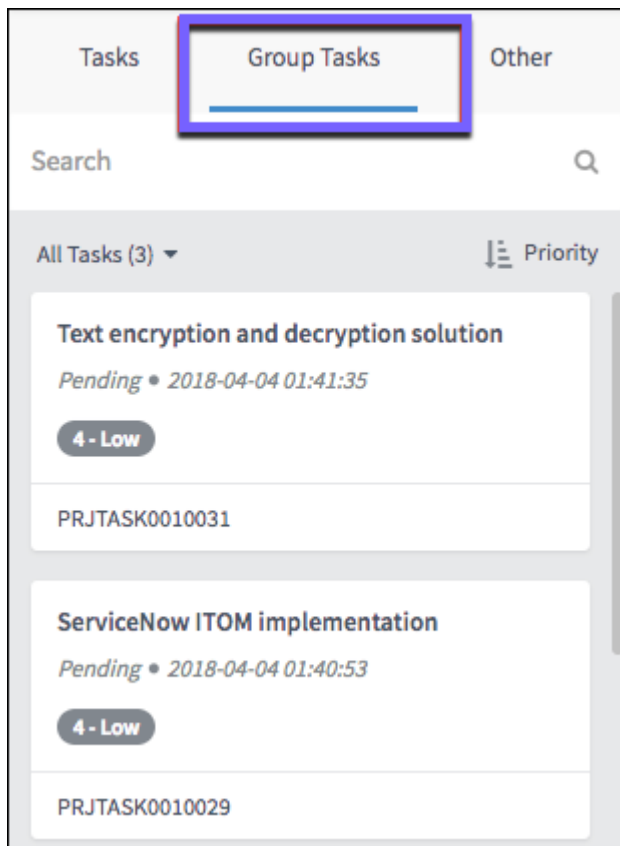

- Case [sn_customerservice_case]
- Work Order [wm_order]
- Work Order Task [wm_task]

On the **Tasks** tab, you can perform the following operations:

- Type a keyword in the search field to view only cards with details that match the keyword.
- Sort cards in ascending or descending order based on priority, irrespective of the task type.
- View cards based on a category, such as projects, project tasks, incident, problem, change, defect, enhancement, test plans, and scrum tasks.
- Create time cards for assigned tasks. See [Create time cards and log time through Time Sheet Portal](#).

Note:

[Time sheet policies](#) apply when you create or edit a time card.

Group Tasks

The **Group Tasks** tab displays the tasks assigned to your **Assignment group**. The group tasks are displayed as cards in the tab. A card provides information about the task, such as short description, state, last updated date and time, and priority.

Other

The **Other** tab displays cards used to log time for operational work, such as administration, meeting, and KTLO.

Note:

The list of categories in the time card controls the list of cards displayed on the **Other** tab. If an administrator marks any of the categories as inactive in the time cards, those categories are not displayed on the **Other** tab.

Time Sheet

Starting Zurich release, time cards and time sheet portal supports resource assignments. Users can select a specific resource assignment while creating time cards and submitting a time card via time sheet portal. Your system administrator can enable the resource assignment column in time sheet portal. For more information on how to add resource assignment column to time sheet, see the Knowledge Base for [KB1649389](#).

The Time Sheet section:

- Displays the date range of the time sheet for the selected week.
- Indicates the state of the time sheet being viewed.
- Displays the total number of tasks and hours that you have entered for each day in a week. When you click a day in the time sheet, the column for that day is highlighted in both the **Time Sheet** and **Logged Time Cards** sections. The first day displayed in the Time Sheet section is based on the value specified in the **Week starts on** field in the users [Time Sheet Policy](#). For example, if the **Week starts on** field is set to Friday, the Time Sheet section starts with Friday.
- Indicates the total number of hours that you entered in the time sheet. Time Sheet breakdown also displays a breakdown of user-entered hours in different work categories, such as project tasks, admin, meeting, follow on tasks, or change requests.
- Provides options that enable you to [submit a time sheet](#) and copy time cards from a previous time sheet. For an approver, options to approve or reject a submitted time sheet and recall a processed time sheet are available.

Logged Time Cards

Logged Time Cards				Add unassigned tasks to Time Sheet ?							
Short description	Project time category	Rate type	Resource plan	Sun 12	Mon 13	Tue 14	Wed 15	Thu 16	Fri 17	Sat 18	Total
Admin	None	None	None	0	1	1	1	1	1	0	5
Sales Reques... PRJ0021497	Develop...	None	RPLN000...	0	2	3	1	3	3	0	12
Security Revi... PRJ0021123	None	None	RPLN002...	0	4	4	4	4	4	0	20
Apply patche... CHG0000009	None	None	None	0	1	1	1	1	1	0	5

Each row in the Logged Time Cards section represents a time card entry for a given week. It has details such as icon for state of the time card, short description of the task, project time category, rate type, resource plan, and logged time. Each row of the time card contains options that enable you to edit, delete, or add notes to a time card. For more information, see [Create time cards and log time through Time Sheet Portal](#).

Note:

- The **Rate type** column is visible only when the **Allow multiple rate types** option in the time sheet policy of the user is selected.
- The **Resource plan** column is visible only when the **Update actual hours and cost in resource plan/reports** option in the time sheet policy of the user is selected.

The icon beside the short description of a row indicates a time card state. The merge icon () in a time card row indicates that a duplicate time card for the same task exists in the time sheet and provides option to merge them into a single time card.

When there are no time cards, the Logged Time Cards section displays the **Generate Time Cards** and **Copy from previous time sheet** buttons to create time cards.

Note:

Time Sheet Portal is not designed for use on mobile devices, and may not appear as shown in this document.

Add columns to the logged time card list

Add columns in the logged time card list on the Time Sheet Portal to show additional information that you might require to log your time cards.

Before you begin

Role required: admin or sp_admin

About this task**Procedure**

1. Navigate to **All > Service Portal > Widget Instances**.
2. Search the Widget column for **Time Card Portal Main Container** and open the record.
3. On the Instance form, update the code by providing values for the following column configurations in the **Additional options, JSON format** field.

Instance form

Column configuration	Description
name	Name of the column in a table.
label	Column name to display in the logged time card list on the Time Sheet Portal. The configuration is mandatory if you are adding a column of a table other than the Time Card [time_card] table.
width_in_percent	Column width in percentage in the logged time card list.

Note:

To add more than one column, separate each column configuration with a comma. The columns are added in the same order as you add them in the code.

4. Click **Update**.

Example:

The following sample code adds the **category** column of the Time Card [time_card] table with the column name **Category** and width of 10% in the logged time card list on the Time Sheet Portal.

```
{
  "tm_grid_options": {
    "displayValue": "Time card grid options",
    "value": {
      "header_fields": [
        {name:"category",label:'Category', width_in_percent: 10}
      ]
    }
  }
}
```

Create time cards and log time through Time Sheet Portal

After you create time cards in Time Sheet Portal, log time in the time cards.

Before you begin

- Time sheet portal supports [resource assignments created using Project Workspace](#). Once the time cards are approved, Project Managers can view the planned vs actual hours for an assignment in Project Workspace and Resource Management Workspace heatmap view.
- Role required: timecard_user

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.
2. Create time cards in the **Logged Time Cards** section using any of the following options.

Based on the **Allow time card reporting on** field settings in the **Preferences** tab of a project, the **Add to Time Sheet** and **Add selected to Time Sheet** options are displayed in Time Sheet Portal.

If a duplicate time card exists for a time card, you can merge both time cards to become a single one, except for time cards in the processed, approved, or recalled state. A duplicate time card is identified by comparing the values in the **Short description, State, Task, Category, Rate Type, Resource Plan, or Project Time Category** fields in the time card.

3. In the **Logged Time Cards** section, log time in a time card.

Result

Your time cards are created and time is logged for the selected week.

What to do next

If you encounter issues with time card creation or time logging, try the following:

- Time cards not generating: Verify that your project tasks are in progress or planned for the selected week, and that the **Allow time card reporting on** field is configured on the project.
- Missing tasks in the portal: Ensure you are assigned to the project tasks and that the task dates overlap with the selected time sheet week.
- Duplicate time cards: Use the merge option to combine duplicate time cards. Duplicates are identified by matching Short description, State, Task, Category, Rate Type, Resource Plan, or Project Time Category fields.
- Incorrect rate type: Verify your default rate type on your user profile. Contact your time card administrator (timecard_admin role) to update rate type settings.

For issues you cannot resolve, contact your system administrator or the user with the timecard_admin role in your organization.

Submit time sheet through Time Sheet Portal

Once you update the time sheet with time worked for a given week, submit it for approval.

Before you begin

Role required: timecard_user

About this task

When you submit a time sheet, time cards are verified against the assigned [time sheet policy](#). If there is no time sheet policy assigned, time cards are verified against the default time sheet policy. Business rules prevent you from submitting a time sheet in case any violation is found.

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.

2. Click **Submit**.

The time sheet moves to the Submitted state.

Approve or reject a time sheet through Time Sheet Portal

Review, approve, or reject a time sheet submitted by a time card user that you manage.

Before you begin

Role required: `timecard_approver` or `timecard_admin`

About this task

A user manager can review, approve, or reject the time sheets or time cards submitted by the time card users. The user manager has either of the required roles and is the one listed as the manager of the time card users.

During out-of-office time, the user manager can [delegate another user](#) with the required roles as the time sheet approver. For the specified time period, the delegated user also receives all the time sheets submitted by the time card users to process.

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.

2. Click the **My Time Sheet** list and select a time card user under **My Resources**.

The **My Time Sheet** list is available only for a user manager.

3. Select the appropriate time sheet period by navigating through the calendar.

4. Click **Approve** or **Reject**.

Log time and submit time sheets of your resources

As a user manager, you can log time and submit the time sheet of your resources.

Before you begin

A user manager must have time card approver role to create and edit time cards, and submit the time sheet of other time card users. The user manager has either of the required roles and is the one listed as the manager of the time card users.

Role required: `timecard_approver`

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.

2. Click **My Time Sheet** choice list and select the user for whom you want to approve or reject time sheet for under **My Resources**.

The **My Resources** section lists the time card users reporting to you.

Note:

The choice list with **My Time Sheet** is available only for a user manager.

3. Create time cards and log time through [Time Sheet Portal](#) as required.

4. Click **Submit**.

Result

- The time sheet of the selected user moves to the Submitted state. The [time sheet policy](#) assigned to the time card user is used for validation when you submit the time sheet.
- All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.
- The **Approve** and **Reject** buttons appear in the Time Sheet section. The two buttons appear only for a user manager.

What to do next

Once you have submitted the time sheet for your resource, you can click **Approve** or **Reject** to approve or reject it. Only the time cards that are routed to the user manager, are approved or rejected. The routing for approval happens based on the **Non-project time approver** and **Project time approver** fields in the time sheet policy of the time card user.

Time Sheets

A time sheet groups all the time cards for a user for the given week.

With time sheets:

- Time card users can submit all the time for their work week in a single step by using a time sheet.
- Time card approvers can approve all the time cards in a time sheet for a user in a single step by approving the time sheet. They do not need to approve multiple time cards for a given user individually.
- Track the activities of a time sheet, such as who submitted or approved a time sheet, in the Activities section on the Time Sheet form. This time sheet activity audit is useful for tracking when you delegate responsibility for your time card processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it is not already enabled. For more information, see [Include a table field in auditing](#) .

A time sheet can have any of the following states:

Pending

A time sheet has been created, but the user is still making changes before submitting it.

Submitted

A time sheet has been submitted for approval. The approver can approve or reject it.

Approved

A time sheet has been approved. If the time sheet isn't automatically updated to Processed, this means there was no task associated with the time sheet.

Processed

A time sheet has been processed by the system. After a time sheet is approved, the after business rule Create expense from approved time card is triggered. This business rule creates an expense line for the associated task, and then updates the state to Processed.

Rejected

A time sheet has been sent back to the submitter for changes.

Recalled

A time sheet has been recalled by the submitter for modification.

Create a time sheet

As a time card user, you can create a time sheet to group all your time cards for the given week and submit them in a single step.

Before you begin

Role required: timecard_user

About this task

A user can create only one time sheet per week.

Note:

When a user creates a time card for a week, a time sheet is also automatically created for that week.

Procedure

1. Create the time sheet with one of these options.

2. On the form, fill in the fields.

Time Sheet form

Field	Description
Week starts on	Starting date of the week for which the time sheet is created. Note: The time sheet policy Week starts on controls the start day of the week.
Total Hours	Number of hours the user has worked in that week. This field is automatically populated from the hours recorded for the associated time cards.
User	Name of the user for which time sheet is created.
State	Current state of the time sheet. All new time sheets begin as Pending. Default states: Pending, Submitted, Approved, Processed, and Rejected, Recalled.
Comments	Comments related to the time sheet.
Notes	Any additional information.

3. Click **Submit**.

What to do next

Add time cards to the time sheet. You can use the related links and related list to add time cards. You can also add time cards using the [Time Sheet Portal](#).

Time sheet form related links

Field	Description
Generate Time Cards	Link to generate time cards for the assigned project tasks.
Copy from previous time sheet	Link to open the Copy Time Sheet window for you to copy the time cards from previous time sheets.
Time Sheet Portal	Link to open the Time Sheet Portal to view and manage the time sheet.

Time sheet form related lists

Field	Description
Time Cards	<p>List of the time cards that are part of the time sheet.</p> <p>To create a time card, click New.</p>

Submit a time sheet

Once the time sheet is updated with time worked, you can submit the time sheet for the week to submit all the time cards for the week together.

Before you begin

Role required: timecard_user

About this task

When a user submits a time sheet, the [time sheet policy](#) assigned to the user is used for validation. If there is no time sheet policy assigned to the user, the default time sheet policy is used. Business rules prevent a user from submitting a time sheet in case any violation is found.

Note:

You can also perform this task from the [Time Sheet Portal](#).

Procedure

1. Navigate to the time sheet using one of the following options:
 - To submit a time sheet in the Pending state, navigate to **Time Sheets > My Time Sheets > Pending**.
 - To submit the time sheet for the current week, navigate to **Time Sheets > My Time Sheets > Current Time Sheet**.
 - To submit a time sheet in the Rejected state, **Time Sheets > My Time Sheets > Rejected**. You can make required changes as suggested in the rejection comments to resubmit a rejected time sheet.
2. To submit in the Time Sheets list, open the time sheet.
3. Add comments, if required.
4. Click **Submit Time Sheet**.

Result

- The time sheet moves to the Submitted state.
- All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.

Approve or reject a time sheet

View, approve, or reject time sheet or time cards for your user, for the given week, in a single step.

Before you begin

Role required: timecard_approver or timecard_admin

About this task

A user manager is the one who has either of the required roles and is selected in the **Manager** field on User form of the time card user.

During out-of-office time, the user manager can [Delegate time sheet approvals to another user](#) with the required roles as the time sheet approver. For the specified time period, the delegated user also receives all the time sheets submitted by the time card users to process.

Note:

- You can also approve or reject the time cards within a time sheet selectively by selecting one or more time cards and approving or rejecting them.
- If a time sheet is rejected, all the associated time cards in the Submitted state are also rejected automatically. The time cards in the Approved and Processed state for the time sheet remain unaffected.
- If all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.
- If a time card in a time sheet is in the Rejected state, then irrespective of the state of other time cards in the time sheet, the time sheet also moves to the Rejected state.

Procedure

1. Navigate to **All > Time Sheets > Time Sheets > Pending Approval**.
2. In the Time Sheets list, open the time sheet to approve or reject.
3. If required, add comments.
4. Click **Approve** or **Reject**.

Result

The time sheet moves to the Approved or Rejected state.

- If a time sheet is rejected, it gets listed in the notifications for the rejected time sheets under the show notifications icon () on [Time Sheet Portal](#) and is moved back to the submitter to adjust the corrections and resubmit it. For more information, see [Submit a time sheet](#).
- Once a time sheet is approved, all the time cards associated with the time sheet are also approved or rejected automatically.
- If any time cards in the time sheet are pending approval by one of the approvers as defined by the [time sheet policy](#), the time sheet remains in the Submitted state.

Recall a processed time sheet

You can recall an incorrect time sheet in the Approved or Processed state to return it to the submitter. The submitter can then make the necessary changes and resubmit the time sheet.

Before you begin

Role required: timecard_approver or timecard_admin

About this task

The recall option is available only if the **Allow recall** option is selected on the associated [time sheet policy](#).

Procedure

1. Navigate to the approved or processed time sheet you want to recall using one of the following options.
2. Click **Recall**.

Result

- Changes the state of the time sheet and associated time cards to **Recalled**.
- Reverts the actual effort and resource hours in a project or demand created when time cards that have task types were approved.
- Creates negative expense lines to zero out the corresponding expense lines created when the time sheet was approved.
- Returns the time sheet to its submitter for modifications.

Delegate time sheet approvals to another user

You can delegate the responsibilities to process the time sheets of your resources to another user when you might not have time or will be unavailable.

Before you begin

Role required: timecard_admin or timecard_approver

About this task

The delegate must have the timecard_approver role.

Procedure

1. Navigate to **All > Time Sheets > Delegate**.
2. In the Delegates list, click **New**.
3. On the form, fill in the fields.

Delegate form

Field	Description
User	User from whom the approvals and tasks are delegated to another user.
Delegate	User to whom the approvals and tasks are delegated.
Starts	Start date of the delegation period.
Ends	End date of the delegation period.
Approvals	Option that enables time card approval delegation.

Note:

The other options on the form (**Assignments**, **CC notifications**, and **Meeting invitations**) are not applicable for time sheet approval delegation.

4. Click Submit.**Result**

The approval delegation has the following effects during the specified period:

- Both you and the delegate receive notifications regarding approval activity.
- On the Time Sheet Portal, the delegate can see your resources under **Delegates** in the **My Time Sheet** list.
- Delegates can perform all the functions that you can do for your resources in the Time Sheet Portal: Create and submit their time sheets, approve or reject the submitted time sheets, and recall the processed time sheets.

Time cards

Time cards are used to record the time worked on a task by a task assignee.

The time card management feature works with the Task table to record time worked on Projects, Incidents, Problems, and Change Requests.

Task assignees can record time worked in the *Time worked* field on a task record or enter hours directly into their time card. Some tables support automatic time card creation based on start and end date fields.

Track the activities of a time card, such as who submitted or approved a time card, in the Activities section on the Time Card form. This time card activity audit is useful for tracking when you delegate responsibility for your time sheet processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it isn't already enabled. For more information, see [Include a table field in auditing](#).

You can associate time cards for the project tasks and other task categories, such as meeting and training, with relevant [resource plans](#).

When you approve a time card, the time logged in the time card is saved day-wise in the Time Card Daily [time_card_daily] table. Using daily time logged data, you can generate time card reports by days for any period irrespective of the time sheet period to which the time cards belong. For example, you can create a monthly time card report that includes time cards from the first day to the last day of the month.

Time cards also have an optional approval mechanism for project managers to approve the time cards. Administrators and time card approvers can see all the time cards for the week. All users who are in a role that is responsible for working on tasks also can access their personal time cards. A time card can have any of the following states:

Time Card states

State	Description
Pending	A Time card that isn't submitted for approval.
Submitted	A time card submitted for approvals.
Approved	An approved time card.

Time Card states (continued)

State	Description
Processed	An approved time card with an expense line for the associated task.
Rejected	A rejected time card.
Recalled	An approved time card recalled for any required adjustments.

Create a time card

You can create time cards to log time against the work you have done.

Before you begin

Role required: timecard_user

About this task

Starting Zurich release, users can select a resource assignment to associate it with time cards to calculate the actual efforts and tag them to the respective projects.

The **Allow time card reporting on** field on the [project form](#) determines the level at which the time cards for the project tasks can be created.

Note:

Time Cards created from Project form do not populate Resource plans automatically to avoid random allocations. For more information, see [KB0814884](#) article in the Now Support Knowledge Base.

Time cards can be created automatically or manually.

- **Automatic:** Use the following options to automatically generate the time cards:
 - *By updating task:*

Auto create time card on task update

Configure time cards to be created when a user updates a task record. The **Auto create time card on task update** setting in the assigned [time sheet policy](#) controls this behavior and is set to false by default.

Auto fill time card with time worked entries

Configure time cards to be created when a user records **Time worked**. A time card is created if a time card does not exist for the task. The time sheet policy **Auto fill time card with time worked entries** controls this behavior and is set to false by default.

In **Project Task**, **Incident**, **Problem**, and **Change** records, the **Time worked** field does not appear by default and must be configured on the form.

- *By scheduled job:* Configure time cards for the project tasks to be generated automatically for users through a [scheduled job](#). Only the admin can configure a scheduled job.

Note:

Time cards cannot be created automatically when you use the mobile interface. Use the desktop interface if you want to use the automatic time card feature.

- **Manual:** Create a time card for each task and enter the time manually.

Procedure

1. Create the time card using one of the following options.
2. On the form, fill in the fields.

Time card form

Field	Description
Week starts on	<p>Starting date of the week of the time sheet.</p> <p>Note: The time sheet policy Week starts on controls the start day of the week. A message is displayed when you try to associate a resource plan with a time card when the week on which the time card starts is outside the resource plan dates.</p>
State	<p>Current state of the time card. All new time cards begin in the Pending state.</p> <p>Different states of a time card are Pending, Submitted, Approved, Processed, Rejected, and Recalled.</p>
Category	Type of task for which the time card is created.
Task	Task that is associated to the time card.
Project time category	<p>Type of activity in the project that time is reported for.</p> <p>This field appears when you select Project/Project Task or Task work in the Category field.</p>
User	Name of the user that the time card is created for.
Resource assignment	<p>Select a resource assignment assigned to the user. When the time card is approved, the actual hours are used to view the planned vs actual hours in the heatmap view in Project Workspace and Resource Management Workspace.</p> <p>A resource assignment is associated with the time card in the following ways:</p> <ul style="list-style-type: none"> ○ If the user has multiple resource assignments, you can select the appropriate assignment. ○ If the user has only one resource assignment, that plan is selected by default.

3. Click **Submit**.

Result

- The time card is created for the selected time card period.
- If the time sheet for the week does not exist, a time sheet is created for the time card week.

What to do next

After the time card is created, the hours for that task can be incremented automatically from the **Time worked** field in the task record. The time sheet policy **Auto fill time card with time worked entries** controls the way the time is updated in time cards. The policy is set to *false* by default. If

automatic updates for time worked are not configured, the user must manually update the time card.

Related topics

[Map a time card category with operational work types](#)

Copy time cards from a previous time sheet

Another option for creating time cards is to copy them from an existing timesheet, which copies all the time cards (for project as well as non-project tasks) from a selected time sheet.

Before you begin

Role required: timecard_user

About this task

You can also perform this task from the [Time Sheet Portal](#).

Procedure

1. Open the time sheet record that you want to create the time cards for.
2. Click the **Copy from previous time sheet** related link.
3. In the **Select Time Sheet** field, select a previous time sheet that you want to copy the time cards from.
4. **Optional:** You can copy the time logged for the tasks in the previous time sheet, select the **Copy time logged** check box.
5. Click **OK**.

Result

Time cards for project tasks

Time cards for all the project tasks that are in progress or planned in the current week are copied from the selected time sheet. If a time card for a project task exists, a duplicate time card is not created during copying.

Time cards for non-task category

Time cards for all non-task category such as meetings and trainings are copied from the selected time sheet. If a time card for a non-task category exists, a duplicate time card is created during copying.

Note:

- If the previous time sheet has rate types and the time sheet policy of the user allows rate types, then rate types are also copied into the current time sheet.
- If the previous time sheet has rate types, but the time sheet policy of the user no longer allows rate types, then rate types are not copied to the current time sheet.
- If the previous time sheet has a rate type that is inactive, that rate type is not copied. If necessary, the user can enter a different rate type before saving the individual time cards.

Auto-generate time cards

As an admin, you can configure a scheduled job to generate time cards automatically for project tasks assigned to time card users.

Before you begin

Role required: admin

About this task

In addition to the manual option **Generate Time Cards**, a scheduled job can be run to automatically generate the time cards for project tasks. A job can be scheduled to run every week, for example, on every Sunday to generate time sheets for all users for the next week. You can configure when to run the scheduled job based on the business process of the organization. By default, the scheduled job is turned off. For more information, see [Schedule a script execution](#) .

Note:

The scheduled job auto-generates time cards only for those users who have the **Auto create time cards every week** option set to true in their assigned [time sheet policy](#).

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. In the Scheduled Jobs list, select **Auto Generate Time Cards**.
3. Configure the following parameters in the script as per the business requirements:
 - run for (CURRENT_WEEK, NEXT_WEEK, LAST_WEEK)
 - Group Name (includeGroups, excludeGroups)

Note:

- If a time card exists for a project task for the time card week, a duplicate time card is not created.
- Time cards are generated only for those project tasks that are in progress or planned in that week.
- The **Allow time card reporting on** field on the [project form](#) determines the level that the time cards for the project tasks are created at.

Example:

The following example script is executed when a scheduled job is run to generate time cards for the **Current** week for the Database and Hardware groups:

```
// Clone this schedule job to run separately for different
// groups at different times
// One of the following values
// TimeCardConstants.CURRENT_WEEK
// TimeCardConstants.NEXT_WEEK
// TimeCardConstants.LAST_WEEK
var runFor = TimeCardConstants.CURRENT_WEEK;

// Comma separated group sys ids or group names.
// TimeSheet/TimeCards will be auto generated for time card users
// in the given groups.
var includeGroups = [Database,Hardware];
var excludeGroups = [];

var generator = new TimeCardGenerator();
generator.generateFromConfig(runFor, includeGroups,
excludeGroups);
```

Submit a time card

As a time card user, once a time card for the week is updated with the time worked, you can submit the time card individually.

Before you begin

- A time card in the Pending or Rejected state can be submitted.
- Role required: timecard_user

About this task

When a user submits a time card, the [time sheet policy](#) assigned to the user is used for validation. If there's no time sheet policy assigned to the user, the default time sheet policy is used. Business rules help prevent a user from submitting a time card in case any violation is found.

Procedure

1. Navigate to **All > Time Sheets > My Time Sheets > All**.
2. Select the time sheet that you want to submit the time card for.
3. In the Time Card related list, open the time card to submit.
4. Select **Submit Time Card**.

Note:

Submit multiple time cards by selecting **Submit Time Card** from the actions on selected rows menu.

Result

- The time card moves to the Submitted state.
- The time card is submitted to an approver based on the **Project time approver** and **Non-project time approver** field values in the assigned time sheet policy.

Note:

If the project or user manager is changed after submitting the time card, the time card is automatically redirected to the new project or user manager for approval.

Approve or reject a time card

As a time card approver, you can view and approve or reject a submitted time card.

Before you begin

Role required: timecard_approver or timecard_admin

About this task

You can view only those time cards that are submitted to you for approval or you have been delegated as the time card approver by one of the other user managers. The [time sheet policy](#) assigned to the user governs the approval process.

Procedure

1. Navigate to **All > Time Sheets > Time Cards > Pending Approval**.
2. Select the time card to approve or reject.
3. Click **Approve** or **Reject**.

Result

- The time card moves to the Approved or Rejected state.
- Expense line is created for an approved time card.
- For an approved time card, a Time Card Daily record is created.

Note:

- A user manager can also approve the time cards within a time sheet by selecting one or more time cards and approving them. When all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.

A user manager is one who is selected in the **Manager** field on User form of the time card user.

- If a time card is in the Rejected state, the associated time sheet also moves to the Rejected state irrespective of the state of other time cards in the time sheet.

Note:

If a time sheet is rejected, it gets listed in the notifications for the rejected time sheets under notifications icon  on [Time Sheet Portal](#).

- If **Project time approver** is set to **Both** in the assigned time sheet policy, the time card is in the Submitted state only if both approvers approve it. If one of the approver rejects, the time card state is set to Rejected and the **Approved by** field is cleared, requiring approval of both approvers on resubmission.

Recall a processed time card

You can recall an incorrect time card in the Approved or Processed state to return it to the submitter. The submitter can then make the necessary changes and resubmit the time card.

Before you begin

Role required: timecard_approver or timecard_admin

About this task

The recall option is available only if the **Allow recall** option is selected on the associated [time sheet policy](#).

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.
2. Click the **My Time Sheet** list and select a user under **My Resources**.
3. Navigate through the **Calendar** widget to select the time sheet.
The time sheet must be within the recall period specified in the time sheet policy.
4. To recall a time card, click the more actions icon () and select **Recall**.
If the cost type for a cost plan is updated before recalling a time card, the expense line of the recalled time card will have the new expense type. For example:
 - a. A Time card is processed with Cost Plan=Labor Opex, an expense line is generated for \$500 with Expense type=Labor Opex.
 - b. If the cost type of cost plan is updated to Cost type=Labor Capex.
 - c. If a time card is recalled, the recalled expense line will have Expense type=Labor Capex.

Result

- Changes the state of the time card to **Recalled**. The state of the associated time sheet also changes to **Recalled** until all time cards in the time sheet are approved or processed again.
- Reverts the actual effort and resource hours in a project or demand created when the time card for a task type was approved.

- Creates negative expense lines to zero out the corresponding expense lines created when the time card was approved.
- Returns the associated time sheet to its submitter for modifications.

Map a time card category with operational work types

Map custom time card categories with operational work types so you can select only the operational resource plans that are associated with the user for a specific time card period and category while posting time.

Before you begin

Role required: pps_admin

About this task

By default, all base system time card categories are mapped with the base system operational work types. If mapping is not done for custom categories, the **Resource Plan** field displays all the operational resource plans associated with the user for that time period when you create a time card.

During time card creation, after you select a time card category and task or during time sheet submission for other category time cards, operational resource plans are populated for that category and task as described in the following table.

Operational resource plans for tasks and categories

Category	Task	Resource Plan
<ul style="list-style-type: none"> • Admin • External labor • Meeting • Phone call • Training • Out of office • Appointment • Time off • KTLO 	Task, project, demand, project task, or demand task, or no value is selected in the Task field.	<p>Displays the resource plans associated with the task, project, demand, project task, or demand task when a task is selected.</p> <p>If no resource plans are associated with the selected task, or no task is selected, then the mapped operational resource plan for that operational work type for that category is displayed.</p>
Custom	Any of the task/project/demand/ project task/demand task	<p>Displays the resource plans associated with the task, project, demand, project task, or demand task when a task is selected.</p> <p>If no resource plans are associated with the selected task, or no task is selected, then the mapped operational resource plan for that custom operational work type for that category is displayed.</p>

Operational resource plans for tasks and categories (continued)

Category	Task	Resource Plan
		If mapping is not done, then all the operational resource plans are displayed.
Other category (custom and OOTB) from Time Sheet Portal	N/A	Displays the mapped operational resource plans. If mapping is not done, then all the operational resource plans are displayed.

Procedure

1. Navigate to **All > Project Administration > Time Card Category Mapping**.
2. Click **New**.
3. From the **Time card category** menu, select the required time card category.
4. From the **Operational work type** menu, select the operational work type you want to map to the time card category you selected in the previous step.
5. Click **Submit**.

Record time worked

The time card retrieves time accrued on a project or spent working on any record in the Task table from the **Time worked** field.

This field does not appear by default on the Project Task, Incident, Problem, and Change forms and must be added by personalizing the form. Time recorded in this field is used to populate an existing time card or to create a new time card if one does not exist. A [time sheet policy](#) controls this behavior.

Note:

When time worked is updated, a time card is created only if:

- the user is a time card user, AND
- the user is assigned to the task through **Assigned to** or **Additional assignee list** field.

The *Time worked* field has a counter that acts like a stopwatch for the duration of the time spent in the record. A button in the field can stop and start the counter. By default, the *Time worked* counter is enabled and begins recording the elapsed time when the record is opened. Stop the counter with the stop button and restart it with the play button.

If you are creating time cards from time worked entries, you can ask your admin to add the **Time Worked** related list to display the time worked records on the time card form. You will also notice an informational message on the time card to let you know that changes to time worked records overrides values in the time card. This is displayed using a [Create a formatter and add it to a form](#), which can be added or removed by configuring the form.

Manage costs

When the cost management feature is enabled, time cards can be used to manage the cost of labor in the Cost Management application.

When a time card for a project task is approved, an expense line is generated for the corresponding labor cost associated with the project. If the project has a [Rate Models](#) associated, then the hourly rate for calculating labor cost for the expense lines is derived from the rate model. If no rate model is associated to the project, the rate listed in the *Labor Rate Card* is considered. If no Labor Rate Cards is applicable, the property `com.snc.time_card.default_rate` defines the default hourly rate.

Roles

The `timecard_admin` role enables users to approve, modify, and delete the time cards of other users.

Analytics Project manager

The Analytics Project manager provides the project managers with quick reports of time card exceptions, and category wise time reported for their projects. The dashboard displays time card reports only for the projects managed by a project manager.

Important:

Starting with Xanadu release, **Project Manager Dashboard** is renamed to **Analytics Project manager** for new customers.

The dashboard can be activated using the Performance Analytics - Content Pack - Project Portfolio Suite Dashboards plugin (`com.snc.pps_dashboards`). You require Performance Analytics license to use this dashboard.

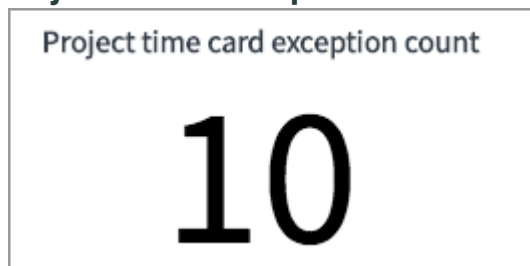

The reports in the dashboard are filtered based on **Project**, and **Date** selected.

The Analytics Project manager consists of these components:

Project time card exception count

It displays the total count of entries in **Project time card exceptions** report.

Project time card exception count

Project time card exceptions report

The Project time card exceptions report lists the users who did not submit their time cards, and the time cards which are not yet approved for the selected project and time range. The exception report is generated for the users who are assigned to a task in progress, or hard allocated to the project/task in that time range. The report displays the following data:

- **User:** The time card user assigned to the selected project, or hard allocated to the resource plan associated with the project. If there are more than one time cards for a user in a given date range which are not submitted or require approval, then multiple entries are listed for the user.
- **Week starts on:** Starting date of the time card week in the selected time range.
- **State:** State of the time card. Time card entries with state as **Not Submitted** are also listed if a time card is not created for the week.

The report is generated from the project_timecard_exception table. It requires the schedule job **Project Time Card Exceptions** to be running to get the up-to-date information.

Total approved hours for project(s)

It displays the total approved hours in all project categories displayed in **Time by Project Time Category** report.

Total approved hours for projects

Time by Project Time Category report

The bar chart report displays the time approved against each project category for the users allocated to the selected project.

Use the Analytics Project manager

The Analytics Project manager shows the time card reports for the selected projects.

About this task

Important:

Starting with Xanadu release, **Project Manager Dashboard** is renamed to **Analytics Project manager** for new customers.

Before you begin

Role required: it_project_manager, timecard_admin

Procedure

1. Navigate to **All > Time Sheets > Analytics Project manager**.
2. Select a project and date range from the **Project** and **Date** choice lists.
3. Review the displayed reports and take necessary actions, if required.
4. Click the more actions icon () to duplicate, share or export the selected report, if required.

Analytics User manager

The Analytics user manager provides the user managers with reports of time sheet exceptions, and category wise time reported by the users.

i Important:

Starting with Xanadu release, **User Manager Dashboard** is renamed to **Analytics User manager** for new customers.

The dashboard can be activated using the Performance Analytics - Content Pack - Project Portfolio Suite Dashboards plugin (com.snc.pps_dashboards). You require Performance Analytics license to use this dashboard.

The dashboard displays time sheet reports only for those time card users who have the **Manager** field on [User form](#)  set to the current user.

The reports in the dashboard are filtered based on **Date** range, and **User** selected.

The Analytics user manager consists of these components:

Time sheet exception count

It displays the total count of entries in **Time sheet exceptions** report.

Time sheet exception count

Time sheet exceptions report

The Time sheet exceptions report lists the users who did not submit/create their time sheets, and the time sheets which are not yet approved for the selected user, and time range. The report displays the following data:

- **User:** The time card user whose manager in User profile is the current user. If there are more than one time sheets for a user in a given date range which are not submitted or require approval, then multiple entries are listed for the user.
- **Week starts on:** Starting date of the time sheet week in the selected time range.
- **State:** State of the time card. Time sheet entries with state as **Not Submitted** are also listed if a time sheet is not created for the week.

The report is generated from the time_sheet_exception table. It requires the schedule job **Time Sheet Exceptions** to be running to get the up-to date information.

Total approved hours

It displays the total approved hours in all categories displayed in **Time by category** report.

Total approved hours**Time by category report**

The bar chart report displays the time approved against each category for the selected users whose manager in User profile is the current user.

Use the Analytics User manager

The Analytics User manager shows the time sheet reports for the users.

Before you begin

Role required: resource_manager, timecard_admin

About this task**Important:**

Starting with Xanadu release, **User Manager Dashboard** is renamed to **Analytics User manager** for new customers.

The dashboard displays time sheet reports only for those time card users who have the **Manager** field on [User form](#) set to you.

Procedure

1. Navigate to **All > Time Sheets > Analytics User manager**.
2. Select a date range and user from the **Date** and **User** choice lists.
3. Review the displayed reports and take necessary actions, if required.

Performance Analytics dashboard for Time Card Management

This Platform Analytics Solution contains preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

The Time Card Management and Time Sheet dashboards are included in the Project Portfolio Suite with Financials Dashboards. For more information, see [Project Portfolio Management Platform Analytics Solutions](#).

Domain separation and Time Card

Domain separation is supported in Time Card. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#) .

For more information about using domain separation with Time Card, see https://community.servicenow.com/community?id=community_article&sys_id=616d706edbb318d066f1d9d9689619c1 .

Mobile Time Sheets

The ServiceNow[®] Mobile Timesheets app enables time sheet users and managers to access their time sheets from a mobile device. Mobile Time Sheets is available on the Now Mobile app and is supported on iOS and Android devices.

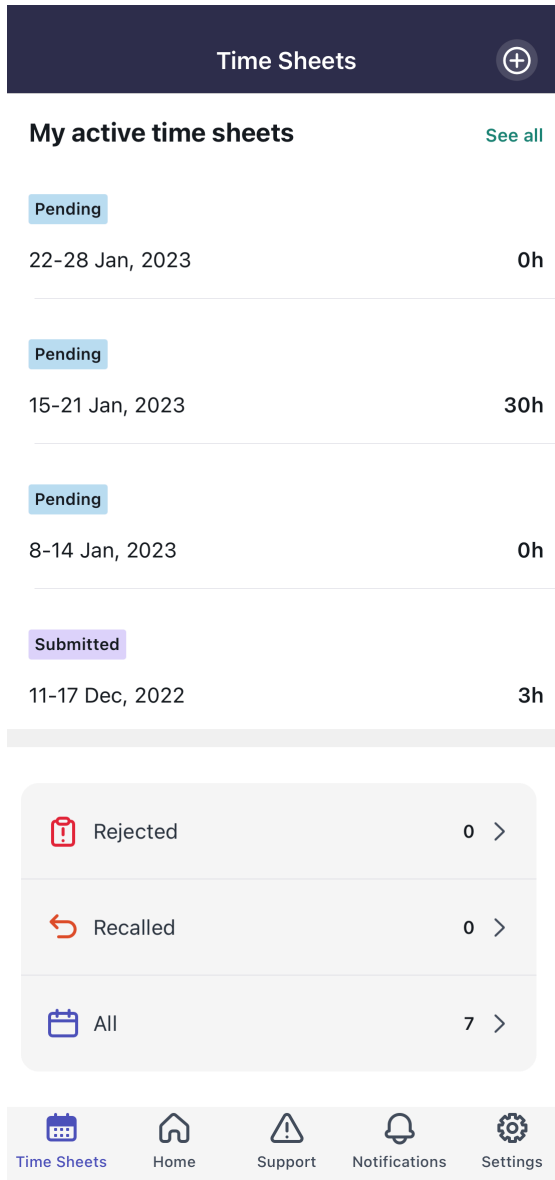

Time sheet users can use Mobile Time Sheets to create, view, edit, enter notes, and submit their time cards from a mobile device. Time sheet project managers or user managers can view, approve, reject, or recall a time sheet or time card from a mobile device.

To access time sheets from your mobile device, you must first download the Now Mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.

Features

The Mobile Time Sheets app provides the following capabilities to time sheet users:

- Create a time sheet
- Create a time card
- Log hours on the time card
- Update hours for the week for a specific time card
- Add notes to your time cards
- Submit a time sheet
- Submit a time card

The Mobile Time Sheets app provides the following capabilities to resource or project managers:

- Approve or reject a time sheet
- Approve or reject a time card
- Recall a time sheet or time card

Install Mobile Time Sheets

Install the Mobile Time Sheets application from the ServiceNow Store website.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the application using the filter criteria and search bar.
You can search for the application by its name or ID. If you cannot find an application, you may have to request it from the ServiceNow store.
3. Click **Install**.
4. In the Application installation dialog box, review the application dependencies.

If your application requires other applications, you need to install them first if they are not already installed.

Installing your application also automatically installs dependent applications or plugins if they are not installed already.

5. If demo data is available and you want to install it, click **Load demo data**.
Some applications include demo data, which are sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.
6. Click **Install**.

Enabling the mobile experience for Mobile Time Sheets

Enable the mobile experience for Mobile Time Sheets so users can fill out time sheets and user managers can approve or reject them from their mobile device.

Before you begin

Role required: admin

Procedure

1. Install the [Mobile Time Sheets application](#) on your instance.
2. Download the Now mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.

For more information on using this mobile app, see the [Now Mobile app](#) topic.
3. Add the instance that has Mobile Time Sheets installed to the Now Mobile application and log in to access the application data on your mobile device.

What to do next

[Log in to an instance with a mobile app](#).

Use Mobile Time Sheets in Now Mobile

You can configure your platform system to use Mobile Time Sheets in the Now Mobile application. By default, Mobile Time Sheets can be viewed in the Now Mobile application.

Before you begin

Role required: admin

The Mobile Time Sheets app must be installed in your system.

Procedure

1. Navigate to **All > System Mobile > Navigation Bar**.
2. Click **Now Mobile Nav**.
3. From the **Navigation Tabs** related list, delete the time sheet record.
4. Navigate to **System Mobile > Navigation Bar**.
5. Click **Now Agent**.
6. Create a new record for the time sheet in the **Navigation Tabs** related list.
7. Download and enable the Now Mobile app.
For more information, see the [Now Mobile app](#) topic.

Create a time sheet from your mobile device

Create a time sheet to group all your time cards for the given week and submit them in a single step from the Now Mobile application.

Before you begin

Role required: timecard_user

Procedure

1. Log in to your instance using the Now Mobile application.
2. Tap the plus icon located on the top-right corner.
3. In the **Select a day to create a time sheet** field, select the starting date of the week for which the time sheet is being created.
4. Tap the forward icon.

What to do next

Add time cards to the time sheet.

Search for a time sheet from time sheet lists

Search for a specific time sheet from the time sheet lists by applying filters.

Before you begin

Role required: timecard_user

About this task

You can apply filters on the time sheet lists to search for a specific time sheet in the **All**, **Rejected**, and **Recalled** groups, or while copying time cards from a previous time sheet. You can apply one or more filters while searching for a time sheet.

Procedure

1. Log in to your instance using the Now Mobile application.
2. Open the **Rejected**, **Recalled**, or **All** list.
3. Tap the **Filters** icon located on the top-right corner to specify your filter criteria.
4. From the **State** menu, select the state of the time sheet, and tap the **Back** icon.
5. Select the user assigned to the time sheet in the **Name** field.
6. Select the week on which the time sheet starts.
7. Tap **Apply**.

Add a time card and log time through the Mobile Time Sheets application

Create time cards to log time from your mobile application for the work you have done.

Before you begin

Role required: timecard_user

About this task

The **Allow time card reporting on** field on the [project form](#) determines the level at which time cards for the project tasks can be created. For example, at the project level, if a user is assigned to multiple tasks in a project, then the time spent on all the tasks is recorded under one time card only; and at the project task level, separate time cards are created corresponding to each planned task.

Procedure

1. Log in to your instance using the Now Mobile application.
2. Open a time sheet from the **Time Sheets** tab.
3. Tap the action icon.
4. Add task-related or non-task related time cards.

5. Log time in a time card:

- Tap a task on the time sheet and enter the hours worked for applicable days.

6. Tap Save.**Update time card hours for a task**

Update hours in a time card for a particular day.

Before you begin

Role required: timecard_user

About this task

You can update the hour field for a specified day for a particular time card. The existing value is overwritten with the new value in the time card.

Procedure

1. Log in to your instance using the Now Mobile application.
2. Open a time sheet from **My active time sheets**.
3. Select the day for which you want to update hours.
4. Tap the task for which you want to update hours.
5. Update the hours in the text box.
6. Save the changes using your device's keyboard.

Manage your time cards

View, edit, or delete your time cards from your mobile device.

Before you begin

Role required: timecard_user

About this task

Manage your time cards by performing actions such as submitting the time card, viewing the notes, adding notes, editing resource plan, or deleting the time card using your mobile device.

Procedure

1. Log in to your instance using the Now Mobile application.
2. Open a time sheet from the **Time Sheets** tab.
3. In the **All Week** tab, tap the action menu for a task.
4. Manage your time cards.

Submit a time card from your mobile device

Once a time card for the week is updated with the time worked, you can submit the time card from your mobile application.

Before you begin

Role required: timecard_user

Procedure

1. Log in to your instance using the Now Mobile application.
2. Open a time sheet.
Cards that have not yet been submitted are in the Pending state. You can also submit cards that are in the Rejected state once you have fixed the issues that caused the rejection.
3. Tap the actions menu for a time card on the time sheet and select **Submit time card**.

Result

- The time card moves to the Submitted state.
- The time card is submitted to an approver based on the values set in the **Project time approver** and **Non-project time approver** fields in the time sheet policy assigned to the user.

Note:

If the project or user manager is changed after submitting the time card, the time card is automatically redirected to the new project or user manager for approval.

Submit a time sheet from your mobile device

Once you have updated the time sheet with the time you worked, you can submit the time sheet for the week to submit all the time cards for the week together from your mobile application.

Before you begin

Role required: timecard_user

Procedure

1. Log in to your instance using the Now Mobile application.
2. Open the time sheet you want to submit.
3. Submit the time sheet using one of the following options.
 - Tap the action icon and tap **Submit Time sheet**.
 - Tap **Submit time sheet** at the bottom of the screen.

The time sheet is validated against the time sheet policy assigned to you or, if no time sheet policy is assigned, against the default time sheet policy.

- If the time sheet meets the time sheet policy requirements, the time sheet is submitted. All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.
- If the time sheet does not meet the time sheet policy requirements, a validation error is displayed. Resolve the issue indicated by the error message and resubmit the time sheet.

Approve or reject a time sheet or time card from your mobile device

As a user manager, you can approve or reject from your mobile device all time cards for a user in a given week in a single step by approving or rejecting a time sheet.

Before you begin

Role required: timecard_approver or timecard_admin

About this task

A user manager is the one who has either of the required roles. The manager who can accept or reject the time sheet is selected in the **Manager** field on the User form of the time card user.

A manager can [delegate another user](#) with the required roles as the time sheet approver. For the specified time period, the delegated user also receives all the time sheets submitted by time card users to process.

Procedure

1. Log in to your instance using the Now Mobile application.
2. In the Time Sheets list, open the time sheet you want to approve or reject.
3. Approve or reject the time sheet or time card.
 - To approve time sheet of your team, from the Team approval requests section, tap the approve (✓) icon.
 - To reject time sheet of your team, from the Team approval requests section, tap the reject (✗) icon.
 - To approve the time sheet, tap the action icon, and select **Approve time sheet** or tap the **Approve time sheet** button at the bottom of the screen.
 - To reject the entire time sheet, tap the action icon, and select **Reject time sheet** or tap the **Reject time sheet** button at the bottom of the screen.
 - To approve a specific time card, tap the action menu and tap **Approve time card**.
 - To reject a specific time card, tap the action menu and tap **Reject time card**.

Result

- The time sheet moves to the Approved or Rejected state.
- All time cards associated with the time sheet are also approved or rejected automatically.
- Time cards that are of non-task type are in moved to the processed state.
- If any time cards in the time sheet are pending approval by one of the approvers, the sheet remains in the Submitted state.
- If a time card in a time sheet is in the Rejected state, the time sheet also moves to the Rejected state regardless of the state of any other time cards in the time sheet.

Track your time sheets

View and track the time sheets grouped according to the date of submission such as the current week, last week, or older.

Before you begin

Role required: timecard_approver or timecard_admin

Procedure

1. Log in to your instance in the Now Mobile application.
2. From the time sheets list, navigate to the **All** section and tap the forward icon.
3. View the time sheets in different states such as submitted, pending, approved, or recalled during the current or previous weeks.
 - To view the time sheets for the current week, tap **This week** tab.
 - To view the time sheets for the last week, tap **Last week** tab.
 - To view the time sheets for previous weeks, tap **Older** tab.

Recall a processed time sheet or time card from your mobile device

As a user manager, you can recall an incorrect time sheet or time card that is in the Approved or Processed state to return it to the submitter. The submitter can then make the necessary changes and resubmit the time sheet or time card.

Before you begin

Role required: timecard_approver or timecard_admin

Procedure

1. Log in to your instance using the Now Mobile application.
2. From the time sheets list in the Team approvals requests section, open the time sheet you want to recall or the one that contains the time card you want to recall.
3. Recall the time sheet or time card.
 - To recall an approved time sheet, navigate to **All** time sheets section, and select a time sheet from the **This week**, **Last week**, or **Older** tab, and then tap the Recall () icon
 - To recall the entire time sheet, tap the action icon, and select **Recall Time sheet** or tap the **Recall time sheet** button at the bottom of the screen.
 - To recall a specific time card, tap the action icon, and select **Recall time card**.

Monetary and non-monetary benefit plans

Benefit plans capture the potential benefits accrued by the work item when the work item is executed. You can create benefit plans to specify the estimated benefits in a category for a fiscal period.

Monetary and non-monetary benefit plans capture the financial and non-financial benefits respectively. You can also associate monetary and non-monetary benefit plans with each other, so that you can capture the potential benefits (financial and non-financial) accrued by the work item for the hybrid benefit plans.

Benefit Plans in Project Management

Strategic Spend Tracking for PPM

Strategic Spend Tracking for PPM enables project or demand managers to evaluate the strategic value of organization's projects and demands. You can identify the purpose and benefits of executing demands and projects and how they contribute to achieving company's strategies and goals.

Strategic Spend Tracking for PPM enables demand and project managers to determine how and where funding is being spent during the execution of a demand or project.

Organizations generally determine and approve investment budgets that represent the funds allocated to achieve their goals. Strategic Spend Tracking for PPM focuses on allocating your investment budget through demands and projects, and tracking the expenditure to achieve your organizational goals.

Each demand and project contributes to achieving one or multiple organizational goals. You can use the Strategic Spend Tracking for PPM to perform the following tasks:

- Associate multiple strategies and goals with a demand or project.
- Allocate a percentage of the demand or project's total cost and benefits towards achieving one or more strategies and goals.
- Generate strategy and goal allocation breakdowns for a demand or project for the fiscal year.
- View the roll up of strategy and goal breakdowns from different demands and projects in the strategy and goal record.
- Use the Strategic Spend Tracking for PPM dashboard to view how the planned costs, actuals costs, and benefits for projects aligned to the organization's goals and strategies trend over time in order to accurately understand the financial performance of your organization.

Install Strategic Spend Tracking for PPM

Install the Strategic Spend Tracking for PPM application from ServiceNow Store applications. Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

Before you begin

Complete the following setup checklist for a smooth installation and configuration.

Setup checklist

Setup tasks	Description
Verify that PPM Standard plugin (com.snc.financial_planning_pmo) is activated.	Navigate to Subscription Management > Subscriptions in your instance. The list displays the subscriptions that your organization has purchased.

Role required: admin

About this task

Activate the PPM Standard plugin (com.snc.financial_planning_pmo) in your ServiceNow instance before you install Strategic Spend Tracking for PPM. For more information see, [Activate PPM Standard \(Project Portfolio Management\)](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the application using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find an application, you may have to request it from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install**.

Components installed with Strategic Spend Tracking for PPM

Several types of components are installed with activation of Strategic Spend Tracking for PPM, including tables and scheduled jobs.

i Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Demo data is available for this feature.

Scheduled jobs installed

Scheduled job	Description
PPM Strategic Spend Tracking - Generate Strategy/Goal Allocation Breakdowns for Projects and Demands	Generates breakdown of strategy and goal allocation for the associated projects and demands.
PPM Strategic Spend Tracking - Update projects and Demands with strategy and goal allocations	Updates strategy and goal allocations for the associated projects and demands.

Tables installed

Table	Description
BO Job Execution Log [sn_ppm_sst_run_log]	Stores information about execution of the scheduled jobs such as time of execution and tasks there were included.
Goal Allocation [sn_ppm_sst_task_goal]	Stores goal allocation details for a project or demand. The details include project or demand number, strategy name, % allocated towards the strategy, budget, planned cost, actual cost, and benefit amount.
Goal Allocation Breakdown [sn_ppm_sst_goal_allocation_breakdown]	Stores goal breakdown details for a project or demand. The details include fiscal year, strategy allocation amount, cost details (planned and actual), and capex and opex amounts (planned and actual).
Strategy Allocation [sn_ppm_sst_task_strategy]	Stores strategy allocation details for a project or demand. The details include project or demand number, strategy name, % allocated towards the strategy, budget, planned cost, actual cost, and benefit amount.
Strategy Allocation Breakdown [sn_ppm_sst_strategy_allocation_breakdown]	Stores strategy breakdown details for a project or demand. The details include fiscal year, strategy allocation amount, cost details (planned and actual), and capex and opex amounts (planned and actual).

Allocate or modify the strategy and goal percentage for a project

Allocate the percentage of a project's total cost, benefit, and budget to help achieve the strategic objectives that the project fulfills. You can also view the breakdown of the project's financial data based on the allocated percentage.

Before you begin

You should have an existing [project](#).

Execute the following scheduled jobs:

- *PPM Strategic Spend Tracking - Update projects and demands with strategy and goal allocations*
- *PPM Strategic Spend Tracking - Generate Strategy/Goal Allocation Breakdowns for Projects and Demands*

Role required: it_project_manager

Procedure

1. Navigate to **Project > Projects > All**.
2. Select the project to which you want to add or update allocation percentages.
3. In the **Business Case** tab, add or update the strategies and goals with which the project is associated.

For more information, see the Business Case field descriptions in the [Create a project](#) documentation topic.

4. Click **Save.**

The selected strategies and goals appear in the Strategy Allocations and Goal Allocations related lists.

5. Update strategy and goal allocations.

- a.** In the Strategy Allocations related list, click the **% Allocation** field and enter the percentage that this project contributes towards the selected organizational strategy.
- b.** In the Goal Allocations related list, click the **% Allocation** field and enter the percentage that this project contributes towards the selected organizational goal.

Note:

The sum of strategy or goal allocations for a project must not exceed 100%.

6. Click the **Recalculate Strategy and Goal Allocation related link to update cost field values in the allocation tabs.**

7. Click **Update.**

8. Optional: In the Strategy or Goal Allocations related list, click the preview icon () , and then click **Open Record** to view the breakdown of the strategy or goal allocation.

9. Optional: View the trends for planned costs, actual costs, and benefits over time using the [Strategic Spend Tracking for PPM dashboard](#).

Allocate or modify the strategy and goal percentage for a demand

Allocate the percentage of a demand's total cost, benefit, and budget towards achievement of strategic objectives that the demand fulfills. You can also view the breakdown of the demand's financial data based on the allocated percentage.

Before you begin

You should have an existing [demand](#).

Execute the following scheduled jobs:

- *PPM Strategic Spend Tracking - Update projects and demands with strategy and goal allocations*
- *PPM Strategic Spend Tracking - Generate Strategy/Goal Allocation Breakdowns for Projects and Demands*

Role required: it_demand_manager

Procedure

- 1. Navigate to **Demand > Demands > All**.**
- 2. Select the demand to which you want to add or update allocation percentages.**
- 3. In the **Business Case** tab, add or update the strategies and goals with which the demand is associated.**
For more information, see the Business Case field descriptions in the [Demand form](#) documentation topic.
- 4. Click **Save**.**
The selected strategies and goals appear in the Strategy Allocations and Goal Allocations related lists.

5. Update strategy and goal allocations.

- a. In the Strategy Allocations related list, click the **% Allocation** field and enter the percentage that this demand contributes towards the selected organizational strategy.
- b. In the Goal Allocations related list, click the **% Allocation** field and enter the percentage that this demand contributes towards the selected organizational goal.

Note:

The sum of strategy or goal allocations for a demand must not exceed 100%.

6. Click the **Recalculate Strategy and Goal Allocation** related link to update cost field values in the allocation tabs.

7. Click **Update**.

8. **Optional:** In the Strategy or Goal Allocations related list, click the preview icon () , and then click **Open Record** to view the breakdown of the strategy or goal allocation.

9. **Optional:** View the trends for planned costs, actual costs, and benefits over time using the [Strategic Spend Tracking for PPM dashboard](#).

Strategic Spend Tracking for PPM dashboard

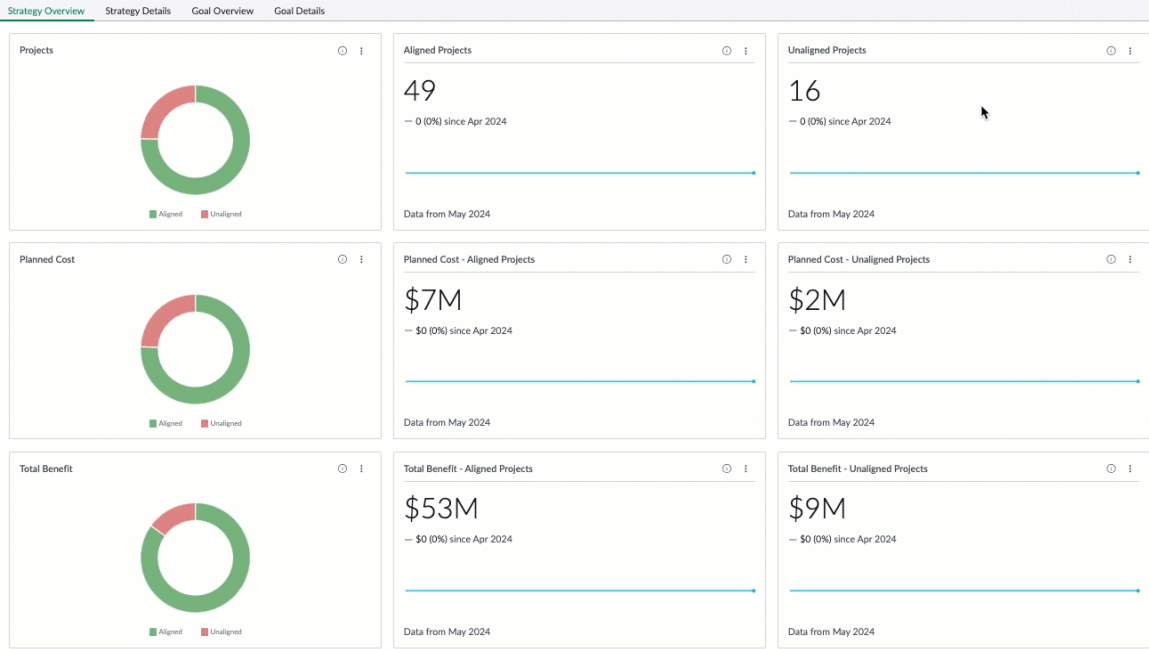

The Strategic Spend Tracking for PPM dashboard provides comprehensive visualization to the business planners to help them understand how the planned costs, actual costs, and benefits for projects aligned to the organization's goals and strategies trend over time. It helps you to accurately understand the financial performance of your organization.

Note:

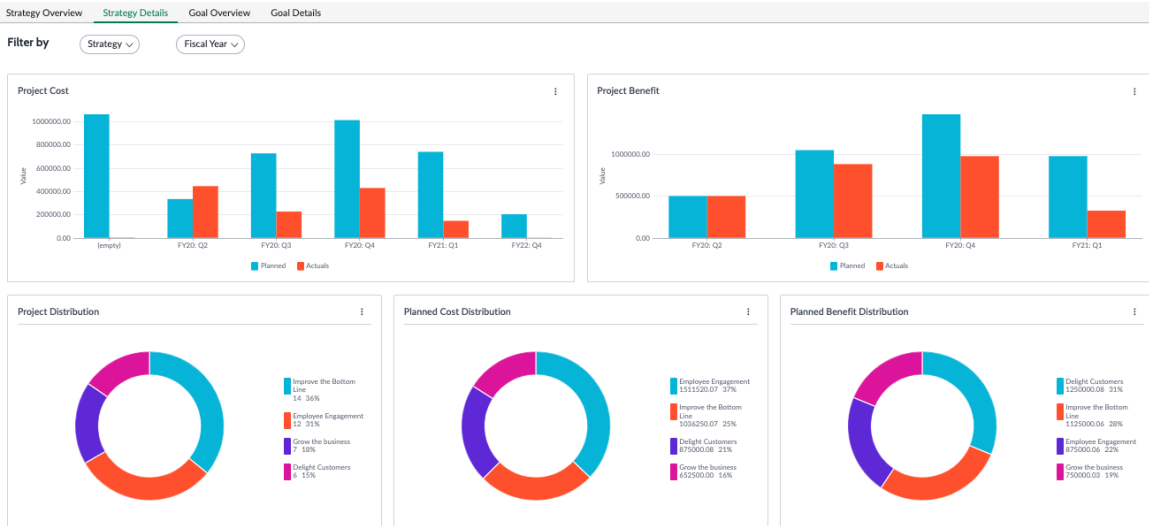

Starting with version 1.1.0, the Strategic Spend Tracking for PPM dashboard is available in the Next experience UI Framework which can be accessed by navigating to **All > Strategic Spend Tracking for PPM > Analytics**.

You can analyze the total expenses, and drill down to what is contributing to the cost, and which departments and business units are spending.

Business Planner: Needs visibility into strategies and goals for projects and demands in the organization.	business_planner

Indicators

The dashboard contains the following indicators for strategies:

Projects

Comparison of aligned and unaligned projects for strategies.

Aligned Projects

Count of the projects aligned to strategies.

Unaligned Projects

Count of the projects not aligned to strategies.

Planned Cost

Comparison of aligned and unaligned planned cost for strategies.

Planned Cost - Aligned Projects

Total planned cost for all projects aligned to strategies.

Planned Cost - Unaligned Projects

Total planned cost for all projects not aligned to strategies.

Total Benefit

Comparison of aligned and unaligned benefit amount for strategies.

Total Benefit - Aligned Projects

Total benefit amount for all projects aligned to strategies.

Total Benefit - Unaligned Projects

Total benefit amount for all projects not aligned to strategies.

Actuals

Comparison of aligned and unaligned actual cost for strategies.

Actuals - Aligned Projects

Total actual cost for all projects aligned to strategies.

Actuals - Unaligned Projects

Total actual cost for all projects not aligned to strategies.

The dashboard contains the following indicators for goals:

Projects

Comparison of aligned and unaligned projects for goals.

Aligned Projects

Count of the projects aligned to goals.

Unaligned Projects

Count of the projects not aligned to goals.

Planned Cost

Comparison of aligned and unaligned planned cost for goals.

Planned Cost - Aligned Projects

Total planned cost for all projects aligned to goals.

Planned Cost - Unaligned Projects

Total planned cost for all projects not aligned to goals.

Total Benefit

Comparison of aligned and unaligned benefit amount for goals.

Total Benefit - Aligned Projects

Total benefit amount for all projects aligned to goals.

Total Benefit - Unaligned Projects

Total benefit amount for all projects not aligned to goals.

Actuals

Comparison of aligned and unaligned actual cost for goals.

Actuals - Aligned Projects

Total actual cost for all projects aligned to goals.

Actuals - Unaligned Projects

Total actual cost for all projects not aligned to goals.

Breakdowns

The dashboard includes the following breakdowns:

- Strategy
- Goal
- Project Cost
- Project Benefit
- Actuals

Data visualizations

The dashboard includes the following visualizations for strategies:

Title	Type	Description
Project Cost	Bar chart 	Comparison of total planned and actual costs for all projects grouped by fiscal period for strategies.
Project Benefit	Bar chart 	Comparison of total planned and actual benefits for all projects grouped by fiscal period for strategies.
Project Distribution	Pie chart 	Breakdown of the distribution of projects by strategy.
Planned Cost Distribution	Pie chart 	Breakdown of the distribution of planned cost of projects by strategy.
Planned Benefit Distribution	Pie chart 	Breakdown of the distribution of planned benefit of projects by strategy.

The dashboard includes the following visualizations for goals:

Title	Type	Description
Project Cost	Bar chart 	Comparison of total planned and actual costs for all projects grouped by fiscal period for goals.
Project Benefit	Bar chart 	Comparison of total planned and actual benefits for all projects grouped by fiscal period for goals.
Project Distribution	Pie chart 	Breakdown of the distribution of projects by goals.
Planned Cost Distribution	Pie chart 	Breakdown of the distribution of planned cost of projects by goals.
Planned Benefit Distribution	Pie chart 	Breakdown of the distribution of planned benefit of projects by goals.

Project Portfolio Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics data visualizations use Performance Analytics **indicator** data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Project Portfolio Management, log in as an admin and navigate to **Performance Analytics > Guided Setup**. Click **Get Started**, then scroll to the section for PPM Standard Dashboards. The guided setup takes you through the entire setup and configuration process.

Alternatively, activate the Performance Analytics – Content Pack – PPM Standard plugin (com.snc.pa.pmo_dashboards).

Activation of com.snc.pa.pmo_dashboards plugin also activates the following plugins:

- PPM Standard (com.snc.financial_planning_pmo)
- Performance Analytics – Content Pack – Project Portfolio Suite Dashboards (com.snc.pps_dashboards)

Access the PMO dashboard using either of the following navigation links:

- **Project > Portfolios > Portfolio Dashboard.**
- **Project > Programs > Program Dashboard.**
- **Self-Service > Dashboards.** Search for **PMO Dashboard** using the search field.
- **Time Sheets > Time Sheet Portal > Time Sheet Dashboard.**

The dashboard displays the data based on the navigation link used to open it.

Domain separation and 'Run As' user

In some solutions, System Administrator is the **Run As** user for data collection jobs in the Platform Analytics Solutions. In other solutions, the **Run As** user for data collection jobs is left blank. Verify that the **Run As** user exists on the instance, and that this user has the appropriate level of access. An inappropriate **Run As** user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.

Older version of this solution

This solution replaces the Project Portfolio Suite (com.snc.pa.ppm) Solution. If you activated an earlier version of the solution and then upgraded your instance, you still have and can still use the earlier solution. You can also activate the newer version without losing data from existing indicators and breakdowns. If you activate the newer version, run a historical data collection job to populate new indicators and breakdowns for the Time Sheet dashboard.

[Activate your Performance Analytics subscription](#) ↗

PMO dashboard

The PMO dashboard provides comprehensive reports to the portfolio and program managers. The dashboard uses Platform Analytics to provide a trend of historical data as well as regular reports. It gives an overview of your investments, provides a pipeline view of upcoming intake and a calendar view of upcoming dates.

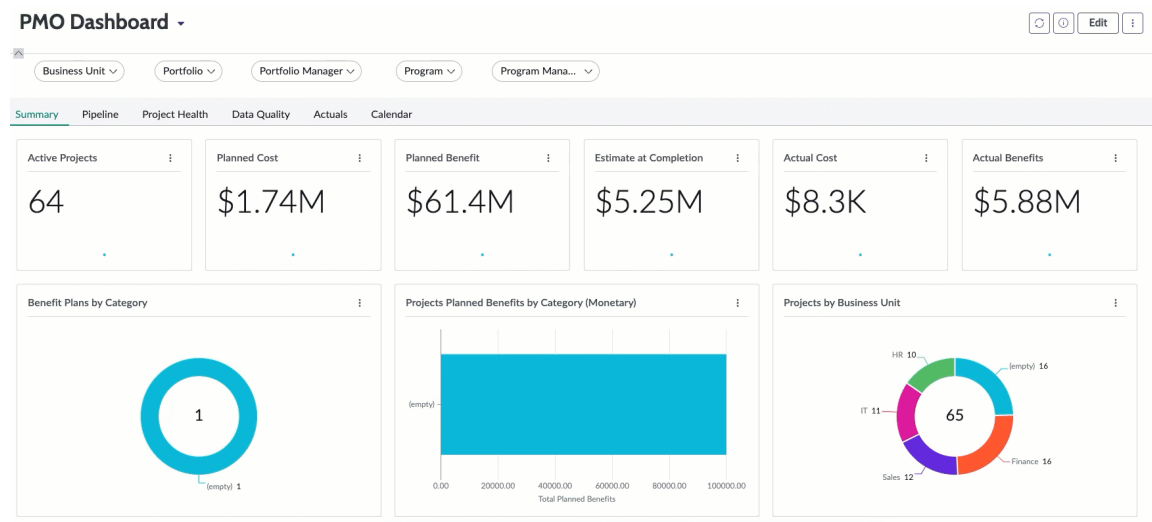

Note:

The PMO dashboard is available in the next experience UI framework which can be accessed through **Analytics Portfolio**. In the next experience, these features are not supported:

- **Pipeline details** pane in the **Pipeline** tab.
- **Highlight based on** list and **View all records** link in the **Calendar** tab.

PMO dashboard in Next experience UI

This animation shows all of the data visualizations in the PMO dashboard tab by tab. They are described in the Data Visualizations section of this topic.

End user and roles

End user and goal	Required role
Portfolio manager: Needs visibility into programs, projects, and demands in their portfolio and actions that should be taken.	it_portfolio_manager
Program manager: Needs visibility into projects and demands in their programs and actions that should be taken.	it_program_manager
Project manager: Has access to the dashboards.	it_project_manager

Indicators

The Summary, Pipeline, and Project Health tabs in the dashboard contain widgets with the following indicators. The data for projects is collected from the [pm_project] table, the data for demands is collected from the [dmn_demand] table, and the data for ideas is collected from the [idea] table.

PPM – Number of Active Projects

Count of active projects. Projects are considered active where actual end date is <after today> or <empty>.

i Note:

If the Actual End Date for a project is in the future but the project is in Closed state, the reports still pick up the project as active.

PPM – Allocated Hours less than Planned Hours

Count of active projects that have resource plans where the allocated hours is less than the planned hours.

PPM – Active Projects in Open, Pending, Work in Progress state

Count of active projects in Open, Pending, or Work in Progress state.

PPM – Number of Active Red Projects

Count of active projects that have an overall red status.

PPM – Total age of Open Project

Total age of all active projects in days. It is the difference between the planned start date of the active project and the date when the indicator score is collected. The indicator is used to calculate the average age of open projects.

PPM – Planned Cost

Total planned cost for all the active projects.

PPM – Actual Cost

Total actual cost for all the active projects.

PPM – Number of Active Projects with negative ROI

Count of active projects with a negative Return on Investment.

PPM – Estimate at Completion

Total estimated cost at completion for all active projects.

PPM – Number of Projects with High Risks

Count of active projects that have a Risk in Pending state and Probability as Absolute or High.

PPM – Number of Projects with Critical Issues

Count of active projects that have an Issue with state Open or Work in Progress and priority as Critical.

PPM – Number of Projects with Missed Milestones

Count of active projects that have a milestone with planned end date due before today.

PPM – Number of Active Overdue Projects

Count of active projects that have **Planned end date** before today.

PPM – Unallocated Resources

Count of projects in state Work in Progress that have resource plans in Planning, Requested, or Confirmed state.

PPM – Allocated Hours less than Actual Hours

Count of active projects that have resource plans where the actual hours is greater than the allocated hours.

PPM – Planned Benefits

Total planned benefit for all active projects.

PPM – Actual Benefits

Total actual benefit for all active projects.

PPM – Number of Projects with critical Change Requests

Count of active projects that have a Project Change Request with state as Open and priority as Critical.

PPM – Number of Total Demands this Month

Count of demands in the given month with state other than Draft.

PPM – Number of Demands with Projects this Month

Count of demands that are converted to projects in the given month.

PPM – Open Demands Submitted, Screening, Qualified or Approved

Count of demands in Submitted, Screening, Qualified, or Approved state.

PPM – Total Age of Open Demand in Submitted, Screening, Qualified, Approved state

Total age (in days) of active demands in Submitted, Screening, Qualified, or Approved state. It is the difference between the creation date of the demand and the date when the indicator score is collected. The indicator is used to calculate the average age of open demands.

PPM – Total Age of Demand to Project this Month

Total age (in days) of all demands that are converted to projects in the given month. It is sum of the difference between the creation date of demands and the creation date of corresponding projects. The indicator is used to calculate the average age of Demand to Project.

PPM – Number of Open Ideas

Count of ideas in Submitted state and no Demand associated.

PPM – Total Age of Open Idea

Total number of days an idea is in state Submitted before conversion to demand.

PPM – Number of Total Ideas this Month

Count of ideas other than Draft state and created in the given month.

PPM – Number of Ideas with Demands this Month

Count of ideas converted to demands in the given month.

The dashboard also uses the following formula indicators. The formula indicators are based on few of the preceding indicators.

PPM – Average age open project

Average number of days a project is in state Pending, Open, or Work in Progress. The indicator is calculated using the **PPM – Total Age of Open Project** and **PPM – Number of Active Projects** indicators.

PPM – Percentage of Ideas to Demands last 12 months

Percentage of ideas converted to demands in last 12 months.

PPM – Average age Demand to Project last 12 months

Average number of days before a demand has been converted to a project.

PPM – Percentage of Demand to Project last 12 months

Percentage of demands converted to projects in last 12 months.

PPM – Average age open demand

Average number of days a demand is in state Submitted, Screen, Qualified, or Approved and has not been converted to project.

PPM – Average age open idea

Average number of days an idea is in state Submitted before conversion to demand.

PPM – Portfolio Health

Percentage of portfolio health based on active projects in overall red status, active projects that are overdue, and active projects with critical issues.

Data visualizations

The dashboard includes the following visualizations:

Title	Type	Description
Benefit Plans by Category	 Pie chart	Breakdown of the number of benefit plans in each category for active projects.
Projects Planned Benefits by Category (Monetary)	 Horizontal bar chart	Total planned financial benefits in each category for active projects.
Projects by Business Unit	 Pie chart	Breakdown of the number of active projects in each business unit.
Projects by Investment Type	 Pie chart	Breakdown of the number of active projects grouped by investment type.
Projects by Investment Class	 Pie chart	Breakdown of the number of active projects grouped by investment class.
Projects by Priority	 Horizontal bar chart	Breakdown of the number of active projects grouped by priority.
Hours by Project Time Category	 Line chart	Trend of total hours reported in time cards for each Project Time Category. The trend is displayed from the beginning of last quarter until the end of next quarter.
Active Demands	 Single score	Number of demands in Submitted, Screened, Qualified, and Approved state with no project associated.

Title	Type	Description
Demands – No Manager	Single score 	Number of active demands with no associated demand manager.
Demands – No Business Case	Single score 	Number of active demands with no business case.
Demands – No Planned Cost	Single score 	Number of active demands with zero total planned cost.
Demands – No Start Date	Single score 	Number of active demands with no start date.
Demands – No Investment Class	Single score 	Number of active demands with no associated investment class.
Demands – No Budget Cost	Single score 	Number of active demands with zero capital and zero operating budget.
Demands – No Due Date	Single score 	Number of active demands with no due date.
Demands – No Investment Type	Single score 	Number of active demands with no associated investment type.
Demands – No Financial Benefits	Single score 	Number of active demands with no or zero financial benefit.
Demands – No Portfolio	Single score 	Number of active demands with no associated portfolio.
Demands – No Program	Single score 	Number of active demands with no associated program.
Demands – No ROI	Single score 	Number of active demands with no Return on Investment.

Title	Type	Description
Active Projects	Single score 	Number of projects with actual end date <after today> or <empty>.
Projects – No Manager	Single score 	Number of active projects with no associated project manager.
Projects – No Business Case	Single score 	Number of active projects with no business case.
Projects – No Planned Cost	Single score 	Number of active projects with zero total planned cost.
Projects – No Task	Single score 	Number of active projects with no associated project tasks.
Projects – No Investment Class	Single score 	Number of active projects with no associated investment class.
Projects – No Budget Cost	Single score 	Number of active projects with zero budget cost.
Projects – No Description	Single score 	Number of active projects that have no description.
Projects – No Investment Type	Single score 	Number of active projects with no associated investment type.
Projects – No Planned Benefit	Single score 	Number of active projects with zero planned benefit.
Projects – No Portfolio	Single score 	Number of active projects with no associated portfolio.
Projects – No Program	Single score 	Number of active projects with no associated program.

Title	Type	Description
Projects – No ROI	 Single score	Number of active projects with no planned Return on Investment.
Planned vs Budget vs Actual Cost	 Bar chart	Comparison of total planned, budget, and actual costs for active projects grouped by fiscal period.
Allocated vs Actual Hours	 Step line chart	Monthly trends of total allocated and actual hours for resource plans associated with active projects.
Monetary Planned vs Actual Benefits	 Bar chart	Comparison of total planned and actual financial benefits for active projects grouped by fiscal period.
Non-monetary Planned vs Actual Benefits	 Bar chart	Comparison of total planned and actual non-financial benefits for active projects grouped by fiscal period.
Monetary Planned vs Actual Benefits by Category	 Bar chart	Comparison of total planned and actual financial benefits in each benefit plan category for active projects.
Project Completion Calendar	 Calendar	Calendar view of planned end dates of projects, project tasks, and milestones.

Analytics Time sheet

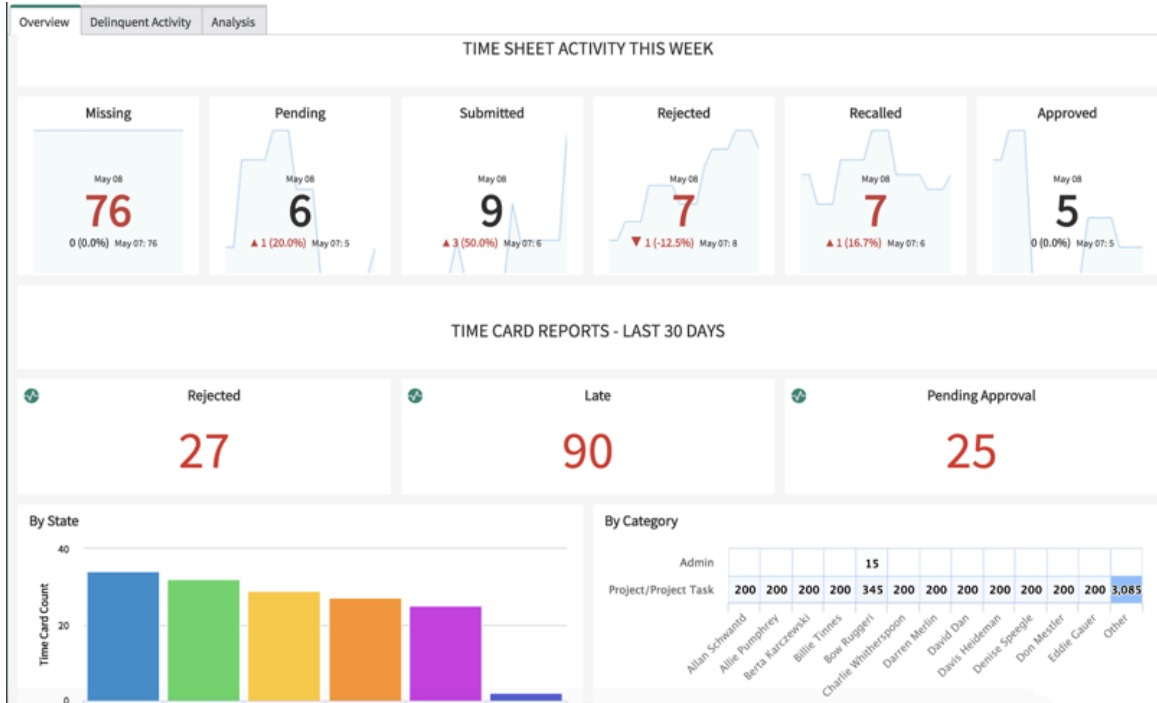

The Analytics Time sheet provides comprehensive time sheet activities and reports to the time card approvers and time card users. The dashboard uses Performance Analytics to provide a trend of historical data and regular reports. It gives an overview of the time sheet activities of resources, time sheet approval and rejection rate, over-allocated and under-allocated resource counts.

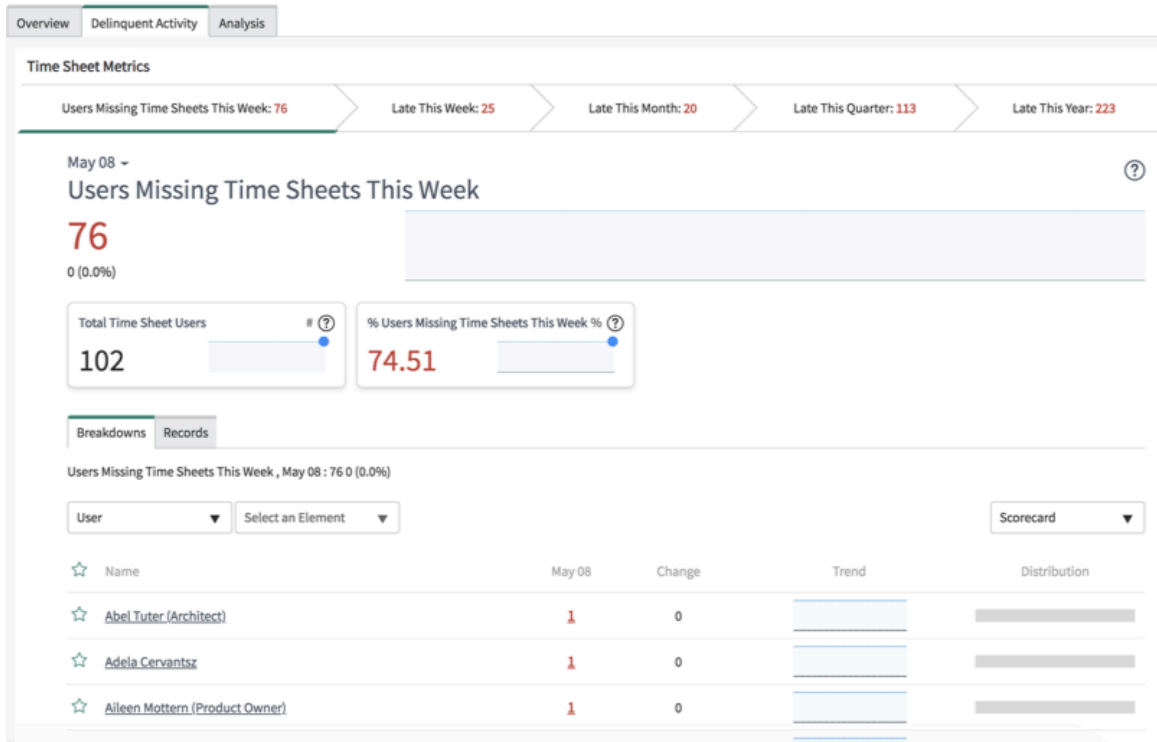

Important:

Starting with Zurich release, **Time Sheet Dashboard** is renamed to **Analytics Time sheet** for new customers.

Indicators

The Overview, Delinquent Activity, and Analysis tabs in the dashboard contain widgets with the following indicators. The data for time sheets and time cards is collected from the [time_sheet] table and the data for users is collected from the [users] table.

PPM – Active Time Sheet Users

Count of active users with the timecard_user role.

PPM – % Late This Year

Percentage of time sheets late this year.

PPM – % Late This Week

Percentage of time sheets late this week.

PPM – % Late This Quarter

Percentage of time sheets late this quarter.

PPM – % Late This Month

Percentage of time sheets late this month.

PPM – Late Time Sheets This Month

Count of late time sheets this month. The indicator includes time sheets of the current month until the past week that are not in the Approved or Processed state.

PPM – Late Time Sheets This Quarter

Count of late time sheets this quarter. The indicator includes time sheets of the current quarter until the past week that are not in the Approved or Processed state.

PPM – Late Time Sheets This Week

Count of late time sheets this week. The indicator includes time sheet of the past week that are not in the Approved or Processed state.

PPM – Late Time Sheets This Year

Count of late time sheets this year. The indicator includes time sheets of the current year until the past week that are not in the Approved or Processed state.

PPM – Total Time Sheets Last Week

Total number of time sheets for the past week.

PPM – Total Time Sheets This Month

Total number of time sheets for the weeks in the current month.

PPM – Total Time Sheets This Quarter

Total number of time sheets for the weeks in the current quarter.

PPM – Total Time Sheets This Year

Total number of time sheets for the weeks in the current year.

PPM – Time Sheets Approved This Week

Count of time sheets approved this week. The indicator includes time sheets in the Approved or Processed state.

PPM – Time Sheets Missing This Week

Count of users with the timecard_user role who did not submit time sheet for the current week.

PPM – Time Sheets Pending This Week

Count of time sheets pending this week. The indicator includes time sheets for the current week in the Pending state.

PPM – Time Sheets Recalled This Week

Count of time sheets recalled this week. The indicator includes time sheets for the current week in the Recalled state.

PPM – Time Sheets Rejected This Week

Count of time sheets rejected this week. The indicator includes time sheets for the current week in the Rejected state.

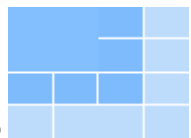

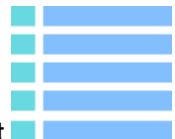

PPM – Time Sheets Submitted This Week

Count of time sheets submitted this week. The indicator includes time sheets for the current week in the Submitted state.

- Program
- Project

Data visualizations

Title	Type	Description
Rejected	 Single score	Number of time cards that are in the Rejected state for the last 30 days.
Late	 Single score	Number of time cards that were submitted late in the last 30 days.
Pending Approvals	 Single score	Number of time cards that have approval pending in the last 30 days.
By State	 Bar chart	Number of time cards in the last 30 days, grouped by their state.
By Category	 Heat map	Breakdown of time spent (hours) by a resource across different project time categories in the last 30 days.
By Resource	 List	The list of time cards submitted by a resource in 30 days.
Total Hours	 Bar chart	Total time (hours) spent on by different categories.

Title	Type	Description
Total Hours by Week Starts On	Time series line 	Weekly trend of the total time (hours) spent on different categories over a period of time.
Time Sheets Over 40 Hours	Bar chart 	Count of time sheets over 40 hours indicating over-allocated resources. This report does not refresh when you select portfolio, program, or project.
Allocated vs Actual Hours	Time series step 	Monthly trend comparing the total allocated hours versus actual hours for all time card users.
Time Cards By Expense Type	Bar chart 	Time cards grouped by expense types: Capital Expense (Capex) and Operating Expense (Opex).

Project Portfolio Management reference

Reference topics provide information about domain separation, quick start tests, business stakeholder role access, and others related to Project Portfolio Management.

Components installed with Project Portfolio Management (PPM) Standard

Several components are installed with the activation of the PPM Standard plugin.

Demo data is available with PPM Standard. The demo data provides sample projects, demands, programs, portfolios, expense lines. The demo data also provides sample cost plans and budget plans for the sample projects and demands.

Plugins installed with PPM Standard (Project Portfolio Management)

Multiple plugins are installed with activation of PPM Standard plugin, if they are not already active.

PPM Standard plugins

PPM Standard adds the following plugins.

Plugin Name	Description
Project Portfolio Suite [com.snc.project_portfolio_suite]	Activates an integrated set of applications for project portfolio management and IT software development.
Financial Planning [com.snc.financial_planning]	Enables financial analysts to assemble spending data, build cost models, and generate reports to show how funds are being allocated.

Plugin Name	Description
Rate Model [com.snc.rate_model]	Delivers date-effective hourly rates for a specific set of criteria coming from the project, demand, or time card being processed.
Ideation with PPM [com.snc.ppm_innovation_management]	Enables your organization to collect new ideas, collaborate on ideas, and identify great ideas for implementation. Convert selected ideas to demands, stories, projects, and epics.

Project Portfolio Suite plugins

Project Portfolio Suite adds the following plugins.

Plugin Name	Description
Demand Management [com.snc.demand_management]	Enables capturing the demands and provide tools to screen, assess and prioritize them.
Project Management [com.snc.project_management_v3]	Enables planning, organizing and managing projects and resources in order to setup, execute, and complete a project faster and easier.
Resource Management [com.snc.resource_management]	Enables resource requesters and resource managers to plan, organize, and manage resources for both planned and operational work.

Demand management plugins

Demand management adds the following plugins.

Plugin Name	Description
Process Flow Formatter [com.snc.process_flow_formatter]	Summarize multiple pieces of information about a process and display the stages graphically at the top of a form.
Assessment [com.snc.assessment_core]	Evaluate, score, and rank records from tables in the system. Evaluate results using unique graphical views designed to highlight key performance information.
Timeline Visualization [com.snc.timeline_visualization]	Provide a high-level graphical representation of your strategic and operational activities for your organization such as incidents, problems, changes, and projects.

Project management plugins

Project management adds the following plugins.

Plugin Name	Description
Checklist	Checklists for tasks.

Plugin Name	Description
[com.glide.ui.checklist]	
Cost Management [com.snc.cost_management]	Enables the definition and tracking of configuration item costs. Uses rate cards with CIs, contracts, and projects.
Process Flow Formatter [com.snc.process_flow_formatter]	Displays the different stages in a linear process flow across the top of a record.
Skills Management [com.snc.skills_management]	Enables an administrator to assign configured competencies, called skills, to groups or individual users.
Timeline Visualization [com.snc.timeline_visualization]	Enables graphical representation of activities over time.
Time card management [com.snc.time_card]	Enables the creation of linear timelines for any activity that is bounded by two dates, such as the actual start and end dates on a project task.

Resource management plugins

Project management adds the following plugins.

Plugin Name	Description
Cost Management [com.snc.cost_management]	Enables the definition and tracking of configuration item costs. Uses rate cards with CIs, contracts, and projects.
Process Flow Formatter [com.snc.process_flow_formatter]	Displays the different stages in a linear process flow across the top of a record.

Tables installed with PPM Standard (Project Portfolio Management)

Tables are added with activation of PPM Standard plugin.

PPM Standard tables

PPM Standard adds the following tables.

Table	Description
Cost Plan [cost_plan]	Cost plan for the resources required for the project.
Cost Plan Breakdown [cost_plan_breakdown]	Cost breakdown of resources based on project, program, or portfolio. These records are rollups of all costs. Project task cost plans are not rolled up to the project.

Table	Description
Cost Type Definition [resource_type_definition]	Definitions of cost types, which specify either an operating expense or capital expense, and can link accounts in the General Ledger [itfm_gl_accounts] table. The General Ledger table is installed with the Financial Management application.
Project Funding [project_funding]	Project or demand target and budget expense values for both capital and operating expenses. The records in this table are for a single fiscal year.
Benefit Plan [benefit_plan]	Benefit plan for the potential benefits that the project or demand can accrue.
Benefit Breakdown [benefit_plan_breakdown]	Benefit breakdown for the project or demand. These records are rollups of all benefits.
Budget Reference Rates [itfm_fx_rate]	The exchange rates that budgets use.
Inbound Actuals Configuration [sn_invst_pln_inbound_actuals_config]	Import and map project codes from ERP systems to SPM.
Incoming Expense Lines [sn_invst_pln_inbound_actuals]	Import expense lines from ERP systems to SPM.

Project Portfolio Suite tables

Project Portfolio Suite adds the following tables.

Table	Description
Project Stakeholder [pm_m2m_project_stakeholder]	Stores all stakeholders who are associated with one or more projects.
Project Time Card Exception [project_timecard_exception]	Stores time card information such as Week starts on, User, Project, and State of the time cards.
Project Time Category [project_time_category]	Stores project sub-categories created for time cards.
Time Sheet Exception [time_sheet_exception]	Stores time sheet information such as Week starts on, User, and State of the time sheets.

Demand management tables

Demand management adds the following tables.

Table	Description
Demand [dmn_demand]	Stores all demands.
Decision [dmn_decision]	Stores all decisions.
Stakeholder Register [dmn_stakeholder_register]	Stores all stakeholders.
Requirement [dmn_requirement]	Stores all requirements.
Demand Stakeholder [dmn_m2m_demand_stakeholder]	Stores all stakeholders who are associated with one or more demands.
Demand Stage Config [dmn_stage_config]	Stores the images displayed in the demand stage pop-up window.
Idea [idea]	Stores all ideas.
Demand Task [dmn_demand_task]	Stores tasks associated with demands. Extends the planned_task table to support demand-level task tracking and resource allocation.

Project management tables

Project management adds the following tables.

Table	Description
Goal [goal]	Project goals.
Issue [issue]	Project issues.
Personalize Workbench [workbench_config_user]	Configuration settings for each user that utilizes the workbench.
Portfolio [pm_portfolio]	Portfolios.
Portfolio Project	Portfolio projects.

Table	Description
[pm_portfolio_project]	
Portfolio Project Goal [pm_portfolio_goal]	Portfolio project goals.
Portfolio Project Issue [pm_portfolio_issue]	Portfolio project issues.
Portfolio Project Relationships [pm_m2m_portfolio_project]	All relationships between a portfolio and each project in the portfolio.
Portfolio Project Risk [pm_portfolio_risk]	Portfolio project risks.
Project [pm_project]	All projects.
Project Task [pm_project_task]	All tasks used in projects.
Project Task Link [pm_project_task_link]	All records for linked changes (installed with the v3 plugin).
Project Template [project_template]	Project templates.
Project Template Configuration [project_template_config]	Configuration settings for project templates.
Project Template Task [project_template_task]	Tasks in project templates.
Risk [risk]	Project risks.
Project Change Request [project_change_request]	Project change requests.
Status Report [project_status]	Project status reports.
Teamspace [pm_app_config]	All teamspace, which refer to the tables that are created for the teamspace. See Installed with teamspace for a list of teamspace tables.

Table	Description
Planned task Relationship [planned_task_rel_planned_task]	Predecessor and successor tasks in a dependent relationship, including task lag values.
Baseline [planned_task_baseline]	All baselines.
Baseline Item [planned_task_baseline_item]	All tasks that are part of baselines.
Task Relationship [task_rel_task]	Predecessor and successor tasks in a dependent relationship.
Planned task Recalculation Exclusions [planned_task_recalculation_exclusions]	<p>Defines tables that are excluded from recalculation (start and end dates). For example, the table is used for all sub tables under planned_task to exclude tables from being recalculated.</p> <p>This table allows you to configure the tables from which you would not like to perform the recalculation from.</p>

Program management tables

Program management adds the following tables.

Table	Description
Program Task [pm_program_task]	All the tasks in program
Program [pm_program]	All programs

Resource management tables

Resource management adds the following tables.

Table	Description
Group Resource Roles group_has_resource_role	<p>Stores the resource roles for the groups with pps_resource_role. The roles in this table are populated from the User Resource Role [user_has_resource_role] table of the users that are part of a group.</p> <p>The table is read-only.</p>
Requested Allocation Daily [requested_allocation_daily]	<p>Stores day-level breakdown for requested allocations.</p> <p>The table is read-only.</p>

Table	Description
Resource Allocation [resource_allocation]	Allocations for resources.
Resource Allocation Daily [resource_allocation_daily]	On a day-to-day basis, stores the events that are created through a resource plan. Also stores: <ul style="list-style-type: none"> • User created calendar events as records. • Actual hours that a user has spent on a task, project, or any other type of activity, such as meeting or admin work.
Resource Aggregate Daily [resource_aggregate_daily]	On a day-to-day basis, stores aggregated values, such as capacity, allocated hours in a project, confirmed hours in a project, non-project time, actual hours, and availability of every user. This table is not enabled by default. To generate daily aggregates and store them in this table, create the <code>com.snc.resource_management.generate_daily_aggregates</code> property and set the value to true.
Resource Aggregate Weekly [resource_aggregate_weekly]	On a weekly basis, stores aggregated values, such as capacity, allocated hours in a project, confirmed hours in a project, non-project time, actual hours, and availability of every user. The values in the table are asynchronously updated on every insert/update/delete to the Resource Allocation Daily [resource_allocation_daily] table.
Resource Aggregate Monthly [resource_aggregate_monthly]	On a monthly basis, stores aggregated values, such as capacity, allocated hours in a project, confirmed hours in a project, non-project time, actual hours, and availability of every user. The values in the table are asynchronously updated on every insert/update/delete to the Resource Allocation Daily [resource_allocation_daily] table.
Requested Allocation [requested_allocation]	Allocations for resource plans.
Resource Event [resource_event]	Stores events that are created for a user.
Resource Event Color [resource_event_color]	The colors that the application displays for each event type.
Resource Plan [resource_plan]	All resource plans. These columns were added for Helsinki: <code>top_task</code> , <code>program</code> , <code>portfolio</code> .
Resource Plan Logs [resource_plan_logs]	Stores errors and warning that might occur during the resource allocation for a resource plan.
Resource Report [resource_report]	Resource reports that you can generate and save.
Resource Report Chart	This table is not used.

Table	Description
[resource_report_chart]	
Resource Report Daily [resource_report_daily]	Daily resource reports that you can generate and save.
Resource Report Export [resource_report_export]	Saves JPG and PNG exports of resource management reports.
Resource Report Monthly [resource_report_monthly]	Monthly resource reports that you can generate and save.
Resource Role [resource_role]	Stores project specific roles.
User Resource Role [user_has_resource_role]	Stores the resource roles for a user.
User Calendar Event [user_calendar_event]	Stores events that are created in the calendar of a user.
User Schedule [user_has_schedule]	Stores the schedule for a user.

Innovation management tables

Innovation Management adds the following tables.

Table	Description
Idea [im_idea_core]	Default table which stores all the information related to the Idea portal. Extends the Task table.
Idea Category [im_category]	Stores the list of static idea categories.
Idea Category Configuration [im_category_config]	Stores idea category definition information such as the table to use, field name, and hierarchy of the idea category. Also stores mapping information between idea categories table and the Idea module.
Idea Categories [im_m2m_idea_category]	Stores mapping information between idea categories and ideas.
Idea Module	Configuration for the Idea portal such as module name, module id, and idea table to

Table	Description
[im_module]	use. Create a separate table for each Idea module.

Time card management tables

Time card management adds the following tables.

Table	Description
Time Card [time_card]	Stores time logged by the user against a category such as a task, meeting, or training.
Time Sheet [time_sheet]	Groups all time cards for the user for a week.
Time Sheet Policy time_sheet_policy	Stores all time sheet policies.
Time Card Daily [time_card_daily]	Stores the time logged in a time card on daily basis.

Rate model tables

Rate model add the following tables.

Table	Description
Rate Model [rate_model]	Stores rate model definition.
Rate Model Entity [rate_model_entity]	List of entities from which the attributes can be selected.
Rate Model Entity Attribute [rate_model_entity_attribute]	List of attributes in the entities.
Rate Model Line [rate_model_line]	Stores rate line values.
Rate Model Line Attribute [rate_model_line_attribute]	Stores rate line attributes that are added from the entities.
Rate Line Import Set [imp_rate_model_line]	Stores import sets that you imported into the instance.

Roles installed with PPM Standard (Project Portfolio Management)

Roles are added with activation of PPM Standard plugin.

Project Portfolio Suite roles

Project Portfolio Suite adds the following roles.

Role title [name]	Description	Contains roles
Portfolio manager [it_portfolio_manager]	Has access to all portfolios. Has the same access permissions as a project user and a demand user. Also has budget owner role is added as part of Financial Management.	<ul style="list-style-type: none"> • it_demand_user • it_project_manager • it_project_user • portfolio_manager • it_demand_manager • it_project_portfolio_user
PPS admin [it_pps_admin]	Can view and modify the preferences, configurations, and settings for projects, demands, programs, portfolios, resources, time cards, agile development, and timeline visualization.	<ul style="list-style-type: none"> • it_program_manager • it_portfolio_manager • it_project_manager • it_demand_manager • pps_admin • timeline_admin • rate_model_admin

Demand management roles

Demand management adds the following roles.

Role title [name]	Description	Contains roles
Demand manager [it_demand_manager]	Can access all the modules of the Demand Management application.	<ul style="list-style-type: none"> • it_project_user • resource_user • timeline_user • demand_manager • it_demand_user • rate_model_user
Demand user [it_demand_user]	Can access the Demand and Stakeholders modules of the Demand Management application.	<ul style="list-style-type: none"> • demand_user • pps_resource

Project management roles

Project management adds the following roles.

Role title [name]	Description	Contains roles
Portfolio user [it_project_portfolio_user]	User who can view IT Portfolio Project records.	project_portfolio_user
Project user [it_project_user]	Can only view Project form fields. Can modify additional fields on the Project Task form, such as Time constraint and State .	<ul style="list-style-type: none"> it_project_portfolio_user project_user
Project manager [it_project_manager]	Has access to all Project Management application features and functionality. This role enables project managers to create and manage projects, tasks, and resource plans. For configuration access to modify application settings and preferences, use the PPS admin [it_pps_admin] role instead.	<ul style="list-style-type: none"> resource_user it_demand_manager it_project_user project_manager <p>The project_manager role also contains the timecard_approver role.</p> <ul style="list-style-type: none"> timeline_user rate_model_user

Program management roles

Program management adds the following roles.

Role title [name]	Description	Contains roles
Program manager [it_program_manager]	Program managers have access to all programs.	<ul style="list-style-type: none"> resource_user it_project user program_manager it_demand_user

Resource management roles

Resource management adds the following roles.

Role title [name]	Description	Contains roles
Resource manager [resource_manager]	Users with this role can:	<ul style="list-style-type: none"> resource_user timecard_approver

Role title [name]	Description	Contains roles
	<ul style="list-style-type: none"> Review resource plans, confirm, and allocate resources to tasks. Create skills and view them in the User Skills list. Read schedules. Create a group of type pps_resource. Add users to or remove them from any groups. Update group name, group email, parent, description, manager, average daily FTE hours/ hours per person day, and hourly rate. 	<ul style="list-style-type: none"> skill_admin rate_model_user
Resource user [resource_user]	Users with this role can create resource plans and request resources. Project managers are typically given this role. Resource users cannot make changes to plans in the Confirmed or Allocated state.	None
PPS resource [pps_resource]	Only users with the PPS Resource role are considered for resource planning, and only users or groups with the PPS resource role appear in resource plans.	None

Innovation management roles

Innovation Management adds the following roles:

Role title [name]	Description	Contains roles
Idea admin [idea_admin]	<ul style="list-style-type: none"> Creates idea module. Defines idea categories. Configures mapping of idea categories with idea module. Manages ideas and creates tasks such as story, epic, feature, project, or demand from an idea. 	idea_manager
Idea manager [idea_manager]	Manages ideas and creates tasks such as project or demand from an idea.	None
Idea manager professional [idea_manager_professional]	Manages ideas and creates tasks such as story, epic, feature, project, or demand from an idea.	None

Time card management roles

Time card management adds the following roles.

Role title [name]	Description	Contains roles
Time card admin [timecard_admin]	Has write access to all time cards.	<ul style="list-style-type: none"> • timecard_user • timecard_approver
Time card approver [timecard_approver]	Approves or rejects time cards for time card users.	timecard_user
Time card user [timecard_user]	Creates time cards for self.	None

Rate model roles

Role title [name]	Description	Contains roles
Rate model admin [it_rate_model_admin]	Manages rate models and rate lines. Has all privileges within rate model, including configuring attributes, export and import of rate lines, and administration.	<ul style="list-style-type: none"> • rate_model_user • import_set_loader • import_transformer • import_admin
Rate model user [rate_model_user]	View rate model and rate lines.	None

Business stakeholder role for PPM

For PPM users, the Business Stakeholder (com.snc.business_stakeholder) plugin contains the business stakeholder roles for Enterprise Architecture (formerly APM), ITFM, and PPM. Users with this role can read records of the tables that are used to retrieve data for reports and dashboards and can approve demands and timecards. You can assign this role to any user who is a business stakeholder.

Upgrade information

If you have upgraded, the business stakeholder role for PPM is available only when you activate Read only roles for PPM Standard plugin (com.snc.pmo_read_roles).

If you are a new customer, the Read only roles for PPM Standard plugin (com.snc.pmo_read_roles) is activated on zBoot. However, the business stakeholder role for PPM is available only when you install the PPM Standard plugin.

Demand and Timecard approver roles

The Read only roles for PPM Standard plugin (com.snc.pmo_read_roles) installs the sn_ppm_read role. The sn_ppm_read role provides read-only access to the Portfolio, Program, and Timecard dashboards along with the Resources report to the assigned users. The sn_ppm_read role also contains the timecard_approver and demand_approver roles, which allow the assigned users to approve demands and timecards. Commenting is enabled, when a business stakeholder role is added as collaborator in demands.

PPM tables accessible to users with the business stakeholder role

Users with the business stakeholder role for PPM can access the following tables that store the data to load the widgets in the Portfolio dashboard, Program dashboard, and Time Sheet dashboard, and Resource reports:

PPM tables

Label	Table name
Action	project_action
Decision	dmn_decision
Demand	dmn_demand
Demand Task	dmn_demand_task
Fiscal period	fiscal_period
Idea	im_idea_core
Issue	issue
Program	pm_program
Project	pm_project
Project Task	pm_project_task
Program Task	pm_program_task
Project Time Card Exception	project_timecard_exception
Requirement	dmn_requirement
Resource Aggregate Daily	resource_aggregate_daily
Resource Aggregate Monthly	resource_aggregate_monthly
Resource Aggregate Weekly	resource_aggregate_weekly
Resource Plan	resource_plan
Risk	risk
Status Report	project_status
Time Card	time_card
Time Sheet	time_sheet
Time Sheet Exception	time_sheet_exception

Domain separation and Project Portfolio Management

Domain separation is supported in Project Portfolio Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level - Basic*

- There is business logic to ensure data goes into the proper domain for the application's service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer's message, the client must be able to see my response.

How domain separation works in Project Portfolio Management

Project Portfolio Management is domain separation-compliant with the following limitations:

- All PPM entities such as ideas, project, demand, resource plan, and allocations are expected to be in the same domain. A project entity having tasks or resources from multiple domains is not supported.
- A parent entity and all child entities, such as a project record and its project tasks, are expected to be in the same domain.
- When you change the domain of a parent record, for example a project record, the domain of the child records are not changed.
- Only users belonging to the same domain, parent domain, or the top domain have the visibility into PPM entities of a domain.
- All system properties are in the global domain and are not specific to a domain. Planning console settings, however, are still domain-specific.

Quick start tests for Project Portfolio Management

Validate that Project Portfolio Management still works after you make any configuration change such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Project Portfolio Management quick start tests require activating the PPM Standard - ATF Tests plugin (com.snc.financial_planning_pmo.atf).

PMO: Financial Tests for verifying cost rollups and demand to project conversion test suite

Test	Description	Release version
PMO: Verify cost plan roll up to project/demand and program	Validate the total planned cost rollup from project and demand to program.	Madrid
PMO: Verify cost plan roll up to project/demand, program and portfolio	Validate the total planned cost rollup from project and demand to portfolio.	Madrid

PMO: Financial Tests for verifying cost rollups and demand to project conversion test suite (continued)

Test	Description	Release version
PMO: Verify financials of Project created from Demand - Simple Financials	Validate the financial tab fields of a project created from a demand.	Madrid
PMO: Verify financials of Project created from Demand - With budget, cost plans, benefit plans	Validate the budget, cost plan, and benefit plan of a project created from a demand.	Madrid
PMO: Verify ETC/EAC at cost plan breakdown and project level	Validate the EAC and ETC values at cost plan breakdown and project level.	Tokyo

PMO: Innovation Management Tests for verifying idea life cycle

Test	Description	Release version
Validate state changes of Idea	Validate that the state of idea is changed when an idea is accepted, rejected, or any other task is created from an idea.	San Diego

PMO: Project Management tests for validating basic life cycle and project rollups test suite

Test	Description	Release version
Validate PPM Cycle from Ideation to demand to project closure	<p>Validate the flow of creating an idea, converting the idea to a demand, and then converting the demand to a project.</p> <p>Note: This test fails if the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is active.</p>	Madrid
Validation of State and Date Rollup for Automatic Project	Validate the date and state rollup from tasks for a project of type Automatic.	Madrid
Validation of State and Date rollup for Manual Project	Validate the date and state rollup from tasks for a project of type Manual.	Madrid
Validation of project percent complete when all tasks are Closed Incomplete	Validate the project percent complete when all the tasks are closed as Closed Incomplete.	Orlando
Validate Project is not 100 percent complete if it has atleast one task as closed incomplete	Validate the project percent complete is not 100% when at least one of the tasks is closed as Closed Incomplete or Closed Skipped with task % complete less than 100%.	Orlando

PMO: Project Management tests for validating basic life cycle and project rollups test suite (continued)

Test	Description	Release version
Validate waterfall project does not show Agile Planning Board	Validate that the waterfall projects cannot use the following: <ul style="list-style-type: none"> • Add stories or epics • Add agile phase • Access Agile board from the project 	Orlando
Validate dates are rolled up from existing projects to program	Validate that the start and end dates of the project are rolled up to the program to which the project belongs.	Paris
Validate dates are rolled up from new projects to program	Validate that the start and end dates of a new project are rolled up to the program to which the project belongs.	Paris
Add projects and demands with risks or issues to program	Validate that the projects and demands with risks or issue records associated with them are added to the program.	Paris
Add projects and demands with benefit plans to program	Validate that the projects and demands with benefit plans associated with them are added to the program.	Paris
Add projects and demands with cost plans to program	Validate that the projects and demands with cost plans associated with them are added to the program.	Paris
Validate program dates on addition of existing demands	Validate that the start and end date of the program are adjusted on addition of an existing demand.	Paris
Validate program dates on addition of new demands	Validate that the start and end date of the program are adjusted on addition of a new demand.	Paris
Validate program state rollup	Validate that the program state is rolled up from state of all the projects in the program.	Paris
Verify Demand task due date column field value empty	Validate that the Due date field is empty for a new demand task.	Rome
Verify baseline is created on Project & Demand when demand is converted to project	Validate that a project and demand baseline is created when a demand is converted to a project.	Rome
Verify timecard financial appears on Demand when time card submitted against demand task	Validate that the actual cost of the demand is updated when a time card is processed for a demand task.	Rome
Validate demand approved date	Validate that the approved dates for demand and the project created from the demand are the same.	Tokyo

PMO: Project Management tests for validating basic life cycle and project rollups test suite (continued)

Test	Description	Release version
Validate project preference "close project milestone tasks when they change to work state"	Validate that the milestone tasks are closed when their state is changed to Work in Progress after setting the project preference to "close project milestone tasks when they change to work state".	Tokyo
Validate project preference "Enable move project for WIP projects"	Validate that the project start date is changed appropriately for a project in WIP state when the project start date is changed after setting the project preference to "Enable move project for WIP projects".	Tokyo
Validate project preference "Rollup project start date from tasks"	Validate that the start date of a project task does not roll up to the project when the project planned dates are different than the project task start date after deselecting the project preference "Rollup project start date from tasks".	Tokyo

Child Test Suite: Validation of Move Project Action

Test	Description	Release version
Validate Planned start date of a project can be shifted by using the Move project action	Validate that the Planned start date of a project in Planning or Open state can be updated to a later or earlier date than the current planned start date using the Move project related link.	Orlando
Validate Move Project is disabled when Project is selected for execution	Validate that the Move Project option is not available if the Project is in Execution phase.	Orlando
Validate Move Project functionality with sprint dates populated for an agile phase	<p>Validate that the sprint start and end dates are cleared when the project is moved using the Move Project related link.</p> <p>Note: This test is available only when Agile Development 2.0 plugin (com.snc.sdlc.agile.2.0) is activated.</p>	Orlando
Validate Move Project functionality with external dependencies and related entities	Validate that the external dependencies and related entities are also shifted and redrawn when the project is moved using the Move Project related link.	Orlando

Child Test Suite: Validation of Move Project Action (continued)

Test	Description	Release version
Validate Move Project functionality with different project states	Validate that the Move Project does not work when the project is in Work In Progress or Closed Complete state.	Orlando

Child Test Suite: Verify RIDAC flow of a Project

Test	Description	Release version
Verify RIDAC flow for Risk	Validate the RIDAC flow for a risk associated with a project.	Quebec
Verify RIDAC flow for Issue	Validate the RIDAC flow for an issue associated with a project.	Quebec
Verify RIDAC flow for Decision	Validate the RIDAC flow for a decision associated with a project.	Quebec
Verify RIDAC flow for Action	Validate the RIDAC flow for an action associated with a project.	Quebec
Verify changes in fields of risk form	Validate that any change is the Risk form fields such as Risk rank, Risk value, and Probability is updated successfully upon submission.	Quebec

Child Test Suite: Verify RIDAC flow of a Demand

Test	Description	Release version
Verify RIDAC flow for Risk	Validate the RIDAC flow for a risk associated with a demand.	Quebec
Verify RIDAC flow for Issue	Validate the RIDAC flow for an issue associated with a demand.	Quebec
Verify RIDAC flow for Decision	Validate the RIDAC flow for a decision associated with a demand.	Quebec
Verify RIDAC flow for Action	Validate the RIDAC flow for an action associated with a demand.	Quebec
Verify changes in fields of risk form	Validate that any change is the Risk form fields such as Risk rank, Risk value, and Probability is	Quebec

Related lists added for financials

PPM Standard adds several related lists to both the Project and Portfolio forms.

Portfolio related lists

Portfolio related lists for financials

Demands (1)	Projects	Programs	Risks	Issues	Cost Plans (6)	Monetary Benefit Plans (6)	Portfolio Target (2)	Planning & Budgeting (1)
-------------	----------	----------	-------	--------	----------------	----------------------------	----------------------	--------------------------

This table explains the related lists and how to create or use the records in these lists in the portfolio workbench.

Portfolio form related lists	Description
Cost Plans	Lists the cost plans of projects and demands that are part of the portfolio.
Monetary Benefit Plans	Lists the financial benefit plans of projects and demands that are part of the portfolio.
Portfolio Target	Lists the portfolio capital and operational expense target for different fiscal years. The values are displayed from the project_funding table. You can create targets for different financial periods.
Planning & Budgeting	Planning & Budgeting of the project. For more information, see #unique_1265.

Project related lists for financials

Project Tasks (7)	Sub Projects	Requirements	Resource Plan (2)	Cost Plans (3)	Monetary Benefit Plans (5)	Project Budget (2)	Expense Lines (1)
-------------------	--------------	--------------	-------------------	----------------	----------------------------	--------------------	-------------------

This table explains the related lists for financials in a project record.

Project form related lists	Description
Cost Plans	Costs of the project for a specific fiscal period. Cost plans can also have an associated expense line.
Monetary Benefit Plans	Potential financial benefits which can be accrued by the project spanning one or more fiscal periods, if the project is executed.
Project Budget	Budget of the project. For more information, see #unique_1265.
Expense Lines	Aggregated actual costs associated with a specific source, such as a user, fixed asset, or a CI.

SPM Benchmarks

The ServiceNow[®] SPM Benchmarks application provides you with an insight into the industry averages of your peers. Use your key performance indicators (KPIs) to compare your performance with global benchmarks, which contributes to improved performance for your organization.

Getting started with SPM Benchmarking This video provides an overview of how you can get started with SPM Benchmarks.

Exploring SPM Benchmarks

The SPM Benchmarks application provides clear visibility into your key performance indicators (KPIs) and trends, providing comparative insights relative to the industry averages of your peers. It enables you to gain deeper insights by comparing your performance with your peers based on industry, size, or region.

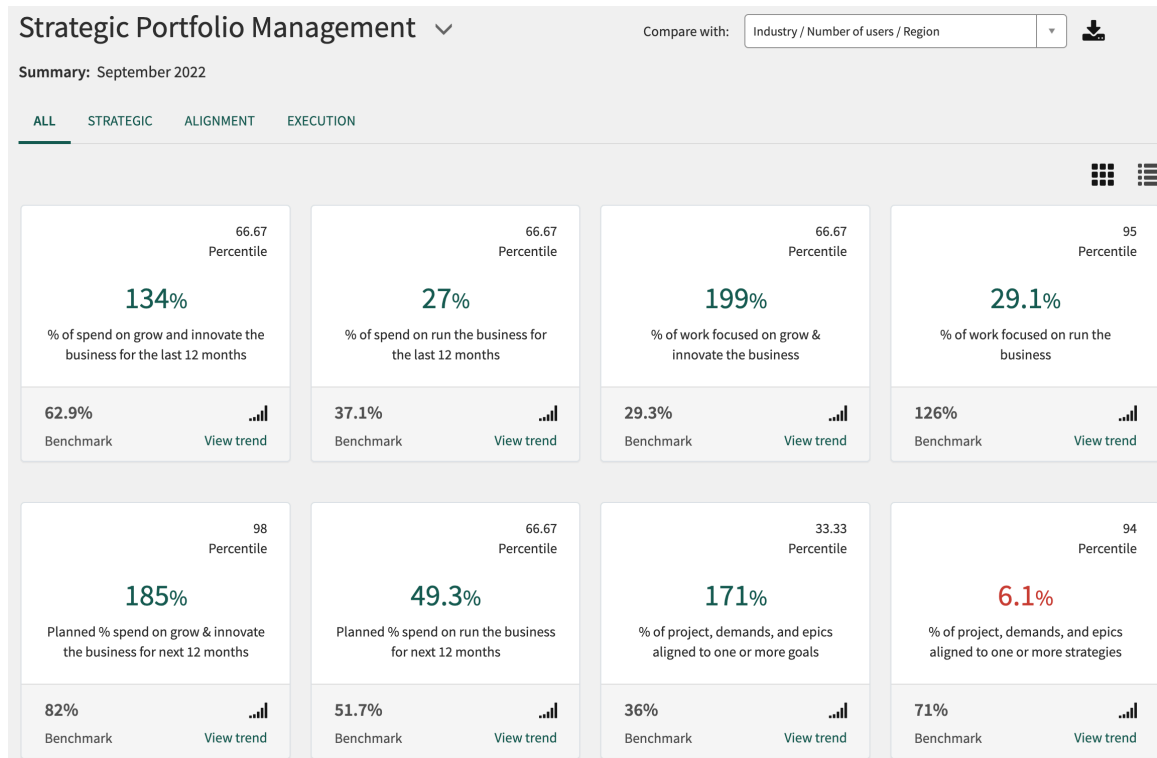

Key features

- 15 available KPIs (6 Strategic, 5 Alignment, and 4 Execution).
- Ability to change KPI definitions to match customizations.
- ServiceNow[®] Benchmarks dashboard in ServiceNow[®] Service Portal (mobile friendly).
- Ability to download KPI reports.
- Email notification when new aggregate monthly data is available.
- Filter data by industry, number of users, or geographical region.
- Percentile ranking to indicate your standing within your participating peer group.
- Product category-based roles to limit data access.
- Integration with ServiceNow[®] Performance Analytics for daily data collection and drill-down on KPI data.

SPM Benchmarks dashboard

View and learn about the SPM Benchmarks dashboard features.

SPM Benchmarks dashboard

The SPM Benchmarks dashboard enables you to do the following.

View KPIs

You can view the KPIs in the following categories.

- The **All** tab shows the list of all the KPIs that you've opted in to.
- The **Strategic** tab shows the list of all the strategic KPIs that you've opted in to.
- The **Alignment** tab shows the list of all the alignment KPIs that you've opted in to.
- The **Execution** tab shows the list of all the execution KPIs that you've opted in to.

Change the KPI view

You can change the way that the KPIs are displayed on the dashboard.

- Click the card view icon () to view your KPIs in a card view.
- Click the list view icon () to view your KPIs in a list view.

Select comparative data

You can select the area in which you want to compare your data using the Compare with drop-down list.

- **Industry**- Select this option to compare your data based on industries.
- **Number of users**- Select this option to compare your data based on the number of users.
- **Region**- Select this option to compare your data based on the region.

Benefits of SPM Benchmarks

The SPM Benchmarks application provides you with an overall understanding of your performance compared to your peers.

Global anonymity

Viewers in your organization have access to SPM Benchmarks for your organization. However, the global benchmarks are anonymous and don't include any company information.

Industry comparison

Using the Compare with drop-down list on the SPM Benchmarks dashboard, filter the benchmarks results by industry, ServiceNow user size, or geographical region to make the results more relevant to your organization.

- Industry is determined based on the standard industry code in the account record for the company.
- Number of users is determined by the number of ServiceNow active users within the company. You can compare your company to similar-sized ServiceNow implementations to gain an understanding about your company.
- Region is determined based on the **Region** field in the company table.

If a filter category includes fewer than 20 participants, the corresponding data is shown in the Other category.

Trends

You can see the results of all published KPIs as well as the last six months of history.

Use the trend data to determine what is working well and what needs improvement.

Reports

SPM Benchmarks reports get refreshed monthly that can be downloaded in PDF format. An email notification is sent to the customer when new data is available.

Configuring SPM Benchmarks

Learn about the process required to set up SPM Benchmarks to view the comparative understandings on your key performance indicators (KPIs).

Use the following steps as guidelines for your SPM Benchmarks setup process.

1. Install SPM Benchmarks. For more information, see [Install SPM Benchmarks](#).
2. Enable SPM Benchmarks. For more information, see [Enable SPM Benchmarks](#).

Install SPM Benchmarks

As an admin, you can install the SPM Benchmarks application (sn_spm_bm) from the ServiceNow® Store. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .
- Review the [SPM Benchmarking](#)  application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with SPM Benchmarks:

- Roles
- Scheduled jobs

For more information, see [Components installed with SPM Benchmarking](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.

2. Find the SPM Benchmarks application () using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

5. Select **Install**.

Enable SPM Benchmarks

Opt in to SPM Benchmarks to participate in SPM Benchmarks data collection for Strategic Portfolio Management KPIs.

Before you begin

Role required: sn_bm_client.benchmark_admin

About this task

You can opt out of the SPM Benchmarks at any time.

Procedure

1. Navigate to **All > Benchmarks > Setup**.

2. Click **Opt-In Agreement** and read the agreement.

3. Click **Done**.

4. Select the **Yes, I have read and accept the Opt-In Agreement** check box, and click **Opt-In**.

You can choose to opt out of SPM Benchmarks at any time. To opt out of benchmarks as a whole, including but not limited to SPM Benchmarks, navigate to **All > Benchmarks > Setup** and click **Opt-out of ServiceNow Benchmarks**.

Customize the SPM Benchmarks KPIs

You can customize the KPI information you would want to see in your SPM Benchmarks dashboard.

You can use the SPM Benchmarks application to do the following:

- [Choose your KPIs](#) from the list of available KPIs, based on your organizational requirement.
- [Change a KPI formula](#) to adjust the details pertaining to your organizational need.

Choose your KPIs

Based on your requirement, you can choose the key performance indicators (KPIs) that you want to use in the SPM Benchmarks application.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Benchmarks > Administration > Setup**.
2. Select **Strategic Portfolio Management** to view the list of SPM Benchmarks KPIs.
3. Select the KPIs that you need for your organization.

Change a KPI formula

View and change the key performance indicators (KPIs) formula according to your requirement and analysis criteria.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Benchmarks > Administration > Category**.
2. From the Benchmark Indicator Categories list, select **Strategic Portfolio Management**.
3. Select a group that contains the KPI that you want to edit from the **Benchmark Indicator Groups**.
4. Click and open the KPI that you want to edit.
5. Click and open the indicator field to view and edit the formula.

SPM Benchmarks reference

Reference information to provide additional details about SPM Benchmarks such as the fields, user roles, and scheduled job information.

Components installed with SPM Benchmarking

Several types of components are installed with activation of the SPM Benchmarks plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role title [name]	Description	Contains roles
Benchmarking admin [sn_bm_client.benchmark_admin]	<ul style="list-style-type: none"> • Set up Benchmarks from an instance • Opt in or out of the Benchmarks program • Enable, disable, or modify indicators (including changing Performance Analytics indicator source, script, and conditions for those KPIs not requiring application-specific roles) • Receive email notification when new aggregate monthly data is available • All functions of the Benchmarks viewer and Benchmarks recommendations roles 	None
Benchmarking data viewer [sn_bm_client.benchmark_data_viewer]	<ul style="list-style-type: none"> • View full benchmark reports in Service Portal • View data visualizations and drill-downs for analyzing trends (not PA scorecards) • Download visualizations • View industry category or size comparisons • Receive email notification when a new aggregate monthly benchmark score is available. 	None

Scheduled jobs installed

Scheduled job	Description
SPM Benchmark Agile Data Collection	Collects scores for indicators related to Agile Development 2.0, as specified in the Relative start and Relative end fields. The collection time is for a month based on the GMT timezone.
SPM Benchmark Data Collection	Collects scores for indicators related to APW and PPM, as specified in the Relative start and Relative end fields. The collection time is for a month based on the GMT timezone.

SPM Benchmarks KPIs

The Strategic Portfolio Management KPIs are performance analytic indicators that collect the usage count data. Strategic, Alignment, and Execution KPIs are available by default in the SPM Benchmarks application.

Strategic KPIs

KPI	Formula
% of spend on grow and innovate the business for the last 12 months	$(\text{Sum of Actual cost spent on Projects \& Demands that belong to innovate \& grow in the last 12 months} / \text{Sum of Actual cost spent on all Projects \& Demands in the last 12 months}) * 100$
% of spend on run the business for the last 12 months	$(\text{Sum of Actual cost spent on Projects \& Demands that belong to run in the last 12 months} / \text{Sum of Actual cost spent on all Projects \& Demands in the last 12 months}) * 100$
% of work focused on grow & innovate the business	$(\text{Count of all Projects, Demands \& Epics that belong to grow \& innovate} / \text{Count of all Projects, Demands \& Epics}) * 100$
% of work focused on run the business	$(\text{Count of all Projects, Demands \& Epics that belong to run} / \text{Count of all Projects, Demands \& Epics}) * 100$
Planned % spend on grow & innovate the business for next 12 months	$(\text{Sum of Planned cost on Projects \& Demands that belong to innovate \& grow in next 12 months} / \text{Sum of Planned cost on all Projects \& Demands in next 12 months}) * 100$
Planned % spend on run the business for next 12 months	$(\text{Sum of Planned cost on Projects \& Demands that belong to run in the next 12 months} / \text{Sum of Planned cost on all Projects \& Demands in the next 12 months}) * 100$

Alignment KPIs

KPI	Formula
% of project, demands, and epics aligned to one or more goals	$(\text{Count of Projects, Demands \& Epics that are aligned to one or more goals} / \text{Count of all Projects, Demands \& Epics}) * 100$
% of project, demands, and epics aligned to one or more strategies	$(\text{Count of Projects, Demands \& Epics that are aligned to one or more strategies} / \text{Count of all Projects, Demands \& Epics}) * 100$
% of work delivered using traditional projects	$(\text{Total count of open Project planning items that are having execution type as Waterfall} / \text{Total count of open Project planning items and Epic planning items}) * 100$
% of work delivered using agile	$(\text{Total count of open Epic planning items} / \text{Total count of open Project planning items and Epic planning items}) * 100$
% of work delivered using hybrid projects	$(\text{Total count of open Project planning items that are having execution type as Hybrid or Agile} / \text{Total count of open Project planning items and Epic planning items}) * 100$

Execution KPIs

KPI	Formula
% of demands converted to projects or epics	$(\text{Count of Demands that are converted to Projects or Epics in last 12 months} / \text{Count of Demands that are created in last 12 months}) * 100$
% of story points completed vs planned with the sprint, in last 12 month	$(\text{Total story points completed in the sprint that falls in last 12 months} / \text{Total story points planned in the sprint that falls in last 12 months}) * 100$
Average number of scrum teams per ART	$\text{Total number of teams in ARTs} / \text{Total number of ARTs}$
Average scrum team size	$\text{Total number of members in scrum teams} / \text{Total number of scrum teams}$

Investment Funding

ServiceNow® Investment Funding enables you to plan and manage investments by allocating funds to investment entities such as Business Units, Products, Teams, and the like. Prioritize your investments based on business needs and strategic objectives of your organization.

You can use the Investment Funding (sn_invst_pln) application to do the following:

- Create investments for entities.
- Allocate funds to an investment to meet a business requirement or strategic objective.
- Request funds from one or more funding sources to achieve business goals.

i Note:

Starting with the Rome release, Investment Funding will be found in the ServiceNow Store. The legacy plugins (com.snc.investment_planning, com.snc.investment_planning_pmo) will be prepared for future deprecation in September 2022. The plugins will be hidden and no longer activated on new instances but will continue to be supported. For details, see the [Deprecation Process \[KB0867184\]](#) article in the Now Support knowledge base.

Investment entities and investments

An investment contains information about funds, costs, benefits, business case, and goals. Use investments to allocate or request funds to meet defined business goals. An investment is associated to an investment entity.

An investment entity is a transaction table for funding. For example, you can create investment entities for records such as Projects, Teams, Business Units, Epics, and Portfolios.

Keeping the investment and investment entity separate provides the following advantages:

- Your work activities are separate from the funding.
- You can fund the same entity for different periods until the investment goals are met.

Generic investments

A generic investment is an investment that is tied an owner without being associated to any entity. You can fund any entity or other generic investment from a generic investment.

For example, as the CEO of a company you might want to set aside some funds for a training or research initiative and there might not be a transaction table to enable such an entity. You could then create a generic entity to fund the investment.

Top-down and bottom-up funding

In top-down funding, you distribute funds to investments based on business goals or as part of a business strategy.

In bottom-up funding, you request funds for your investments from one or more funding sources.

Investment Funding enables you to manage funds for both funding approaches.

Domain separation in Investment Funding

[Domain separation](#) provides complete data isolation for domain-specific users. Investment Funding is compliant with domain separation at the **Data only** level.

Install Investment Funding

You can install the Investment Funding application (sn_invst_pln_v2) from ServiceNow Store if you have the admin role.

Before you begin

Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).

Role required: admin

About this task

Investment Funding activates these related plugins if they are not already active.

Plugins for Investment Funding

Plugin	Description
Fiscal Calendar [com.snc.fiscal_calendar]	Enables you to generate and manage different kinds of fiscal calendars that are used in various financial applications.
Widgets [com.snc.app.widgets]	Enables widgets on the dashboard pages.
Ag-Grid Components Plugin [com.snc.app.grid]	Enables grid view.
Planned Task_v2 [com.snc.planned_task_v2]	Enables task entities.

If the PPM Standard (com.snc.financial_planning_pmo) plugin is also installed, you can use the Investment Funding features to request or allocate funds for your projects and demands.

Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the Investment Funding application using the filter criteria and search bar.
 You can search for the application by its name or ID (sn_invst_pln_v2). If you cannot find an application, you may have to request it from ServiceNow store. Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#).
3. Click **Install**.
4. In the Application installation dialog box, review the application dependencies.

If your application requires other applications, install them first if they are not already installed.

Installing your application also automatically installs the dependent applications or plugins if they are not installed already.

5. Click **Install**.

Result

The following components are installed with installation of the Investment Funding application:

- Roles
- Tables

See [Components installed with Investment Funding](#) for more information.

Components installed with Investment Funding

Several types of components are installed with activation of the Investment Funding (sn_invst_pln) plugin, including tables and user roles.

i Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Demo data is available for this feature.

Roles installed with Investment Funding

Role title [name]	Description	Contains roles
Investment admin [sn_invst_pln_v2.investment_admin]	Creates investment entities and sets up preferences and fiscal calendar.	fiscal_calendar_admin
Investment planner [sn_invst_pln_v2.investment_planner]	Manages top investment, investment entities, and records associated with investment entities.	investment_user
Investment user [sn_invst_pln_v2.investment_user]	Manages investments and funds.	fiscal_calendar_user

Role title [name]	Description	Contains roles
	<p>Note: Users with this role can perform create, read, update, and delete operations on all cost and benefit plans.</p>	

Tables installed with Investment Funding

Table	Description
Business Case [business_case]	Stores business cases for investments.
Fund Request [sn_invst_pln_invst_funding_base_request]	Stores fund request details.
Funding [sn_invst_pln_invst_funding_base_fund]	Stores fund details.
Funding Base [sn_invst_pln_invst_funding_base]	Base table for funding and requests.
Funding Base Breakdown [sn_invst_pln_invst_funding_base_breakdown]	Stores the breakdown of funding base records.
Funding Configuration [sn_invst_pln_invst_funding_configuration]	Stores funding configuration details.
Investment Entity [sn_invst_pln_invst_funding_entity]	Stores investment entity types.
Funding State [sn_invst_pln_invst_funding_state]	Stores different states of a funding.
Investment [sn_invst_pln_invst_investment]	Stores investment details.

Upgrading legacy Investment Funding to Store application

If you are upgrading from the legacy Investment Funding, post installation of the Investment Funding application, you can migrate your existing data to the ServiceNow Store application tables. Also, you must update the reference tables for the **Investment** and **Funding Entity** fields to the ServiceNow Store application tables.

Migrate data from legacy Investment Funding to Store application

With the admin role, you can migrate your existing data from the legacy Investment Funding tables to the new ServiceNow Store application tables by running the scheduled job.

Before you begin

Role required: admin

i Note:

Migrating data to the ServiceNow Store application tables is a one-time job, and not meant to be on a schedule.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Search for and click the **Migrate Investment Funding To Store** scheduled job.
3. On the Scheduled Script Execution form, ensure that the frequency is selected as **On Demand** in the **Run** field.
4. Click **Execute Now**.

Update references from legacy Investment Funding tables to Store tables

Post migration of your legacy Investment Funding data, you must update the reference tables for the **Investment** and **Funding Entity** fields from the legacy Investment Funding tables to the ServiceNow Store application tables in the required tables.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Update the reference tables from the legacy Investment Funding tables to the Store application for the **Investment** and **Funding Entity** fields for the following tables.

Table	Column label (Field)	Reference table for the legacy Investment Funding plugin	Reference table for the Store application
Cost Plan	Investment	invst_investment	sn_invst_pln_invst_investment
Cost Plan	Funding Entity	invst_investment_entity	sn_invst_pln_invst_funding_entity
Benefit Plan	Investment	invst_investment	sn_invst_pln_invst_investment
Goal	Investment	invst_investment	sn_invst_pln_invst_investment

Investment Funding administration

The Investment Funding application requires you to do some initial administrative tasks for it to be fully functional.

Fiscal calendar setup for Investment Funding

The Fiscal calendar setup you choose determines the fiscal periods used by your organization to request or allocate funds.

Based on the fiscal calendar setup, you can then set the **funding frequency** that aligns with the funding cycles your organization uses, such as monthly or quarterly, for fund requests and allocations.

Note:

Once you allocate or request funds for investments for a fiscal period, you cannot change to another fiscal calendar type.

For information about fiscal calendars, see [Defining fiscal calendars](#).

For information about how to generate a fiscal calendar, see [Generate a fiscal calendar](#).

Set Investment Funding preferences

As an administrator, you can set global defaults for Investment Funding preferences, which affect the funding behavior.

Before you begin

Role required: sn_invst_pln_investment_admin

Procedure

1. Navigate to All > Investment Funding > Setup > Preferences.

2. In the Funding frequency list, select a frequency of periods in which you can request or allocate funds to an investment.

The list shows options based on the configured fiscal calendar.

For example, if you set up the Standard fiscal calendar and you want to fund your investments quarterly, select **Quarter**.

The default value is Quarter for the Standard fiscal calendar setup or Period for any other fiscal calendar setup.

3. Optional: In the **Number of editable past periods** field, enter a number to specify the number of past periods enabled for you to modify the allocated or requested fund.

(Optional) For example, if the funding frequency is Quarter and you enter 2 in the field, you can edit funds for the previous two quarters.

The default value is 0 (editing of past period funding is not enabled).

4. Optional: Select the **Hide actuals in tree view** check box to hide the actual amount of an investment in the tree view cards.

5. Optional: Select the **Allow fund overallocation** check box to enable allocation of funds in addition to the received funds.

The **Fund overallocation percent (%)** and **Allow fund overallocation at investment level** fields are enabled.

6. Optional: In the **Fund overallocation percent (%)** field, enter the percentage by which funds can be allocated in addition to the received funds.

(Optional) For example, if the received fund amount is \$200,000, and you enter 10% in the **Fund overallocation percent** field, a total of \$220,000 can be used for funding.

7. Optional: Select the **Allow fund overallocation at investment level** check box to enable source investment owners who have funded the investment and are not removed from the allocation to override the fund overallocation percent at investment level.

8. Click **Save**.

9. Select an option from the confirmation window that is displayed:

- Update the overallocation preferences at the investment level for all existing investments
- Update the overallocation preferences at the investment level for existing investments that have not overridden the overallocation percentage
- Update the overallocation preferences at the investment level only for new investments

10. Click **Confirm**.

Create an investment entity

Create an entity for investments through which you can receive or allocate funds.

Before you begin

Role required: sn_invst_pln_v2.investment_admin

Procedure

1. Navigate to **All > Investment Funding > Setup > Investment Entities**.
2. Click **New**.
3. On the form, fill in the fields.

i Note:

The **Entity** tab in the form is replaced by the **Owner** tab when the **Generic** option is selected.

Investment Entity form

Field	Description
Name	Unique name of the investment entity.
Active	Option for indicating the status of the investment entity. You can create investments only for active investment entities.
Description	Short description of the investment entity.

When the **Generic** option is not selected:

Entity tab

Field	Description
Table	Transaction table on which funding is enabled.
Condition	Condition to filter data from the table enabled for funding.

Field	Description
	For example, you could enable funding for the Project table and add a filter condition to list only projects that are in the Ready state.
Owner field	<p>Any user field in the transaction table mapped to the investment owner field.</p> <p>The user on the mapped field is automatically assigned as the investment owner when you are creating an investment.</p> <p>For example, for a Project investment entity, you could map the Project manager field as the investment owner field.</p>

When the **Generic** option is selected:

Owner tab

Field	Description
Owner table	User table mapped as the investment owner field.
Owner filter	<p>Condition to filter users that are listed in the Owner field in the Investment form to select the investment owner.</p> <p>For example, for a Project investment entity, you could create a filter to list only users with the Project manager role.</p> <p>By default, the Active is true filter is set, which means that only active users are listed for selection.</p>

4. Optional: Click the **Unlock fundable entities** icon to enable the selection of entities that can be funded by the current entity.

(Optional) For example, a portfolio entity can fund a program, a program can fund a project, a project can request from a program, and a program can request from a portfolio.

5. Optional: Add the entities to the **Fundable entities** list.

(Optional) If no value is selected, all entities are considered to be enabled for funding.

6. Click Submit.

What to do next

- Create funding artifacts to [create a business rule to synchronize investment and investment entity owners](#) or to [add a related link on the investment target form](#).
- Create [a top-level investment](#) or [an investment](#) for an investment entity.

Enable synchronization of investment and investment entity owners

Create a business rule for an investment entity that synchronizes the investment owner with the investment entity owner. If you update the name of the investment entity owner, the owner of the corresponding investment and the **Viewable by** field for the investment is automatically updated.

Before you begin

Role required: sn_invst_pln_v2.investment_admin

Procedure

1. Navigate to **All > Investment Funding > Setup > Investment Entities**.
2. Open an entity for which you want to enable synchronization of owners.
3. On the form, click the **Create Funding Artifacts** related link.
4. In the dialog box, select the **Create business rule to sync investment owner with investment entity owner** option, and click **OK**.

Result

A business rule is created for the investment entity that synchronizes the owner of the investment with the associated investment entity owner when you update the investment entity owner.

Access investments directly from an investment target

Create a related link to go directly to the My Funds page from an investment target.

Before you begin

Role required: sn_invst_pln_v2.investment_admin

Procedure

1. Navigate to **All > Investment Funding > Setup > Investment Entities**.
2. Open an investment entity for which you want to create a related link.
3. On the form, click the **Create Funding Artifacts** related link.
4. In the dialog box, select the **Create related link for requesting/funding on the form** option, and click **OK**.
5. Click **OK**.

Result

The **Add/View Investments** related link appears on the form of the investment target for direct navigation to the My Funds page.

Create a top-level investment

Create a top-level investment for the investment entity record for which you want to receive and allocate funds.

Before you begin

Role required: sn_invst_pln_v2.investment_planner

About this task

A top-level investment does not have a source investment or source investment entity. Once created, a top-level investment cannot be converted to a normal investment later.

Procedure

1. Navigate to **All > Investment Funding > Top level Investments.**
2. Click **New.**
3. On the form, fill in the fields.

New Top level Investment form

Field	Description
For	<p>Investment entity record to associate with the investment. To access the records associated with an entity, select an investment entity in the list on the left. The list on the right then displays the records associated with the selected entity.</p> <p>You can create only one top-level investment for an investment entity type-investment entity value pair.</p> <p>Note: When you select the Generic Bucket entity option, the list to select the associated entity record is disabled.</p>
Owner	<p>User who will own the top-level investment.</p> <p>This field is set to the Owner field value determined while creating the selected investment entity.</p>
Name	Unique name of the investment.
Top investment	Option that indicates that this is a top-level investment. This setting cannot be changed.

4. Click **Create.**

What to do next

- [Fund a top-level investment](#) to meet the business goals.
- [Create a business case](#) to define the business need of the investment.

Fund a top-level investment

Allocate funds to a top-level investment so that the investment owner can distribute funds further.

Before you begin

Role required: sn_invst_pln_v2.investment_planner

Procedure

1. Navigate to **All > Investment Funding > Top level Investments**.
2. Open an investment to which you want to allocate funds.
3. On the **Details** tab, click **Add fund**.
4. On the form, fill in the fields.

Add fund form

Field	Description
Fiscal period	Fiscal period for which the fund is allocated to the investment.
Funded capex	Amount funded as a capital expense.
Funded opex	Amount funded as an operating expense.

5. Click **Submit**.

Result

The top-level investment is funded with the specified amount for the selected period.

Create an investment

Create an investment to fund a target.

Before you begin

Role required: sn_invst_pln_v2.investment_user

Procedure

1. Navigate to **All > Investment Funding > My Funds**.
2. Click **New**.
3. On the form, fill in the fields.

Investment form

Field	Description
For	Investment entity record to associate with the investment. To access the records associated with an entity, select an investment entity in the list on the left. The list on the right then displays the records associated with the selected entity.

Field	Description
	<p>Note: You can create only one top-level investment for an investment entity type-investment entity value pair.</p>
Name	Unique name of the investment.

4. Click Submit.

What to do next

- [Add a business case](#) to define the business needs of the investment.
- [Request funds](#) from a funding source.
- [Allocate funds](#) from your available funds.

Add a business case for an investment

Add a business case for an investment to define its business needs and goals.

Before you begin

Role required: sn_invst_pln_v2.investment_user

About this task

An investment can have only one business case.

When a business case is created on a demand or project record, the same is mapped to the corresponding investment record. And when a business case is created on an investment record, the same is mapped to the corresponding demand or project record. Cost plans and benefit plans associated with project or demand records are also mapped to the investment records.

Procedure

1. Navigate to **All > Investment Funding > My Funds**.
2. Open an investment to add the business case.
3. On the **Details** tab, click the **Create Business case** related link.
The related link is available only if a business case does not exist for the investment.
4. In the Add Business case dialog box, provide information in the fields based on your business needs and goals for the investment.

Add Business case form

Field	Description
Name	Unique name of the business case.
Investment type	Type of the investment.
Investment class	Investment class category assigned to the investment: <ul style="list-style-type: none"> ○ Run: Investment made to sustain the existing business. ○ Change: Investment made to implement a change in the business.

Business case tab section of the Add Business case form

Field	Description
Description	Description of the business case supporting the investment.
Enablers	Key enablers for the investment.
Barriers	Major barriers to the investment.
Assumptions	Assumptions made for the investment that help to determine the scope and risks, and fine-tune the time and cost estimates.

Scope section of the Add Business case form

In scope	Scope of the investment, which includes a set of boundaries that define the extent of the investment.
Out of scope	Activities that are not in the scope of the investment.
Risk of performing	Risks associated with the investment if it is carried out.
Risk of not performing	Risks associated with the investment if it is not carried out.

5. Click Submit.

Co-owners for an investment

Investment co-owners manage, request, and allocate funds on your behalf to the investments that you own. The co-owner has the same rights and permissions as the owner.

- Co-owners have the same capabilities and access rights as the owner for the investments, which include:
 - Add funds to top-level investments.
 - Add child investments and fund them.
 - Add and request source and funds from a top-level investment.
 - See, request, and allocate funds to child investments.
 - Add others as co-owners.
 - Delete any unfunded investments.
 - See who funded an investment.
- Co-owners are added to the **Viewable by** field for all the child investments.
- An investment can have multiple co-owners. There is no maximum limit for the number of co-owners for an investment.
- In the Active Investments page, you can see the access level for the investments.

- Owned investments are marked with an owned icon ().
- Co-owned investments are marked with a co-owner icon ().
- Viewable investments are marked with a view only icon ().

Manage co-owners for an investment

Add co-owners to your investments to request, approve, and manage the funds on your behalf. You can remove the existing co-owners when you no longer need them to manage your investments.

Before you begin

Role required:

- For managing co-owners in top-level investments: `sn_invst_pln_v2.investment_planner`
- For managing co-owners in My funds: `sn_invst_pln_v2.investment_user`, `sn_invst_pln_v2.investment_planner`

Procedure

1. Open a top-level investment or My fund.
2. Click the **Details** tab.
3. Click the unlock co-owner icon ().
 - To add a user as a co-owner, use the select target record search field to search for and select the users.
 - To remove an existing co-owner, select the name and click the remove selected item icon ().
4. Click **Update**.

Request funds for an investment

Request funds from a funding source for your investment.

Before you begin

Role required: `sn_invst_pln_v2.investment_user`

About this task

You cannot request funds for a generic investment from any other generic investment.

You can request funds only from generic source investments that have allocated funds to your investment in the past.

You can request funds only in the funding frequency configured in the [Investment Funding Preferences](#).

You can request funds from only those entities that were added in the **Fundable entities** field while creating the entity.

You can withdraw funding requests that are in the requested and planning state and are for past funding periods or non-editable funding periods.

Procedure

1. Navigate to **All > Investment Funding > My Funds**.

2. Click an investment card to open the investment for which you need funds.

If you want to open a different investment, access the drop-down menu next to the name of the currently displayed investment. Either search for another investment by entering its name in the **Search My Investments** field or choose it from the five most recently visited investments.

3. Click the **View/Request Funds** tab.

4. Select a working period and click **Apply**.

The Request Funds list displays only funding sources that you previously requested funds from for your investment.

5. Click the **Add New Source** link to select the funding source.

6. In the **Select a Source** pane, select one or more source investments from the list, and then click **Add Selected**.

The specified funding source is added in the Request Funds grid.

7. In the Request Funds grid, specify the amount in the **CapEx** and **OpEx** columns under **New/Modify Request** of the funding sources from which you want to request funds.

The state of all updated funding sources changes to Draft or Planning, which is indicated by highlighted cells.

8. Click **Request**.

9. In the Confirm request dialog box, verify your requests and add a comment if required.

10. Click **Request**.

11. **Optional:** Right-click on a column on the **New/Modify Request** field and select **Withdraw** to withdraw a funding request.

Result

- Funds are requested from the source investments sources for the specified period.
- The state of the fund request record changes to Requested.

Plan fund allocations for investments

Plan your fund allocations if you are not yet ready to finalize the allocation of your funds.

Before you begin

Role required: sn_invst_pln_v2.investment_user

About this task

Keep investments in the planning stage if you are not yet ready to allocate the funds. For example, you might want to wait to determine whether you require additional funds to meet the needs of all your investments.

If you plan to allocate funds to an investment that are in addition to the received funds, a warning message is displayed in the **Totals** row indicating that you are overallocating, and the additional fund amount will be deducted from the buffer amount set in your funding preferences. For more information on setting up overallocation of funds, see the [Set Investment Funding preferences](#) topic. If you plan to allocate beyond the available fund plus the buffer amount, an error message indicates that new funds cannot be submitted for allocation.

You can plan fund allocations only according to the funding frequency configured in the [Investment Funding Preferences](#).

Procedure

1. Navigate to **All > Investment Funding > My Funds**.
2. Click an investment card to open an active investment that has funds that you plan to allocate to other investments.

If you want to open a different investment, access the drop-down menu next to the name of the currently displayed investment. Either search for another investment by entering its name in the **Search My Investments** field or choose it from the five most recently visited investments.

3. Click the **Allocate Funds** tab.
4. Select a working period and click **Apply**.
 - If you have allocated funds earlier or there are incoming fund requests, those investments are listed in the **Allocate Funds** list.
 - You can filter for pending (planning and requested) investments by clicking the filter icon ()
5. In the **Allocate Funds** list, select the incoming requests to which you are planning to allocate funds.
6. Click **Plan**.

Result

- Funds allocations are planned for the selected investments for the specified period.
- The state of all updated investments changes to Planning, which is indicated by highlighted cells.
- The amount remaining after planning your allocations is displayed in the **Left after planning** row.

What to do next

[Allocate funds to planned investments](#)

Allocate funds to an investment

Allocate funds to investments based on your business goals and available funds.

Before you begin

Role required: sn_invst_pln_v2.investment_user

About this task

You can allocate funds only in the funding frequency configured in the [Investment Funding Preferences](#).

If you allocated funds to an investment earlier, you can increase or decrease the funded amount by entering an amount greater or lesser than the existing amount. Entering a lesser value unfunds the investment by the difference amount.

If you allocate funds to an investment that are in addition to the received funds, a warning message is displayed in the **Totals** row indicating that you are overallocating, and the additional fund amount will be deducted from the buffer amount set in your funding preferences. For more information on setting up overallocation of funds, see the [Set Investment Funding preferences](#) topic. If you try to allocate beyond the available fund plus the buffer amount, an error message indicates that new funds cannot be submitted for allocation.

You can allocate funds to only those entities that are added in the **Fundable entities** field while creating the entity.

Note:

For generic investments, you can allocate funds to investments that you own.

Procedure

1. Navigate to **All > Investment Funding > My Funds**.

2. Click an investment card to open an active investment that has sufficient funds to allocate to another investment.

If you want to open a different investment, access the drop-down menu next to the name of the currently displayed investment. Either search for another investment by entering its name in the **Search My Investments** field or choose it from the five most recently visited investments.

3. Click the **Allocate Funds** tab.

4. Select a working period and click **Apply**.

- If you have allocated funds earlier or there are incoming fund requests, those investments are listed in the **Allocate Funds** list.
- You can filter for pending (planning and requested) investments by clicking the filter icon ()

5. **Optional:** Add more investments to the **Allocate Funds** list for allocating funds.

a. Click **Add**.

b. **Optional:** Click **New** to create a new entity record if you have sufficient privileges for the source entity.

c. In the **Add** pane, select one or more investments from the list, and then click **Add Selected**.

(Optional) To include all the listed investments, click **Add All**.

6. In the **Allocate Funds** list, enter the amount under the **CapEx** and **OpEx** columns under **New Fund** for all investments to which you want to allocate funds.

Note:

For an incoming request, take into account the amount in the **New Request** column while entering amounts in the **CapEx** and **OpEx** columns under **New Fund**.

The state of all updated investments changes to Planning, which is indicated by highlighted cells.

7. Click **Fund**.

8. In the Confirm Allocate Funds dialog box, verify your allocations and click **Fund**.

While confirming fund allocations, you can view all the details of the quarters where funds are available for funding in one section, and the details of the quarters where funds are not available for funding in another section.

9. **Optional:** Right-click on a column on the grid and select **View Past Funding Details** to view the funding details of your child investments for the past fiscal periods.

(Optional) For more information, see the [View past funding details](#) topic.

Result

- Funds are allocated to selected investments for the specified period.
- The state of funded investments changes to Funded.

Enter actual spends for an investment

Enter actual spends for your investments to track fund utilization.

Before you begin

Role required: sn_invst_pln_v2.investment_user

About this task

You can use funds in your investments to execute business activities or allocate funds to other investments to meet business goals. You can record the amount spent as actual spends ("actuals") in the respective investment. Tracking actuals enables you to do the following:

- Track where and how you spent your funds.
- Add up to the parent investment actuals.

Actual cost incurred for projects or demands will be summed up and displayed in the Investment Funding grid automatically if there is a single funded source. If there are multiple sources, you need to perform the following steps to enter the actuals manually.

Note:

- (For customers upgraded from legacy Investment Funding plugin to the ServiceNow Store application) If you have entered actuals manually prior to upgrade, then the same does not match with the actuals posted in the project post-upgrade.
- If the **Budget** field on the cost plan breakdown of a project or demand has been edited post funding, the CapEx and OpEx budgets do not match the amount funded from the Investment Funding flow.

Procedure

1. Navigate to **All > Investment Funding > My Funds**.
2. Open an investment for which you want to enter actuals.

If you want to open a different investment, access the drop-down menu next to the name of the currently displayed investment. Either search for another investment by entering its name in the **Search My Investments** field or choose it from the five most recently visited investments.

3. Click the **View/Request Funds** tab.
4. Select a working period and click **Apply**.
5. In the Request Funds list, specify the actual amount spent under the **Actual CapEx** and **Actual OpEx** columns for your investments.

Note:

If you do not see the **Actual CapEx** and **Actual OpEx** columns in the list, click the configuration icon () and select them.

Result

- The entered amount is updated as actual funds spent through the investment.
- The amount rolls-up to its parent investment, which in turn rolls-up until the top-level investment.

Reject a fund request

You can reject an incoming fund request based on your business priorities or if you do not have sufficient funds.

Before you begin

Role required: sn_invst_pln_v2.investment_user

Procedure

1. Navigate to **All > Investment Funding > My Funds**.
2. Open an active investment.

If you want to open a different investment, access the drop-down menu next to the name of the currently displayed investment. Either search for another investment by entering its name in the **Search My Investments** field or choose it from the five most recently visited investments.

3. Click the **Allocate Funds** tab.
4. Select a working period and click **Apply**.
5. Select an investment from the **Allocate Funds** grid.
6. Click the **Allocate Funds** drop-down list and select **Reject**.
7. **Optional:** Select an investment, and click **Clear** from the **Allocate Funds** drop-down list to remove the planning state funding requests that are for past funding periods or non-editable funding periods from your list.

Review the use of your funds

Review the flow of your funds from your investment to other investments to make an informed decision when you allocate or request funds.

Before you begin

Role required: sn_invst_pln_v2.investment_user

About this task

Reviewing the use of your funds enables you to see when an investment has not used funds, or whether the funds are still meeting the priorities of your business goals.

Note:

The actual amount in your investment is the sum of the direct spends you entered and the total from all investments to which you had allocated funds. The correct actual amount is reflected only if the owners of those investments have entered the actual spends in their investments.

You can view the difference between funds received and actuals (underspent or overspent amount) in the tree view cards. If the funds received amount is greater than the amount in the fund, the underspent amount is displayed in green. If the funds received amount is lesser than the amount in the fund, the overspent amount is displayed in red.

You can configure which information should be displayed on the cards in the list view of **Allocate Funds** or **View/Request Funds**. For example, you can configure the list view to display only the **Total Actuals** amount.

Users that the investment owner adds in the **Viewable by** field can also review the investment details. The owner of an investment that funds a particular investment is automatically added to the field list for that investment. For example, if a program investment receives funds from a portfolio investment, then the owner of the portfolio investment is added to the **Viewable by** field for the program investment.

Procedure

1. Navigate to **All > Investment Funding > My Funds**.

2. Click an investment card to open an active investment to review fund allocations.

If you want to open a different investment, access the drop-down menu next to the name of the currently displayed investment. Either search for another investment by entering its name in the **Search My Investments** field or choose it from the five most recently visited investments.

3. On the **Allocate Funds** tab, click the tree view icon ()

Your investment and the investments that you funded directly display as cards in a hierarchical view. The number of child investments is displayed in the parent investment card. If there are more than 10 investment cards, you can access a compact card view.

4. Click an investment to view its fund allocation to other investments.

As you drill down to child investment cards, the clickable menu in the top-right corner displays the current level of the hierarchy.

5. **Optional:** Click the **Actions** menu and select **View Investment** to navigate to the investment grid.

View past funding details

View the past funding details of your investments.

Before you begin

Role required: sn_invst_pln_v2.investment_user

Procedure

1. Navigate to **All > Investment Funding > My Funds**.

2. Click an investment card to open the investment for which you want to view the past funding details.

If you want to open a different investment, access the drop-down menu next to the name of the currently displayed investment. Either search for another investment by entering its name in the **Search My Investments** field or choose it from the five most recently visited investments.

3. Click the **Allocate Funds** tab.

4. Right-click on a column on the grid, and select **View Past Funding Details** to view the funding details of your investments for past fiscal periods.

If you are not the owner of the investment but have been added in the **Viewable by** field of the investment, you can view the investments in read-only mode.

The graph displays the comparison between the total funds received and the total actuals for the fiscal periods in the past one year.

Domain separation and Investment Funding

Domain separation is supported in Investment Funding. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#) .

Handling domain separation for Financials in Workspace

Defining funding entity is an important configuration to create Investment Object (IO) for any entity. The accessibility of the Funding entity definition configuration record is important to determine whether IO can be created for the entity. Let's consider example of Project as entity. Similar process is applicable for any entities configured through Funding Entity definition.

1. Define funding entity in Global domain.

This helps users to access projects from any specific domain or global domain.

2. If a project is required to access from a specific domain to meet your organization requirements, define the funding entities in that specific domain only.

3. Always create Investment Object in the same domain of the respective Project's domain.

When a user in a parent domain accesses the financials of a project in a child domain, the system creates the investment object in the child domain. This ensures that users in the child domain can access the financials and the investment object.

Export to PowerPoint for Strategic Portfolio Management

The ServiceNow[®] Export to PowerPoint for Strategic Portfolio Management add-in helps you to generate and download project status reports from your instance as a Microsoft PowerPoint file. You can use this file to share it across the stakeholders or teams for collaboration.

Export to PowerPoint overview

Export to PowerPoint overview video. Approximately two minutes long.

Get started

<p>Explore</p>  <p>Learn about Export to PowerPoint add-in features.</p>	<p>Configure</p>  <p>Install and configure the Export to PowerPoint add-in.</p>
<p>Use</p>  <p>Use Export to PowerPoint to generate and download your project status report.</p>	<p>Reference</p>  <p>Get details about components installed, form fields, tables, roles, and general guidelines.</p>

Important:

- For more information about the data processing required to generate a project status report within the ServiceNow servers based on your location, see the [KB1170323](#)  article in the Now Support Knowledge Base.
- Export to PowerPoint is currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. Please check for availability updates in future releases.

Troubleshoot and get help

- Ask or answer questions in the [Strategic Portfolio Management forum on the ServiceNow Community](#) 
- [Search the Known Error Portal for known error articles](#) 
- [Contact Customer Service and Support](#) 

Exploring Export to PowerPoint

The Export to PowerPoint application helps you generate and download your project status report. Use this file to present your project status report to stakeholders or teams for collaboration and to identify the next steps.

Use the following data types to create a Microsoft PowerPoint template.

Report template types

Report type	Description
Text	Generates a text format report.
Table	Generates a table format report.
Line	Generates a line chart report.
Bar	Generates a bar graph report.
Repeater	A token used to generate data for all the entries in a record by retaining the template format.

Configuring Export to PowerPoint

Learn about the process and prerequisites used to install the Export to PowerPoint application in your instance and configure it in Microsoft PowerPoint.

Configuration workflow

Use the following steps as guidelines to configure and install the ServiceNow add-in for Microsoft PowerPoint after you download the Export to PowerPoint application from the ServiceNow Store.

1. Install Export to PowerPoint for Strategic Portfolio Management from the ServiceNow Store. For more information, see [Install Export to PowerPoint for Strategic Portfolio Management](#).
2. Manage the related tables and scripted elements components. For more information, see [Manage Related Tables and Scripted Elements forms](#).
3. Download the manifest file from your instance to and share it with your Microsoft Office 365 account manager. For more information, see [Download the manifest file from your instance](#).
4. Configure the Export to PowerPoint add-in for your Microsoft PowerPoint. For more information, see [Configure the Export to PowerPoint add-in for Microsoft PowerPoint](#).

Install Export to PowerPoint for Strategic Portfolio Management

You can install the Export to PowerPoint for Strategic Portfolio Management application (sn_ppt) if you have the admin role. The application includes demo data and installs related ServiceNow[®] Store applications and plugins, if they are not already installed.

Before you begin

- Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Role required: admin

- **Important:**

For more information about the data processing required to generate a project status report within the ServiceNow servers based on your location, see the [KB1170323](#)  article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.

2. Find the **Export to PowerPoint for Strategic Portfolio Management** application (sn_ppm_ppt_export) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install**.

Result

The following components are installed with installation of the Export to PowerPoint for Strategic Portfolio Management application.

- Roles
- Tables

See [Components installed with Export to PowerPoint for Strategic Portfolio Management](#) for more information.

Manage Related Tables and Scripted Elements forms

Manage the **Related Tables** and **Scripted Elements** components that are required to create a Microsoft PowerPoint template.

Before you begin

Role required: sn_ppm_export.ppt_admin

Procedure

1. Navigate to **All > PowerPoint Management > PowerPoint Report Types**.
2. Select a parent table record, for example, Project report pm_project.

Option	Description
<p>To manage Related Tables</p>	<p>You can add a custom remote table or a child from the parent table.</p> <ol style="list-style-type: none"> a. In the Related Tables related list, select New. On the Related tables form, fill the fields. For a description of the field values, see Related Tables form. b. To add a custom remote table: <ol style="list-style-type: none"> i.       ii. Select the required remote table from list. iii. Select the Enable custom script option. iv. In the Custom script box, write the code to establish a connection between the remote table and main table. c. To select a child table from the main table: <ol style="list-style-type: none"> i. Select a child table from list. ii. Set the Parent relation column to the field that links the child table to the parent table. d. Select Submit. <p>The selected table and its relation to the parent table is displayed in the Related tables section.</p>
<p>To manage Scripted Elements</p>	<ol style="list-style-type: none"> a. In the Scripted Elements component, select New. b. On Scripted Elements form, fill the fields. For a description of the field values, see Scripted Elements form. c. Select Submit.

3. To configure a **Script** component, specify the script logic to generate dynamic content in the template.

Script components allow you to include calculated or dynamically generated content in your PowerPoint template. Use scripts when the built-in Field, Table, or Text component types do not meet your requirements.

Example: To display a formatted project health status:

```
(function() {
    var gr = new GlideRecord('pm_project');
    gr.get(current.getValue('sys_id'));
    var health = gr.getValue('health');
    if (health == 'green') return 'On Track';
    else if (health == 'yellow') return 'At
    Risk';
    else return 'Off Track';
})();
```

Note:

Verify the available scripting API and context variables with your ServiceNow administrator. Script components execute server-side and have access to the current record context.

4. Select **Update**.

Download the manifest file

Configure the user roles and download the add-in manifest file to use the Export to PowerPoint add-in for Microsoft PowerPoint.

Before you begin

Role required: sn_ppt_export.ppt_admin

Procedure

1. Navigate to **All > ServiceNow Add-Ins for Office > Office Add-In Manifests**.
2. Click **Templates for ServiceNow**.

Note:

Check the **Templates for ServiceNow** description to match with **PowerPoint plugin for ServiceNow** to ensure that the correct manifest file is selected.

3. Click **Download Manifest** to download the add-in file.

The manifest file you download is specific to your instance. It contains the instance URL and configuration details that apply only to your environment. Using a manifest from one instance on another instance does not work and may cause errors.

If you work with more than one ServiceNow instance, for example, a development instance and a production instance – you have two options:

- Install a separate manifest for each instance. Download and install the manifest individually from each instance you need to connect to.
- Use the sideload option. If installing multiple manifests is not practical, use the sideload option to temporarily load the manifest for a different instance without installing it permanently.

What to do next

- Share the `manifest.xml` file with Microsoft Office 365 account manager to [upload the manifest file for Microsoft Office 365 users](#) to enable the Export to PowerPoint add-in for Microsoft PowerPoint.

Alternatively, you can sideload the add-in for testing purposes using one of the following processes.

- For Windows machines: <https://learn.microsoft.com/en-us/office/dev/add-ins/testing/create-a-network-shared-folder-catalog-for-task-pane-and-content-add-ins> 
- For macOS machines: <https://learn.microsoft.com/en-us/office/dev/add-ins/testing/sideload-an-office-add-in-on-mac> 
- For more information about the additional configuration steps required to enable the Export to PowerPoint add-in for browser version of Microsoft PowerPoint, see the [KB1171422](#)  article in the Now Support Knowledge Base.

Configure the Export to PowerPoint add-in for Microsoft PowerPoint

Configure the Export to PowerPoint add-in in your Microsoft PowerPoint to interact with your instance and fetch the data required to generate and download your project status reports.

Before you begin

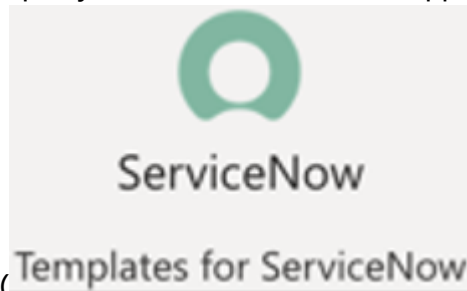

- Role required: sn_ppt_export.ppt_admin or sn_ppt_export.ppt_user.
- The Export to PowerPoint add-in must be deployed to your Microsoft PowerPoint. If the add-in icon does not appear on the Home tab, verify the following.
 1. [Download the add-in manifest file](#) from your ServiceNow instance.
 2. Contact your Microsoft Office 365 administrator to deploy the manifest using the Microsoft 365 admin center (**Settings > Integrated apps > Upload custom apps**).
 3. After deployment, restart Microsoft PowerPoint and verify the ServiceNow add-in icon appears on the Home tab.
- For the Export to PowerPoint plugin configuration on your instance, see [Configure the Export to PowerPoint add-in for Microsoft PowerPoint](#).

Tip:

If you do not see the add-in icon after deployment, check **Insert > My Add-ins** in Microsoft PowerPoint to verify the add-in is installed. You may need to select it manually to add it to your ribbon.

Procedure

1. Open your Microsoft PowerPoint application and select the ServiceNow add-in icon

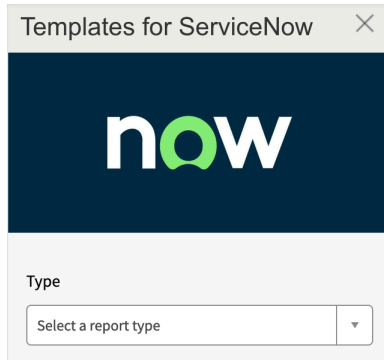

(Templates for ServiceNow) on the **Home** tab.

A panel appears with a login option to access your ServiceNow instance.

2. Select **Log in**.
3. Enter your ServiceNow instance credentials and select **Log in**.
A prompt requesting access to your instance with details such as the instance name is displayed.
4. Check your instance details and select **Allow**.

Result

The landing page of the add-in appears as the right panel.

**Note:**

For more information about the additional configuration steps required to enable the Export to PowerPoint add-in for the browser version of Microsoft PowerPoint, see the [KB1171422](#) article in the Now Support Knowledge Base.

What to do next

[Create a Microsoft PowerPoint template.](#)

Using Export to PowerPoint

Use the Export to PowerPoint add-in for Microsoft PowerPoint to create a template to generate reports.

Note:

While creating a template, any formatting options that you use such as font style, font size, background color, and so on, are retained while generating a report.

1. Create a Microsoft PowerPoint template. For more information, see [Create a Microsoft PowerPoint template.](#)
2. Upload a Microsoft PowerPoint template to your ServiceNow instance. For more information, see [Upload your Microsoft PowerPoint template.](#)
3. Download a project status report using the created template. For more information, see [Download a project status report.](#)

Create a Microsoft PowerPoint template

Configure the Export to PowerPoint add-in in your Microsoft PowerPoint to interact with your instance and fetch the data required to generate and download your status reports. Create your own custom template with the required data to generate a report, based on the reporting needs of your organization.

Before you begin

- Let us connect your instance to the Microsoft PowerPoint using the add-in login and create a template Portfolio Planning to generate a report for epic details.
- Role required: sn_ppt_export.ppt_user

Procedure

1. Open your Microsoft PowerPoint application and select the ServiceNow add-in icon

([Templates for ServiceNow](#)) on the **Home** tab.

A side panel appears with a login option to access your ServiceNow instance.

2. Select **Log in**.
3. Enter your ServiceNow instance credentials and select **Log in**.
A prompt with your instance details is displayed.
4. Check your instance details and select **Allow**.
The landing page of the add-in appears on the side panel.

5. Select **Personal portfolio report** from the Type list.

Select the data type you want to populate.

- Text – Text entries from the parent table. Example: Portfolio name, owner name, and so on.
- Table – Table entries mapped using [related tables](#).
- Repeater – To populate additional details for each of the selected records.
- Line and Bar chart – Graph entries mapped using [scripted elements](#).

Note:

While creating a template, you can:

- Change the font size and color for the token values to reflect the same in your status report.
- Move around the token to place them in a required format.
- Add your custom or organization logos on the slides.
- Resize the chart tokens according to the requirement.

You can customize data retrieval for template tokens by appending link attributes. The following attributes are available:

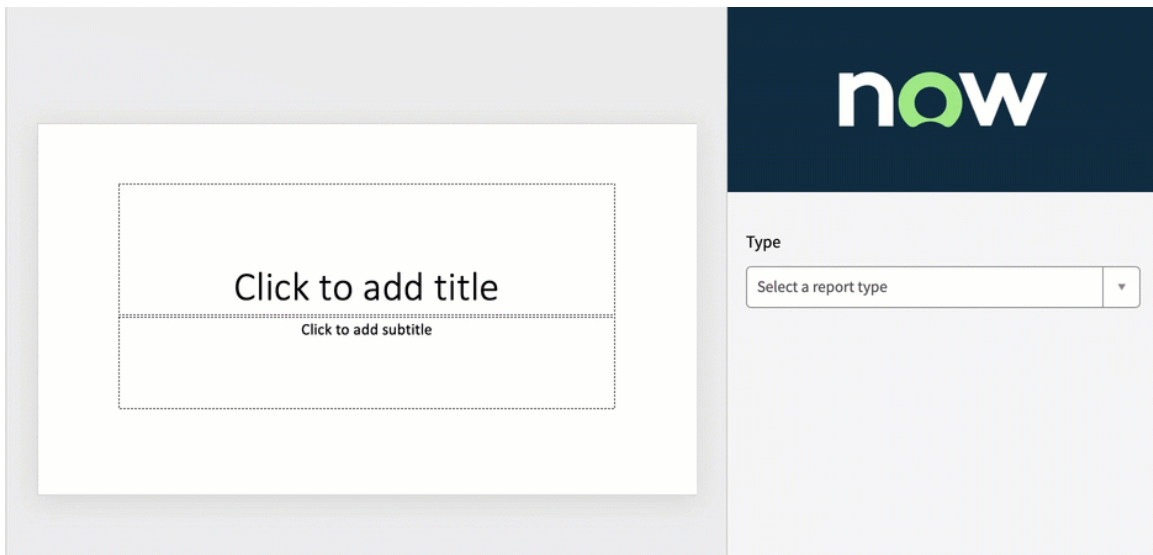

Template token link attributes

Attribute	Description	Example
orderByColumnName	Sorts the data by the specified column name in ascending or descending order.	orderByColumnName=priority^orderBy
filterQuery	Applies an encoded query to filter the data populated in the template token.	filterQuery=state=2^priority=1
maxRows	Limits the maximum number of rows returned for a table or repeater token.	maxRows=10

Apply these attributes by appending them to the token URL in the template field properties. For details on configuring related tables and scripted elements, see [Manage components](#).

6. To populate the Portfolio name on the first slide:

- a. Select **Text** from the data type.
- b. Filter the Column list to locate Name and select it. A token value representing the portfolio name is generated in the subsequent empty text box.
- c. Select the **Copy text** button to copy the token.
- d. Paste the token on the slide.

Add a new slide to Microsoft PowerPoint, insert a table with three columns and two rows to generate the Epics with their numbers, status, and due date.

7. To populate Epics details such as numbers, status, and due date:

- a. From the add-in landing page, select **Table** from the Data list.
 - Use the **Back** (←Back) button to go back to the add-in landing page.
- b. Select **Epic** from the Related table list.
- c. From the Related table (optional) list, select a related table to the Epic.
- d. Select the number of rows that you want to populate and By default, five rows are selected.

You can select a minimum of one row and a maximum of 10 rows.

- e. Use the filter icon to see any existing filter or to define a condition to populate the data.

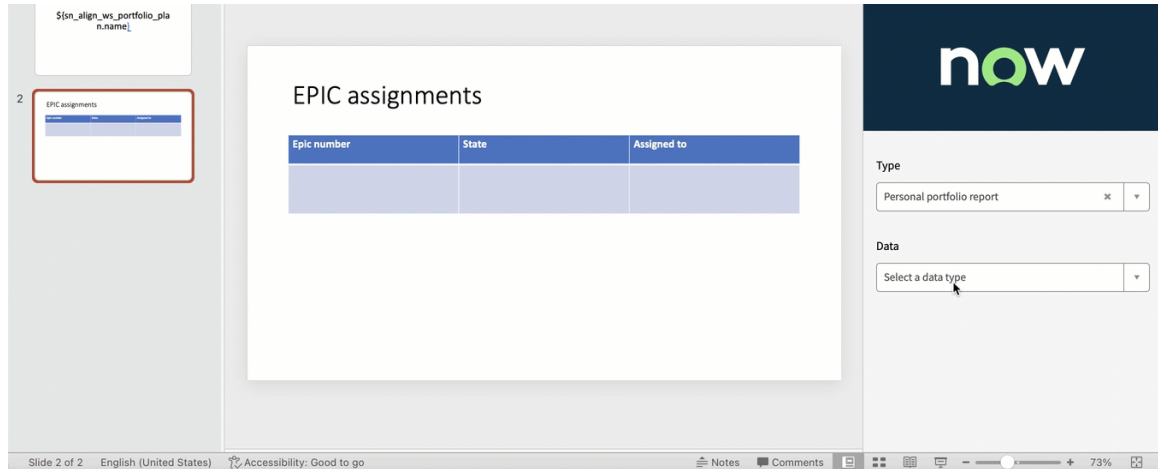

Here, we're picking Epics which are in either Ready or Work in progress state with a deadline on April 30.

- f. Select **Next**.

- g. Select **Number** from the Column list.

- h. Copy the token value and paste it in the table.

- i. Similarly, copy and paste the token values of **State** and **Assigned to** fields from the Column list.

Add slide to Microsoft PowerPoint.

- 8. To populate the required details of each of the selected records:

- a. From the add-in landing page, select **Table** from the Data list.

Use the **Back** (←Back) button to go back to the add-in landing page.

- b. Select **Repeater** from the Data list.

- c. Select **Epic** from the Related table list.

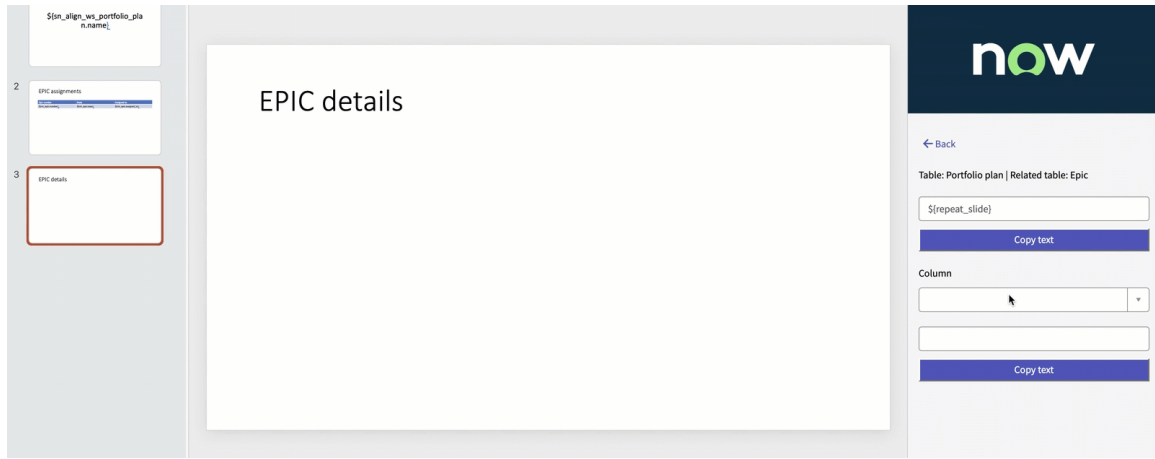

- d. Add the required filter using the filter option and select **Next**.

- e. Select the required fields to copy and paste the token on the slide.

- f. Copy and paste the repeater token to the slide

Note:

The repeater token doesn't generate any values in the status report.

Add a new slide to Microsoft PowerPoint.

9. To populate a line or bar chart:

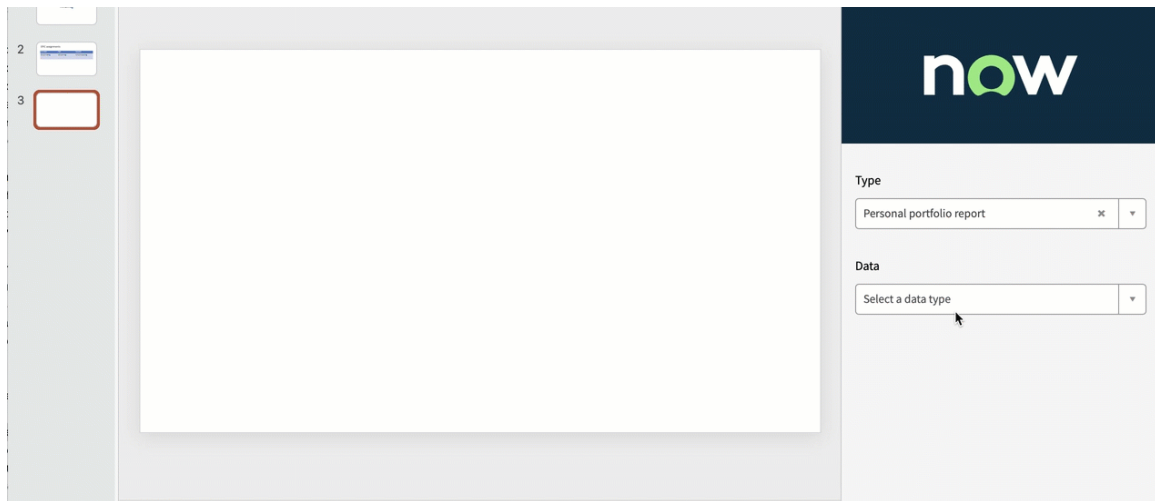

a. From the add-in landing page, select **Line Chart** or **Bar Chart** from the Data list.

Use the **Back** (←Back) button to go back to the add-in landing page.

b. From the Select a chart (defined using scripted elements) list, select a chart you want to populate for your report and select **Next**.

c. Select the **Copy to clipboard** button to copy the chart token.

d. Paste the token on a slide.

10. Save the Microsoft PowerPoint file in the . pptx format with a maximum of 50 slides and file size not exceeding 15 MB.

Note:

The Export to PowerPoint for Strategic Portfolio Management application comes with default templates which you can use to generate reports and consider as a reference to create templates.

Upload your Microsoft PowerPoint template

Upload the latest template to your instance to generate and download the status report as a Microsoft PowerPoint file.

Before you begin

Role required: sn_ppt_export.ppt_user

Procedure

1. Navigate to **All > PowerPoint Management > PowerPoint Templates**.
2. Select a record to attached the latest template.
3. Select the manage attachments icon ().
4. Select **Choose file** to browse and upload the template.

Note:

You can use only one template (. ppt x) at a time with a maximum file size of 15 MB. Delete the existing template to upload and use a new one.

5. Close the dialog box, and select **Update** on the form.

What to do next

[Download a project status report.](#)

Download a project status report

Download your projects and project status reports as a Microsoft PowerPoint file to share it with the stakeholders.

Before you begin

Role required: sn_ppt_export.ppt_user

Important:

Export to PowerPoint is currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. Please check for availability updates in future releases.

Procedure

1. To download your status report for Enterprise Architecture (formerly Application Portfolio Management), see [Export data to Microsoft PowerPoint - Legacy](#) .
2. To download your status report for Project Workspace, see [Export a project status report to Microsoft PowerPoint from Project Workspace](#).
3. To download your project from Project Workspace, see [Export a project from Project Workspace](#).
4. To download your status report for Strategic Planning, see [Export the portfolio plan status or roadmap to Microsoft PowerPoint](#).
5. To download your status report for Portfolio Planning, see [Export the portfolio plan status or roadmap to Microsoft PowerPoint](#).

Result

Your report is downloaded as a Microsoft PowerPoint file with the project number and status report date as the file name.

Export to PowerPoint Reference

Reference topics provide additional details about Export to PowerPoint such as fields, tables, roles, and some guidelines.

Components installed with Export to PowerPoint for Strategic Portfolio Management

Several types of components are installed with activation of the Export to PowerPoint for Strategic Portfolio Management (sn_ppt) add-in, including user roles and tables.

Roles installed

Role title [name]	Description	Contains roles
Export to PowerPoint for Strategic Portfolio Management admin [sn_ppt_export.ppt_admin]	<ul style="list-style-type: none"> • Create, edit, and manage the attributes required to generate Microsoft PowerPoint templates. • Assign this role in confidence because it is a high security role for the Export to PowerPoint application with access to modify the source code for Scripted Elements. 	sn_ppt_export.ppt_user
Export to PowerPoint for Strategic Portfolio Management user [sn_ppt_export.ppt_user]	<ul style="list-style-type: none"> • Create a template, upload it to the ServiceNow instance, generate, and download the project status report. • By default, users with the project_user role are assigned this role. 	None

Tables installed

Table	Description
PowerPoint Cell Formatter [sn_ppt_export_ppt_cell_formatter]	Stores the color properties for text, text background, table cell, and shape fill.
PowerPoint Element [sn_ppt_export_ppt_element]	Stores the required elements to generate a Microsoft PowerPoint template.
PowerPoint Formatter [sn_ppt_export_ppt_formatter]	Stores the text formatting options.
PowerPoint Formatter Mapping [sn_ppt_export_ppt_formatter_mapping]	Stores the format mapping for the tokens.
PowerPoint Report Type	Stores report types that can be used to generate a report.

Table	Description
[sn_ppt_export_ppt_report_type]	
PowerPoint Template [sn_ppt_export_ppt_template]	Stores the metadata required for the templates.
PPT Service Request Log [sn_ppt_export_ppt_poi_service_request_log]	Stores service requests logs.
Related Table [sn_ppt_export_ppt_related_table]	Stores related tables for a report.
Scripted Element [sn_ppt_export_ppt_scripted_element]	Stores the supported chart types, such as line chart and bar chart.

Default templates installed

Template name	Description and use case	Data included
Project Report Template - Default	A comprehensive project report template designed for detailed project reviews. Use this template for in-depth project status meetings with project teams and stakeholders.	Project details, task breakdown, milestone status, resource allocations
Project Status Report Template - default	A concise executive summary template designed for high-level status updates. Use this template for portfolio reviews, steering committee meetings, and executive dashboards.	Project overview, key metrics, status indicators, high-level timeline

Tip:

To view and manage all available templates, navigate to **All > PowerPoint Management > PowerPoint Templates**.

Related Tables form

Use the Related Tables form to define the child tables for the configured parent table. This Related Tables helps in fetching data to export the project status report as Microsoft PowerPoint.

Related table form

Field	Description
Name	Name of the child table to include in the export.
Parent relation column	The column that defines the relationship between the parent and child tables. This field determines how the child table data is joined to the parent record.

Related table form (continued)

Field	Description
	For more information on how to manage Related Tables, see Manage Related Tables and Scripted Elements forms .
Enable custom script	Select this option to enable custom scripting for the related table data. When enabled, you can write server-side JavaScript to customize how child table data is fetched, filtered, or transformed before it is included in the PowerPoint export. <div style="background-color: #e0f2f1; padding: 5px; border: 1px solid #ccc;"> <p>i Important: Custom scripts run with the permissions of the current user. Test scripts thoroughly on a non-production instance before deploying to production.</p> </div>
Advanced	Expand this section to access advanced configuration options for controlling how the related table data is rendered in the PowerPoint export, including field mappings, sort order, and display formatting.

Scripted Elements form

Use the Scripted Elements form to define the data script to fetch data for a complex report type such as line chart or bar chart.

Scripted Elements form

Field	Description
Name	Name for the element.
Type	Chart type (Line chart or Bar chart) that you want to generate. After the required chart type is selected, the suggested format of the scripted elements code format is displayed in the Data Script field.
Description	Description for the report. (Example: Comparison of planned vs. Actual costs.)
Data Script	Script used to fetch data for the report. For more information on how to manage Scripted Elements, see Manage Related Tables and Scripted Elements forms .

Line chart parameter

Following are the basic parameters used to define the properties and formatting of a line chart.

Line chart parameters

Parameter	Description	Reference value
<code>@property {String} seriesArray.properties.color</code> - Color of Line	Color of the line.	Use Hex code values to define a color of the line. For example, use the hex code #FF0000 for red color.
<code>@property {String} seriesArray.properties.type</code> - type of Line	Type of line.	For more information about reference line formats, see https://poi.apache.org/apidocs/dev/org/apache/poi/xddf/usermodel/PresetLineDash.html#DASH .
<code>@property {String} seriesArray.properties.markerStyle</code> - style of marker	Style of the marker to identify key points on the chart.	For more information about reference marker formats, see https://poi.apache.org/apidocs/dev/org/apache/poi/xddf/usermodel/chart/MarkerStyle.html .
<code>@property {Number} seriesArray.properties.markerSize</code> - size of style	Size of the marker on the chart.	Minimum inclusive: 2, maximum inclusive: 72
<code>@property {String} legendPosition</code> - Position of legend in chart. This is optional	Legend position of the chart.	For more information about legend position, see https://poi.apache.org/apidocs/dev/org/apache/poi/xddf/usermodel/chart/LegendPosition.html .

Bar chart parameters

Following are the basic parameters used to define the properties and formatting of a bar chart.

bar chart parameters

Parameter	Description	Reference value
<code>@property {String} barProperties.direction</code>	The direction of plotting the bars in the chart.	For more information about defining a bar direction, see https://poi.apache.org/apidocs/dev/org/apache/poi/xddf/usermodel/chart/BarDirection.html .

bar chart parameters (continued)

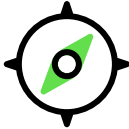

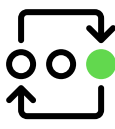

Parameter	Description	Reference value
<code>@property {String} barProperties.grouping - grouping of bars</code>	Grouping style of the bar in the chart.	Use options such as standard, clustered, stack. For more information about bar grouping properties, see https://poi.apache.org/apidocs/dev/org/apache/poi/xddf/usermodel/chart/BarGrouping.html .
<code>@property {Number} barProperties.overlay</code>	Size of overlapping among the bars in the chart.	Accepted numeric value range is from 0 to 100.

Agile Development 2.0

ServiceNow Agile Development 2.0 provides an agile software development environment for product-based or project-based efforts, using the Scrum framework. Implement a pure agile approach over the entire life cycle of a product, or a hybrid approach using agile methods within a traditional project structure.

This video provides an introduction to development in the ServiceNow SPM Agile 2.0 application including creating stories, planning backlogs and sprints, and tracking progress

Get started

Exploring Agile Development 2.0

Learn about the Scrum methodology framework, typical activities, and artifacts that are used in ServiceNow® Agile Development 2.0.

Overview of product based and project based approaches in Agile Development 2.0. Approximately three minutes long.

Agile Development 2.0 supports both product-based and project-based development efforts. For a quick overview of these approaches, watch the video.

Use the information in the following sections for a deeper understanding of Agile Development basics, its process, and the scenarios in which Agile Development is used. Also, learn about the features of the Agile Development 2.0 application.

Basics of Agile Development

Scrum is one of the popular methodologies of Agile Development, which includes a fixed sprint schedule and regular requirements testing. These activities are performed by common roles such as product owner, scrum master, and group members. Learn about the basics of Agile Development process.

Scrum framework

Familiarize yourself with the terminology and artifacts used in Agile Development.

Assignment group or Agile team

Group of users who are involved in working on and completing the development for an Agile product. In Agile Development 2.0, this team is called as an assignment group.

In an assignment group, a user is designated as the scrum master, who is responsible to ensure that all the scrum activities are properly performed for a release. For more information, see [Assignment groups in Agile Development 2.0](#).

Epic

High-level definition of a requirement that provides value to the business, such as a new feature or a significant enhancement. Epics are broken down into Agile stories and can be worked on by a single or multiple teams.

Story

Short, manageable pieces of work that are related to an epic. Stories capture the who, what, and why of a requirement in a simple and concise way. Using the description and criteria mentioned in the stories, teams can accurately estimate the effort required to implement the work in it.

Scrum task

Distinct tasks that are required to complete a story. A task might require from 4 through 12 hours to complete.

Backlog

List of work that must be implemented, as part of achieving specific outcomes. Backlog contains work related to new features, enhancements to existing features, and other activities of product development.

Backlog is considered as the single source of work for a product or team. Anything that is not included in the backlog would not be prioritized for development.

Personal Backlog

Product owners define a personalized work pipeline called personal backlog, by applying relevant filter criteria. In Agile Development 2.0, product owners can define as many personalized backlogs as necessary. The criteria used to create the personalized backlog is flexible and can be modified at any time.

Sprints

Short, fixed periods, in which team members pick and complete a set number of stories. These short, time-boxed cycles provide the teams the flexibility to adapt to changing priorities.

The cadence of recurrence for a sprint is decided by the development teams and the product owners. For example, a 10-day sprint, or a 1-week sprint.

Sprint backlog

Scope of work for a sprint. Product owners and their development teams use the sprint planning activity to review their backlog and decide on the stories to be picked up for a sprint.

Theme

Area of focus with an associated business value. A theme is related to one or more of the company's goals. Themes help you prioritize your work at a high level and can be associated with multiple epics.

Product

Entity to organize themes, epics, and stories of similar functionality into a single context. A product represents an item or a feature that is to be developed and released to the market.

Release

A release has a start and end date during which several development iterations are completed. Releases are created by a product owner and contain user stories, sometimes from multiple products and can also involve multiple teams. The stories associated to a release form its release backlog.

Note:

In Agile Development 2.0, ensure that you create a product before you create themes, epics, or stories. You cannot submit these records without attaching them to a product.

After creating stories and scrum tasks for your products, you can create a personalized backlog containing the stories from one or more of these products.

Defects

Defects can be used to report and track the resolution of issues that are noticed during the development of a new feature, or as a feedback for existing features. Product owners then review these defects and decides on creating stories for them, which are assigned to the relevant assignment groups.

Using the Agile Development – Unified Backlog, you can set up a triage board to maintain a centralized backlog for records of different task types, such as defects, stories, and enhancements. For more information, see [Agile Development – Unified Backlog](#).

Enhancements

Enhancement requests can be used to log feature enhancements for a product. These requests can arise from internal requirements or customer feedback. Product owners review these logged requests and decides on creating stories for them based on priority. These stories are then assigned to the relevant assignment groups for development.

Using the Agile Development – Unified Backlog, you can set up a triage board to maintain a centralized backlog for records of different task types, such as defects, stories, and enhancements. For more information, see [Agile Development – Unified Backlog](#).

Scrum activities

The Scrum process usually consists of the following activities.

Sprint planning

Assignment group members meet to decide on the stories that they can commit to deliver in the sprint. Typically, they commit to the top ranked stories first. The group decides which scrum tasks are necessary for each story. The product owner should be present to answer any questions.

Daily standup

Assignment group members meet to discuss the progress of their work from the previous day, work planned for the current day, and any blockers. The daily standup keeps the group members focused on completing the stories for the current sprint and informs the scrum master of any blockers.

At the end of the sprint, all its stories should be complete. Any incomplete stories are moved back into the backlog, or a future sprint.

Sprint reviews

Sprint review meetings are held at the end of each sprint. In these meetings, the assignment group reviews the work that they completed and demonstrate the newly developed features to their product owner.

Sprint retrospectives

A retrospective meeting is conducted at the end of each sprint, to facilitate discussion between the group members on what went well and what did not. The goal of a sprint retrospective is to discuss ways to improve the execution of future sprints.

For details on how Agile Development 2.0 can help you manage your efforts of product development, see [Agile Development process flow](#).

Scrum reports

Scrum reports help you analyze the performance and progress of your agile team. These reports can be related to an epic, sprint or release, and provide historical data of your team's work velocity. Performance Analytics Content Pack for Agile 2.0 provides pre-configured dashboards with data visualizations to help you improve your Agile practices.

For more information, see [Performance Analytics Content Pack for Agile 2.0](#).

Agile Development process flow

Learn the process that is used to manage product development efforts in Agile Development 2.0, such as creating a product or tracking a sprint or release.

Note:

The flow explained here represents the common practice for managing agile development efforts using the functionality available in the Agile Development 2.0 application. This flow does not represent the only possible process.

Define products

A product can be a set of features or functionality offered to users. Each product can have an owner that maintains the work pipeline, such as epics and stories, for the product. These work items can be associated to a theme, which is related with a business goal.

See [Create a product in Agile Development 2.0](#).

Create epics and stories

Epics contain high-level requirements for your products, which you can use to break down into manageable stories. While creating epics and stories in Agile Development 2.0, you can associate them with a product.

See [Create an epic in Agile Development 2.0](#) and [Create a story in Agile Development 2.0](#).

Create releases

Some organizations have a fixed time frame to make their products available to the market, which is referred to as a release. A release has a start and end date, during which several development iterations are completed. For example, you can have quarterly or half-yearly schedules to release new applications or enhancements to existing applications.

After you create a release in Agile Development 2.0, you can associate products, epics, and stories to it. See [Create a release in Agile Development 2.0](#).

Create personalized backlogs

A personalized backlog can be created by defining filter criteria. For example, one personalized backlog can be a combination of stories, defects, and incidents while the other personalized backlog can be a combination of stories and incidents. In this way, you can create as many personalized backlogs as necessary.

See [Create a personalized backlog in Agile Development 2.0](#)

Create assignment groups

Create an assignment group add members to it. For each group member, define the number of story points that they can complete in a sprint. At the group level, the sum of the story points of all the group members determines the group capacity.

See [Create an assignment group in Agile Development 2.0](#)

Create sprints

A sprint is the time frame in which the development team delivers one or more stories. A sprint can be of any length, but typically takes between one and four weeks to finish. The scrum master creates the number of sprints required for the group, and these sprints are used by the group members to complete the work required for an upcoming release. However, all sprints within a release must be within the release start and end dates.

Plan sprint activities

Before a sprint starts, the group and scrum master decide on what stories from the backlog they can commit to complete within a sprint. Stories for a sprint can be selected based on priority. The scrum master must ensure that the effort (total story points) required to complete the stories matches the capacity of the group.

While planning your sprints, you can use the velocity reports as guidance to estimate how much work the group can complete in the next sprint. The [Agile 2.0 Team dashboard](#) provides Velocity history report and Velocity by type report.

- **Velocity History:** Gain an insight on the overall velocity of the team for the past 10 sprints. Analyze if the team is achieving a stable, predictable velocity, and is meeting the commitments.
- **Velocity by Type:** Analyze the way your team's velocity changes over time and compare the team's strategic workload with operational or other types of workload.

For more information on how to plan your sprints, see [Plan your sprint activities in Agile Development 2.0](#).

Track sprint progress

The scrum master manages the sprint team efforts, provides progress reports, and removes any blockers that the team encounters. Team members update story records and conduct daily standup meetings to discuss their progress and communicate the concerns to the scrum master and product owners.

The team is expected to complete all the stories that are committed for a sprint. The scrum master expects that the stories are fully tested and are ready for release, according to the acceptance criteria.

Ideally, the committed stories and the scope for a specific sprint should not change while the sprint is in progress. Agile Development 2.0 provides the flexibility to update as necessary and adapt to changing priorities. However, stories must be added or removed from a sprint only after a discussion between the group, scrum master, and product owner.

You can use the [Agile 2.0 Sprint dashboard](#) with reports such as burnup and burndown charts to track the progress of the team for a sprint.

Tip:

If you're running a hybrid or traditional project delivery, you can still use the Agile 2.0 Sprint dashboard to track workflow state transitions using the cumulative flow diagram. For more information about enabling dashboard access, see [Performance Analytics Content Pack for Agile 2.0](#).

Track release progress

The product owner tracks the progress of the release and verifies whether the team is completing stories in the pace that is necessary to achieve the release goal.

You can use the [Agile 2.0 Release dashboard](#) with reports such as burnup, burndown, and cycle time charts to track the progress of the team for a release.

Note:

All Agile 2.0 dashboards are available with [Performance Analytics Content Pack for Agile 2.0](#).

Agile Development use cases

Learn the different methods that organizations could use to plan their backlog and deliver stories.

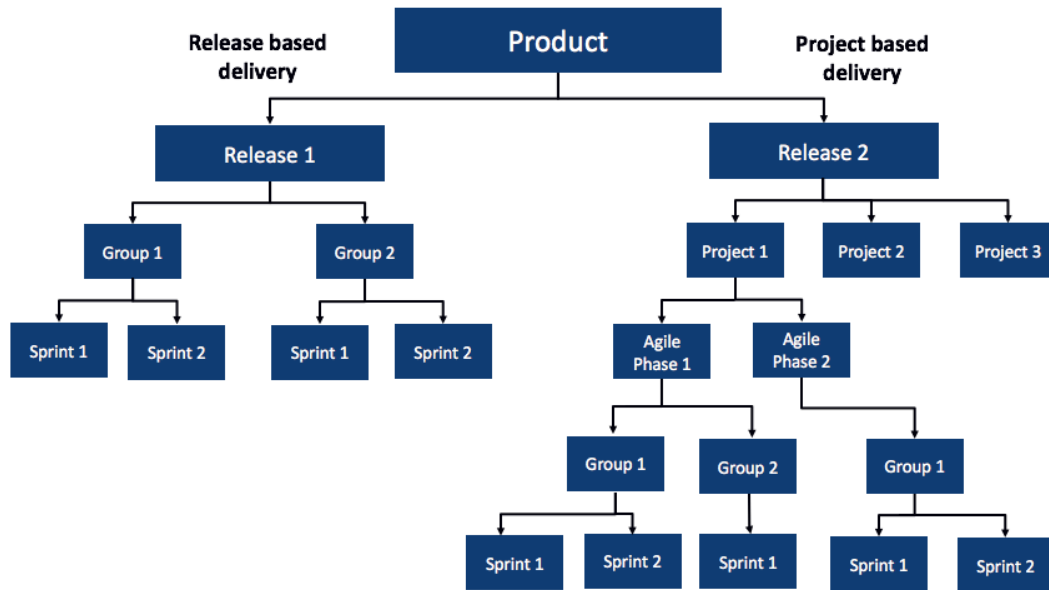

Some common delivery methods are:

- [Release-based delivery](#)
- [Project-based delivery](#)
- [Standalone project development](#)

Agile Development 2.0 provides the flexibility to maintain a unified backlog that can be used for both release-based or project-based types of delivery. You can maintain all your backlog in one place and associate the stories to a product, project, or both. You can also select stories from the backlog and execute them as a project, as a standalone project development.

The following example shows how Agile Development 2.0 supports a unified backlog for both project-based and release-based type of deliveries.

Agile development work flow use cases

Release-based development use case in Agile Development

An example of release-based development and delivery model using Agile Development.

The usual activities involved in a release-based agile development are:

- **Maintain Product Backlog:** Product owners maintain the product backlog. They continuously groom their backlogs by adding stories, prioritizing, and estimating them.

In Agile Development 2.0, navigate to **Agile Development > Backlog > All Stories** for the list of all the stories. You can filter the list for a specific product.

- **Release Planning:** Organizations have definite release cycles such as quarterly release, bi-yearly release, yearly release. The product owners select the prioritized stories from the product backlog that should be completed in a given release to form Release Backlog.
- **Assignment of stories:** In Agile Development 2.0, navigate to **Agile Development > Stories**. Select the stories that you want to assign to a release and select **Assign to release/group**. Specify a team that you want to associate these stories with.
- **Sprint planning:** The scrum teams define their sprint schedule such as two-week sprint or three-week sprint. They work with the product owner, and select stories from the release backlog that should be completed in each sprint to create Sprint Backlog. The group members along with product owner and scrum master decide stories for each sprint using Sprint Planning.

In Agile Development 2.0, navigate to **Agile Development > Agile Board > Sprint Planning**.

Project-based development use case in Agile Development

An example of project-based development and delivery model in Agile Development.

The usual activities involved in a project-based Agile Development include the following:

- **Product Backlog:** Product owners maintain the product backlog. They continuously groom their backlogs by adding stories, prioritizing and estimating them.

In Agile Development 2.0, navigate to **Agile Development > Backlog > All Stories** for the list of all the stories.

- **Project Backlog:** Product owners select the prioritized stories and assign them to one or more projects, thus creating the project backlog. Product owners can create one or more projects and capture additional details such as required resources, cost, risk, strategic alignment. All these projects undergo portfolio prioritization process, and the selected projects are executed by the project teams.

Note:

Some organizations also define release cycles such as quarterly release, bi-yearly release, yearly release. They then move the stories from product backlog to the release backlog. In these cases, stories are assigned to the projects from the release backlog.

In Agile Development 2.0, navigate to **Agile Development > Stories** and select **Assign to project** to assign stories to a new or existing project.

You can also open an existing project and associate stories to the project from the backlog. These stories are then executed as part of project execution.

- **Assignment of stories:** Assign the stories of the project to an assignment group so that the team can pick these up in the upcoming sprints.

In Agile Development 2.0, select the stories that you want to assign to a release, select **Assign to release/group** and specify an assignment group.

- **Sprint planning:** The scrum teams define their sprint schedule such as two-week sprint or three-week sprint. They work with the product owner, and select stories from the release backlog that should be completed in each sprint to create Sprint Backlog. The group members along with product owner and scrum master decide stories for each sprint using Sprint Planning.

In Agile Development 2.0, navigate to **Agile Development > Agile Board > Sprint Planning**.

Standalone project development use case in Agile Development

An example of a standalone project development and delivery model in Agile Development.

In this case, a request (**demand**) for a new product or feature or system is raised. Demand managers capture the requirements in terms of stories. They also capture the other details for the demand such as resources required, cost, risks, and strategic direction. Such demands are converted into projects upon approval. Project managers can choose pure agile or hybrid mode of project execution. In hybrid mode, the initial phases such as planning, and analysis are taken up as waterfall tasks, and then the execution is done as agile phase. The agile phase is assigned to an agile group. The agile group then completes the work by sprint execution.

Using Agile Development 2.0 for standalone hybrid project development

Steps to execute a standalone hybrid project:

1. **Create demand:** **Capture requirements** at demand state in terms of user stories. Use the Stories related list on the demand form to create stories.
2. **Demand to Project conversion:** When the demand is converted to a project, the stories in demand move to the project so that the project team (assignment group) can execute them. During the conversion, an Agile phase is also created, and the stories are assigned to the Agile phase.
3. **Sprint planning:** The agile group members along with project manager, and scrum master perform sprint planning. Navigate to **Agile Development > Agile Board > Sprint Planning** to plan sprints.

Agile board in Agile Development 2.0

The Agile board is a landing page where you can perform key actions of the scrum process such as managing your backlogs, planning your sprints, and tracking the sprint progress.

The Agile board is organized in the following tabs to help you manage these activities. You would require one or more of the `scrum_admin`, `scrum_master`, `scrum_product_owner`, or `scrum_sprint_planner` user roles.

Backlog

The Backlog tab helps you manage your personalized backlogs. Within the Backlog tab, you can:

- Create stories, epics, and themes.
- View all active stories that are assigned to a team but that are not assigned to any sprint.
- View cards indicating the total number of stories, stories that do not have story points, and stories that do not have acceptance criteria in your backlog.

Clicking any of these cards gives you a list of stories from that category.

- Reorder stories in the backlog across pages.
- Filter the stories by epic by using the Records by epic section.

In this section, only those epics are listed, which belong to the stories of the selected backlog.

- The epics for the stories from your backlog are listed in this section.
- Epic completion is indicated by a progress bar and percentage.
- You can show or hide this section by selecting the configuration icon ()
- Personalize columns by using the personalize icon ()
- Use the search option to filter stories using a keyword.

For more information on how to manage your backlog, see [Manage your product backlog in Agile Development 2.0](#).

Sprint Planning

The Sprint Planning tab of the Agile board shows the team backlog and sprints as sections, which contain the list of stories. You can create, edit, and plan for sprints using the options available in this tab.

From the Sprint Planning tab, you can:

- Create, organize, monitor, start, and complete sprints.
- View current and future sprints in chronological order.
- View planned start and end dates, story points, percentage group velocity, and the number of story points (total, complete, and pending) for the current sprint.
- Assess stories in the backlog and drag them to sprints.
- Add stories to the backlog and set up their order of implementation.
- Move unfinished stories from the completed sprint to the backlog or to a future sprint.

Sprint Tracking

From the Sprint Tracking tab, you can track the progress of your current sprint in a Story board, Task board, or list view.

Story board

- Track all the stories of the current sprint across lanes.
- Move a story from one lane to another, which updates the state of the story.
- Filter stories by search criteria.

For more information, see [Track progress of stories for a sprint in Agile Development 2.0](#).

Task board

The Task board enables you to track all the scrum tasks for stories of the current sprint across lanes. You can:

- Move scrum tasks from one lane to another, which updates the state of the stories.
- Filter scrum tasks by search criteria.

For more information on tracking your scrum tasks using the board view, see [Track progress of scrum tasks for a sprint in Agile Development 2.0](#).

Sprint Tracking in the Task board view

List

The List view displays scrum tasks and tests for the stories of the current sprint. In the List view, you can:

- Add scrum task and tests without leaving the context of the record.
- View the state, short description, and assignee of the scrum task.
- View the short description and result of a test.
- Assess scrum tasks and tests that are still pending before the current sprint is closed.

For more information on tracking a sprint's progress using the List view, see [Track sprint progress in Agile Development 2.0](#).

Reporting defects in Agile Development 2.0

Create defects for the issues that are reported for your product using Agile Development 2.0. You can then create stories for these defects so that your teams can start working on resolving them.

Defects can be used to report and track the resolution of issues that are noticed during the development of a new feature, or as a feedback for existing features. Product owners then review these defects and decides on creating stories for them, which are assigned to the relevant assignment groups.

User role to create defects

Users who are expected to create defects in Agile Development 2.0 must have one of the following roles:

- feature_user
- scrum_story_creator
- scrum_admin

However, if a user has just the feature_user role, they can only view the defects from the **Defects** module of the Agile Development application. They can not view the stories associated with the defects in the Stories related list of the defect record.

For information on how to create Defects, see [Report a defect in Agile Development 2.0](#).

Enhancement requests in Agile Development 2.0

Create enhancement requests for different areas of your product in Agile Development 2.0. You can then create stories for these requests so that your teams can start working on developing them.

Enhancement requests can be used to log feature enhancements for a product. These requests can arise from internal requirements or customer feedback. Product owners review these logged requests and decides on creating stories for them based on priority. These stories are then assigned to the relevant assignment groups for development.

User role to create enhancement requests

Creating or editing enhancement requests requires one of the following roles:

- feature_user
- scrum_story_creator
- scrum_admin
- rm_enhancement_admin

However, a user without scrum roles can only access these requests from the **Enhancement Requests** module of the Agile Development application and not stories that are created for this request.

Note:

The administrator must grant the feature_user role to all users who are expected to create an enhancement request in the Agile Development application.

For information on how to create enhancement requests, see [Create an enhancement request in Agile Development 2.0](#).

After an enhancement request is created, users with scrum_story_creator or scrum_admin role can:

- Review the enhancement request and create a story for it.
- Manage stories from the *Stories* related list in the Enhancements form.

Agile Development – Unified Backlog

The ServiceNow[®] Agile Development – Unified Backlog application helps you maintain a centralized backlog for records of different task types, such as defects, problems, or enhancements. Prioritize different task types from one location, and automatically create stories for these records, saving time.

The work flow described here represents the common practice of creating and managing records using the Agile Development – Unified Backlog with Agile Development 2.0.

Set up a triage board

Define filter criteria and create your triage boards. Triage boards help you view records of a specific task type, giving better visibility. For example, you can create one triage board for defects and another for incidents. The triage board is automatically updated with any new record that matches the defined filter criteria.

See [Set up a triage board in Agile Development 2.0](#)

Triage records

From the Backlog tab of the Agile board, you can:

- View the total numbers of records in the triage boards of all task types
- Open the triage board of a specific task type
- Edit the filter definition of an existing triage board

You can triage the records and add them to your product or team backlog. Items added to the backlog from the triage board will also have stories created for them automatically. See [Triage items and add them to a backlog in Agile Development 2.0](#).

Assign records

After a record is added to the backlog from a triage board, treat it as you would a regular story. You can assign it to the relevant product teams and schedule it for upcoming sprints. See [Plan your sprint activities in Agile Development 2.0](#).

Work with the assigned records in a board view

Records from a triage board are represented by stories on the Agile board. You can track the status of these stories from the Story board view of the Sprint Tracking tab. See [Track progress of stories for a sprint in Agile Development 2.0](#).

When you move these stories to different lanes on the story board to update their state, the state of the associated story is updated but the state of the original triaged record remains the same. To change the state of the original record, open the story and switch to the original record tab.

Configuring Agile Development 2.0

Activate Agile Development 2.0, migrate from Agile Development 1.0, and perform other related tasks to set up Agile Development 2.0.

Using guided setup to implement Agile Development 2.0

Agile Development 2.0 guided setup provides a sequence of tasks that help you configure the application on your ServiceNow instance.

To open Agile Development 2.0 guided setup, navigate to **All > Agile Development > Agile Development Guided Setup**.

For more information about using the guided setup interface, see [Using guided setup](#).

Activate Agile Development 2.0

Activate the Agile Development 2.0 plugin (com.snc.sdlc.agile.2.0) if you have the admin role.

Before you begin

Role required: admin

About this task

- If you are upgrading from an earlier ServiceNow release version of Agile Development to Agile Development 2.0, read upgrade information before activating the plugin.
- The dashboards for Agile Development 2.0, if required, must be activated separately using the Performance Analytics – Content Pack – Project Portfolio Suite Dashboards plugin (com.snc.pps_dashboards). The Performance Analytics license is required to use the dashboards.

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

i Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>`.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#).

Migration from Agile Development 1.0 to Agile Development 2.0

Migrate from Agile Development 1.0 to Agile Development 2.0 for enhanced agile capabilities and features.

i Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Apply the following migration steps on a non-production instance, verify if the migration is completed as intended, and then perform the migration steps on a production instance.

- [Manage customizations before upgrading to Agile Development 2.0.](#)
- [Delete customizations.](#)
- [Activate Agile Development 2.0.](#)
- [Complete the prerequisites for converting teams to Agile Development 2.0 groups](#)
- [Convert Agile Development 1.0 teams to Agile Development 2.0 groups](#)
- [Verify the conversion of Agile Development 1.0 teams to Agile Development 2.0 groups](#)

Related topics

[Migration Guide - Agile Development 1.0 to Agile Development 2.0](#) 

Manage customizations before upgrading to Agile Development 2.0

You can take complete advantage of enhanced agile functionality by managing your customizations before upgrading to Agile Development 2.0.

Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

As of any regular upgrade, if core platform artifacts such as form layout, adding of fields, removal of preconfigured fields, list layout, business rules, or client scripts, are customized in your environment, then changes made to any of these artifacts as part of the Agile Development 2.0 enhancements are not applied in your environment. You should delete all your customizations before upgrading to Agile Development 2.0, and selectively reapply customizations as needed after upgrade.

Following are the three possible scenarios:

No customizations

You do not have any customizations in your Agile Development implementation and want to use the Agile Development 2.0 functionality. In such a case, install the Agile Development 2.0 plugin (com.snc.sdmc.agile.2.0).

Minor customizations

There are few minor customizations, but you want to use the Agile Development 2.0 functionality. In such a case, [delete all customizations](#).

Customizations require review

There are a few customizations in your Agile Development implementation that are mapped to your business process. Though you want to use the Agile Development 2.0 functionality, you may want to review your customizations and decide whether to delete all the customizations or retain a few customizations. For such a case:

- A utility is provided which automatically detects the customized platform artifacts, such as list layout, form layout, business rules, that were enhanced as part of the Agile Development 2.0 enhancements. For details of this utility and list of all platform artifacts enhanced in Agile Development 2.0, see [Review a utility customization for Agile Development 2.0](#).
- After analyzing, if you do not want to retain any of the customizations, then [delete the customizations](#). If you want to retain a few, delete the customizations and reapply them after the upgrade.
- If you have created your own artifacts, such as business rules and UI policies, verify whether the artifacts work as intended after the upgrade.

Delete customizations before upgrading to Agile Development 2.0

Take complete advantage of enhanced functionality by deleting all your customizations before upgrading to Agile Development 2.0.

Before you begin

Role required: admin

About this task

Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Procedure

1. In the Navigation filter, enter `sys_properties.list`.
The entire list of properties in the System Properties [sys_properties] table appears.
2. Click **New**.
3. On the form, fill in the fields as follows:

Field	Value
Name	com.snc.sdlc.scrum.pp.delete_customer_updates
Description	Delete customizations in the Agile Development application from the Customer Update [sys_update_xml] table.
Type	true false
Value	true

4. Click **Submit**.

All customizations would be deleted and the property also would be automatically deleted.

What to do next

If the Agile Development 2.0 plugin (com.snc.sdlc.agile.2.0) has been installed before deleting the customizations, refresh the plugin by reinstalling it.

Related topics

[Add a system property](#) 

Convert Agile Development 1.0 teams to Agile Development 2.0 groups

Complete most of the migration steps by converting teams in Agile Development 1.0 to groups in Agile Development 2.0.

Before you begin

Complete the procedure given in [Complete the prerequisites for converting teams to Agile Development 2.0 groups](#).

Role required: admin

About this task

i Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Procedure

1. Navigate to **All > Agile Development > Groups**.

An empty list is displayed because there are no assignment groups with the type Agile Team. If there are any groups with the type Agile Team, a list of groups are displayed.

2. Click the **Convert Release Teams to Groups** related link.

The list of all release teams (scrum_pp_team) table that you had defined in the Agile Development plugin is displayed. If you have been defining teams for each release, multiple records are displayed for the team (team with the same name), one for each release. In the following screenshot, four records are displayed for the team Facilities Software Team, one for each release.

3. [Complete the prerequisites for converting teams to groups](#).

Since migration is performed on a non-production instance first, convert one team to a group, verify if the migration is done successfully for the team, and then perform the same procedure for rest of the teams.

In the preceding example, all the four records for the Facilities Software Team can be selected at once. Consider the Facilities Software Team team as a sample team.

4. Select all records of the sample team and click **Convert to Group**.

All the teams are converted to an assignment group. If an assignment group exists with the same name, a new group is not created, but other migration activities are carried out for the group, for example, updating the group reference to the sprint and story table. Perform the following steps manually:

- Update the group type to Agile Team.
- If release team members and group members are different, synchronize the members between group and team.

Complete the prerequisites for converting teams to Agile Development 2.0 groups

Perform prerequisite steps to later ensure that the conversion of teams to Agile Development 2.0 groups is successful.

Before you begin

Role required: admin

About this task

i Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

The team being selected should have at least one sprint that is current. The current sprint should have a few completed and a few WIP stories. This is to verify that the sprint burndown is updated correctly post conversion. If you do not have such a team, you may select any team for conversion.

Procedure

1. Find out the sprints assigned to the team across all a release.

Note:

Use this step to verify whether the assignment group is updated successfully across all the sprints.

- a. In the search panel in navigator, type `rm_sprint.list` to view the list of all sprints.
 - b. Display the **Team** and **Assignment group** fields if not displayed.
 - c. Apply the team name filter. The **Assignment group** field is empty.
 - d. Capture the screen or export the list of all sprints. In the sample example, sprint 5 is the current sprint for the team being converted.
2. Find out the stories that are associated with the sprints of the team being converted.

Note:

Use this step to verify that the assignment group is updated successfully across all stories.

- a. In search panel in navigator, type `rm_story.list` to view the list of all stories.
- b. Filter out the stories belonging to the sprints noted in the preceding step.
- c. Display **Sprint.Team** and **Assignment group** fields in the list layout. The **Assignment group** field is empty.
- d. Capture the screen or export this list.
- e. Filter the story table to fetch the list of all stories belonging to sprints of the team being converted. Apply the following filter:

sprint.release_teamSTARTSWITH<name of the team>

Verify the conversion of Agile Development 1.0 teams to Agile Development 2.0 groups

Perform verification steps to ensure that the conversion of a team to an assignment group is successful.

Before you begin

Role required: admin

About this task

Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Verify that the team has been converted to an assignment group.

If group appears here, it implies that the group type is already set to Agile Team.

3. Verify that the assignment group is updated across all the sprints of the team. It is the same sprint list that you have noted prior to conversion. This list must have the assignment group updated after conversion.

4. Verify that the stories associated with the sprints of team have been updated with the assignment group.

Following is the list of stories that were noted prior to converting to group:

5. Review the sprint burndown for the sprint that was noted prior to conversion.

It must be same as it was prior to conversion.

- a. Open the `rm_srpint` table (`rm_sprint.list`), or open the assignment group.
 - b. Click the current sprint.
 - c. Mark any WIP story as complete.
 - d. Review the sprint burndown that is to be updated with the completed story.
6. Once the story is complete, the release burndown must also be updated correctly.
For example, in the following screenshot, the burndown is updated correctly for the current release.

7. For Group Velocity:

- a. Navigate to **Agile Development > Groups**.
 - b. Review the velocity of the group. It must be same as it did prior to conversion.
 - c. Complete the current sprint. It must display the velocity of group for the completed sprint in addition to the sprints that were completed before conversion.
8. Once you verify the steps for one group, it is confirmed that the migration has completed successfully.
You can repeat this procedure for all other teams one by one. This is a synchronous process, hence, you should perform these steps on one team at a time.

Agile Development 2.0 enhancements over Agile Development 1.0

Agile Development 2.0 offers a few enhancements over Agile Development 1.0.

i Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

These enhancements can be divided into the following categories:

- [Data model enhancements from Agile Development 1.0 to Agile Development 2.0](#)
- [Usability enhancements from Agile Development 1.0 to Agile Development 2.0](#)
- [Functionality enhancements from Agile Development 1.0 to Agile Development 2.0](#)

Data model enhancements from Agile Development 1.0 to Agile Development 2.0

Agile Development 2.0 offers a few data model enhancements over Agile Development 1.0.

Use of the common platform construct – Assignment Group

To map an agile team (scrum team), Agile Development 1.0 uses a separate entity called the Release Team table (`scrum_pp_team`). This entity is associated to a release entity as displayed in the following screen shot.

i Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

All other tasks on platform such as incidents, problems, changes, projects rely on the assignment group entity to make assignments to a group. Group managers can run reports on an assignment group to gain insight into the work assigned to their groups.

To standardize the use of a group across platform even for scrum work such as stories and tasks, the standard construct Assignment Group is used as opposed to the standalone entity Release Team. Agile Development 2.0 uses assignment groups to map agile teams. An assignment group of type Agile Team is used for defining an agile team.

Agile team (group) need not be created for each release

With Agile Development 1.0, teams are to be created for each release and the teams are to be associated to each release. For example, if a scrum team called Team – Alpha works on multiple quarterly releases. You cannot create the team for one time and associate the team to any release, or release over release. Each time a new release is created, you must create a team with the same name and associate team to the release.

With Agile Development 2.0, groups are created independent of releases, and you can work on stories from multiple releases without recreating the group for every release.

Sprints can be created without a release

With Agile Development 1.0, creating a release is mandatory for creating sprints. Sprints cannot be created for a team independently. Agile Development 1.0 mandates the creation of a release for story execution via sprints. If there is no release, sprint cannot be populated on a story record. In Agile Development 2.0, sprints are associated with Assignment Groups.

Team backlog can be maintained independent of release

Typically, a team can have an ongoing team backlog release after release, it can pull stories from its backlog, and execute them through sprints in the release.

With Agile Development 1.0, a team cannot be defined without defining a release. Hence, team backlog cannot be maintained independent of a release.

With Agile Development 2.0, an assignment group is not created within a release. It can be associated to the release, but not created within a release. Hence, an assignment group can maintain its own backlog.

Association between Release and Group

As there is no direct relation between a release and a group in Agile Development 2.0 (groups are independent and do not have to create groups for each release), the m2m_release_group_list table has been introduced. This table stores the association of a group with a release. This association is not used for sprint generation, but is used to derive the capacity of a release.

Specify the number of sprints for which the group works in a release. From the capacity of the team, the capacity of the release is derived.

m2m_release_group

Team	Start Sprint	End Sprint	Points (each sprint)	Total Group Capacity For Release
A	A_Sprint 1	A_Sprint 3	30	90 (3*30)
B	B_Sprint 1	B_Sprint 4	40	160 (4*40)

Total Release Capacity = 90+ 160 = 250 points

Functionality enhancements from Agile Development 1.0 to Agile Development 2.0

Agile Development 2.0 offers a few functionality enhancements over Agile Development 1.0.

i Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Integration with Test Management 2.0

Agile Development 2.0 is integrated with Test Management 2.0. This integration allows you to define tests for your stories, and run the tests before a story is marked as complete.

i Note:

This integration is available from the London release.

Integration with Agile Development – Unified Backlog

Agile Development – Unified Backlog is integrated with Agile Development 2.0. This integration allows you to maintain a centralized backlog containing records of different task types, such as defects, problems, incident tasks, and stories. It facilitates in prioritizing and sequencing of different task type records in one location, saving you steps. It removes the overhead of converting records to stories.

i Note:

This integration is available from the London release.

Usability enhancements from Agile Development 1.0 to Agile Development 2.0

Agile Development 2.0 offers a few usability enhancements over Agile Development 1.0.

i Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Manage and groom your backlog**Flexible backlog definition**

Agile Development 2.0 enables you to define backlogs. For example, you can create different backlogs by products or teams, or combine backlogs for one or more epics.

Backlog grooming

Agile Development 2.0 provides an advanced view for your backlog, where you can drag stories to rank them. Also, you can view backlogs by epics and get analytics about the overall backlog situation. For example, analytics of stories without acceptance criteria.

Enhanced sprint planning experience

Sprint Tracking

Agile Development 2.0 leverages the visual task boards feature to track the progress of stories in a sprint. It also provides the ability to create scrum tasks from the tracking view.

Review a utility customization for Agile Development 2.0

Use the Agile_2.0_Upgrade_Diagnostics update set to analyze your customizations on the platform artifacts (such as form layout, list layout, business rules, and client scripts) that are modified as part of the Agile Development 2.0 enhancements. Delete the customizations prior to upgrade.

Before you begin

- Role required: admin
- Download the [Agile_2.0_Upgrade_Diagnostics update set](#) .

About this task

Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Procedure

1. Click the **Retrieved Update Sets** module.
2. Click **Import Update Set from XML**.
3. Select and upload the update set.
4. Preview and commit the update set.
5. Navigate to **Agile Development 2.0 > Upgrade Diagnostics > View Diagnostics**.
Displays all the artifacts from Agile Development 1.0 that have been modified on the instance and on Agile Development 2.0.
6. Click the file name of the artifact, or click the **View Update** link to review the latest update on the file.

List of platform artifacts modified after upgrading to Agile Development 2.0

Post migration, you can review the list of artifacts that are modified in Agile Development 2.0.

Important:

Agile Development 1.0 and its features such as Sprint burndown chart and release burndown chart are deprecated and no longer available. [Agile Development 2.0](#) provides the latest experience for supporting your Agile work methodology.

Activate Agile Development – Unified Backlog

You can activate the Agile Development – Unified Backlog plugin (com.snc.sdlic.agile.multi_task) if you have the admin role.

Before you begin

[Activate Agile Development 2.0.](#)

Role required: admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All.**
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#).

Quick start tests for Agile Development 2.0

Validate that Agile Development 2.0 still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Danger:

By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See [Enable or disable executing Automated Test Framework tests](#).

Agile Development 2.0 quick start tests require activating the Agile Development 2.0 plugin (com.snc.sdmc.agile.2.0) and the Agile Development 2.0 - ATF Tests plugin (com.snc.sdmc.agile.2.0.atf).

Agile Development 2.0 quick start test suite

Test	Description	Release version
Verify that global rank is populated when a story is created	Verify the global rank of a story after creation.	Madrid
Verify that closing a sprint with active stories is prevented	Verify that a sprint with active stories cannot be closed.	Madrid
Verify that sprints cannot overlap in the same group	Verify that sprints in the same group do not overlap.	Madrid

Agile Development 2.0 quick start test suite (continued)

Test	Description	Release version
Verify that sprint points are updated	Verify that changes to stories produce accurate sprint point totals.	Madrid
Verify that only one sprint in a group can have the current state	Verify sprint statuses.	Madrid
Verify sprint end date is after the sprint start date	Verify sprint start and end dates.	Madrid
Verify that any update on story rolls up to Epic	Verify that adding, estimating, removing, deleting, updating, or cancelling a story updates the epic-level roll-ups correctly.	Orlando
Verify changes to the scope of a current sprint do not alter the value of the Total Committed Points	Verify that the value of Total Committed Points does not change with change in the scope of a sprint after its state is changed to Current.	Orlando
Verify active flag is set false when Agile Story state is changed to Completed/ Cancelled	Verify that active flag of an Agile story is set to the following: <ul style="list-style-type: none"> • False, if the state is changed to Completed or Cancelled • True, for all other states 	Orlando
Verify that updating the team/ group capacity overrides the capacity on all the future sprints	Verify that any update to the Group capacity field of the assignment group results in the following changes to the Group capacity field of the various sprints associated with this assignment group: <ul style="list-style-type: none"> • For the sprints that are in the Draft and Planning state: <ul style="list-style-type: none"> ○ The group capacity is updated to the new value. ○ The Group capacity field is editable. • For the sprints in the Current, Complete, or Cancelled state: <ul style="list-style-type: none"> ○ The group capacity remains the old value. ○ The Group capacity field is read-only. 	Paris

Agile Development 2.0 quick start test suite (continued)

Test	Description	Release version
	<p>For the sprints in the Draft or Planning state, you can individually edit the group capacity of the sprint anytime later. This would not change the group capacity of the assignment group associated with this sprint.</p>	
<p>Verify create and edit functionality of an epic backlog on the scrum program board</p>	<ul style="list-style-type: none"> • Verify that you can create an epic backlog for scrum programs from the Backlog tab of Agile Board. • Verify that you can update an existing epic backlog for scrum programs from the Backlog tab of Agile Board. • The epics listed in the backlog must belong to the selected epic backlog. 	<p>Quebec</p>
<p>Verify a Demand is converted to a scrum story</p>	<p>If the PPM Standard plugin (com.snc.financial_planning_pmo) is active, verify that a Demand can be converted to an Agile 2.0 story using the Create Story related link on the Demand form.</p> <p>For more information on how to create an Agile 2.0 story from a demand, see Create an artifact from a demand.</p>	<p>Quebec</p>
<p>Verify a Demand is converted to a scrum epic</p>	<p>If the PPM Standard plugin (com.snc.financial_planning_pmo) is active, verify that a Demand can be converted to an Agile 2.0 epic using the Create Epic related link on the Demand form.</p> <p>For more information on how to create an Agile 2.0 epic from a demand, see Create an artifact from a demand.</p>	<p>Quebec</p>

Using Agile Development 2.0

Learn how to use the features of Agile Development 2.0 to efficiently manage your product development life cycle.

Create a release in Agile Development 2.0

Create a release to start associating the stories and scrum tasks of your product development to the release in Agile Development 2.0.

Before you begin

Role required: `scrum_release_planner`, `scrum_admin`

About this task

Use the Releases module to create a release record to start planning for your upcoming release.

A release has a start and end date during which several development iterations are completed. Releases are created by a product owner and contain user stories, sometimes from multiple products, and can also involve multiple teams. The stories associated to a release form its release backlog.

Procedure

1. Navigate to **All > Agile Development > Releases**.
2. Select **New** in the record list.
Alternatively, if you already created Product records in Agile Development 2.0, you can use the Releases related list to open the new release form.
3. On the form, fill in the fields.

New release form

Field	Description
Number	System-generated unique number for the release.
State	Current state of the release. The default is Draft .
Total committed points	Sum of all story points from the stories associated with this release.
Release capacity	Sum of group capacity of all the assignment groups associated with the release. Group capacity of an assignment group for a release is calculated as: $\text{Group capacity} * \text{Number of sprints in the release for that group}$ Release capacity is updated only when the Start sprint and End sprint fields are populated for the groups in the Groups related list in the release record.
Planned start date	Estimated start date of the release.
Planned end date	Estimated end date for the release.
Assigned to	User assigned to the release.

Field	Description
	Release must be assigned to a scrum user, such as a release planner or product owner, whose role allows rights to create and edit releases.
Short Description	Brief description of the release.
Description	Detailed description of the release.
Work notes	Updates about the work being performed on the release. This field is updated by the Assigned to user as the work progresses on the release.

4. Select Submit.

What to do next

Start planning your release by associating products, stories, and the assignment groups to this release record. Use the related lists available in the release record for these actions.

For information on the related lists of a release, see [Related lists for a Release in Agile Development 2.0](#)

Create a theme in Agile Development 2.0

Create a theme in Agile Development 2.0 to group stories of different products together for an abstract goal.

Before you begin

Role required: scrum_product_owner, scrum_release_planner, scrum_admin

Procedure

1. Navigate to All > Agile Development > Themes.

2. Select New.

Alternatively, you can open the new theme form by using:

- Backlog Planning or Sprint Planning tabs of the Agile board
- Themes related lists of a Product record

3. On the form, fill in the fields.

New theme form

Field	Description
Number	System-generated unique number for the theme.
Name	Name for the theme that states the high-level business case.
Product	Product with which this theme is associated. You can associate a theme with just one product at a time.
Short Description	Brief description of the theme.
Description	Detailed description about the theme.

4. Select Submit.

What to do next

Add epics and stories to the theme using the related lists available in the Theme record. For more information, see [Related lists for a Theme in Agile Development 2.0](#)

Create a product in Agile Development 2.0

Create a product to represent a feature or functionality important to customers. A product can contain themes, epics, and stories that describe these enhancements from the perspective of a user.

Before you begin

Role required: `scrum_product_owner`, `scrum_release_planner`, `scrum_admin`

Procedure

1. Navigate to **All > Agile Development > Products**.
2. Select **New**.

Alternatively, you can use the Products related list of a Release record to open the form for a new product.

3. On the form, fill in the fields.

Product form

Field	Description
Name	Name of the product.
Short Description	Description of the product that briefly explains its features and mentions the theme and groups associated to it.
Product owner	User responsible for managing the development and releases for the product.

4. Select **Submit**.

What to do next

Use the related lists of the Product record to associate releases, themes, epics, stories, and assignment groups with it. For more information, see [Related lists for a Product in Agile Development 2.0](#).

Assignment groups in Agile Development 2.0

Learn the requirements to create and manage your assignment groups in Agile Development 2.0.

Creating assignment groups

https://player.vimeo.com/video/1070078725?h=f04196c519&badge=0&autoplay=0&player_id=0&app_id=58479

A user with the admin role can create assignment groups of the type **Agile Team**. Your scrum teams are represented by these agile groups, which you can use to assign to work items such as stories and epics. For more information, see [Create an assignment group in Agile Development 2.0](#).

Adding members to assignment groups

- **New customers:** After an agile group is created, you can request your admin to [add](#) members to the group.
- **Existing customers:** If you upgraded to the Zurich release, a user with the `scrum_admin` role or the `scrum_master` role can add members to your agile group.

Note:

You can restrict this function just to the admin by creating the `scrum.disallow_scrum_add_group_member` property and setting it to **true**. For information on how to create a property, see [Add a system property](#) .

For information on the procedure to add members to groups, see [Add members to an assignment group in Agile Development 2.0](#)

Capacity of an assignment group

For each group member, a default number of story points can be defined. At the group level, the sum of these story points determines the group capacity.

Create an assignment group in Agile Development 2.0

Create an assignment group of the type Agile Team so that you can assign these groups to a product or a release.

Before you begin

Role required: admin

About this task

https://player.vimeo.com/video/1070078725?h=f04196c519&badge=0&autoplay=0&player_id=0&app_id=58479

Procedure

1. Navigate to **All > Agile Development > Create Agile Group**.
2. On the form, fill in the fields.

Agile Group form

Field	Description
Name	Name of your assignment group.
Description	Brief description of the assignment group. You can indicate the products or the releases that this groups works on.

3. Select **Submit**.
Assignment group is created and the form reopens with additional fields, related links, and related lists.
4. **Optional:** Fill in additional fields.

Group form

Field	Description
Manager	Manager of the group
Group capacity (points)	Number of points a group can accommodate in each sprint.
Group email	Email address of the group.

Result

The Agile assignment groups are created and stored in the Groups [sys_user_group] table and the **Type** of these groups is set to **Agile Team**.

What to do next

- [Add members to an assignment group in Agile Development 2.0.](#)
- Use the related links and lists to create sprints and plan the sprint activities for your group. For more information, see [Related links and lists of assignment group in Agile Development 2.0.](#)

Convert a release team to a group (only for existing customers having release teams)

Convert an existing release team to an assignment group of type Agile Team so that you can assign them to a product or a release.

Before you begin

Role required: admin

About this task

Agile Development 2.0 does not use Release Teams. Existing users who have created release teams must convert the existing teams to assignment groups.

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Click the **Convert Release Teams to Groups** related link.
3. Select the team that you want to convert to an assignment group.
4. Click **Convert to Group**.

Result

- The release team is available as assignment group from **Agile Development > Groups**.
- The members of the release team are copied to the assignment group.

Add members to an assignment group in Agile Development 2.0

Add members who would work on the scrum stories and tasks.

Before you begin

Role required: admin

Any user that you want to add to the assignment group must have the scrum_user role.

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Open the group to which you want to add members.

3. From the Group Members related list, select **Edit**.

4. Add the required scrum user.

Result

The selected scrum user is listed in the Group Members related list.

Create an epic in Agile Development 2.0

Define the high-level requirements of the features that you want to develop by creating epics in Agile Development 2.0.

Before you begin

Role required: scrum_story_creator, scrum_admin

About this task

Create epics in Agile Development 2.0 and organize them in a hierarchy of parent and children. You can associate an epic to a product, theme, or configuration item (an item or service that is affected).

Procedure

1. Navigate to **Agile Development > Epics**.

2. Select **New**.

Alternatively, you can open the new epic form using the Agile board, from a theme record, or from a product record.

You can also convert an existing active story into an epic. For details, see [Related links and lists for a Story in Agile Development 2.0](#).

3. On the form, fill in the fields.

Epic form

Field	Description
Number	System-generated number for the epic.
Product	Product associated with this epic. You can associate an epic with only one product at a time.
Priority	Priority of the epic.
State	State of the epic. Select one of the following: <p>Draft</p> <p>The epic requirements, such as the detailed description, are still being drafted.</p> <p>Ready</p> <p>The epic is ready for pickup by the product team. The product manager and the scrum team can break the epic down into stories.</p> <p>Work in Progress</p> <p>The development team is working on the stories for epic and recording the changes in the work notes field.</p>

Field	Description
	<p>Complete</p> <p>The development and testing efforts on all the stories and any child epics for the epic are complete.</p> <p>Cancelled</p> <p>The epic has been canceled.</p> <p>This field is automatically set to Draft.</p>
Short Description	Brief description of the epic.
Description	Detailed description of the epic.
Work notes	Notes about the work done on the epic.
Total story count	Number of stories in the epic.
Completed count	Number of completed stories in the epic.
Percent complete by count	Percentage of completed work in the epic. Story count is used to calculate this value.
Total estimate	Sum of the estimates of all stories in the epic.
Completed estimate	Sum of the estimates of all the completed stories in the epic.
Percent complete by epic	Percentage of completed work in the epic. Story estimate is used to calculate this value.
Missing estimate	Number of stories in the epic that are missing estimates.
Top program	<p>Program mapped to the scrum work enabling top-down hybrid planning.</p> <p>This field is visible in the Scrum view of the epic form if you activate the PPM Standard plugin (com.snc.financial_planning_pmo).</p>

Fill in the Planning section if you want to create benefit plans for the epic. This section is available in the Benefit view of the epic form.

4. Click **Submit.**

What to do next

- Add child epics or stories to the epic:
 - Create a child epic for this epic by selecting **New** from the Child Epics related list.
 - Add stories to this epic by selecting **New** from the Stories related list. For more information, see [Create a story in Agile Development 2.0](#).

An epic can have one or more stories, but a story can belong to only one epic at a time.

- You can also associate epics to a project in Project Portfolio Management from the Epics related list.

This related list appears only when the value for the **Execution Type** field is selected as **Agile** and the Agile Development 2.0 plugin is installed.

Create a monetary benefit plan for an epic

Epic benefit plans capture the potential benefits accrued by the epic when the epic is executed. Create a monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods.

Before you begin

Role required: `scrum_master`, `scrum_product_owner`, or `scrum_admin`

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan.

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Select **View > Benefit** from the Additional actions menu ().
4. On the form, fill in the required fields in the Planning section.
This section is available when the Benefit view is selected.

Planning section of the Epic form

Field	Description
Planned start date	Projected start date for the epic. The planned start date can be the current date or a future date.
Planned end date	Projected end date for the epic. The planned end date must be after the planned start date.
Planned benefit	Benefit value that is rolled up from the benefit breakdown.
Actual start date	Actual start date for the epic. The actual start date can be on or before the planned start date.
Actual end date	Actual end date for the epic. The actual end date can be before the planned start date but not before the actual start date.
Actual benefit	Actual benefit value that is rolled up from the actual benefit in the benefit breakdown.

5. Save the record.
6. In the Monetary Benefit Plans related list, click **New**.
7. On the form, fill in the fields.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Epic to which the benefit plan belongs.
Sponsor	Sponsor for the epic.
Category	Type of benefit: <ul style="list-style-type: none"> ○ Hard: Benefits that can be measured in terms of revenue. ○ Soft: Benefits that are measured in terms of value.
Sub category	Sub-categories of hard and soft benefits. The selection in Category field determines the selections available in this field.
Benefit type	Type of benefit. Select Monetary benefits .
Offset type	Field to indicate when the benefits start realizing. Select any of the following options: <ul style="list-style-type: none"> ○ None: The default value is None. When you select None, you need to manually enter the benefit plan start and end fiscal periods. ○ Milestone: After completion of a milestone. ○ Start Date: At the start of the epic. ○ End Date: After the epic ends. <p>If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the end date of the epic changes, the benefit plan start date shifts to align with the new end date of the epic.</p>
Milestone	Epic milestones to which the benefit plan belongs. The field appears if you select Milestone in the Offset type field.
Milestone start date	Start date of the selected milestone. The field appears if you select Milestone in the Offset type field.
Work start date	Start date of the epic. The field appears if you select Start Date in the Offset type field.
Work end date	End date of the epic. The field appears if you select End Date in the Offset type field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as End Date and the offset is -2, the benefit plan is two periods prior to the epic end date. If the epic end date shifts, the benefit plan start date shifts to two periods prior to the new epic due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Work start date, or Work end date, and Duration in period values. The field is editable if you select None in the Offset type field.

Field	Description
	When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. Populated based on the value in the Offset field relative to the selected Milestone , Work start date , or Work end date , and Duration in period values. The field is editable if you select None in the Offset type field. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Non-monetary benefit that is associated to this monetary benefit plan.

Benefit Plan form - Financials details

Field	Description
Entered benefit	Benefit incurred from the epic specified in terms of entered currency.
Entered currency	Currency in which you want the benefit plan to be created.
Functional currency	Currency that is obtained from the glide.system.locale property  .
Total planned benefit	Estimated amount of potential benefit of the epic.
Benefit in functional currency	Benefit incurred from epic in terms of functional currency. The value in this field changes if the Entered currency is different from the functional currency.
Actual benefit	Actual benefit that is incurred from the epic. This value is rolled up from the Actual benefit field of all the benefit plan breakdowns.
Recurring	Option to indicate that the benefit is recurring for all the fiscal periods in the benefit plan.

8. Click **Submit**.

What to do next

On the Benefit Plan form, view the benefit breakdown by fiscal period in the Monetary Benefit Plan Breakdowns related list.

Update a monetary benefit plan breakdown for an epic

Update a monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: `scrum_master`, `scrum_product_owner`, or `scrum_admin`

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Select **View > Benefit** from the Additional actions menu (☰).
4. Click the Monetary Benefit Plans related list.
5. Open the required monetary benefit plan.
6. In the Monetary Benefit Plan Breakdowns related list, click the information icon (i) for a monetary benefit plan breakdown.
7. Click **Open Record**.
8. On the Monetary Benefit Plan Breakdown form, view and update the enabled fields.
9. Click **Update**.

Create a non-monetary benefit plan for an epic

Epic benefit plans capture the potential non-financial benefits accrued by the epic when the epic is executed. Create a non-monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods.

Before you begin

Role required: `scrum_master`, `scrum_product_owner`, or `scrum_admin`

About this task

The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: April and FY16: May. The Non-monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period for the epic.

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Select **View > Benefit** from the Additional actions menu (☰).
4. On the form, fill in the required fields in the Planning section.
This section is available when the Benefit view is selected.

Planning section of the Epic form

Field	Description
Planned start date	Projected start date for the epic. The planned start date can be the current date or a future date.
Planned end date	Projected end date for the epic. The planned end date must be after the planned start date.
Planned benefit	Benefit value that is rolled up from the benefit breakdown.

Field	Description
Actual start date	Actual start date for the epic. The actual start date can be on or before the planned start date.
Actual end date	Actual end date for the epic. The actual end date can be before the planned start date but not before the actual start date.
Actual benefit	Actual benefit value that is rolled up from the actual benefit in the benefit breakdown.

5. Save the record.
6. Click the Non-monetary Benefit Plans related list.
7. To create a non-monetary benefit plan, click **New**.
8. On the form, fill in the fields.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Epic to which the benefit plan belongs.
Sponsor	Sponsor for the epic.
Category	Type of benefit: <ul style="list-style-type: none"> ○ Hard: Benefits that can be measured in terms of revenue. ○ Soft: Benefits that are measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The value of the Category field determines the choices available in this field.
Benefit type	Type of benefit. Select Non-monetary benefits .
Offset type	Field to indicate when the benefits start to be realized. Select any of the following options: <ul style="list-style-type: none"> ○ None: The default value is None. When you select None, you must manually enter the benefit plan start and end fiscal periods. ○ Milestone: After completion of a milestone. ○ Start Date: At the start of the epic. ○ End Date: After the epic ends. <p>If the value in the Offset type field changes, the benefit plan start date shifts accordingly. For example, if the Offset type field is set to End Date and the end date of the epic changes, the start date of the benefit plan shifts to align with the new end date of the epic.</p>
Milestone	Epic milestones to which the benefit plan belongs. This field appears only when Milestone is selected from the Offset type field.
Milestone start date	Start date of the selected milestone. This field appears only when Milestone is selected from the Offset type field.

Field	Description
Work start date	Start date of the epic. This field appears only when Start Date is selected from the Offset type field.
Work end date	End date of the epic. This field appears only when End Date is selected from the Offset type field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as End Date and the offset is -2, the benefit plan is two periods prior to the epic end date. If the epic end date changes, the benefit plan start date shifts to two periods prior to the new epic due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. This field is populated based on the value in the Offset field relative to the selected Milestone, Work start date, or Work end date , and Duration in periods field values. This field is editable if you select None in the Offset type field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. This field is populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date, and Duration in period values. This field is editable if you select None in the Offset type field. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Monetary benefit that is associated to this non-monetary benefit plan.

Non-monetary Details section of the Benefit form

Field	Description
Measure	Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score. Select the option Yes/No to track the benefits that are not quantifiable. When this option is selected, the only field available is Benefits achieved . You can select the check box to indicate that the benefits have been achieved.
Non-monetary entered benefit	Estimated value of the potential benefit. Any change in the planned benefit in the benefit plan updates the associated benefit breakdown values for future fiscal periods only.

Field	Description
Non-monetary planned benefit	Benefit value that is rolled up from the benefit breakdown.
Benefits achieved	Option to indicate if the benefit is achieved.
Breakdown type	Type of breakdown creation when you save the benefit plan. <ul style="list-style-type: none"> ○ None: No breakdowns are created. ○ Automatic: A Non-monetary Benefit Plan Breakdowns record is created automatically with data. The breakdown is calculated linearly. ○ Manual: A Non-monetary Benefit Plan Breakdown record is created automatically but without data in the Entered benefit column.
Aggregation mode	Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the Non-monetary planned benefit and Non-monetary actual benefit fields. <ul style="list-style-type: none"> ○ Sum: Aggregates data from all breakdowns. ○ Average: Average value from all breakdowns. ○ Most recent: Recent breakdown value. ○ Max: Maximum value among the breakdowns. ○ Min: Minimum value among the breakdowns.
Non-monetary actual benefit	Actual benefit value that is rolled up from the actual benefit in the non-monetary benefit plan breakdown.

9. Click Submit.

What to do next

- On the Benefit Plan form, view the benefit breakdown by fiscal period in the Non-monetary Benefit Plan Breakdowns related list.
- [Associate monetary and non-monetary benefit plans](#), so that you can capture the potential benefits (financial and non-financial) accrued by the epic for the hybrid benefit plans.

Update a non-monetary benefit plan breakdown for an epic

Update a non-monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: `scrum_master`, `scrum_product_owner`, or `scrum_admin`

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Select **View > Benefit** from the Additional actions menu (☰).
4. Click the Non-monetary Benefit Plans related list.
5. Open the required non-monetary benefit plan.
6. In the Non-monetary Benefit Plan Breakdowns related list, click the information icon (i) for a non-monetary benefit plan breakdown.
7. Click **Open Record**.
8. On the Non-monetary Benefit Plan Breakdown form, view and update the enabled fields.
9. Click **Update**.

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the epic for the hybrid benefit plans.

Before you begin

Role required: `scrum_master`, `scrum_product_owner`, or `scrum_admin`

About this task

You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

i Note:

When you delete a benefit plan, any relationship with the associated benefit plan is also removed.

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Select **View > Benefit** from the Additional actions menu (☰).
4. Select the Monetary Benefit Plans or Non-monetary Benefit Plans related list.
5. Select the information icon (i) for a benefit plan that you want to associate.
6. Select **Open Record**.
7. On the Benefit Plan form, select **Associate new benefit**.
8. On the form, fill in the fields.
For description of fields, see [Create a monetary benefit plan for an epic](#) and [Create a non-monetary benefit plan for an epic](#).
9. Select **Save**.

Result

The selected benefit plan is associated with another plan.

What to do next

Select the **View Associated benefit plan** related link to view the associated benefit plan.

Generate labor costs for epics

View the labor cost expenses based on the resource assignments for your epics.

Before you begin

- The epic should have the resource assignments.
- Role required: sn_spm_financial_user

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Select the required epic.
3. Select the **Generate labor costs** related link.
Refresh the page to view generated labor costs in the Cost Plan related list.

Create a story in Agile Development 2.0

Create high-level definitions of your requirements in the form of stories in Agile Development 2.0. Manage and track your stories by associating them to a product, project, or release and by assigning them to an assignment group.

Before you begin

Role required: scrum_story_creator, scrum_admin

Procedure

1. Navigate to **All > Agile Development > Stories**.
2. Select **New**.
Alternatively, you can create a Story from one of the following:
 - Backlog Planning or Sprint Planning tab of the Agile board.
 - Stories related list of a product, release, sprint, theme, or epic.
 - Defect or enhancement record.
3. On the form, fill in the fields.

i Note:

Some of the fields on the Story form may appear filled depending on the option that you used to create the story.

Story form

Field	Description
Number	System-generated number for the story.
Theme	Theme associated with the story. A theme can have one or more stories, but a story can belong to only one theme at a time. Select the theme for this story from a list of themes that are associated with the Product field.
Epic	Epic associated with the story.

Field	Description
	<p>An epic can have one or more stories, but a story can belong to only one epic at a time.</p> <p>Select an epic for this story from the epics that are associated with the Product field.</p>
Type	<p>Type of story.</p> <p>Choose from options such as Development, Documentation, Spike, and others.</p>
Classification	<p>Type of development that the story involves. This field is automatically set to Feature.</p> <p>This field has no connection to the Defect and Enhancement fields in the Related Records tab.</p>
State	<p>State of the story. Select one of the following:</p> <ul style="list-style-type: none"> ○ Draft: The story requirements, such as the description and acceptance criteria, are still being drafted. ○ Ready: The story is ready for pickup by the development team. ○ Work in Progress: The development team is working on the story and recording the changes in the work notes field. ○ Ready for Testing: The story is ready for pickup by a tester. ○ Testing: The tester is testing the story based on the requirements provided in the story. ○ Complete: The development and testing efforts on the story are complete. ○ Cancelled: The story has been canceled. <p>This field is automatically set to Draft.</p>
Points	<p>Number of points that indicate the estimated effort that is required to complete the story.</p> <p>A larger point value indicates that the story requires a greater amount of effort.</p>
Priority	<p>Priority assigned to the story.</p> <p>A product owner can use priorities to rank stories in the planning board.</p>
Product	<p>Product that this story is associated with.</p>
Release	<p>Release that this story is associated with.</p> <p>The release can be from the releases associated with the selected product.</p>
Assignment group	<p>Agile team that the story belongs to.</p>
Sprint	<p>Sprint that this story is associated with.</p> <p>This field is available only when a value is selected from the Assignment group field.</p>

Field	Description
Assigned to	User who is working on the story. Users on this list have appropriate scrum roles.
Demand	<p>Demand that this story is associated with.</p> <p>When the demand is converted to project, the demand stories move from demand to project.</p> <p>When a demand is converted to a story, the reference to the demand is displayed here.</p>
Project	Project that this story is associated with.
Project phase	<p>Name of the agile project phase that this story is associated with. This field is available only when a value is selected from the project field.</p> <p>If a project has only one phase, then the story is automatically tagged to that phase.</p> <p>Note: An agile phase can have stories that belong to more than one group.</p>
Blocked	An indicator to show that there are issues that prevent the story from progressing.
Short description	A brief description of the story.
Description	A detailed description of the story.
Acceptance criteria	The functional criteria or testing results that are required to move this story to the Complete state.
Work notes	Notes about the work done for this story.

Related Records section of the Story form

Field	Description
Defect	<p>Defect that is associated with the story. This field is a reference field from the Defect [rm_defect] table. This field is required if the story is created for a defect.</p> <p>Click the search icon (🔍) in this field to display the existing defects or to open a new defect.</p> <p>Only users with the feature_user role can open a defect. The admin must grant the feature_user role to all users who are expected to open defects in the Agile Development application. This field is the only location in the Agile Development application where records from the Defect [rm_defect] table appear.</p>

Field	Description
	For more information on defects, see Reporting defects in Agile Development 2.0 .
Enhancement	<p>Enhancement associated with the story. This field is a reference field from the Enhancement [rm_enhancement] table. This field is required if the story is created for an enhancement.</p> <p>Click the search icon (🔍) in this field to display the existing enhancement requests or to open a new enhancement.</p> <p>Only users with the feature_user role can open an enhancement. The admin must grant the feature_user role to all users who are expected to open enhancement requests in the Agile Development application. This field is the only location in the Agile Development application where records from the Enhancement [rm_enhancement] table appear.</p> <p>For more information on enhancements, see Enhancement requests in Agile Development 2.0.</p>

4. Select **Submit.**

Result

- The story is created and the form reopens with related links and lists.
- The story is listed in the backlog depending on the fields filled in the story form.

What to do next

- Use the related links and lists of the story to create scrum tasks for this story, or convert this story into an epic or split this story into two stories. For more information, see [Related links and lists for a Story in Agile Development 2.0](#).
- [Add dependencies for Agile Development 2.0 stories](#)
- You can create a story with the same details as this story by using the **Insert** or **Insert and Stay** options from the story additional actions (≡).

When you use **Insert and Stay**, the form of the newly created story stays open. You can modify the details of the story or create more stories with these details. On the Agile board, the new story is positioned right below the original story. The global rank of the new story is set accordingly.

i Note: Set the *glide.ui.task.insert* and *glide.ui.advance* properties to **true** to access these actions. These actions are not allowed on stories added from the triage board.

Generate acceptance criteria for stories using Now Assist for Strategic Portfolio Management (SPM)

Create clear, comprehensive, and testable acceptance criteria for user stories without writing them manually in Agile Development 2.0. Review and refine suggested options to ensure they meet your requirements.

Before you begin

Ensure that Now Assist for SPM is installed in your instance and that the following two skills are active:

- Acceptance criteria generation
- Refine records

For more information, see [Configure Now Assist Admin features](#).

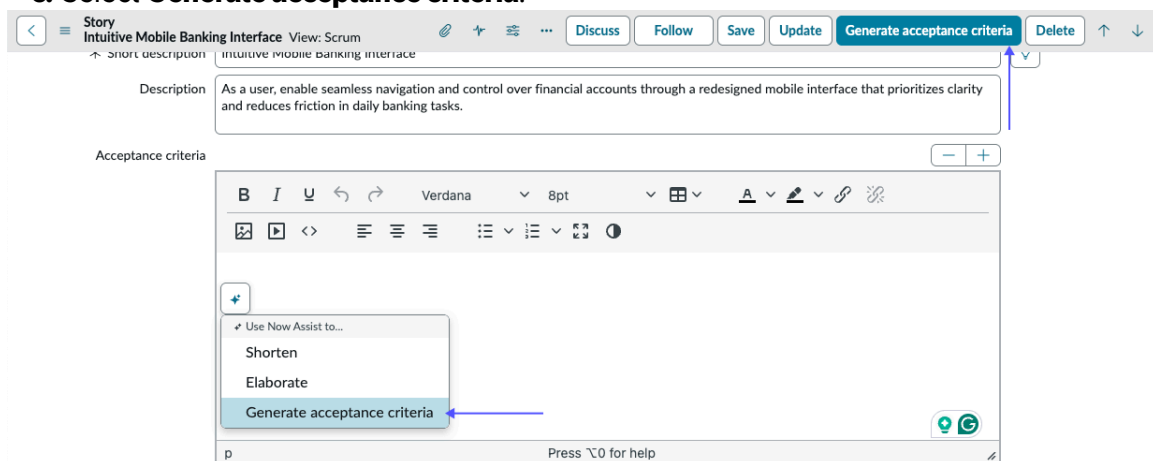

Role required: `scrum_story_editor`

About this task

For an Agile 2.0 story, you can generate acceptance criteria by selecting **Generate acceptance criteria** from the story header or using the Now Assist context menu in the Acceptance criteria field.

Procedure

1. Navigate to **All > Agile Development > Stories**.
2. Open your story record.
3. Generate acceptance criteria for the story using one of the following options:
 - From the story form header: Select **Generate acceptance criteria**.
 - From the Acceptance criteria field:
 - a. Place your mouse cursor in the field.
 - b. Select **Refine with Now Assist** menu ()
 - c. Select **Generate acceptance criteria**.

4. Review the generated acceptance criteria.
5. You can choose to further refine the generated content using the Now Assist context menu () or generate a new criteria.
6. Save the Story form.

Add dependencies for Agile Development 2.0 stories

Add prerequisite and dependent items for stories in Agile Development 2.0 so that you can visualize these dependencies on the scrum planning board and plan your sprints accordingly.

Before you begin

Role required: scrum_story_creator, scrum_story_editor

Procedure

1. Navigate to **All > Agile Development > Stories**.
2. Open the story to which you want to add dependencies.
Alternatively, you can use the scrum program board from the Agile board to open your story and add dependencies.
3. Add dependencies to the stories using the Prerequisite Stories or Dependent Stories related lists.
 - Prerequisite Stories is the list of all stories that must be complete before the current story.
 - Dependent Stories is the list of all stories that depend on the completion of the current story.
4. Select **Save** and then select **Update**.

What to do next

You can visually analyze the dependencies of the stories using the scrum program board to help with your sprint planning.

1. Navigate to **All > Agile Development > Agile Board > Program > Planning**
2. Use the dependencies icon () to show or hide dependencies between stories.

Note:

Access to the Scrum program board is available only with the Scrum Programs plugin (com.snc.sdlc.scrum_program).

Create a scrum task for Agile Development 2.0 stories

Create scrum tasks in Agile Development 2.0 to break down a story into manageable pieces for your team to work on. You can create one scrum task at a time or multiple scrum tasks at once.

Before you begin

Role required: scrum_story_creator, scrum_admin

About this task

Team members volunteer for tasks based on their skills and track the hours remaining daily. If the task is not complete within the planned hours, it can be further split into additional tasks. A story is not complete until all its tasks are complete.

This task explains how to create one scrum task at a time. To save time, you can create multiple scrum tasks at once. See [Create multiple scrum tasks for stories in Agile Development 2.0](#).

Procedure

1. Navigate to **All > Agile Development > Stories**
2. Open a story that you want to create tasks for.
3. From the Scrum tasks related list, select **New**.
Alternatively, you can create a scrum task using the Task board view of the Sprint tracking tab, on the Agile board.

4. On the form, fill the fields.

Scrum Task form

Field	Description
Number	System-generated number for the story.
Story	Displays the story associated with the scrum task.
Priority	Priority for the task.
Planned hours	Estimated number of hours to complete the task. A typical scrum task should take between 4 and 12 hours. If the task requires more than 12 hours, consider breaking it down into multiple tasks.
Remaining hours	Estimated number of hours remaining to complete the scrum task. The assigned group member updates this value as work is progressing on the task.
Actual hours	After the task is complete, enter the number of hours the task actually took.
Type	Type of work involved.
State	Current state of the scrum task. The default for a new task is Draft .
Assignment group	Group that would work on this task. This field is automatically populated from the Assignment group of the story from which the task is created.
Assigned to	User working on the scrum task. This field is set to the story owner by default.
Blocked	Indicator to show that there are issues that prevent the scrum task from progressing.
Short description	Brief description of the scrum task.
Description	Detailed summary of the scrum task.
Work notes	Notes to indicate progress on the scrum task or issues blocking it.

5. Select **Submit**.

i Important:

When a Scrum Task is created under a Story, the date fields on the Story become read-only.

Create multiple scrum tasks for stories in Agile Development 2.0

For your Agile Development 2.0 stories, create batches of different types of scrum tasks at a time, to save time.

Before you begin

Role required: scrum_story_creator, scrum_admin

About this task

Select a story that need scrum tasks and create all these tasks together. You can create tasks of different types such as Testing, Analysis, and others. All these tasks are created with the short description **ToDo...** Open the task records later and fill in more details for the task.

Procedure

1. Navigate to **All > Agile Development > Stories**
2. Right-click a story number and select **Add Scrum Tasks**.
3. On the form, enter the number of scrum tasks to create for each task type.
 - Analysis
 - Coding
 - Documentation
 - Testing
4. Select **OK**.

Result

A batch of tasks of the selected types is created with a short description of **ToDo...** and are listed in the Scrum Tasks related list of the story record.

What to do next

Open each scrum task record and fill in more details such as description, priority, and others. For field information of a Scrum Task form, see [Scrum Task form](#).

Create a personalized backlog in Agile Development 2.0

Create filters to define which stories appear in your backlog in Agile Development 2.0.

Before you begin

Role required: `scrum_product_owner`

About this task

A backlog is a prioritized list of stories that are related to a specific product, epic, release, and so on. The definition of a backlog is flexible and it is set up by the product owner.

Procedure

1. Navigate to **All > Agile Development > Personal Backlogs**.
2. Select **New**.
3. On the form, fill in the fields.

Backlog definition form

Name	Name for the backlog.
Table	Table from which records are pulled for this backlog. The default value for this field is Story [rm_story] .
Visible to	Users that you want to share the backlog with. Use the Unlock Visible to icon (🔓) to add users.
Visible to Groups	Groups of users that you want to share the backlog with. Use the Unlock Visible to icon (🔓) to add groups.

Filter	<p>Filter criteria that are applied to stories in the backlog.</p> <p>The default filter criteria is Active is True and Sprint is Empty.</p>

Create a new backlog

Define which stories matter to you. Stories of specific products, teams, epics, etc. - whatever you consider as your scope of work.

* Name

Table Story [rm_story]

Visible to

Visible to Groups

Filter

All of these conditions must be met

Task type	is	Story	<input type="button" value="AND"/>	<input type="button" value="OR"/>	<input type="button" value="✖"/>
Active	is	true	<input type="button" value="AND"/>	<input type="button" value="OR"/>	<input type="button" value="✖"/>
Sprint	is empty		<input type="button" value="AND"/>	<input type="button" value="OR"/>	<input type="button" value="✖"/>

4. Select **Submit**.

What to do next

You can create any number of personal backlogs that match different priorities. Access all your personal backlogs by navigating to **Agile Development > Personal Backlogs** and also on the Backlog tab of your Agile Board.

Manage your product backlog in Agile Development 2.0

Manage your product backlog from a centralized location called the Agile board in Agile Development 2.0. Add stories to a personalized backlog and prioritize them as needed.

Before you begin

Role required: scrum_product_owner

About this task

Prioritize stories in your backlog. You can add stories, assign stories to a release or a product, add triaged records, and so on.

- Steps 1 and 2 take you to where you can manage your scrum backlogs.
- Steps 3 through 12 provide guidance on the different actions that you can perform on your backlog. Choose the actions based on your requirement.
- All actions that involve a triage board are accessible only when the Agile Development – Unified Backlog plugin (com.snc.sdmc.agile.multi_task) is active.

Procedure

1. Navigate to **All > Agile Development > Agile Board > Backlog**.

If you have already created a personalized backlog, it automatically appears in this tab. If you have not created a personalized backlog, then a welcome page appears that provides a link to create a backlog.

2. From the list at the top-left corner, select the required backlog or create a backlog by using the Create Backlog icon (⊕).
3. Update the existing filter criteria of your selected backlog by using the Edit Backlog icon (✎).
4. Personalize columns in a list by selecting the personalize icon ⚙️.
5. Add a story to the backlog.

a. Click **Create Story**.

b. Specify the required details in the Story form.

c. Click **Submit**.

The story is listed at the bottom of the backlog on the last page.

If you want to add a story at a particular position in the backlog, select a story just above this position, and then click **Create Story**. The new story is listed below the story that you selected.

6. Update a story from the backlog.

a. Click the story number of the story that you want to update.

b. Edit the story details and click **Update**.

If you have read-only access, you can open the Story form but cannot edit the story details.

7. Create an epic or a theme directly from the **Backlog** tab.

a. Select the options icon (▾) next to the **Create Story** option.

b. Select **Create Epic** or **Create Theme** from the list.

c. On the form, fill in the fields and submit it.

The new epic is listed in the epics filter only if its stories meet the filter criteria of the selected backlog.

8. Arrange stories within a Backlog page using one of the following options.

- Use the mouse device to select and hold a story, drag it to the required position, and drop it.
- Use the keyboard. For more information, see [Arrange Agile Development 2.0 stories in Agile Board using the keyboard](#)

Rearranging stories in the backlog adjusts the ranking of stories in the `global_rank` column in the Story [rm_story] table. When you move a story within a backlog, its rank changes relative to the stories within the same backlog. So, the story at the top of the backlog list has a lower rank value and assumes higher priority while the story at the bottom of the backlog list has a higher rank value and assumes lower priority.

9. Perform any of the following actions on a single story or a set of stories by selecting the required stories and clicking the Options icon ().
10. Use the **Triage Board** option to view and edit the records in your triage boards. You can do the following actions using the **Triage Board** option:
 - View and edit the total number of records (such as problems or defects) in the triage boards of all task types
 - Open the list of a specific task type
 - Edit an existing triage filter definition
11. Add a triaged record, such as a defect, to the bottom of your backlog.
 - a. Click **Triage Board**.
 - b. Select your triage filter definition. For example, a definition for all defects.
 - c. Select the records that you want to add to your backlog.
 - d. Click **Add to Backlog**.
12. Move a triaged record from your backlog back to the triage board.
 - a. Open the triaged record by clicking its number.
 - b. Click the **Move back to triage board** related link. You need a specific role that provides access to a triaged record in the backlog. For example, to view a problem in the backlog, you must have the itil role. If you do not have access to any record, an error message appears.

Arrange Agile Development 2.0 stories in Agile Board using the keyboard

Learn how to use the keyboard to move and rearrange Agile Development 2.0 stories in the Backlog and Sprint Planning tabs of your Agile board.

Before you begin

Role required: `scrum_admin`, `scrum_master`, `scrum_product_owner`, or `scrum_sprint_planner`

Procedure

1. Reorder a single story:
 - a. Highlight the desired story by pressing the Tab key.
 - b. Highlight the context menu () icon on the story by pressing the Tab key again.
 - c. Select the story by pressing the Enter key.
 - d. Move the story to the desired position using the up and down arrow keys.
 - e. Fix the position of the story by pressing the Enter key.

2. Reorder multiple stories:

- a.** Highlight the desired story by pressing the Tab key.
- b.** Select the story by pressing the Enter key.
- c.** Select multiple stories using the up and down arrow keys and the Shift or Control keys.
 - To select consecutive stories, use the down arrow key to highlight the last story that you want to select, and then press the Shift and Enter keys.
 - To select stories that are in different positions on the page, use the down arrow key till you go to the next story that you want to select. Then, press the Control and Enter keys.

Repeat this process to select other stories.

- d.** Highlight the context menu (☰) icon on the story by pressing the Tab key again.
- e.** Press the Enter key to group all the selected stories.

Multiple stories that you selected appear

Number	Short Description	Epic	Points
STRY0010003	HR: Update Content & Text for Human Resources Page		2
STRY0010051	Update HR Now portal Catalog to Human Resources catalog		1
STRY0010086	HR KM - Knowledge Content updates	HR Knowledge Management	1
STRY0010016	HR Service Portal - Homepage > Category/Subcategory boxes (i.e. Benefits, Careers, General, & Pay)	HR Portal	3
STRY0010094	HR Portal Catalog Link		4
STRY0010076	Create Inbound Action for Germany		1
STRY0010026	HR KM - Approval process for articles that have been submitted	HR Knowledge Management	3
STRY0010087	Sub-Category Creation for Fifth Main Content Category	EE - Catalog	
STRY0010143	Integrate Career/Training/Recognition with Workday	Knowledge Redesign	16

grouped.

- f.** Move the stories to the desired position using the up and down arrow keys.
- g.** Fix the position of the stories by pressing the Enter key.

Plan your sprint activities in Agile Development 2.0

Streamline your sprint activities such as creating, editing, and completing sprints, or adding stories to sprints, using the Sprint Planning tab of the Agile board.

Before you begin

- You must be a member of an agile group to access the Sprint Planning tab.
- You can perform only a set of actions on the Sprint Planning tab based on the role that is assigned to you. For more information, see roles in [Components installed with Agile Development 2.0](#).
- Role required: `scrum_admin`, `scrum_master`, or `scrum_sprint_planner`

About this task

- Steps 1 through 3 take you to where you can plan your sprint activities.
- Steps 4 through 11 provide various actions that you can perform to plan your sprints. Choose the ones that suit your requirement.

For more information on the Agile board, see [Agile board in Agile Development 2.0](#).

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. Select the Sprint Planning tab.
3. From the **Group** field, select an assignment group for which you want to plan the sprint activities.

The list displays all the teams to which you are added as a group member. The default assignment group is the team that you have selected earlier or the first team in which you were added as a group member.

4. Create a sprint.
 - a. Select **Create Sprint**.
 - b. On the form, fill in or update the fields.
 - c. Select **Submit**

Alternatively, you can also create sprints in bulk for an assignment group and come back to this planning tab to continue planning your sprints. See [Create sprints in bulk in Agile Development 2.0](#).
5. Edit a sprint.
 - a. Open the sprint form by selecting its name.
 - b. In the Sprint form, update its details.

Until the sprint begins, you can also update the capacity of the assignment group using the **Group capacity** field to account for changes in team composition, holidays, or vacations.
 - c. Select **Update**.
6. Add a new story to the backlog.
 - a. Select **Create Story**.
 - b. On the form, fill in the fields.

For field information, see [Create a story in Agile Development 2.0](#).
 - c. Select **Submit**.

The story appears at the bottom of the backlog. You can edit the story details by selecting its number. If you have read-only access, you can view the story form but cannot edit the story details.

7. Add a story to the backlog or a sprint and simultaneously decide its order of implementation.

- a. From the Backlog or a sprint, select the row of a story under which you want to add the new story.
 - b. Repeat steps 6a through 6c.
The new story is placed under the story that you initially selected.
8. Personalize columns in a list using the personalize option ().
 9. Arrange the stories according to your priority by reordering the stories in the Backlog or any of the sprint sections.
 10. Start a sprint by selecting **Start Sprint** in the section of the top sprint.
The Sprint Tracking tab appears.
 11. Mark a sprint complete by selecting **Complete Sprint** in the section of the top sprint.
 - a. In the Complete Sprint dialog box, move any incomplete stories to the backlog or a future sprint.
 - b. Select **Complete**.
The sprint is marked complete and disappears from the Sprint Planning tab.

[Agile board in Agile Development 2.0](#)

Create sprints in bulk in Agile Development 2.0

Create multiple sprints at once for one or more Agile Development 2.0 assignment groups to save time.

Before you begin

Role required: `scrum_admin`, `scrum_master`, or `scrum_sprint_planner`

About this task

Create multiple sprints for an assignment group at a time. If multiple assignment groups follow the same sprint cadence, you can generate sprints in bulk for all these groups together.

Procedure

1. Navigate to **All > Agile Development > Groups**.
2. Select the assignment groups that you want to create sprints for and select **Create Sprints**.
3. On the form, fill in the fields.

Create Sprints form

Field	Description
Name	Name for the sprint that applies to all the selected assignment groups. For example, if all the selected assignment groups would work for the upcoming release, you can name your sprint by the release name, such as <Release name> sprint .
Starting Number	Starting number of the sprint.

Field	Description
	The sprints created for the selected assignment groups are named as <Name> <Starting Number> .
Start date	Date that the sprint starts on.
Duration (days)	Number of days that a sprint contains.
Number of Sprints	Number of sprints that you want to create for the selected assignment groups.

4. Select OK

Result

The sprints are created for the selected assignment groups and are listed in the Sprints related list of these groups.

Track progress of stories for a sprint in Agile Development 2.0

Use the Sprint Tracking tab of the Agile board in Agile Development 2.0 to track the development of the stories from your current sprint.

Before you begin

You must be a member of an assignment group to access the board.

Role required: `scrum_user` or `scrum_admin`

About this task

Use the Story board view of the Sprint Tracking tab to check the state of your stories for the current sprint. On the board, stories are shown as cards, and their states are indicated as lanes.

You can move the story cards into different lanes or add new stories for the team, to make real-time updates during scrum calls or other status meetings.

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. Select the **Sprint Tracking** tab.
3. From the **Story board** view, review the stories for the current sprint using the state lanes.
4. **Optional:** Change the state of a story by moving the story from one lane to another.

(Optional) If you use triage board and add those records to your backlog, your board could have stories associated to the triaged records. When you move these stories to different lanes on the story board to update their state, the state of the associated story is updated but the state of the original triaged record remains the same. To change the state of the original record, open the story and switch to the original record tab.

The screenshot shows the 'Story Information' form in ServiceNow. The form is titled 'Story Information' and has a 'View: Scrum*' dropdown. The form contains the following fields:

- Number: STRY0010010
- Product: Employee Portal
- Theme: [Empty]
- Release: [Empty]
- Epic: [Empty]
- Assignment group: [Empty]
- State: Draft
- Assigned to: [Empty]
- Points: [Empty]
- Project: [Empty]
- Sprint: [Empty]
- Project phase: [Empty]
- Original task: DFCT0000002
- Blocked:
- * Short description: Error while configuring the model

5. Optional: Hide lanes that you do not want to be displayed by selecting **Hide Lane** from the vertical lane menu (⋮).

6. Optional: Display any hidden lanes and change the board theme.

a. Select **Configuration** (⚙️).

b. Select **Advanced Settings**.

c. Select the lanes you want to be displayed.
You can also change the order of the lane display by reordering them in the Lane configuration section.

d. Select a different color to change the board theme.

7. Optional: Add a story to a specific lane.

a. Select **+ Add Card**.

b. On the form, fill in the fields and click **Submit**.
For field information, see [Create a story in Agile Development 2.0](#).

Track progress of scrum tasks for a sprint in Agile Development 2.0

Use the Sprint Tracking tab of the Agile board in Agile Development 2.0 to track the progress of scrum tasks for the stories from your current sprint.

Before you begin

You must be a member of an agile group to access the board.

Role required: `scrum_user` or `scrum_admin`

About this task

Use the Task board view of the Sprint Tracking tab to check the state of your scrum tasks for the current sprint. On the board, each story is a collapsible section. Tasks for each story are shown as cards in these sections, with their states indicated as lanes.

You can move the task cards into different lanes or add new task for a story, to make real-time updates during scrum calls or other status meetings.

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. Click the **Sprint Tracking** tab.
3. From the **Task board** view, review the states of the scrum tasks of all stories scheduled for the current sprint.
4. Change the state of a scrum task by moving the task from one lane to another.
5. Add a scrum task to a specific lane.
 - a. Click **+ Add Card**.
 - b. On the form, fill in the fields and click **Submit**.
For field information, see [Create a scrum task for Agile Development 2.0 stories](#).

Track sprint progress in Agile Development 2.0

Track the progress of stories, scrum tasks, and tests for the current sprint from a single consolidated view on the Agile board in Agile Development 2.0.

Before you begin

- You must be a member of an Agile 2.0 assignment group to access the Sprint Tracking board.
- Viewing, adding, or updating tests for stories requires activating the Test Management 2.0 plugin (com.snc.test_management.2.0).

Role required: scrum_user or scrum_admin.

About this task

Using the List view of the Sprint Tracking tab, review the progress of scrum tasks and tests created for the stories of the current sprint.

Each story is listed as section that can be expanded to show the tasks or tests created for it. You can add new tasks or tests to the stories, or run tests that are in the Ready state.

Steps 3 through 8 provide different actions to perform on the Sprint Tracking board. Choose the ones that suit your requirement.

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. From the Sprint Tracking tab, select the **List** view.

All stories scheduled for the current sprint are listed as sections, which can be expanded and collapsed. The details of the story such as the current state, short description, and assigner user can be seen.
3. From the **Show** field, select the items that you want to review the status of.
 - Scrum Tasks
 - Tests
4. Expand each story section to see the details of the tasks or tests added to it.

You can customize the information shown for these items using the personalize option ()

5. Add a new scrum task to a story.
 - a. In step 3, select **Scrum Tasks**.
 - b. From the section of the story that you want to add the task for, select **Add Scrum Task**.
 - c. On the form, fill in the fields.
For field information, see [Create a scrum task for Agile Development 2.0 stories](#).
 - d. Select **Submit**.
 6. Add a new test for a story.
 - a. In step 3, select **Tests**.
 - b. From the story that you want to add the test for, select **Add Test**.
 - c. Enter the short description and select **Submit**.
A test is created and listed in the story section. You can open the test form, add test steps, verify them and mark the test as ready to run. For information on the test form, see [Test version form in Agile Development 2.0](#).
- Note:**
Adding tests to a Story requires activating the Test Management 2.0 plugin. See [Activate Test Management 2.0](#).
7. If there are tests in Ready state for a story, you can run those tests.
For more information, see [Run tests for a story in Agile Development 2.0](#).

Run tests for a story in Agile Development 2.0

For a story whose tests are marked ready to be run, run those tests and execute all the test steps using the Sprint Tracking tab of the Agile board in Agile Development 2.0.

Before you begin

Role required: scrum_user

About this task

From the Agile board, use the List view of the Sprint Tracking tab to check stories that have test versions ready to be run. These stories have a **Run** option next to their state. Run those tests by executing and verifying each test step.

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. From the Sprint Tracking tab, select the **Listview**.

All stories scheduled for the current sprint are listed as sections, which can be expanded and collapsed.
3. From the **Show** field, select **Tests**
4. For the story that you want to run the tests on, select **Run**.
5. Select the environment on which the test is to be run and confirm by selecting **Run**.
6. In the Test Execution window, execute each test step and mark them as passed, failed, or blocked accordingly.

- Passed (✓)
- Failed (✗)
- Blocked (⚠)

If you select Failed or Blocked for a test step, you can enter comments and attach files to support your selection.

7. If you're running multiple tests for the story, use the Next Test option (➤) to move to the next test after verifying the current one.

8. Repeat step 6 and 7 until you've executed and verified all the test steps.

9. **Optional:** You can pause the test for the moment by selecting **Pause**

(Optional) If you've paused the test, skip step 10.

When you want to resume the paused test run later, you can find it at **Test Management > Runs**.

10. After marking all test steps, select **Done**.

Result

The result of each test is indicated on the Agile board as Passed, Failed, Blocked, or Not finished according to the following conditions.

- If all the test steps are passed, the status is **Passed**.
- If at least one step of the test is not executed, the status of the test is **Not finished**.
- If at least one step of the test fails, the overall status of the test is **Failed**. This rule takes precedence over the previous rule.
- If at least one step of the test is blocked, the overall status of the test is **Blocked**. This rule takes precedence over the previous two rules.

What to do next

[View the test results for a story in Agile Development 2.0](#)

View the test results for a story in Agile Development 2.0

Analyze results of the tests that you run on Agile Development 2.0 stories. Troubleshoot failures so that the story can be moved to completion.

Before you begin

Role required: `scrum_user`

About this task

Use the Sprint Tracking tab of the Agile board to review the tests run for a story. The results of the run tests are listed in the Test results related list of each test form. From these results, you can find additional details such as the comments for why a test has been blocked or failed, and any attachments supporting the comments. Use these additional details to troubleshoot and fix any issues in your product or feature.

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. From the Sprint Tracking tab, select the **List** view.

All stories scheduled for the current sprint are listed as sections, which can be expanded and collapsed.

3. From the **Show** field, select **Tests**
4. From a story section, select a test that you want to analyze the results of.
5. From the Test results related list, select a test result to view its details in a form.

Test results form

Field	Description
Number	Automatically generated number for the test result.
Test	Test that is run.
Result	Execution status of the test: Passed,Failed, or Blocked.
Version	Version of the test that is executed.
Execution environment	Environment on which the test is executed.
Updated	Date and time that the test result was recorded.
Run by	Name of the tester who executed the test plan.
Test run	Name of the test run.

Beneath these fields, the tests steps that are executed and verified for this test are listed along with their execution status. Any comments or attachments that are added to these steps are also displayed for reference.

[Track sprint progress in Agile Development 2.0](#)

Report a defect in Agile Development 2.0

Track issues associated to your product or feature by reporting defects in Agile Development 2.0.

Before you begin

Role required: feature_user, scrum_story_creator, or scrum_admin

The administrator must grant the feature_user role to all those users who are expected to report defects using the Agile Development 2.0 application.

About this task

Create a defect record using the Defects module. You can later create a story for this defect so that the relevant assignment group can work on resolving the issues.

Procedure

1. Navigate to **All > Agile Development > Defects.**
2. Select **New.**
3. On the form, fill in the fields.

Defect form fields

Field	Description
Number	System-generated unique identifier for the defect.
Priority	Priority assigned to the defect. A product owner can use priorities when creating stories.
State	<p>State of the defect. Select one of the following:</p> <ul style="list-style-type: none"> ○ Draft: The defect details are still being drafted. ○ Scoping: The defect is being triaged and the scope of the defect and its fix is being analyzed. ○ Awaiting approval: The scope of the defect is finalized and the team is awaiting approval to start working on it. ○ Work in progress: The team is working on the fix for the defect. ○ Testing/QA: The tester is testing the defect fix based on the scope provided. ○ Deploy/Launch: The team is ready to launch the fix for the defect. ○ Closed Complete: The fix for the defect is deployed into the product. ○ On Hold: The defect is put on hold due to any blockers and until further review. ○ Cancelled: The team cancels working on this defect. This field is automatically set to Draft.
Assignment group	The group to which the defect belongs.
Assigned to	The user assigned to the defect.
Product	Product with which this defect is associated. The field is required if the defect is part of a product.
Reported against	Problem, change, or other task record that this defect is reported against.
Short Description	Brief description of the defect.
Description	Detailed description of the defect.
Work notes	Notes about the work being performed on the defect. Work notes can be updated as the work progresses on this defect.

4. Select Submit.

Result

The defect is created and the form reopens with the Stories related list. The list of stories is only visible to users with a scrum role.

What to do next

A scrum product owner can review the defect and decide if a story must be created for it. See [Create a story in Agile Development 2.0](#).

Create an enhancement request in Agile Development 2.0

Capture enhancement ideas for your feature or product as enhancement requests in Agile Development 2.0 so that you can review and prioritize them later.

Before you begin

Role required: Any one of the feature_user, scrum_story_creator, scrum_admin, or rm_enhancement_admin roles

The administrator must grant the feature_user role to all users who are expected to create an enhancement request in the Agile Development application.

About this task

Create an enhancement record using the Enhancements module. You can later review this record and create a development story for it if you choose to prioritize for any of your upcoming releases.

Procedure

1. Navigate to **All > Agile Development > Enhancements**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Enhancement form

Field	Description
Number	System-generated number for the enhancement.
Priority	Priority assigned to the enhancement. Product owners can refer to this value when creating stories and scoping it into upcoming releases.
State	Current state of the enhancement. The default is Draft .
Assignment group	Group that would work on this enhancement
Assigned to	User assigned to the enhancement.
Product	Product with which this enhancement is associated. The field is required if the enhancement is part of a product.
Short Description	Brief description of the enhancement.
Description	Detailed description of the enhancement.
Work notes	Notes about the work being performed on the enhancement.

4. Click **Submit**.

Result

The enhancement request is created and the form reloads with the Stories related list. The list of stories is only visible to users with a scrum role.

What to do next

A scrum product owner can review the request and decide whether to create stories for it.

Set up a triage board in Agile Development 2.0

Set up your own triage board to view and manage records that are important to your product, such as problems, incident tasks, defects, or change requests at one place easily.

Before you begin

Ensure that you own a backlog. See [Create a personalized backlog in Agile Development 2.0](#).

Role required: `scrum_product_owner`

About this task

Define filters to create a triage board, so that you can access and manage the records that you want easily.

You can create as many triage boards as you want. For example, you can create one triage board for defects and incidents and another for enhancements.

Procedure

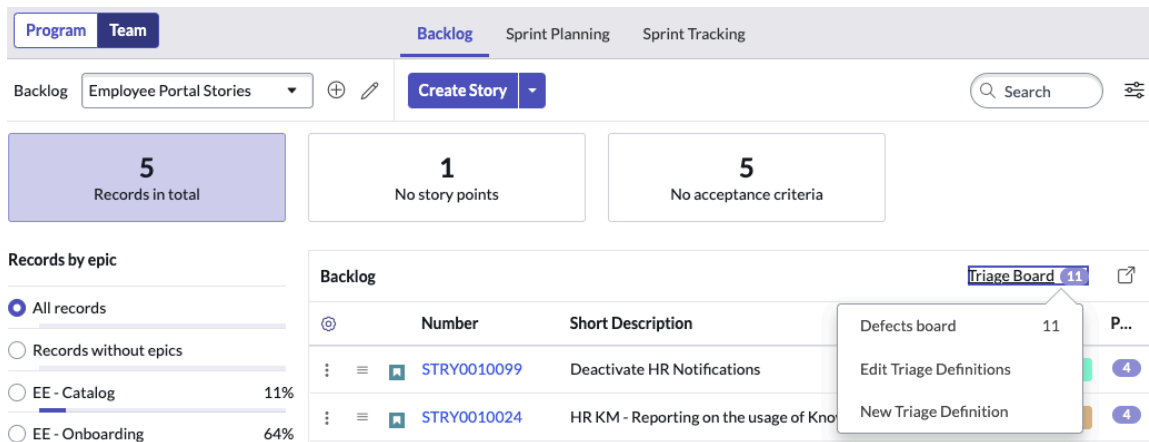

1. Navigate to **All > Agile Development > Agile Board > Backlog**.
2. Set up a new triage board.
 - If this is your first triage board, select **Triage Board > Set up Triage Board**.
 - If you already have a triage board, select **Triage Board > New Triage Definition**
3. On the form, fill in these fields.

Field	Description
Name	Name for the triage board.
Table	Table from which you want to filter records for the triage board.
Filter	<p>Filter criteria to be applied on the selected table to populate the triage board.</p> <div style="background-color: #e0f2f1; padding: 5px; margin-bottom: 10px;"> <p>i Important: Do not to remove the default conditions: Active is true and Agile story is empty.</p> </div> <ul style="list-style-type: none"> ○ Active is true ensures that your triage board only shows the tasks that are active and not completed or cancelled. ○ Agile story is empty ensures that the task doesn't already have a story associated to it and is not already present in some other backlog.
Backlog definition	Backlog that any stories created from this triage board would be added to.

4. Select **Submit**.

Result

A triage board is created and can be accessed from the Backlog section of the Agile board.

What to do next

- Edit the filter criteria for existing triage boards.
 - Select **Triage Board** and then select **Edit Triage Definitions**.
- Open the new triage board to view its contents.
 - Select **Triage Board** and then select the board that you created.
- [Triage items and add them to a backlog in Agile Development 2.0](#)

Related topics

[Manage your product backlog in Agile Development 2.0](#)

Triage items and add them to a backlog in Agile Development 2.0

Review the list of items in your triage board and add them to your Agile Development 2.0 backlog. Based on their priority, you can schedule them in the upcoming sprints for your product teams to work on them.

Before you begin

- [Activate Agile Development – Unified Backlog](#)
- [Set up a triage board in Agile Development 2.0](#)

Role required: `scrum_product_owner`

About this task

Select the items from your triage board and add them to your backlog based on their priority for your product. Every item that is added to the backlog from the triage board has an associated story to it. From the Agile board, you can switch between the original item Information and Story Information tabs for more details.

These stories can be later assigned to product teams and scheduled into sprints.

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. From the Backlog section of the Agile board, select your product or team backlog from the **Backlog** field.
3. Select **Triage Board** and select the triage board that you want to review the items of.

For example, in the screenshot here, Defects board can be selected.

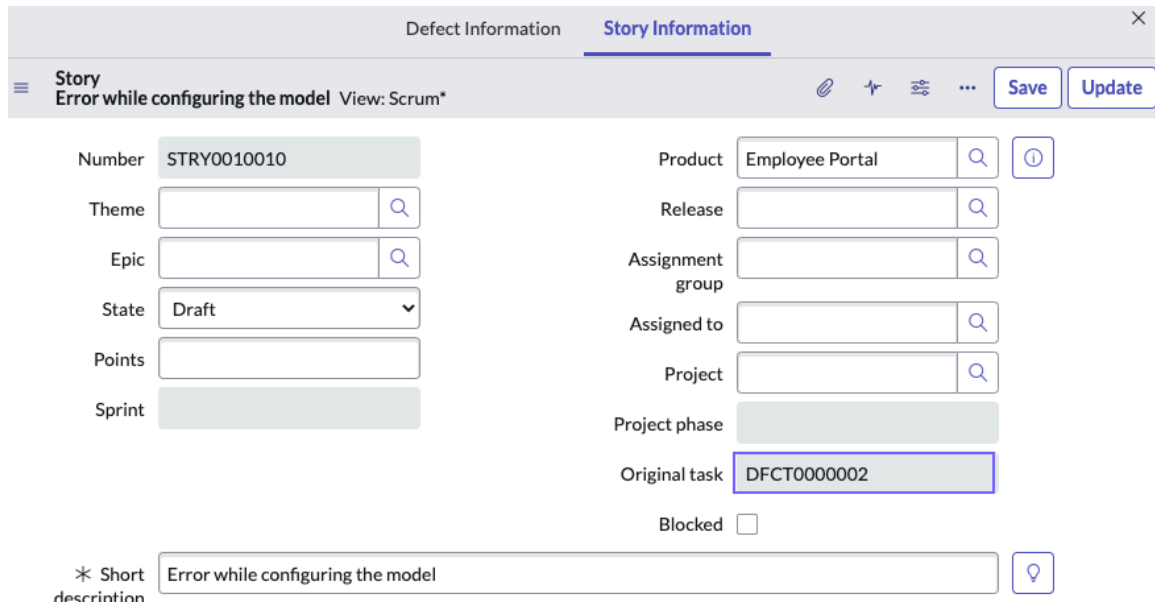

4. Review the list and select the ones that you want to add to the backlog.

5. Select **Add to Backlog**.

Result

The selected list of items from the triage board is added to the backlog as stories. You can schedule these stories into upcoming sprints using the Sprint Planning tab of the Agile board.

An example here shows how an associated story is created for a defect that is added to the backlog. The story has a reference to this defect in the **Original task** field.

Scrum Programs for Agile Development 2.0

Plan and track the work of multiple teams that work together, either toward a common short-term outcome or on an ongoing basis.

This video provides an overview of Scrum Programs for Agile Development 2.0.

The examples of short-term outcomes are a demand, project, epic, or a release. Teams that work together on a scrum program can:

- Work in synchronized or varied sprint cadences.
- Contribute to work outside of this common scrum program.

With the centralized Planning page for a scrum program on ServiceNow® Agile Development 2.0, you can:

- Assign work and compare the workload of multiple teams across sprints.
- Set, view, and adjust dependencies between stories across multiple teams.

Activate Scrum Programs

Activate the Scrum Programs (com.snc.sdlc.scrum_program) plugin to start planning your scrum programs in Agile Development 2.0.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

i Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>`.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#).

Components installed with Scrum Programs

Understand the roles, tables, business rules, and UI macros that are installed when you activate the Scrum Programs plugin.

i Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Roles installed with Scrum Programs

Role title [name]	Description	Contains roles
Program manager [it_program_manager]	Users with this role have full control on all the scrum programs.	<ul style="list-style-type: none"> • program_manager • scrum_product_owner • scrum_master

Note:

The `it_program_manager` role is installed with the activation of Scrum Programs only if it is not already installed through the Project Portfolio Management plugin.

Tables installed with Scrum Programs

Table	Description
<code>epic_backlog_definition</code>	Stores the filter criteria that is used to create the epic backlogs.
<code>scrum_program_m2m_group</code>	Stores the relationship between a scrum program and its teams.

Business rules installed with Scrum Programs

Name	Table	Description
Set global rank for epic	<code>rank_configuration</code>	Contains fix script to populate global rank for existing epics.

UI macros installed with Scrum Programs

Name	Description
<code>program_planning_constants</code>	<p>Contains customizable <code>TEAM_LIMIT</code> and <code>STORY_LIMIT</code> properties.</p> <p>These properties limit the number of teams and stories that can be shown on the scrum program planning board.</p>

The default value for the `TEAM_LIMIT` property is 15 and `STORY_LIMIT` property is 1000. You can change these values according to your preferences.

Note:

Increasing the values might result in longer loading times and degraded performance of the scrum program planning board.

Create an epic backlog

Categorize epics into epic backlogs by defining a set of filters according to your preferences. While planning your scrum program, you can use these epic backlogs to plan for only those stories that belong to the epics in this backlog.

Before you begin

Role required: `it_program_manager`

About this task

With epic backlogs, you can filter stories on the planning board, to display the stories from only certain epics. For example, you can create a backlog of epics with Priority set as High. Later on the planning board, you can focus only on the stories belonging to these high-priority epics and plan your sprints accordingly.

Procedure

1. Navigate to the Epic Backlog form in one of the following ways:

Option	Action
From the Epic Backlogs module	<p>a. Navigate to Agile Development > Epic Backlogs.</p> <p>b. Click New.</p>
From Agile Board	<p>Navigate to Agile Development > Agile Board > Program > Backlog and do one of the following:</p> <ul style="list-style-type: none"> ○ If you are creating an epic backlog for the first time, click Create Backlog. ○ If this backlog that you want to create is an addition to existing epic backlogs, click the create icon (+).

2. In the **Name** field, enter a name of your choice for the epic backlog.

3. To set the desired filter conditions, click **Add Filter Condition** or **Add "OR" Clause**.

For example, you can choose to filter your epics by the priority set for them.

Note:

The default filter condition is **Task type is Epic** and **Active is true**.

4. Click **Submit**.

[Manage your epic backlogs](#)

Manage your epic backlogs

Create, update, and rearrange your epics by using a centralized view of epic backlogs on Agile Board.

Before you begin

Role required: it_program_manager, scrum_user

Procedure

1. Navigate to **All > Agile Development > Agile Board**.

2. From the **Program** tab, select **Backlog**.

- If an epic backlog exists, the page populates a list of epics that match the criteria of this backlog.
- If you have no existing epic backlogs, see [Create an epic backlog](#).

3. To switch between the available epic backlogs, select a backlog from the Backlog list.

4. To edit the selected backlog, click the edit icon (✎).

Note:

You must have the role of `it_program_manager` to perform this step.

5. To add a new epic to the selected backlog, click **Create Epic**.
6. To filter the list of epics by product, select a product category from **Epics by product**.
You can show or hide the **Epics by product** filter. Click the configuration icon () and toggle **Show Products Filter** on or off.
7. To locate an epic from the backlog, using the short description or the epic number, use the search bar.
8. To edit the details of an epic, click the epic number.
9. To rearrange the epics based on their priority, do one of the following:

Action	Description
Use the mouse device to rearrange the epics	<ol style="list-style-type: none"> a. Select the required epics. b. Drag the selection to the desired position and drop it.
Use the keyboard to rearrange a single epic	<ol style="list-style-type: none"> a. To highlight the context menu icon () of the desired epic, press the Tab key and press the Enter key. b. Move the epic to the desired position by using the up and down arrow keys. c. To fix the position of the epic, press the Enter key.
Use the keyboard to rearrange a group of epics	<ol style="list-style-type: none"> a. To highlight an epic, press the Tab key. b. To select the epic, press the Enter key. c. Navigate using the up and down arrow keys and do the following: <ol style="list-style-type: none"> i. To select consecutive epics, press the Shift and Enter keys together. ii. To select random epics, press the Ctrl (for Windows) or Command (for Mac) key and the Enter key together. d. To highlight the context menu icon () of an epic, press the Tab key and press the Enter key. e. Move the epics to the desired position by using the up and down arrow keys. f. To fix the position of the epics, press the Enter key.

You can also perform the following actions on a single epic or a group of epics:

- a. Select the required epics.
- b. Click the more options icon () of an epic and select any of the following options:

Option	Action
Move to top	Moves epics to the top of the Backlog list.
Move to bottom	Moves epics to the bottom of the Backlog list.
Product	Opens the Products list. Select the product to which the epics belong.

10. To view the backlog in a standard platform list, click the standard list view icon ()

Create a scrum program

Create a scrum program to plan sprints and track the progress of the multiple scrum teams that are working together.

Before you begin

Ensure that you have the information of the teams to be included in the program.

Role required: it_program_manager

Procedure

1. Navigate to the Program form using one of the following ways:

Option	Action
From the Scrum Programs module	<ul style="list-style-type: none"> a. Navigate to Agile Development > Scrum Programs. b. Click New.
From Agile Board	<ul style="list-style-type: none"> a. Navigate to Agile Development > Agile Board. b. From the Program tab, select Planning. c. Click Create Program. <p>Note: You can create a scrum program from the Planning page of Agile Board but only if it is your first scrum program.</p>

2. On the form, fill in the fields.

Program form

Field	Description
Planned start date	Start date of the program. Manually enter the date or pick from the calendar. The default date is the current day.
Planned end date	End date of the program. Manually enter the date or pick from the calendar.
Planned duration	Duration of the program in days and hours. This field auto-populates based on the start and end dates. The default duration of a scrum program is one day.
Program manager	Manager of the program.
Default Epic Backlog	Initial epic backlog that is applied to the planning page, when you select this scrum program. Currently on the planning page, the epic backlog is not automatically applied for a program. So, it is recommended that you manually select the required backlog while planning.
Program Name	Brief description of the program.

3. Click **Submit.**

Any user with the role `scrum_user` can view the created scrum programs.

What to do next

- [Assign teams to a scrum program.](#)
- Click the **Scrum Program Board** related link to [plan your scrum program.](#)

Assign teams to a scrum program

Add teams to your scrum program to assign work and track the progress of the work.

Before you begin

Ensure that the teams that work on this scrum program are created as agile groups. For the procedure to create an agile group and assign members to it, see [Create an agile group in Agile Development 2.0.](#)

Role required: `it_program_manager`

Procedure

1. Navigate to **All > Agile Development > Scrum Programs**.
2. Open your scrum program record.
3. In the Teams related list, click **Edit**.
4. Move the desired teams from **Collection** to **Teams List**.
5. Click **Save**.

You can add a team to multiple scrum programs by following the same procedure. The teams that you add to a scrum program are displayed in its Teams related list.

What to do next

[Plan a scrum program.](#)

Scrum program planning board

Use a centralized view on Agile Board to plan work for the teams that are working on your scrum program.

Quick view of the scrum program planning board UI components.

Agile Board has a program planning board where you can plan, schedule, and review work for your scrum teams. The planning page contains the following components that guide you during your planning process.

Program selector

Select a program that you want to plan or review. After you select a program, you can add teams or update other information by clicking the edit icon (✎).

Program timeline

Navigate the program timeline by scrolling horizontally or by using the forward (➤) and back (⏪) icons.

Epic Backlog filter

Select an epic backlog that is associated with your scrum program. You can filter the stories on the program planning board and the epic backlog pane. By analyzing the workload for just these selected epics, you can understand how the workload is scheduled across sprints.

Configuration panel

Turn on or off the following components on the planning board by using the configuration panel icon (⚙️).

Team backlog

Enables you to show or hide the team's backlog lane.

Story dependencies

Enables you to visually analyze dependencies between the stories of different sprints and teams by using the story dependency lines. You can use the dependencies option to show or hide these dependency lines. If you choose to hide the dependencies or if the dependencies involve a story that's not on the board, then you can see a colored border on the story card.

The color of the dependency indicates the way you've scheduled the stories.

- Green: The prerequisite story is scheduled in a sprint first. Then, the dependent story is scheduled in a later sprint.
- Red: The dependent story is scheduled in a sprint first. Then, the prerequisite story is scheduled in a later sprint. Review the dependency and reschedule the story as required.

If none of the stories have a prerequisite or dependent story that is associated with them, the dependencies option is not visible.

For information on how to add story dependencies, see [Add dependencies for Agile Development 2.0 stories](#).

Epic Backlog pane

Enables you to see a list of all the epics that are based on the filter criteria in the epic backlog definition. For more information, see [Create an epic backlog](#).

In the backlog pane, you can do the following actions for an epic:

- View the epic description.
- View the unassigned and unscheduled stories of the epic as cards with their short descriptions and story points.
- Edit the epic's information by clicking its name.
- Add a new story to the epic by clicking **Create Story**.

Scrum teams

View all the teams that are involved in the selected scrum program toward the left of the planning board.

You can update a team's information, such as the team members, group capacity, or description, by clicking the team's name.

If your teams do not have sprints added to them, or if you want to add more sprints, you can [Add sprints from the program planning board](#) directly.

Team backlog lane

Enables you to see the stories that are assigned to the team but these stories aren't scheduled yet into any sprint.

While planning your scrum program, if you know which stories must be assigned to the team but you don't know what sprints to use, you can move these stories to the team's backlog lane. By doing so, you can have a clear idea of the team's workload for the upcoming sprints and then eventually add these stories to the correct sprints.

You can also unplan a story that has already been scheduled to a sprint by dragging the story card back to the team's backlog. Use the backlog lane on the planning board to see which team has the story. Then, decide which sprint to schedule it in.

If you want to unassign a story from a team, you can drag the story card and drop it back into the epic backlog lane.

Team sprint lanes

Enable you to see the sprint cadences of the teams.

Pointing your cursor to a sprint's name shows you its details such as the duration, total story points, and filled capacity. You can edit details, such as group capacity and planned start and end dates, by clicking the sprint name.

While planning your scrum program, if you know the sprint in which the story would be worked on, you can move the story card to that sprint.

Story cards

Enable you to see the stories of the epics from your scrum program in the form of cards. You can move these cards around to assign them to teams and to plan them into sprints.

If you have activated the Agile Development – Unified Backlog plugin (com.snc.sdlic.agile.multi_task), you can also see stories that were added from the triage board to your unified backlog. From the planning board, you can double-click a story card to open it in a pop-up window and edit its details. If the story is created from a record on the triage board, such as a defect, you can see both the story information and the defect information side-by-side.

Note:

Stories can be created from enhancements, defects, incidents, or other such records only if you have activated the Agile Development – Unified Backlog plugin (com.snc.sdlic.agile.multi_task).

Sprint workload capacity bar

Plan a sprint efficiently. The bar, which is under a sprint name, indicates the workload that is planned for the team versus the team's capacity for that sprint. Pointing your cursor to the sprint name gives you additional details.

Zoom in and zoom out

Adjust the board view using the zoom in icon () and the zoom out icon ().

Search

Filter the stories on the planning board using a search term. For example, you can enter a story number or a phrase from a short description.

Stories list

View a list of all stories of the program using the standard list view icon (.

Plan a scrum program

Plan work for sprints, using a centralized view on Agile Board, of multiple scrum teams that are working together on a scrum program.

Before you begin

- [Create an epic backlog.](#)
- [Create a scrum program.](#)
- Role required: scrum_sprint_planner

Procedure

1. Navigate to **All > Agile Development > Agile Board.**
2. From the **Program** tab, select **Planning.**
3. From the Program list, select a scrum program that you want to plan.

A planning board displays all the teams that are working on the selected program, their sprint cadences, and sprint capacities.

4. From the Backlog list, select an epic backlog and click the backlog icon () to display the epics from the selected backlog.
5. View the stories of an epic by selecting the epic from the backlog.
6. Assign a story to a scrum team by dragging a story card from the backlog and dropping it either in a sprint or team's backlog lane.

You can reschedule the stories across teams and sprints by rearranging the story cards.

- If you move the story card to a team's backlog, the **Assignment group** field is updated accordingly.
- If you plan the story card into a sprint, the **Assignment group** and the **Sprint** fields of the story are updated accordingly.

The sprint capacity bar below the sprint name fills up depending on the stories that are scheduled for it.

7. **Optional:** Update the group capacity of a team's sprint by clicking the sprint name.
8. **Optional:** Unplan a story by dragging it from the planning board and dropping it either in the epic backlog pane or the team's backlog lane.
 - Dropping the story back into the epic backlog pane clears the references of the sprint and assignment group from the story.
 - Moving the story to the team's backlog lane clears only the sprint reference but retains the assignment group.

[Scrum program planning board](#)

Add sprints from the program planning board

Add sprints to your scrum teams directly from the scrum program planning board without having to navigate to another module.

Before you begin

Role required: `scrum_sprint_planner`

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. From the **Program** tab, select **Planning**.
3. From the Program list, select a scrum program that you want to plan.
4. Under the team name, click **Add sprints**.
5. On the form, fill in the fields.

Create Sprints form

Field	Description
Name	Name of the sprint for the team.
Starting Number	Number that you want the sprints to start with.

Field	Description
	For example, if it's your team's first sprint, enter 1 .
Start date	Start date of the team's sprint.
Duration (days)	Sprint duration of the team.
Number of Sprints	Number of sprints that you want to add to the team. For example, if you want to add four sprints to the team, enter 4 .

6. Click OK.

You can see new sprints for the team on the program planning board.

Work Progress Status for Agile Teams

The Work Progress Status for Agile Teams application provides you with indicators such as estimated completion date and progress status (green, yellow, red) for all your Agile Development 2.0 epics.

As a product owner or a team lead, these indicators help you understand if your Agile team could complete the epics' work by the planned end dates so that you can adjust your plans accordingly. As a team member working on stories of an epic, these status indicators help you understand your contribution to the overall work and your progress so that you can review your work strategy if necessary.

Note:

You must enter a value for the **Planned end date** field for an Agile Development 2.0 epic for these work progress status indicators to populate.

Install Work Progress Status for Agile Teams

Install the Work Progress Status for Agile Teams (sn_scrum_progress) application from ServiceNow Store.

Before you begin

- Activate the Agile Development 2.0 (com.snc.sdlc.agile.2.0) plugin.
- [Install Performance Analytics Content Pack for Agile 2.0.](#)

To verify that plugins and applications are activated and installed, navigate to **Subscription Management > Subscriptions** in your instance. The list displays the subscriptions your organization has purchased. Activation of Agile Development 2.0 and Performance Analytics Content Pack for Agile 2.0 on production instances may require separate licenses. Contact ServiceNow Support for details.

Role required: admin

Procedure

1. Navigate to [ServiceNow® Store](#).
2. Search for Work Progress Status for Agile Teams.

3. Click the application tile.

You can view detailed information about the application you are installing.

i Note:

Consider reading the Other Requirements and Dependencies sections, as applicable.

4. Click **Get** and enter your Now Support login credentials.**5.** Click **Request Install**.**6.** In the **Instance Name** field, enter your details and click **Validate Instance**.**7.** In the **Reason for the Instance** field, enter your details and click **Request**.

You receive an email with detailed installation instructions.

8. Log in to the instance you want to install Work Progress Status for Agile Teams on.**9.** Navigate to **System Applications > Applications**.**10.** Locate the Epic Progress Status for Agile 2.0 application, select it, and click **Install**.**What to do next**

If you haven't already, start the [Scrum] Daily Data Collection job. For more information, see [Enable daily data collection for Agile 2.0 dashboards](#).

Reviewing progress status for Agile Development 2.0 epics

Understand if your work would be completed by the planned end dates by reviewing progress status of your Agile Development 2.0 epics.

Navigate to **Agile Development 2.0 > Epics** and filter the epics for your team.

The Status column of the epics list shows a Green, Yellow, or Red indicator for each epic to indicate the following:

- Green: Your epic is on track to be complete by the planned end date.
- Yellow: Your epic is off track and your plan of execution must be reviewed.
- Red: Your epic is not progressing well and might be at risk of not being complete by the planned end date,

The estimated completion date displays a date with the likelihood of the epic's completion.

The [Scrum] [daily data collection job](#) helps generate the burnup report for your epics. Using the data generated for these epic burnup reports, an estimated completion date is determined for each of your epics. You can see that this date is the intersection of Completed and Scope forecast series in the respective epic burnup reports.

Based on this estimated completion date, the progress status for your epics is determined. Progress status for an epic is calculated only under the following conditions:

- Planned end date is populated in the epic.
- Percentage completion of the epic is a value greater than 0.

The color of the progress status indicator is determined using the following conditions:

- Green: Estimated completion date is on or before the planned end date.
- Yellow: Estimated completion date is beyond the planned end date by a deviation of 1% to 14%.
- Red: Estimated completion date is beyond the planned end date by a deviation of 15% or more.

Install Performance Analytics Content Pack for Agile 2.0

Install the Performance Analytics Content Pack for Agile 2.0 application from the ServiceNow Store.

Before you begin

- Activate the Agile Development 2.0 (com.snc.sdlic.agile.2.0) plugin.
- Activate the Performance Analytics (com.snc.pa) plugin.

Role required: admin

i Note:

- To verify that plugins and applications are installed and activated, navigate to **Subscription Management > Subscriptions** in your instance. The list displays the subscriptions your organization has purchased.
- Activation of the Agile Development 2.0 and Performance Analytics plugins on production instances may require separate licenses. Contact ServiceNow Support for details.

Procedure

1. Navigate to [ServiceNow® Store](#) .
2. Search for Performance Analytics Content Pack for Agile 2.0.
3. Click the application tile.
You can view detailed information about the application you are installing.

i Note:

Consider reading the Other Requirements and Dependencies sections, as applicable.

4. Click **Get** and enter your Now Support login credentials.
5. Click **Request Install**.
6. In the **Instance Name** field, enter your details and click **Validate Instance**.
7. In the **Reason for the Instance** field, enter your details and click **Request**.
You receive an email with detailed installation instructions.
8. Log in to the instance you want to install Performance Analytics Content Pack for Agile 2.0 on.
9. Navigate to **System Applications > Applications**.
10. Locate the application, select it, and click **Install**.

Result

You can access the Agile Development 2.0 dashboard from **Agile Development > Dashboards**.

What to do next

Start the [Scrum] Daily Data Collection job. For more information, see [Enable daily data collection for Agile 2.0 dashboards](#).

Enable daily data collection for Agile 2.0 dashboards

Enable scheduled data collection to begin collecting scores on new data automatically. Data collection jobs automatically collect scores for automated indicators and breakdowns.

Before you begin

Role required: pa_admin or admin

About this task

Note:

Historical data collection is not supported for the underlying indicators of the [Scrum] Daily Data Collection job.

Procedure

1. Navigate to **All > Performance Analytics > Data Collector > Jobs**.
2. Find and open the [Scrum] Daily Data Collection job.
3. Start the [Scrum] Daily Data Collection job.
 - a. Scroll down to the Job parameters section.
 - b. Set the **Run as** field to a user that has one of the following roles: pa_admin, pa_data_collector, or admin roles.
 - c. Verify that the time zone in the **Run As tz** field is appropriate for your organization. This timezone is used for the following:
 - Database queries created for this job
 - Indicator conditions such as `[[Created]][on][Today]`
 - d. Enable the scheduled run of the job by selecting the **Active** checkbox.
4. Click **Update**.

Upgrading the layout of Agile 2.0 dashboards

Upgrade to the latest layout of Agile 2.0 dashboards using Solution Library.

Existing users who upgraded to the latest version 1.1 of Performance Analytics Content Pack for Agile 2.0 can install the latest layout of the dashboards from Solution Library.

For example, if you are upgrading from version 1.0.2 or earlier of the application, then install the following dashboards from Solution Library to access the latest layout:

- Agile 2.0 Epic Dashboard
- Agile 2.0 Sprint Dashboard
- Agile 2.0 Prior Sprint Dashboard
- Agile 2.0 Release Dashboard
- Agile 2.0 Team Dashboard

Note:

For users on the Paris release, the **Install** and **Upgrade** buttons are not visible on the Solution Library content form. For information on resolving this issue, see [Allow PA Solution Library for Store apps](#).

Agile 2.0 Epic Dashboard

Visually analyze the progress of the stories of an epic over a given period using the Epic Dashboard.

Navigate to **All > Agile Development > Dashboards** and select **Agile 2.0 Epic Dashboard**.

Epic Summary tab

Epic Summary Cycle Time

Cycle Time tab

The Agile 2.0 Epic Dashboard provides the following information:

- Displays the number of stories that are complete, and number of stories that are missing estimates for an epic.
- Displays the number of stories of the epic in their current state and their progress.
- Indicates the scope changes, if any, and trends of those scope changes.
- Indicates the pace at which the team is working on stories in the epic.
- Forecasts when the epic is likely to be completed based on scope change and completion rate trends.
- Shows time elapsed for the stories of an epic to go from an in-progress state to a completed state.

Canceled stories are not included in any of this data.

End user and roles

End user goal with required role and benefits

End user and goal	Required role	Benefits
Scrum master: Needs clear visibility into real-time progress of team stories and the changes in scope for the epic to complete the epic on time.	scrum_user	<ul style="list-style-type: none"> • View current states and time in each state for the stories of the epic • View epic burnup trend • Estimate epic completion dates • Identify outlier stories that took longer than expected

Indicators

Scrum: Sum of story points of all stories in epics

Generates the scope series in the Epic Burnup report, which indicates the size of the epic.

Scrum: Sum of story points of completed stories in epics

Generates the completed series in the Epic Burnup report, which indicates the amount of work that has been completed in the epic.

Scrum: Count of all stories in the current epic

Generates the area series the Epic Cumulative Flow Diagram report, which indicates the number of stories of the current epic by state.

Breakdowns

- Scrum: Epic
- Scrum: State

Widgets

Total Story Count

Indicates the total number of stories in the epic.

Stories Completed

Indicates the number of stories in the epic that are complete.

Missing Estimates

Indicates the number of stories in the epic that are missing estimates.

Data visualizations

Epic Summary

Title	Type	Description
Epic Burnup	Line chart 	Shows the epic burnup trends. You can estimate when the epic completed. The Epic Burnup report comprises the following series that can be displayed based on your preference: <ul style="list-style-type: none"> • Scope: Indicates the size of the epic. • Scope Forecast: Predicts the possibility of scope change for the epic, which is based on historical data.

Epic Summary (continued)

Title	Type	Description
		<ul style="list-style-type: none"> • Completed: Indicates the amount of work in the epic that is completed. • Completed Forecast: Predicts the burnup for the future dates, whether you can complete the epic on time. This prediction is based on historical data. <p>Note: The point at which the Completed Forecast series intersects and crosses the Scope Forecast series is a predictor for when the epic is completed. If the Completed Forecast series and the Scope Forecast series do not appear to ever intersect, it is a warning that scope is increasing faster than work is being completed.</p>
Epic Cumulative Flow Diagram	<p>Area chart</p> 	<p>Monitor the progress of all the stories of your epic between its start and end dates.</p> <p>View the number of stories in each state by their arrival to a state, the state, and its departure from this state.</p> <p>The Epic Cumulative Flow Diagram report comprises the following information that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Ready: Indicates the number of stories of the epic that are ready for development. • Work in Progress: Indicates the number of stories of the epic that are in development. • Ready for Testing: Indicates the number stories of the epic that are ready to be tested. • Testing: Indicates the number of stories of the epic that are currently being tested. • Complete: Indicates the number of stories that are complete. <p>Note: Stories in Ready and Cancelled states are not included in the Epic Cumulative Flow Diagram report.</p>

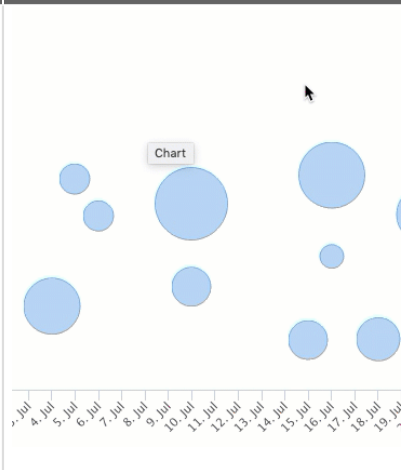

Cycle Time

Title	Type	Description
Story Cycle Time	<p>Bubble chart</p> 	<p>Identify the time taken for each story in the epic to move from an in-progress state to completion.</p> <p>Each bubble on the graph represents a story. The height of the bubble from the x-axis shows how long that story took to move from an in-progress state to completion. The size of the story bubbles represents the number of stories in that state.</p>

Cycle Time (continued)

Title	Type	Description
		<p>are relative to each other based on their story points.</p> <p>Hovering your mouse cursor over a bubble displays the following details about that story:</p> <ul style="list-style-type: none"> • Story points • Date that the story is moved to completion • Total cycle time (in days) of the story • Number of days that the story was in the Work in progress state • Number of days that the story was in the Ready for testing state • Number of days that the story was in the Testing state <p>From the Story State section towards the right of the report, you can filter the report to view the cycle time of the stories for the selected states. The chart displays the cycle time for each story as the cumulative sum of all duration of the selected states.</p> <p>If there are too many stories at any area of the chart and the bubbles appear crowded on the report, you can zoom in that particular area of the report for a clearer view.</p>

Cycle Time (continued)

Title	Type	Description
		

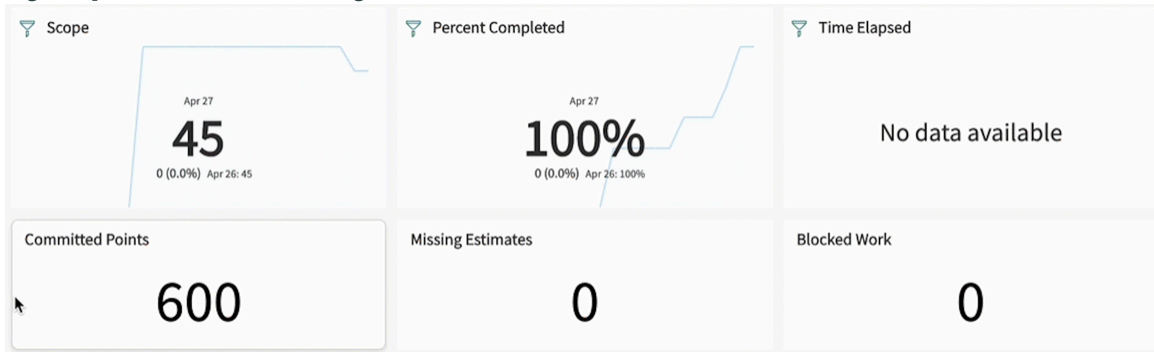

You can customize the Burnup and Cumulative Flow Diagram reports. For more information, see [Customizing Agile 2.0 dashboard reports](#).

Agile 2.0 Sprint Dashboard

Track the progress of your stories in the current sprint and forecast sprint completion using the Sprint Dashboard.

Navigate to **All > Agile Development > Dashboards** and select **Agile 2.0 Sprint Dashboard**.

Agile sprint dashboard widgets

Agile sprint dashboard burndown report

Agile sprint dashboard burnup visualization

Agile sprint dashboard cumulative flow diagram

The Agile 2.0 Sprint Dashboard provides the following insights:

- Displays details of the sprint such as percentage of work that is complete, time elapsed, and total number of stories that are missing estimates.
- Displays the number of stories of the sprint in their current state and their progress.
- Indicates the scope changes, if any, and trends of those scope changes.
- Indicates the way the team needs to progress on stories to achieve the sprint goal.
- Forecasts data showing the likelihood of completing the sprint as planned.

End user and roles

End user and goal	Required role	Benefits
Scrum master and sprint planner: Need visibility into scope changes, completed and remaining work for a sprint to adjust plans to complete the sprint on time.	scrum_user	<ul style="list-style-type: none"> • Analyse the sprint burnup and burndown trends • Analyse the scope change for the sprint • View current states and analyse the time in each state for the stories of the sprint • Estimate sprint completion dates

Indicators

Scrum: Sum of story points of all stories in the current sprint

Generates the scope series in the Sprint Burndown and Burnup reports. The scope series indicates the amount of work (in story points) that is the planned for the sprint.

Scrum: Sum of story points of active stories in the current sprint

Generates the completed series in the Sprint Burndown and Burnup reports. The completed series indicates the amount of work (in story points) completed in the sprint.

Scrum: Time elapsed in sprint

Calculates the time to be displayed in the Time Elapsed widget.

Scrum: Count of all stories in the current sprint

Generates the area series in the Sprint Cumulative Flow Diagram report. It indicates the number of stories in the current sprint.

Scrum: Percent Completed by Points

Calculates the amount of work (in percentage) completed for the sprint. The value is the result of the following formula:

```
([[Scrum: Sum of story points of completed stories in current sprint]]/[[Scrum: Sum of story points of all stories in the current sprint]]*100)
```

Breakdowns

- Scrum: Sprint

Widgets

Scope

Indicates the amount of work in story points that is planned for the sprint. This widget lets you see at a glance how much work must be completed to achieve the sprint goal. It also lets you drill down to detail on the stories planned into the sprint.

Percent Completed

Indicates the percentage of work that has been completed in the sprint using story points. This widget lets you see at a glance how much work has been completed in the sprint. Together with the adjacent Time Elapsed widget, these widgets let you easily see whether you are completing work at a rate consistent with achieving the sprint goal on schedule.

Time Elapsed

Indicates the percentage of time that has elapsed between the start date and planned end date of the sprint. Together with the adjacent Percent Completed widget, these widgets let you easily see whether you are completing work at a rate consistent with achieving the sprint goal on schedule.

Committed Points

Indicates the committed scope (in number of story points) of the sprint. Together with the adjacent Scope widget, these widgets let you see difference between the scope committed at the start of the sprint and the current scope of the sprint.

Note:

This widget is not visible by default. You can add it from Reports to your dashboard. For more information, see [Edit a responsive dashboard](#).

Missing Estimates

Indicates the total number of stories in the sprint that are missing estimates. It is required that you use estimates for the other indicators, widgets, and reports on this dashboard to be meaningful.

Tip:

If you do not estimate stories, enter a "1" in the **Story Points** field. The other indicators, widgets, and reports will then effectively function by count.

Blocked Work

Indicates the amount of work (in story points) in the sprint that is blocked.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Agile 2.0, then install this dashboard from Solution Library to upgrade its layout and access the following visualizations:

- Sprint Burnup
- Sprint Cumulative Flow Diagram

For more information, see [Upgrading the layout of Agile 2.0 dashboards](#).

Note:

For all reports shown in the Sprint dashboard, the planned end date of the Sprints is used as a filter. Completed Sprints appear in the chart only if their Planned end date is less than or equal to the current date.

Title	Type	Description
Sprint Burndown	Line chart 	<p>Indicates the scope changes, if any, and trends of those scope changes. Indicates the ideal pace of work, how much work is remaining, and if the scope is likely to be completed before the end of the sprint.</p> <p>The Sprint Burndown report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the sprint. • Scope Forecast: Predicts the possibility of scope change for the future dates, which is based on historical data. • Ideal Burndown: Indicates how the team needs to progress on stories to complete the sprint on time.

Title	Type	Description
		<ul style="list-style-type: none"> • Remaining: Indicates the amount of work left for completion in the sprint. If the actual burndown is above the ideal burndown, it implies that there is more work left than originally estimated. The team is running behind the schedule of the sprint. If the actual burndown is below the ideal burndown, it implies that there is less work left than originally estimated. The team is running ahead of the schedule of the sprint. • Remaining Forecast: Predicts the burndown for the future dates. It indicates whether you can complete the sprint on time. The prediction is based on historical data.
<p>Sprint Burnup</p>	<p>Line chart</p> 	<p>Shows the sprint burnup trend indicating scope changes. Forecasts future changes in scope and the trend of work completion.</p> <p>The Sprint Burnup report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the sprint. • Scope Forecast: Predicts the possibility of scope change for the future dates, which is based on historical data. • Completed: Indicates the amount of work completed in the sprint. • Completed Forecast: Predicts the burnup for the future dates. It indicates whether you can complete the sprint on time. The prediction is based on historical data.
<p>Sprint Cumulative Flow Diagram</p>	<p>Area chart</p> 	<p>Monitor the progress of all the stories of your sprint between its actual start and end dates.</p> <p>View the number of stories in each state by their arrival to a state, time in this state, and its departure from this state.</p> <p>The Sprint Cumulative Flow Diagram report comprises the following areas that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Ready: Indicates the number of stories in the sprint that are ready to start work on. • Work in Progress: Indicates the number of stories in the sprint that are in development. • Ready for Testing: Indicates the number stories in the sprint that are ready to be tested. • Testing: Indicates the number of stories in the sprint that are currently being tested. • Complete: Indicates the number of stories in the sprint that are complete.

Title	Type	Description
		<p>Note: Stories in Ready and Cancelled states are not included in this report.</p>

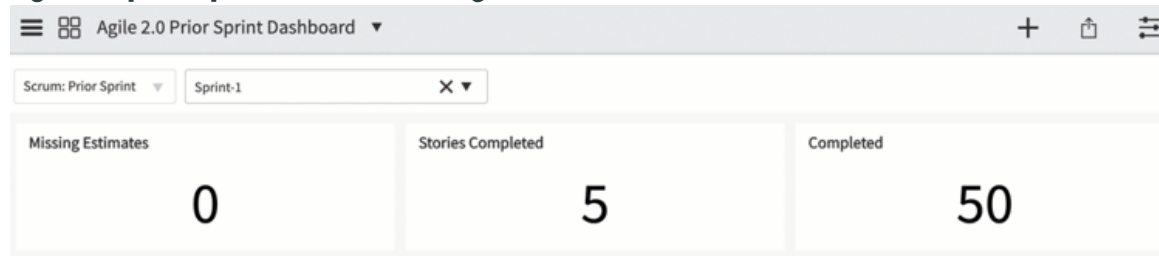

You can customize the Burnup, Burndown, and Cumulative Flow Diagram reports. For more information, see [Customizing Agile 2.0 dashboard reports](#).

Agile 2.0 Prior Sprint Dashboard

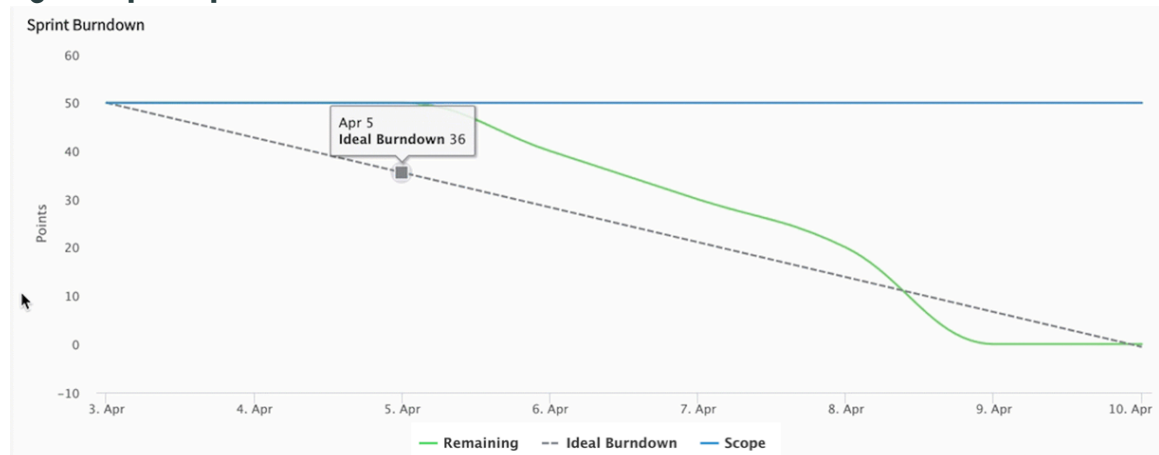

Prior Sprint Dashboard provides data visualization on scope, actual burndown and burnup, and forecast trends of previous sprints. Analyze the data and plan the work for upcoming sprints.

Navigate to **All > Agile Development > Dashboards** and select **Agile 2.0 Prior Sprint Dashboard**.

Agile 2.0 prior sprint dashboard widgets

Agile 2.0 prior sprint dashboard burndown visualization

Agile 2.0 prior sprint dashboard burnup visualization

Note: Canceled stories are not included in any of this data.

End user and roles

End user and goal	Required role	Benefits
Scrum master and sprint planner: Need visibility into actual changes in scope and forecast trends of the previous sprints.	scrum_user	<ul style="list-style-type: none"> Analyze sprint burndown and burnup trends Use the data to plan for upcoming sprints

Indicators

The following are the indicators which are used to generate the data for the reports of this dashboard.

Scrum: Sum of story points of all stories in the current sprint

Generates the scope series in the Sprint Burndown and Sprint Burnup reports.

Scrum: Sum of story points of active stories in the current sprint

Generates the completed series in the Sprint Burndown and Sprint Burnup reports.

Breakdowns

The following are the breakdowns used by the indicators.

- Scrum: Sprint
- Scrum: Prior Sprint

Widgets

Committed points

Indicates the committed scope (in number of story points) of the sprint.

Stories Completed

Indicates the total number of stories that were completed in the previous sprint.

Completed

Indicates the amount of work (in story points) that was completed in the previous sprint.

Missing Estimates

Indicates the total number of stories in the previous sprint that were missing estimates.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Agile 2.0, then install this dashboard from Solution Library to upgrade its layout and access the Sprint Burnup visualization. For more information, see [Upgrading the layout of Agile 2.0 dashboards](#).

Agile 2.0 Release Dashboard

Track the progress of your stories and analyze scope changes in the current release using Agile 2.0 Release Dashboard.

Navigate to **All > Agile Development > Dashboards** and select **Agile 2.0 Release Dashboard**.

Release Summary tab

Cycle Time tab

The dashboard:

- Displays important details of the release such as percentage of work that is complete, time elapsed, and total number of stories that are missing estimates.
- Displays the number of stories of the release in their current state and their progress.
- Indicates the scope changes, if any, and trends of those scope changes.
- Indicates the pace at which the team is completing stories that are planned for the release.
- Forecasts data showing the likelihood of completing the release as planned.
- Shows time elapsed for the stories of a release to go from an in-progress state to a completed state.

Note:

Canceled stories are not included in any of this data.

End user and roles

End user goal with required role and benefits

End user and goal	Required role	Benefits
Product owner: Needs visibility into scope changes, team's pace, and real-time progress of the stories for the release.	scrum_user	<ul style="list-style-type: none"> • Track progress of your stories that are planned for a release • Resolve any bottlenecks to deliver the release on time • Identify outlier stories that took longer than expected

Indicators

Scrum: Sum of story points of completed stories in the active releases

Generates the Completed series in the Release Burndown and Burnup reports. These series indicate the amount of work in story points that has been completed for the release.

Scrum: Sum of story points of active stories in the current releases

Generates the scope series in the Release Burndown and Release Burnup reports. The scope series indicates the amount of work in story points that is planned for the release.

Scrum: Time elapsed in the release

Calculates the time to be displayed in the Time Elapsed widget.

Scrum: Count of all stories in the current release

Generates the area series in the Release Cumulative Flow Diagram report, which indicates the number of stories of the current release by state.

Breakdowns

- Scrum: Release
- Scrum: State

Widgets

Percent Completed

Indicates the percentage of work (in story points) that has been completed in the release. This widget lets you see at a glance how much work has been completed in the release. Together with the adjacent Time Elapsed widget, these widgets let you easily see whether you are completing work at a rate consistent with achieving the release goal on schedule.

Scope

Indicates the amount of work in story points that is planned for the release. This widget lets you see at a glance how much work must be completed to achieve the releaser goal. It also lets you drill down to detail on the stories planned into the release.

Time Elapsed

Indicates the percentage of time that has elapsed between the start date and planned end date of the release. Together with the adjacent Percent Completed widget, these widgets let you easily see whether you are completing work at a rate consistent with achieving the Release goal on schedule.

Blocked Work

Indicates the total number of stories in the release that are missing estimates. It is required that you use estimates for the other indicators, widgets, and reports on this dashboard to be meaningful.

Note:

If you do not estimate stories, enter a "1" in the **Story Points** field. The other indicators, widgets, and reports will then effectively function by count.

Blocked Work

Indicates the number of stories in the release that are missing estimates.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Agile 2.0, then install this dashboard from Solution Library to upgrade its layout and access the following visualizations:

- Release Cumulative Flow Diagram
- Story Cycle Time

For more information, see [Upgrading the layout of Agile 2.0 dashboards](#).

Release Summary

Title	Type	Description
Release Burnup	Line chart 	<p>Analyse the burnup trends, and estimate when the release work is likely to be completed. The release burnup report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the release. • Scope Forecast: Predicts the possibility of scope change for the future dates. This prediction is based on historical data. • Completed: Indicates the amount of release work that is complete. • Completed Forecast: Predicts the burnup for the future dates in the release. It indicates whether you can deliver the release on time. <p>Note: The point at which the Completed Forecast series intersects with or crosses the Scope Forecast series is a predictor for when the release might be completed. If the Completed Forecast series and the Scope Forecast series do not appear to ever intersect, it is a warning that scope is being added faster than work is being completed.</p>
Release Burndown	Line chart 	<p>Indicates the scope changes, if any, and trends of those scope changes. Indicates the ideal pace of work, how much work is remaining, and if the scope likely to be completed before the end of the sprint. The Release Burndown report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the release. • Scope Forecast: Predicts the possibility of scope change for the future dates in the release. This prediction is based on historical data. • Ideal Burndown: Indicates how the team needs to progress on stories to deliver the release on time. • Remaining: Indicates the amount of work that is completed. <p>If Remaining is above the ideal burndown, it implies that there is more work left than originally estimated. The team is running behind the schedule of the release. If the Remaining is below the ideal burndown, it implies that there is less work</p>

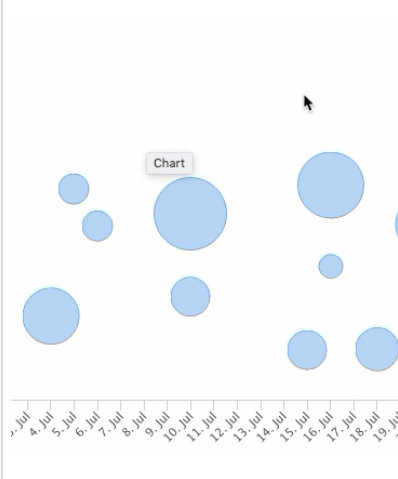

Release Summary (continued)

Title	Type	Description
		<p>left than originally estimated. The team is running ahead of the schedule of the release.</p> <ul style="list-style-type: none"> • Completed Forecast: Predicts the burndown for the future dates in the release. It indicates whether you can deliver the release on time.
Release Cumulative Flow Diagram	<p>Area chart</p> 	<p>Monitor the progress of all the stories of your release between its actual start and end dates.</p> <p>View the number of stories in each state by their arrival to a state, time in this state, and its departure from this state.</p> <p>The Release Cumulative Flow Diagram report comprises the following areas that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Ready: Indicates the number of stories in the release that are ready to start work on. • Work in Progress: Indicates the number of stories in the release that are in development. • Ready for Testing: Indicates the number stories in the release that are ready to be tested. • Testing: Indicates the number of stories in the release that are currently being tested. • Complete: Indicates the number of stories in the release that are complete. <p>Note: Stories in Ready and Cancelled states are not included in this report.</p>

Cycle Time

Title	Type	Description
Story Cycle Time	<p>Bubble chart</p> 	<p>Identify the time taken for each story in the release to move from an in-progress state to completion.</p> <p>Each bubble on the graph represents a story. The height of the bubble from the x-axis shows how long that story took to move from an in-progress state to completion. The size of the story bubbles are relative to each other based on their story points.</p>

Cycle Time (continued)

Title	Type	Description
		<p>Hovering your mouse cursor over a bubble displays the following details about that story:</p> <ul style="list-style-type: none"> • Story points • Date the story is moved to completion • Total cycle time (in days) of the story • Number of days that the story was in the Work in progress state • Number of days that the story was in the Ready for testing state • Number of days that the story was in the Testing state <p>From the Story State section towards the right of the report, you can filter the report to view the cycle time of the stories for the selected states. The chart displays the cycle time for each story as the cumulative sum of all duration of the selected states.</p> <p>If there are too many stories at any area of the chart and the bubbles appear crowded on the report, you can zoom in that particular area of the report for a clearer view.</p> 

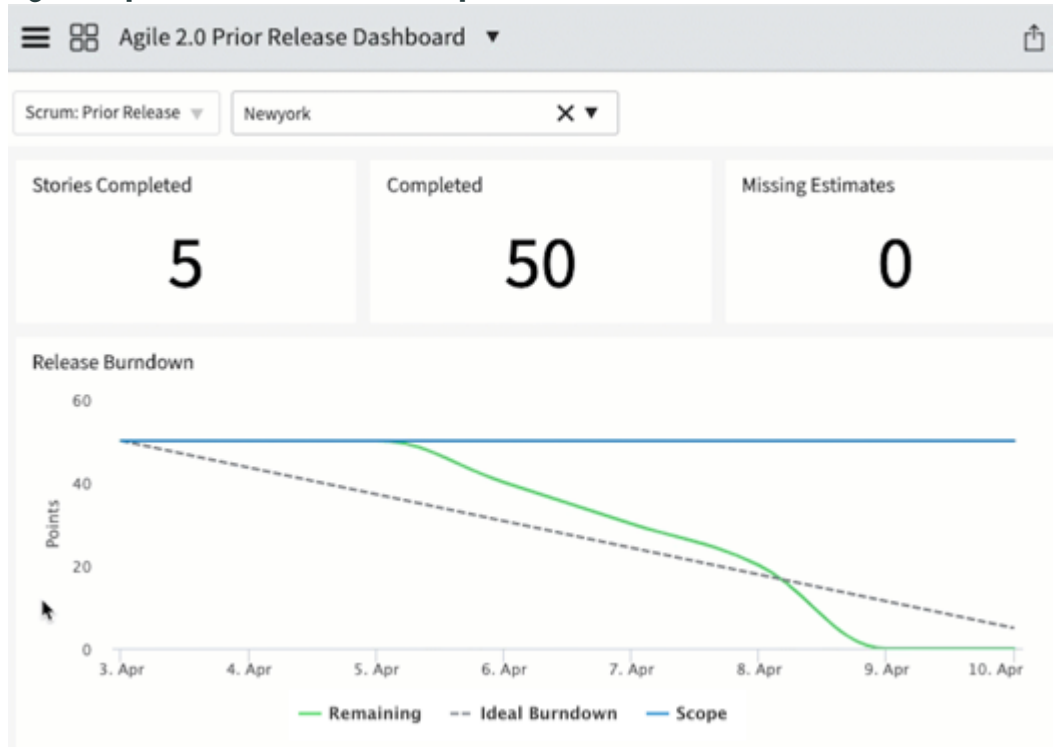

You can customize the Burnup, Burndown, and Cumulative Flow Diagram reports. For more information, see [Customizing Agile 2.0 dashboard reports](#).

Agile 2.0 Prior Release Dashboard

Prior Release Dashboard provides data visualization on scope, actual burnup and burndown, and forecast trends of previous releases. Analyze the data and plan the work for upcoming releases.

Navigate to **All > Agile Development > Dashboards** and select **Agile 2.0 Prior Release Dashboard**.

Indicators

Scrum: Scrum: Average Story State Duration

Generates data that is displayed in the Average Cycle Time per State report.

Scrum: Story State Duration

Generates data that is displayed in the Time in State report.

Scrum: Total stories in a sprint

Generated data that is displayed in the Active Stories by State report.

Breakdowns

- Scrum: Group
- Scrum: State

Data visualizations

The Team Dashboard reports are segregated into the following three tabs:

- Work item progress: Reports of Active Stories by State, Time in State, and Average Cycle Time per State
- Sprint Performance: Reports of Velocity History and Sprint Variance
- Team Members: List of all the members of the team

Note:

For existing customers who upgrade to the latest version, the list of the team members appears in both the Work item progress and Team Members tabs but only one of these locations would display the accurate information. You can remove this widget from the Work item progress tab to avoid this issue. For more information on how to remove a widget, see [Edit a responsive dashboard](#).

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Agile 2.0, then install this dashboard from Solution Library to upgrade its layout and access the following visualizations:

- Velocity History
- Velocity by Type
- Sprint Variance
- Story Cycle Time

For more information, see [Upgrading the layout of Agile 2.0 dashboards](#).

Work item progress

Title	Type	Description
Active Stories by State	Bar chart 	View the total number of stories in each state of a story, for example, testing, work in progress, and testing.

Work item progress (continued)

Title	Type	Description
Time in State	Stacked bar chart 	View the time in hours that the team spends in each state of a story.
Average Cycle Time per State	Line chart 	View how the work in progress is trending over time and what are the most significant cycle times.

Sprint Performance

Title	Type	Description
Velocity History	Bar chart 	<p>Gain an insight on the overall velocity of the team for the past 10 sprints. Understand if the team is achieving a stable, predictable velocity, and is meeting the commitments.</p> <p>The Team Velocity History report comprises the following series per sprint that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Team Capacity: Indicates the team capacity (in story points) for the sprint. • Committed Story Points: Indicates the number of story points committed by the team for the sprint. • Completed Story Points: Indicates the number of story points completed by the team for the sprint. • Average Completed Points: Indicates the average number of story points

Sprint Performance (continued)

Title	Type	Description
		<p>completed by the team for the sprint.</p> <ul style="list-style-type: none"> • Linear (Actual): Indicates if the amount of completed work is trending up, trending down, or relatively stable over sprints.
Velocity by Type	<p>Stacked bar chart</p> 	<p>Analyze the way your team's velocity changes over time and compare the team's strategic workload with operational or other types of workload.</p> <p>The bar charts have two stacks that show the sum of the story points of the following types of completed stories:</p> <ul style="list-style-type: none"> • Regular stories • Stories added to the unified backlog from the items in the triage board <p>Clicking any bar would take you to its corresponding sprint details.</p> <p>Data displayed in this report is of the past 10 sprints with the earliest sprint on the left.</p> <p>Note: This report is not available by default. You can add it from Scrum custom charts to your dashboard. For more information, see Edit a responsive dashboard.</p>
Sprint Variance	<p>Bar chart</p> 	<p>Analyze the percentage variance of the team compared to the capacity and committed points, for the past 10 sprints.</p> <p>The Team Sprint Variance report comprises the following series per sprint that can be</p>

Sprint Performance (continued)

Title	Type	Description
		<p>hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> Completed to Capacity: Indicates the percentage of completed work compared to the expected capacity for the sprint. Completed to Committed: Indicates the percentage of completed work compared to the committed work of the team for the sprint.

Team Members

Title	Type	Description
Team Members	List 	View the details of all team members.

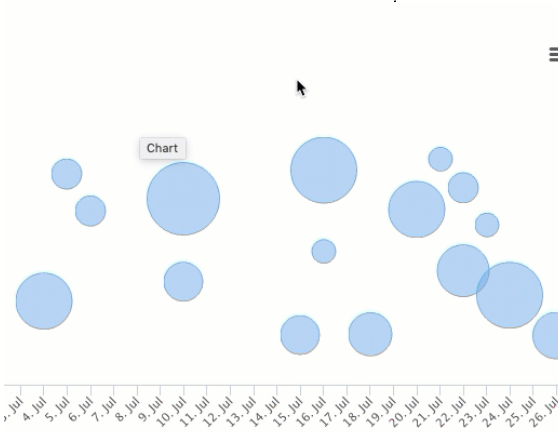

Cycle Time

Title	Type	Description
Story Cycle Time	Bubble chart 	<p>Identify the time taken for each story, which the team has worked on, to move from an in-progress state to completion.</p> <p>Each bubble on the graph represents a story. The height of the bubble from the x-axis shows how long that story took to move from an in-progress state to completion. The size of the story bubbles are relative to each other based on their story points.</p> <p>You can compare the cycle times of stories with different story points and analyze the trend in the time taken by the team to complete them. Identify the stories that</p>

Cycle Time (continued)

Title	Type	Description
		<p>took longer to complete and analyze the reasons so that you can chart an action plan to reduce the team's cycle time in the future.</p> <p>Hovering your mouse cursor over a bubble displays the following details about that story:</p> <ul style="list-style-type: none"> • Story points • Date the story is moved to completion • Total cycle time (in days) of the story • Number of days that the story was in the Work in progress state • Number of days that the story was in the Ready for testing state • Number of days that the story was in the Testing state <p>From the Story State section towards the right of the report, you can filter the report to view the cycle time of the stories for the selected states. The chart displays the cycle time for each story as the cumulative sum of all duration of the selected states.</p> <p>If there are too many stories at any area of the chart and the bubbles appear crowded on the report, you can zoom in that particular area of the report for a clearer view.</p>

Cycle Time (continued)

Title	Type	Description
		 <p data-bbox="1013 703 1380 871"> Note: The stories shown in this chart are the ones that the team has completed in the past 30 days. </p>

Customizing Agile 2.0 dashboard reports

Customize the Burnup, Burndown, and Cumulative Flow Diagram reports of your Agile 2.0 dashboards according to the custom states of your scrum stories.

- Configure indicators to reflect your customizations.

For example, if there are any new states introduced to the scrum story table, then the corresponding indicators and indicator sources for the story table that rely on the **State** field must be updated as well.

For more information, see [Customize indicators of your Agile 2.0 dashboard reports](#).

- Update or clone UI scripts for modifications to use your own indicators.

Add customizations by overriding methods in empty implementation (Impl) classes of UI scripts such as ScrumAreaChartImpl and ScrumVelHistoryImpl.

For more information, see [Update UI scripts to use customized indicators for Agile 2.0 dashboards](#).

Customize indicators of your Agile 2.0 dashboard reports

Configure indicators to reflect your customizations on the Agile 2.0 dashboards.

Before you begin

Role required: admin or pa_admin

Procedure

1. Navigate to **All > Performance Analytics > Indicators > Automated Indicators**.
2. Search for and open the required indicator.

For example, if you want to customize the Sprint Burnup report, open Scrum: Sum of story points of completed stories in current sprint from the list of indicators.

3. In the Additional conditions section, modify the conditions according to your preferences.
4. Click **Update**.

Update UI scripts to use customized indicators for Agile 2.0 dashboards

Customize UI scripts by overriding methods in empty implementation (Impl) classes.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System UI > UI Scripts**.
2. Search for and open the required UI script.
For example, if you want to customize the Sprint Cumulative Flow Diagram report, open ScrumAreaChartImpl from the list of UI scripts.
3. Overwrite the base implementation according to your preferences.
4. Click **Update**.

Customize story states of your Agile Development 2.0 dashboard reports

Configure story states to reflect your customizations on the Agile Development 2.0 dashboards.

Before you begin

Role required: admin or pa_admin

Procedure

1. Navigate to **All > Agile Development > Stories**.
2. Open a story to which you would like to add the custom states.
3. Right-click **State** and select **Configure Choices** from the drop-down menu.
4. In the **New item text** field, enter the new custom state name.
5. In the **Numeric value** field, enter any corresponding number.
6. Click **Add**.
The new state appears in the Selected list.
7. Click **Save**.

Integrating Agile Development 2.0 with third-party applications

Integrate third-party applications such as Microsoft Azure DevOps or Atlassian Jira with Agile Development 2.0, so that the planned and executed work can be synchronized in both applications.

After the integration is set up, plan the work, such as epics and stories, in Agile Development 2.0 and enable your teams to deliver using the execution application of their choice, such as Microsoft Azure DevOps or Atlassian Jira.

All the existing work items are synced between the two applications. New items that are created in either application are easily exported and imported between each other. Changes made to these items would automatically synchronize between the two applications.

To get started with configuring these integrations, see:

- [Microsoft Azure DevOps Integration for Agile Development](#)
- [Atlassian Jira Integration for Agile Development](#)

Atlassian Jira Integration for Agile Development

Enable bidirectional synchronization of records between Atlassian Jira and ServiceNow® Agile Development by integrating the two applications.

If the source of your work is in the ServiceNow platform while the progress of the work is tracked in Jira, you can perform integrated tracking of your product development efforts by integrating Agile Development 2.0 with Jira.

For example, if you update a record in Jira, you can find that update in Agile Development 2.0. Similarly, if you update a record in Agile Development 2.0, you can find the same update in Jira.

When you synchronize Jira with Agile Development 2.0, you can:

- View available Jira projects and boards in Agile Development 2.0.
- Perform a bulk import of records from Jira to Agile Development 2.0.
- Perform single record updates between Jira and Agile Development 2.0.
- Avoid duplicating record update entries in Jira and Agile Development 2.0.
- Plan, track, and update your tasks from a single application.

Starting with version 1.1.1, Atlassian Jira Integration for Agile Development 2.0 supports map configuration at the project level and not at the instance level. Also, the application supports the following project types associated with Jira Cloud and Jira Server:

- Classic
 - Scrum
 - Kanban
 - Bug tracking
- Next-gen
 - Scrum
 - Kanban

Note:

Integration with Jira Data Center, Jira Align and other Atlassian products is not available.

Importing issues from Kanban projects in Jira

Before importing Jira projects that are of the Kanban type, consider the following notes:

- Issues such as epics and stories are imported to Agile Development 2.0
- If your Kanban project has one or more Jira Boards, not all those Boards would be mapped to distinct Agile groups. The Jira project is mapped to a single group in Agile Development 2.0 and all issues of this project, regardless of their association to boards, would be assigned to one Agile group.

Request apps on the Store

Visit the [ServiceNow Store](#)  website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#) .

Install Atlassian Jira Integration for Agile Development

Install the Atlassian Jira Integration for Agile Development (sn_agile_jira_int) application v2.0.1 from ServiceNow Store.

Before you begin

Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).

Complete the following setup tasks for a smooth installation and configuration.

1. Navigate to **Subscription Management > Subscriptions** in your instance. The list displays the subscriptions that your organization has purchased.
2. Verify that Agile Development 2.0 (com.snc.sdlc.agile.2.0) is activated.
3. Verify that ServiceNow Integration Hub Starter Pack Installer (com.glide.hub.integrations) is activated.
4. Verify that Jira Spoke 2.6.8 (sn_jira_spoke) is activated.
5. Verify that Integrations - External Authentication Framework (com.glide.external.app) is activated.

Role required: admin

Note:

Activation of the Agile Development 2.0, ServiceNow Integration Hub Starter Pack Installer, Jira Spoke, and Integrations - External Authentication Framework plugins on production instances may require separate licenses. Contact ServiceNow Customer Support for details.

Procedure

1. Navigate to the [ServiceNow Store](#).
2. In the ServiceNow Store, search for Atlassian Jira Integration for Agile Development.
3. Click the application tile.
You can view detailed information about the application. Consider reading the Other Requirements and Dependencies sections, as applicable.
4. Click **Get** and enter your Now Support login credentials.
5. Click **Request Install**.
6. In the **Instance Name** field, enter your details and click **Validate Instance**.
7. In the **Reason for the Instance** field, enter your details and click **Request**.
You receive an email with detailed installation instructions.
8. Log in to the instance on which you want to install the Atlassian Jira Integration for Agile Development application.
9. Select **System Applications > All Available Applications > All**.
10. Locate the application using the filter criteria and search bar, select it, and click **Install**.

Result

The following components are installed with installation of the application:

- Roles
- Scheduled Jobs
- Tables

For more information, see [Components installed with Atlassian Jira integration for Agile Development](#).

Components installed with Atlassian Jira integration for Agile Development

Several types of components are installed with activation of the Atlassian Jira integration for Agile Development application, including tables, user roles, and scheduled jobs.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Roles installed

Role title [name]	Description	Contains roles
Jira integration admin [sn_jira_int.admin]	Has complete access to the application	<ul style="list-style-type: none"> sn_int_common.admin sn_jira_int.user
Jira integration user [sn_jira_int.user]	<ul style="list-style-type: none"> Sets up integration between Jira and Agile Development Can create new or update the existing map configurations between Jira and Agile Development 	<ul style="list-style-type: none"> connection_admin sn_int_common.user credential_admin

Scheduled jobs installed

Scheduled job	Description
Import Jira Issue	<p>Imports issues and sprints from Jira automatically at a scheduled time.</p> <p>This job is inactive by default.</p> <p>For more information, see Schedule a job to auto-import issues from Jira to Agile Development 2.0.</p>

Tables installed

Table	Description
Attachment Map [sn_int_common_attachment_map]	Stores the mapping of attachments to issues between Jira and Agile Development.
Choice Map [sn_int_common_choice_map]	Stores the list of workflow state mapping for Jira projects.
Event Type	Stores information of the type of webhook events such as create, update, or delete of a work item.

Table	Description
[sn_int_common_input_event_type]	
External Identifiers [sn_int_common_external_identifiers]	Stores the list of all Jira reference identifiers such as External ID, External Key, External Project, External URL, and so on.
External Project [sn_int_common_project]	Stores information of the Jira project such as project ID, the Jira instance of this project, project name, and so on.
External system [sn_int_common_external_system]	Stores information of Jira application used for the integration.
External System Version [sn_int_common_external_system_version]	Stores version information of Jira application used for the integration.
Field Map [sn_int_common_field_map]	Stores the list of field mapping of different issue types for Jira projects.
Jira Board [sn_jira_int_board]	Stores the list of imported boards from Jira.
Jira Import Request [sn_jira_int_import_request]	Stores the list of all import requests created to import projects, boards, and project style mappings from Jira.
Jira Instance [sn_jira_int_instance]	Stores the list of all Jira instances.
Jira Project [sn_jira_int_project]	Stores the list of all imported projects from Jira.
Project Integration Settings [sn_agile_jira_int_import_settings]	Stores the list of one-to-one relation between a Jira project, board, and an Agile assignment group.
Project Style Mapping [sn_jira_int_prj_style_mapping]	Store the list of map configuration templates per Jira project style.
Table Map [sn_int_common_table_map]	Stores the list of table maps for Jira projects.
Webhook Registry [sn_int_common_webhook_registry]	Stores details of the registry callback path for webhooks registered in Jira to receive event updates.

Setting up the integration between Jira and Agile Development 2.0

Understand the setup process of Atlassian Jira Integration for Agile Development 2.0.

After you have the application installed in your ServiceNow instance, you can proceed to set up the integration, using the `sn_jira_int.user` role.

The setup process for the integration includes the following tasks:

1. Connect Agile Development 2.0 with Jira.
2. Discover and import available projects and boards from Jira.
3. Enable import and export of issues and import issues in bulk from Jira projects to Agile Development 2.0.
4. Associate Jira projects with assignment groups in Agile Development 2.0.
5. Import sprints from Jira to Agile Development 2.0.
6. Enable a scheduled job to periodically import projects and issues from Jira.
7. Create custom map configurations for tables, fields, and workflow states between Jira and Agile Development 2.0.

Using guided setup to implement integration between Jira and Agile Development 2.0

Guided setup provides a sequence of tasks that help you configure the integration between Agile Development 2.0 and Jira on your ServiceNow instance. To open guided setup, navigate to **All > Agile Jira Integration > Guided Setup**.

Connecting Agile Development 2.0 to Jira

Establish a connection between Agile Development 2.0 and Jira using a Jira connection alias and a Jira instance.

When you connect Agile Development 2.0 to Jira, a webhook is registered in Jira which receives the following event updates between Jira and Agile Development 2.0.

- Creating or updating projects.
- Creating, updating, or deleting information of epic, story, sprint, and any custom table maps and their fields.

Create a Jira connection alias for integration with Agile Development 2.0

Create a Basic Auth credential and an HTTP(s) connection with a Jira connection alias to establish a connection with Jira.

Before you begin

Roles required:

- admin to create a connection and credential alias
- `sn_jira_int.admin` or `sn_jira_int.user` to create basic authorization credentials and HTTP(s) connection

Procedure

1. Create a Connection & Credential alias [🔗](#)

- You can use the connection alias (`sn_jira_int.Jira`) that is available by default.
- You must create a connection alias for every Jira instance that you use.
- For Jira server (on-prem) users, ensure that the **server_type** and **server_version** connection attributes are present.

2. Create Basic authorization credentials [🔗](#).

Ensure that the user for whom the basic authorization credentials are created has access to all Jira projects.

3. Create an HTTP(s) connection .

Create a Jira Instance for integration with Agile Development 2.0

Create a Jira instance record using the connection alias that you created to enable the setup of Jira integration with Agile Development 2.0.

Before you begin

Role required: sn_jira_int.admin or sn_jira_int.user

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Jira Instance form

Field	Description
Name	Name of the Jira instance. Enter a name of your choice.
Connection Alias	Jira connection alias that you already created. Use the lookup () option to select your connection alias.
Version	Jira version. Use the lookup () option to select your Jira API version.

4. Click Submit.

Connect Agile Development 2.0 to Jira

Connect Jira to Agile Development 2.0 to enable the integration.

Before you begin

Role required: sn_jira_int.user

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. Click **Connect**.

Result

- If the connection is successful, the **State** field on the Jira Instance record shows Connected. A webhook is now registered in Jira to receive update events.
- If the connection could not be established, the **State** field on the Jira Instance record shows Connection Failed. You can view the reason for the failure in the error message.

What to do next

[Discover and import Jira projects and boards](#)

Discover and import Jira projects and boards

Discover and import all available Jira projects and boards into Agile Development 2.0 to start using the integration between the two applications.

Before you begin

- [Connecting Agile Development 2.0 to Jira.](#)
- Role required: sn_jira_int.user

About this task

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances.**
2. Open your Jira instance record.
3. Click **Discover Projects.**

This action creates requests to import Jira projects, map configuration for all these projects, and Jira Boards. You can view all the import requests in the Jira Import Requests related list and the initial state of all the requests would be **Requested.**

Result

Once the status of each import request changes to **Complete**, you can see that the related lists of this Jira instance are populated as follows:

- Jira Projects: All available projects from Jira
- Jira Boards: All available boards from Jira
- Project Style Mappings: Map configuration for all the imported Jira projects according to the type of your Jira instance as follows:
 - The **classic_on_prem** project template contains the map configurations related to the Jira Server projects.
 - The **classic** project template contains the map configurations related to Jira Cloud Classic projects.
 - The **next-gen** project template contains the map configurations related to Jira Cloud Next-gen projects.

Once the status of the Create Mappings request changes to **Completed**, you can see the map configuration for each of the imported Jira project under the Mapping Config column of the Jira Projects related list. For more information on the default map configuration of work items, see [Default mapping configuration between Agile Development 2.0 and Jira.](#)

What to do next

Import your issues from Jira to Agile Development 2.0. For more information, see [Importing issues and sprints from Jira to Agile Development 2.0.](#)

Default mapping configuration between Agile Development 2.0 and Jira

Understand the default field mapping configuration for work items of a project between Jira and Agile Development 2.0.

Mapping configuration is used to map records in Jira to Agile Development 2.0 for a project. If the table map does not exist for an issue type in your Jira project, the issue cannot be imported and exported between Jira and Agile Development 2.0.

By looking at the default mapping configuration, you can understand how issue types in Jira are mapped to task types in Agile Development 2.0. You can also see how fields are mapped between the two applications. When you import the available issues and sprints of a Jira project, this data is stored in tables as defined in the project's map configuration.

From version 11.1 onwards, mapping configuration is generated per project and not at the instance level. You must update any custom maps that you previously configured to ensure that the import and export of work items is not impacted.

Here's how you can view the default map configuration tables of your Jira project.

1. Navigate to **Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. From the Jira Projects related list, open a Jira project.
4. From the Table Maps related list, open the record for Story or Epic.

The following table lists the default field map configuration for a Story and Epic.

Map configuration for Epic

Field in Jira	Field in Agile Development
Epic Name	Short Description
Priority	Priority
Summary	Description
Status	State

Map configuration for Story

Field in Jira	Field in Agile Development 2.0
Status	State
Sprint	Sprint
Description	Description
Priority	Priority
Epic Link	Epic
Summary	Short Description
Assignee	Assigned to

You can add or update the configuration for field, table, and choice maps of your projects between Jira and Agile Development 2.0 according to your organizational preferences. For details, see [Customizing map configuration for your Jira projects](#).

Importing issues and sprints from Jira to Agile Development 2.0

Understand the process of importing existing issues and sprints from Jira to Agile Development 2.0.

You can import existing issues from Jira projects as stories and epics, and existing sprint data from Jira boards as sprints to Agile Development 2.0. After importing the available data, any updates that you make to the epic, story, or sprint records will be synchronized automatically in both Jira and Agile Development 2.0.

Importing issues

From version 2.0.1, you can proceed to import issues from a Jira project directly after discovering projects from Jira. You do not have to create team integration settings. However, the imported issues are not associated to any assignment group in Agile Development 2.0. You can manually assign these issues to an assignment group later.

If you want your imported issues to be assigned to an assignment group automatically, you can create team integration settings for your Jira project by associating it to an Agile 2.0 assignment group and then proceed to import the issues. This setting ensures that any imported issues that belong to a Jira project are assigned to its associated assignment group.

Importing sprints

Importing sprint data from Jira boards require that the board has team integration settings that associate it to an Agile 2.0 assignment group. Sprint data of a Jira board is imported to its assignment group, only if these sprints have already started in Jira. Also, only the completed and current sprints of Jira are imported.

Team integration settings

From version 2.0.1, the Project Integration Settings module is available as Team Integration Settings. Team integration settings help you associate Jira projects and boards with Agile 2.0 assignment groups to facilitate the bidirectional synchronization of record updates.

Associating a Jira project to an assignment group allows the following:

- Enable import and export of all available stories and epics between this project and its associated group.
- View any new stories and epics or updates made to the existing stories and epics in both Agile Development 2.0 and Jira.

Associating a Jira board to an assignment group allows the following:

- Import all completed and current sprints from this board into the associated group.
- View any completed and current sprints or updates made to them in both Agile Development 2.0 and Jira.

To understand the workflow of the import and export of issues between Agile Development 2.0 and Jira, see [Importing and exporting issues between Agile Development 2.0 and Jira](#).

Associate a Jira project and board with an assignment group in Agile Development 2.0

Associate your Jira projects and boards with assignment groups in Agile Development 2.0 to enable import and export of all available issues between the associated project and assignment group.

Before you begin

- [Discover and import Jira projects and boards](#).
- Create assignment groups in Agile Development 2.0. See [Create an assignment group in Agile Development 2.0](#).
- Ensure that your Jira project has a defined mapping configuration.
- Role required: sn_jira_int.user

About this task

Create team integration settings to associate a Jira project and Jira board with an Agile 2.0 assignment group.

i Important:

You can associate an assignment group with only one project and board from Jira.

Procedure

1. Navigate to **All > Agile Jira Integration > Team Integration Settings**.
2. Click **New**.
3. On the Team Integration Settings form, select the following:
 - A Jira project
 - A Jira board
 - An assignment group in Agile Development 2.0 to which you want to associate the selected Jira project and board

Selecting a Jira board in the form is optional. If you do not want to synchronize the sprint data of the board between Agile Development 2.0 and Jira, you can skip selecting a Jira board.

i Note:

If your Jira project is of Kanban type, you can leave the **Jira board** field empty. All issues of your Kanban project will be mapped to a single Agile 2.0 group.

4. Click **Submit**.

What to do next

You can import or issues from this Jira project or sprints from this Jira board to the associated assignment group.

Related topics

[Import issues from a Jira project to Agile Development 2.0](#)

[Import sprints from Jira to Agile Development 2.0](#)

Import issues from a Jira project to Agile Development 2.0

Import available issues from a Jira project, with or without the team integration settings for this project, so that you can update existing records of Jira from Agile Development 2.0.

Before you begin

- [Discover and import Jira projects and boards](#)
- Role required: sn_jira_int.user

About this task

If your Jira project has team integration settings, then the imported issues are assigned to an assignment group according to the team integration settings. If your Jira project does not have team integration settings, then the imported issues are not associated to any assignment group.

i Note:

This task does not explain importing sprints. For information on how to import sprints from Jira, see [Import sprints from Jira to Agile Development 2.0](#).

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. From the Jira Projects related list, open the project from which you want to import the issues.
4. Enable the import and export of issues by selecting the **Enable Import** and **Enable Export** options as applicable.
Synchronisation of multi-select fields between Agile and Jira is now supported.
5. Click **Import Issues**.
6. Select a date range from which you want to import the issues from Jira.
7. Click **Submit**.

An import request of type Import Issues is created in the Jira Import Requests related list. Once the state of this request changes to Completed, you can view all the imported records in the Epics and Stories modules in Agile Development 2.0. The relationship between the stories and epics is retained as it is in Jira.

Note:

Existing comments and attachments of issues are not imported from Jira during a bulk import.

Import sprints from Jira to Agile Development 2.0

Import sprints from a Jira board so that you can track progress of these sprints directly in Agile Development 2.0.

Before you begin

- Ensure that the Jira board from which you want to import the sprints has team integration settings. For more information, see [Associate a Jira project and board with an assignment group in Agile Development 2.0](#).
- Role required: sn_jira_int.user

About this task

Import completed and current sprints of Jira board into Agile Development 2.0.

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. From the Jira Projects related list, open the project that is associated to a Jira board from which you want to import the sprints.
4. Enable the import and export of sprints by selecting the **Enable Import** and **Enable Export** options as applicable.
5. Click **Import Issues**.
6. Select a date range from which you want to import the sprints from Jira.
7. Click **Submit**.

An import request of type Import Sprints is created in the Jira Import Requests related list. Once the state of this request changes to Completed, you can view all the imported sprint data in the Sprints related list of the associated assignment group in Agile Development.

Schedule a job to auto-import issues from Jira to Agile Development 2.0

Schedule a job to auto-import issues and sprints periodically from Jira into Agile Development 2.0.

Before you begin

Role required: sn_jira_int.user

About this task

After you've configured the scheduled job, it imports issues from all the projects for which you've selected the **Enable import** option.

If you do not configure the scheduled job, you must manually import issues for the discovered projects.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.

2. Open the Import Jira Issue job.

The job is inactive by default.

3. Execute the job manually by clicking **Execute Now**.

4. Set the job to run at a scheduled time by selecting the **Active** check box.

You can edit the details of the **Run** and **Time** fields according to your preference.

5. Click **Update**.

Customizing map configuration for your Jira projects

Customize the field, table, or workflow state map configuration for your Jira projects. You can customize map configuration of a single project or multiple projects of the same project style.

Note:

Only fields of type number, select, text, and date are supported for custom map configuration.

Customize your table map configuration

Map a Agile Development 2.0 table of your preference for a Jira project.

Before you begin

- [Discover and import Jira projects and boards](#).
- Role required: sn_jira_int.user

About this task

Create a custom table map of your preference for your Jira project and configure its fields.

If you have a custom table that is applicable to all Jira projects of a specific project type, see [Apply custom map configuration to multiple Jira projects](#).

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.

2. Open your Jira instance record.

3. From the Jira Projects related list, open a Jira project for which you want to customize the map configuration.

- From the Table maps related list of the Jira project, click **New**.
- On the form, fill in the fields.

Table Map form

Field	Description
Internal Table	Table name in Agile Development 2.0.
Map configuration	Map configuration for this project. This field is auto-populated based on the project.
External Table	Table ID in Jira.
External Table Name	Display name of the table in Jira.

- Save the table configuration.
- From the Field Maps related list of your table map record, create new field maps for the following fields:

Field in Jira	Field in Agile Development 2.0
Summary of the issue	Short description
Description of the issue	Description

For information on how to configure field mapping for a table, see [Customize your field map configuration](#). You can also create other field maps for your new table configuration.

What to do next

- Validate your new table map configuration by clicking **Validate and fix mapping** from your project form.
- In the Table maps related list of your project, if the Valid column of your configuration shows:
 - true, validation of your map configuration is successful.
 - false, validation of your map configuration failed. Ensure that you enter correct values for all the fields and validate again.
- Create a business rule to support export of this new table map configuration to Jira. See [Create a business rule to apply a custom Agile Development 2.0 table map configuration](#).
- If you want to support import and export of attachments for this new table map, see [Allow import and export of attachments on a custom Agile Development 2.0 table](#).
- If you want to enable display of fields that reference Jira identifiers in your custom table map, see [Populate Jira project identifier reference fields for Agile Development 2.0 custom table](#).

Customize your field map configuration

Map a field of your preference for a Jira project.

Before you begin

- [Discover and import Jira projects and boards](#).
- Role required: sn_jira_int.user

About this task

If you have a custom field for a Jira project that you want to map with a field in Agile Development 2.0, you can create custom field map configuration that would apply only to this Jira project.

If you have a custom field that is applicable to all Jira projects of a specific project type, see [Apply custom map configuration to multiple Jira projects](#).The following field types are supported for custom field map configuration:

- Number
- Select
- Text
- Date
- Identity
- Date time
- Reference
- List

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. From the Jira Projects related list, open a Jira project for which you want to customize the map configuration.
4. From the Table Maps related list, open the Sprint, Epic, or Story record to add a new field map configuration for that record.
5. From the Field Maps related list, click **New**.
6. On the form, fill in the fields.

Field Map form

Field	Description
Internal Field	Field name in Agile Development 2.0.
Table Map	Table map in Agile Development 2.0, in which this field is created. This field is auto-populated based on the table map record you select.
Internal Table	Table in Agile Development 2.0. This field is auto-populated based on the table map record you select.
External Field	Field ID in Jira.
External Field Name	Display name of the field in Jira. Ensure that this field is added to the Jira project screen.

7. Click **Update**.

What to do next

1. Validate your field map configuration by clicking **Validate and fix mapping** from your project form.
2. From the Table maps related list of your project, navigate to your new field map configuration. If the Valid column of your configuration shows:
 - true, validation of your map configuration is successful.
 - false, validation of your map configuration failed. Ensure that you enter the correct values for all fields and validate again.

Important:

If your custom map configuration is invalid or if the custom field configured is not added to the default screen scheme of the issue, the export action does not work.

Configuring a reference field in Jira

Understand how to configure a reference field while creating a new field map configuration.

When you select a reference field for the **Internal Field** field, you must select a value for the **Lookup Column Name** field. The value from the **Lookup Column Name** field is used during the import and export of work items between Jira DevOps and Agile Development 2.0.

During import, the integration application searches for the record in the reference table using the **Lookup Column Name** field. If the record is not found, the value in the work item will be empty in Agile Development 2.0.

Customize your workflow state configuration

Create a custom workflow state map of your preference for a Jira project.

Before you begin

- [Discover and import Jira projects and boards.](#)
- Role required: sn_jira_int.user

About this task

Map a custom workflow state from Jira to Agile Development 2.0.

You can map a workflow state in Jira to multiple workflow states in Agile Development 2.0. In such cases, the state in Agile Development 2.0 for an issue type depends on the choice order value that you provide for this state configuration.

For example, the **In Progress** state in Jira is mapped to multiple states such as **Work in progress**, **Ready for testing**, and **Testing** in Agile Development 2.0 using a choice order of 10, 20, and 30.

So, when an **In Progress** issue from Jira is imported, the **State** field in Agile Development 2.0 is set to **Work in progress** as it has the lowest choice order value.

You can also map multiple workflow states in Jira to a single workflow state in Agile Development 2.0.

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. From the Jira Projects related list, open a Jira project for which you want to customize the choice map configuration.

4. Open the workflow state map for this project.
 - a. From the Table Maps related list, click **Story**.
 - b. From the Field Maps related list, click **Status**.
5. From the Choice Maps related list, click **New**.
6. On the form, fill in the fields.

Choice Map form

Field	Description
Internal Choice	Value of the workflow state in Agile Development 2.0. This value is an integer.
External Choice	ID of the workflow transition in Jira. Note: In case there is no transition, insert the ID of the workflow state.
External Choice Name	Display name of the workflow transition in Jira. Note: In case there is no transition, insert the display name of the workflow state.

7. Click **Update**.

What to do next

1. Validate your choice map configuration by clicking **Validate and fix mapping** from your project form.
2. From the Table maps related list of your project, navigate to your new choice map configuration. If the Valid column for your configuration shows:
 - o true, validation of your map configuration is successful.
 - o false, validation of your map configuration failed. Ensure that you enter correct values for all fields and validate again.

Apply custom map configuration to multiple Jira projects

Add a custom table or field, which is applicable to all your Jira projects of a specific type, to the map configuration template in Agile Development 2.0.

Before you begin

- [Discover and import Jira projects and boards](#).
- Role required: sn_jira_int.user

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.

3. From the Project Style Mappings related list, select the project template to which you want to add the custom field.
For example, if the field that you want to add is applicable to all Jira projects of the type Classic, then select **classic**.
4. Add the custom table or field from Agile Development 2.0 to the existing map configuration in the **Default Mapping** field.
You can copy the contents of the **Default Mapping** field into a JSON viewer to view the contents in a format of your preference. For example, as shown in the following figures, you can add a new table for Defect [rm_defect] to map the Bug table from Jira or a new field in the existing Story [rm_story] table to map story points.

Custom table map for Defects

```
    },  
  },  
},  
  
"rm_defect": {  
  "name": "Bug",  
  "fields": {  
    "short_description": {  
      "name": "Summary"  
    }  
  }  
},  
},  
  
"rm_epic": {
```

Custom field map for Story Points

```

{
  "rm_story": {
    "name": "Story",
    "fields": {
      "short_description": {
        "name": "Summary"
      },

      "story_points": {
        "name": "Story Points"
      },

      "description": {
        "name": "Description"
      },
      "epic": {
        "name": "Epic Link"
      },
    },
  },
}

```

Custom field for story points

Custom field map for Multi-select fields

```

{
  "rm_story" : {
    "name" : "Story",
    "fields" : {
      "short_description" : {
        "name" : "Summary"
      },

      "business_units" : {
        "name" : "BusinessChoices",
        "id" : "customfield_10062",
        "lookup_table_name" : "business_unit",
        "lookup_column_name" : "name"
      },

      "description" : {
        "name" : "Description"
      },
      "epic" : {
        "name" : "Epic Link"
      },
      "state" : {
        "name" : "Status",
      },
    },
  },
}

```

If you're adding a new field, ensure that the custom field configured is added to the default screen scheme of the issue.

5. Click **Update**.

What to do next

Apply the custom project style map to all its related Jira projects.

1. Delete the existing map configuration of all the imported Jira projects.

You can delete the map configuration of a project by making its **Mapping Config** field empty.

 **Tip:**

From the Jira Projects related list, make a multiple select on the **Mapping Config** field of all the Jira project records and remove their value, making all these fields empty.

2. If you've created a new table map, create a business rule to apply this new table map configuration. See [Create a business rule to apply a custom Agile Development 2.0 table map configuration](#).
3. Import these projects from Jira by clicking **Discover Projects**.

This would import all the Jira projects with their map configuration as per the customized project style map.

Create a business rule to apply a custom Agile Development 2.0 table map configuration

Create a business rule to enable export from your new custom Agile Development 2.0 table map configuration to your Jira projects.

Before you begin

Role required: admin or sn_jira_int.admin

About this task

After you create a custom table map for a single or multiple Jira projects, create a business rule similar to Synch Story with Jira to support export of information from this new table map from Agile Development 2.0 to Jira.

Procedure

1. Navigate to **All > System Definition > Business Rules**.
2. From the list of available business rules, locate and open the Synch Story with Jira rule.
3. From the context menu () , perform an Insert and Stay operation on this business rule. If you have not enabled the **Insert and Stay** action in your ServiceNow instance, see [Allow insert options on records](#) .
4. On the business rule form, edit the following fields.

Business rule form

Field	Description
Name	Unique name for the business rule. For example, if your new table map is to map defects, name this rule as Sync Defect with Jira.
Table	Select the Agile Development 2.0 table for which you've created the custom map. For example, Defect [rm_defect].

5. Click **Update**.

Allow import and export of attachments on a custom Agile Development 2.0 table

Enable import and export of attachments between Jira and Agile Development 2.0 for a custom Agile 2.0 table that you added to the map configuration.

Before you begin

Role required: admin or sn_jira_int.admin

Procedure

1. Navigate to **All > System Definitions > Business Rules**.
2. From the list of business rules, locate and open the Sync Attachment to Jira rule.
3. In the When to run section of the form, include your custom table map by adding it to the filter conditions.
For example, if the custom table that you added is Defect, do the following:
 - a. Click **Add "OR" Clause**.
 - b. Set the new clause to **Table name is rm_defect**.
4. Click **Update**.

Populate Jira project identifier reference fields for Agile Development 2.0 custom table

Enable Jira identifier reference fields for your Agile Development 2.0 custom table that you added to the map configuration.

Before you begin

Role required: admin or sn_jira_int.admin

About this task

You can display references of ID, key, Jira project, and the project URL on your custom table form by adding this table to the Populate External Identifier Reference business rule.

Procedure

1. Navigate to **All > System Definitions > Business Rules**.
2. From the list of business rules, locate and open the Populate External Identifier Reference rule.
3. In the When to run section of the form, include your custom table map by adding it to the filter conditions.
For example, if the custom table that you added is Defect, do the following:
 - a. Click **Add "OR" Clause**.
 - b. Set the new clause to **Reference table is rm_defect**.
4. Click **Update**.

What to do next

Configure the form layout or personalize the list layout of your custom table to display any or all of the following fields.

- External ID
- External Key
- External Project
- External URL

Related topics

[Personalise a v2 list](#) 

[Configuring the form layout](#) 

Reset mapping configuration of Jira projects

Reset the existing mapping configuration for multiple Jira projects to a default mapping configuration.

Before you begin

- [Discover and import Jira projects and boards](#)
- Role required: sn_jira_int.user

About this task

Apply a default mapping configuration to all or a few Jira projects. Any existing custom mapping configuration for these projects will be deleted after you reset the mappings.

If you've cleared the **Mapping Config** field or deleted the existing table maps for this project, resetting the mappings for this project will restore the mapping configuration to the default configuration.

Procedure

1. Navigate to **All > Agile Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. Reset the mappings of multiple Jira projects using one of the following ways.

Result

The mapping configuration of the projects is updated to as per the **Default Mapping** field in the Project Style Mappings form that the selected projects belong to.

Importing and exporting issues between Agile Development 2.0 and Jira

Understand the workflow for the import and export of issues between Agile Development 2.0 and Jira.

To export and import issues between Agile Development 2.0 and Jira, you must complete the [team integration settings](#) for your Jira projects.

Importing to Agile Development 2.0 from Jira

- When you create an issue of type epic in a Jira project, an epic is created for the assignment group according to the team integration settings that you configured.
- When you create an issue of type story in a Jira project, a story is created for the assignment group according to the team integration settings that you configured.
 - The relationship between the story and its epic is retained as it is in Jira.
 - The **Assigned To** field in the story displays the user from Jira, only if a user with the same email address is found in Agile Development 2.0.
- Only the fields that are defined in the field map are retained in the story or epic. For details of the default mapping configuration, see [Default mapping configuration between Agile Development 2.0 and Jira](#).

- When you add an attachment to an issue in Jira, the same attachment is added to the corresponding story or epic in Agile Development 2.0.
- When you add comments for an issue in Jira, they are updated in the **Work notes** field of the story or epic in Agile Development 2.0, based on the map configuration.

Note:

The images added in the comments appear as attachments.

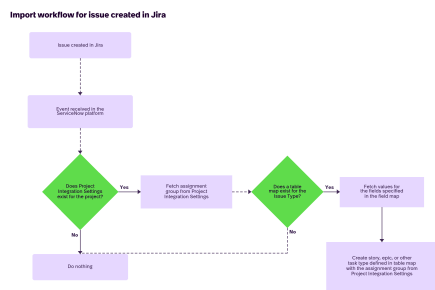

- When you delete an issue in Jira, the corresponding record is deleted in Agile Development 2.0.

Note:

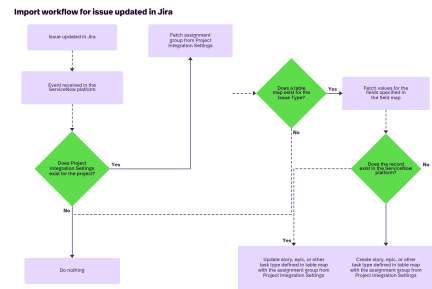

To delete records in Agile Development 2.0, set the **Can Delete** field to **true** in the Application access of the respective tables. For details, see [Table design and runtime settings](#).

- When you start a sprint in Jira, a sprint is created for the assignment group in Agile Development 2.0, if the Jira board is configured in the team integration settings.

Import workflow for issue created in Jira

Import workflow for issue updated in Jira

Exporting from Agile Development to Jira

- When you create an epic for an assignment group, it is exported to the project in Jira according to the team integration settings that you configured.
- When you create a story for an assignment group, it is exported to the project in Jira according to the team integration settings that you configured.
 - The relationship between the story and its epic is retained in Jira.
 - Updates to the **Assigned To** field in the ServiceNow platform is exported to Jira.
- When you add an attachment to a story or an epic, the same attachment is added to the corresponding issue in Jira.
- When you add work notes to a story or an epic, they are updated in the corresponding issue in Jira as comments.
- When you update the assignment group of an existing story in Agile Development 2.0, the issue is recreated in the Jira project that is associated with the updated assignment group.

- When you create a sprint for an assignment group in Agile Development 2.0, it is exported to Jira only if you configured the Jira board in the team integration settings.

Note:

If your Jira instance has state transition rules, the export sync from Agile Development 2.0 to Jira might fail. For example, if a transition rule in Jira restricts a story or work item from moving directly to a **Complete** state without first passing through an **In Progress** state, and the story is marked **Complete** without that intermediate step, the sync fails.

Troubleshooting issues of Jira integration with Agile Development 2.0

Resolve common issues that you might face while working with the integration of Jira and Agile Development 2.0.

Issue	Action
<p>The export action is not working.</p>	<ul style="list-style-type: none"> • Review your custom map configuration. <p>If your custom map configuration is invalid or if the custom field configured is not added to the default screen scheme of the issue, export does not work.</p> <ul style="list-style-type: none"> • Ensure that the Enable Export check box is selected in the project integration settings for this Jira project or board. • Check if your Jira password has expired.
<p>The sprint is not associated to the imported stories.</p>	<p>Verify if the sprint is started in Jira. If the sprint that is associated with the stories is a future sprint, then it is not associated to the stories in Agile Development.</p> <p>Sprint data from Jira is updated in Agile Development only if the sprint is active in Jira.</p>
<p>The sprint is not imported into Agile Development 2.0.</p>	<ul style="list-style-type: none"> • Ensure that your sprint in Jira has dates. • Ensure that the dates of a sprint in Jira does not overlap with another sprint in the same assignment group in Agile Development 2.0.
<p>A value from a field in Jira is not populated in Agile Development 2.0.</p>	<p>Verify if the custom field map is configured.</p>
<p>The value of Priority or State fields from Jira is not populated in Agile Development 2.0.</p>	<p>Verify if the custom workflow state map is configured.</p>
<p>An update by a user in Jira is not updated in Agile Development 2.0.</p>	<p>Ensure that the user credentials that are used to set up the integration of Jira with Agile</p>

Issue	Action
	Development are not used to perform record updates.
The issue is deleted in Jira and not deleted in Agile Development 2.0.	Ensure that the Can Delete field in the Application access of the respective tables is set to true.
For Jira cloud users, when you import, you see duplicate comments.	Verify the cyclic payload. Ensure that the privacy settings should be enabled for the connection user (used in http connection in Agile Development 2.0) to make the Email address visible in webhook events.
Deleting a project or board in Jira does not result in any action in Agile Development 2.0.	After deleting the project or board in Jira, the Jira administrator must manually delete the associated stories in the Agile Development 2.0.
Using rich text in Jira results in garbled text in Agile Development 2.0.	The wiki text format that is used in Jira is not supported.
For a Next-gen Jira project, when a story is created for an epic in Jira, the relation between story and epic is not imported to Agile Development 2.0.	In Jira, make a nominal update to the story which would send the epic relation along with this update to the Agile Development 2.0.
Sub tasks information is neither imported nor exported between Jira and Agile Development 2.0.	To enable import of sub tasks from Jira to Agile Development 2.0, you must manually configure custom mapping for this task type. For more information, see Customize your table map configuration .
For a Next-gen Jira project, scrum tasks are not exported from Agile Development 2.0 to Jira.	The application supports only the import of sub tasks from Jira to the Agile Development 2.0 but not the export of these tasks to Jira.
After discovering and importing projects, map configuration is not generated for a project.	Ensure that the user for whom the connection alias is created has access to all Jira projects.
The UI actions for Connect, Disconnect, and Validate and Fix result in an error when using for the first time.	This is a known issue. Retry the UI action.
While fetching Jira project metadata, the API call fails in the Flow designer, with a API response size exceeded error.	Reduce the value of the batch size property by setting it to any value between 1 and 50. For more information, see Define batch size for Jira project metadata .
Import Issues are staying in 'Processing' state forever.	Import requests are stuck because Reset mapping in't working as server type, as it was incorrectly set as 'cloud' instead of 'server'. Few customers will not setup connection attributes, and therefore 'server type' and 'server verions' are defaulted to 'cloud' and '8' respectively. Set guidelines for Jira on-

Issue	Action
	prem customers to use proper connection attributes.
Bulk importing of work items data fails with a API response size exceeded error.	Reduce the value of <i>MAX_LIMIT</i> in the JiraConstants Script Include and then try to bulk import the work items data again.

Enabling detailed project logs

To view all the details on project logging, enable the integration project logging property. For more information, see [Enable detailed project logging in Jira Integration with Agile Development](#).

Enable detailed project logging in Jira Integration with Agile Development

Understand how to enable integration project logging in Jira so that you can view details of the project logs.

Before you begin

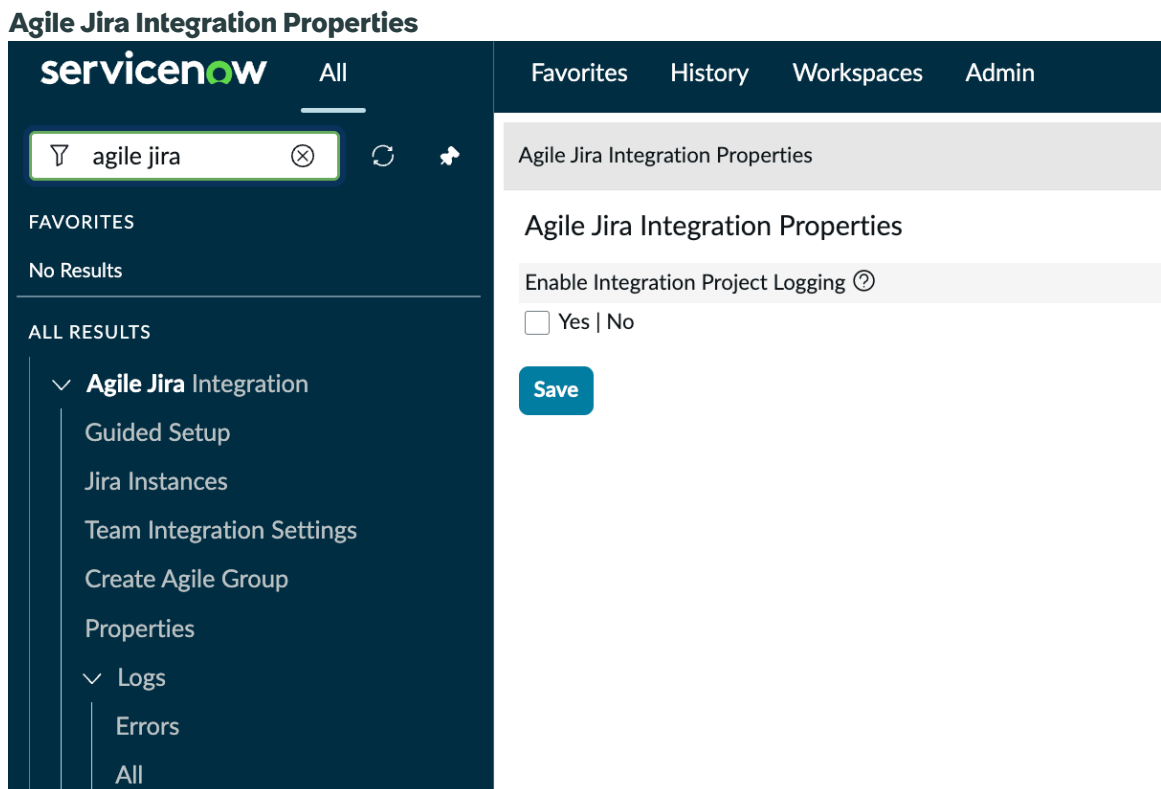

Role required: sn_jira_int.admin (with edit access) or sn_jira_int.user (with read access).

About this task

Enable the project logging property in the Agile Jira Integration application.

Procedure

1. Navigate to **All > Agile Jira Integration > Properties**.
2. Click the **Enable Integration Project Logging** check box.

3. Click **Save**.

Define batch size for Jira project metadata

Define a batch size value that is used to fetch the metadata from the Jira projects.

Before you begin

Role required: sn_jira_int.admin (with edit access) or sn_jira_int.user (with read access).

About this task

Reduce the value of the batch size property to resolve the **API response size exceeded** error that you might get while fetching Jira project metadata.

Procedure

1. Navigate to **All > Agile Jira Integration > Properties**.
2. Modify the **Define the batch size for fetching Jira project metadata** field value to a value less than 50.
The suggested value range is 5–50.
3. Click **Save**.

Microsoft Azure DevOps Integration for Agile Development

Enable bidirectional synchronization of work items between Microsoft Azure DevOps and ServiceNow® Agile Development 2.0 by integrating the two applications.

For example, if you update a record in Microsoft Azure DevOps, the update is reflected in Agile Development 2.0. Similarly, if you update a record in Agile Development 2.0, the update is reflected in Microsoft Azure DevOps.

The Integration of Microsoft Azure DevOps with Agile Development enables you to do the following:

- View available Microsoft Azure DevOps projects in Agile Development.
- Perform a bulk import of records from Microsoft Azure DevOps to Agile Development 2.0.
- Perform single record updates between Microsoft Azure DevOps and Agile Development 2.0.
- Avoid duplicating record update entries in Microsoft Azure DevOps and Agile Development 2.0.
- Plan, track, and update your tasks from a single application.

Starting with version 1.3, Microsoft Azure DevOps Integration for Agile Development supports process-level map configuration enabling you to configure multiple processes to be synchronized with Agile Development 2.0.

Request apps on the Store

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

Components installed with Microsoft Azure DevOps integration for Agile Development

Several types of components are installed with activation of the Microsoft Azure DevOps integration for Agile Development application, including user roles, scheduled jobs, and tables.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Roles installed

Role title [name]	Description	Contains roles
Azure DevOps integration admin [sn_ado_int.admin]	Has complete access to the application	<ul style="list-style-type: none"> sn_int_common.admin sn_ado_int.user
Azure DevOps integration user [sn_ado_int.user]	<ul style="list-style-type: none"> Sets up integration between Azure DevOps and Agile Development Can create new or update the existing map configurations between Azure DevOps and Agile Development 	<ul style="list-style-type: none"> connection_admin sn_int_common.user credential_admin

Scheduled jobs installed

Scheduled job	Description
Discover Azure Project Job	Discovers new Azure DevOps projects at a scheduled time and imports them automatically.
Import Azure DevOps Teams Areas and Iterations	Imports teams, areas, and iterations from Azure DevOps automatically at a scheduled time.
Import Azure DevOps Work Items	Imports work items from Azure DevOps automatically at a scheduled time.

All the scheduled jobs are inactive by default. For more information, see [Schedule jobs to import projects, teams, areas, and work items from Azure DevOps](#).

Tables installed

Table	Description
Area Team M2M [sn_ado_int_m2m_area_team]	Stores the relationship between teams and areas.
Attachment Map [sn_int_common_attachment_map]	Stores the mapping of attachments to issues between Azure DevOps and Agile Development.
Azure DevOps Area [sn_ado_int_area]	Stores the list of imported areas from Azure DevOps.

Table	Description
Azure DevOps Import Request [sn_ado_int_import_request]	Stores the list of all import requests created to import projects and process mappings from Azure DevOps.
Azure DevOps Instance [sn_ado_int_instance]	Stores the list of all Azure DevOps instances.
Azure DevOps Iteration [sn_ado_int_iteration]	Stores the list of imported iterations from Azure DevOps.
Azure DevOps project [sn_ado_int_project]	Stores the list of imported projects from Azure DevOps.
Azure DevOps Subscriptions [sn_ado_int_subscription]	Stores the subscription IDs of the event type for the webhooks registered in Azure.
Azure DevOps Team [sn_ado_int_team]	Stores the list of imported Azure DevOps teams.
Choice Map [sn_int_common_choice_map]	Stores the list of workflow state mapping for Azure DevOps projects.
Event Type [sn_int_common_input_event_type]	Stores information of the type of webhook events such as creating, updating, or deleting a work item.
External Identifiers [sn_int_common_external_identifiers]	Stores the list of all Azure DevOps reference identifiers such as External ID, External Key, External Project, External URL, and so on.
External Project [sn_int_common_project]	Stores information of the Azure DevOps project such as project ID, the Azure DevOps instance of this project, project name, and so on.
External System [sn_int_common_external_system]	Stores information of the Azure DevOps application used for the integration.
External System Version [sn_int_common_external_system_version]	Stores the API version information of the Azure DevOps application used for the integration.
Field Map [sn_int_common_field_map]	Stores the list of field mapping of different work items for Azure DevOps projects.
Process Mapping [sn_ado_int_process_mapping]	Stores the list of map configuration templates per Azure DevOps process.
Table Map	Stores the list of table maps for Azure DevOps projects.

Table	Description
[sn_int_common_table_map]	
Team Integration Settings [sn_agile_ado_int_import_settings]	Stores the list of one-to-one relation between Azure DevOps project, team, and an Agile assignment group.
Webhook Registry [sn_int_common_webhook_registry]	Stores details of the registry callback path for webhooks registered in Azure DevOps to receive event updates.

Setting up the integration between Microsoft Azure DevOps and Agile Development 2.0

Understand the setup process of Microsoft Azure DevOps Integration for Agile Development 2.0.

After you have the application installed in your ServiceNow instance, you can proceed to set up the integration, using the sn_ado_int.user role.

The setup process for the integration includes the following tasks:

1. Connect Agile Development 2.0 with Azure DevOps.
2. Discover and import available projects from Azure DevOps.
3. Import area, teams, and iterations into Agile Development 2.0 from Azure DevOps.
4. Set up the import and export between Agile Development 2.0 and Azure DevOps.
 - a. Register webhooks for an Azure DevOps project.
 - b. Associate Azure DevOps projects with assignment groups in Agile Development 2.0.
5. Bulk import work items and iterations into Agile Development 2.0. Enable a scheduled job to auto-import issues from Azure DevOps.
6. Create custom map configurations for tables, fields, and workflow states between Azure DevOps and Agile Development 2.0.

Connecting Agile Development 2.0 and Azure DevOps

Establish a connection between Agile Development 2.0 and Azure DevOps using a connection alias and an Azure DevOps instance.

Create an Azure DevOps connection alias

Create a Basic Auth credential and an HTTP(s) connection which will together be used as a connection alias to establish a connection with Azure DevOps.

Before you begin

Roles required:

- admin to create a connection and credential alias
- sn_ado_int.admin or sn_ado_int.user to create basic authorization credentials and HTTP(s) connection

Procedure

1. Create a Connection & Credential alias [🔗](#)
 - A connection alias (sn_ado_int.Azure_DevOps) is available by default.
 - You must create a connection alias for every Azure DevOps organization that you use.
2. Use OAuth 2.0 or Basic Auth to create credentials.

- OAuth 2.0: See [Set up the Microsoft Azure DevOps Boards spoke using OAuth](#).

Important:
 Make sure to specify a username in the OAuth 2.0 Credentials [oauth_2_0_credentials] table for the Credential Alias record. This username must correspond to the service account used to interact with Azure DevOps.

- Basic Authentication: See [Basic authentication credentials](#).

Note:
 When creating Basic Auth credentials, use the details of your personal access token in Azure DevOps.

- Set the **Password** field of the basic authentication credential as the personal access token in Azure DevOps.
- Set the **User Name** field of the basic authentication credential as the username used to create the personal access token in Azure DevOps.

If your login is in the format of *domainname | username*, use only the *username*.

3. Create [Create an HTTP\(s\) connection](#).

What to do next

[Create an Azure DevOps instance](#)

Create an Azure DevOps instance

Create an Azure DevOps instance record using the connection alias that you created. This instance is used to establish an integration between Agile Development 2.0 and Azure DevOps.

Before you begin

Role required: sn_ado_int.admin or sn_ado_int.user

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Azure DevOps Instance form

Field	Description
Name	Name of the Azure DevOps instance. Enter a name of your choice.
Connection Alias	Azure DevOps connection alias that you already created. Use the lookup (🔍) option to select your connection alias.
Version	Azure DevOps version. Use the lookup (🔍) option to select your Azure DevOps version.

4. Click **Submit**.

What to do next

[Connect to Azure DevOps](#)

.

Connect to Azure DevOps

Connect Azure DevOps with Agile Development 2.0 to enable the integration.

Before you begin

Role required: sn_ado_int.user

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances**.
2. Open your Azure DevOps instance record.
3. Click **Connect**.

Result

If the **State** field on the Azure DevOps Instance record shows:

- **Connected**, the connection is successful.
- **Not connected**, the connection could not be established. You can view the reason for the failure in the error message.

What to do next

[Discover and import Azure DevOps projects](#)

.

Discover and import Azure DevOps projects

Discover and import all available Azure DevOps projects into Agile Development 2.0 to start using the integration between the two applications.

Before you begin

- Complete [connecting Agile Development and Azure DevOps](#).
- Role required: sn_ado_int.user

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances**.
2. Open your Azure DevOps instance record.
3. Click **Discover Projects**.

This action creates requests to import Azure DevOps projects and process map configuration for all these projects. You can view all import requests in the Azure DevOps Import Requests related list. The initial state of these requests is **Requested**.

Result

Once the status of each import request changes to **Complete**, you can see that the related lists of this Azure DevOps instance are populated as follows:

- Azure DevOps Projects: All available projects from Azure DevOps
- Process Mappings: Map configuration for all the imported Azure DevOps projects according to the process type.

For example, default process types such as Agile, Basic, and CMMI or any custom process types that you defined for your Azure DevOps projects.

For more information on the default map configuration of work items, see [Default map configuration for Azure DevOps integration with Agile Development 2.0](#).

What to do next

[Import areas, teams, and iterations from Azure DevOps](#)

Default map configuration for Azure DevOps integration with Agile Development 2.0

Understand the default field map configuration, of different process types, between Azure DevOps and Agile Development 2.0.

By looking at the default map configuration for different process types, you can see how work item types in Azure DevOps are mapped in Agile Development. You can also see how fields are mapped between the two applications.

When you import available epics, stories, and issues from Azure DevOps, this data is stored in tables as defined in the process map configuration.

Note:

When you upgrade to version 1.3 of the application, map configuration is generated at the process level per process type and not at the instance level. You must update any custom maps that you previously configured to ensure that the import and export of work items is not impacted.

Here's how you can view the default map configuration for different process types.

1. Navigate to **Agile Azure DevOps Integration > Azure DevOps Instances**.
2. Open your Azure DevOps instance record.
3. From the Process Mappings related list, open the record for a process map.

You can add or update the configuration for field, table, and choice maps between Azure DevOps and Agile Development 2.0. For details, see [Customizing your map configuration for Azure DevOps integration](#).

The following are the details of the default map configuration for various process types in Azure DevOps.

Default mapping for Agile process

Default mapping configuration for Agile Process

Table in Azure DevOps	Table in Agile Development 2.0
User Story	Story [rm_story]
Epic	Epic [rm_epic]
Feature	Feature [sn_safe_feature]

Product Backlog Item	Story [rm_story]
Epic	Epic [rm_epic]

Import areas, teams, and iterations from Azure DevOps

Import areas, teams, and iterations of your Azure DevOps projects. These details are used to import sprint data and associate your Azure DevOps projects with assignment groups in Agile Development 2.0.

Before you begin

- [Discover and import Azure DevOps projects.](#)
- Role required: sn_ado_int.user

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances.**
2. Open your Azure DevOps instance record.
3. From the Azure DevOps Projects related list, open a project record.
4. Click **Import Areas, Iterations and Teams.**

Details of your import requests are available in the Azure DevOps Import Requests related list.

You can view all the imported teams, iterations, and areas in the Azure DevOps Teams, Azure DevOps Iterations, and Azure DevOps Areas related lists of this project.

What to do next

[Setting up import and export between Azure DevOps and Agile Development 2.0](#)

Setting up import and export between Azure DevOps and Agile Development 2.0

Configure the settings for the import and export actions of work items between Agile Development 2.0 and Azure DevOps.

To enable synchronization of work items, register webhooks for your Azure DevOps projects and associate your Azure DevOps projects and teams with assignment groups in Agile Development 2.0.

Register webhooks for an Azure DevOps project

Register webhooks to subscribe to the events from your Azure DevOps projects to Agile Development 2.0.

Before you begin

- [Discover and import Azure DevOps projects.](#)
- Role required: sn_ado_int.user

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances.**
2. Open your Azure DevOps instance record.
3. From Azure DevOps Projects related list, open your project record.
4. Click **Register Webhooks.**
If the webhook registration is successful, the **State** field in the project form changes from **Not Registered** to **Registered.**

Result

When you register webhooks in Azure DevOps, it receives the following event updates between Azure DevOps and Agile Development 2.0.

- Create a work item
- Update a work item
- Delete a work item
- Restore a work item
- Comment on a work item

For more information on synchronization of work items according to these webhook events, see [Importing and exporting work items between Agile Development and Azure DevOps.](#)

What to do next

[Associate Azure DevOps projects with assignment groups in Agile Development 2.0](#)

.

Associate Azure DevOps projects with assignment groups in Agile Development 2.0

Associate your Azure DevOps projects and teams with assignment groups in Agile Development 2.0 to enable import and export of issues between the two applications.

Before you begin

- [Import areas, teams, and iterations from Azure DevOps.](#)
- Create assignment groups in Agile Development. See [Create an assignment group in Agile Development 2.0.](#)
- Role required: sn_ado_int.user

About this task

After you associate an Azure DevOps team with an assignment group, you can:

- Import all available stories and epics of this team into the associated group.
- View any new stories and epics or updates made to the existing stories and epics in both Agile Development 2.0 and Azure DevOps.
- Import iterations as sprints in Agile Development 2.0.

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Team Integration Settings**.

2. Click **New**.

3. In the Team Integration Settings form, select:

- An Azure DevOps project.
- A team of your Azure DevOps project.
- An assignment group in Agile Development 2.0 with which you want to associate the selected Azure DevOps team.

The value of the **Default Area** field is filled automatically depending on the selected team.

Note:

If a **Default Area** value is already used for a Team Integration Settings record, then it cannot be used for another Team Integration Settings record because Backlog in Agile Development 2.0 can't be shared among multiple assignment groups.

Stories or epics that don't have an Assignment group in Agile Development 2.0 will not be synced with Azure DevOps. This is because values from the Team Integration Setting record are used determine which ADO project a story or epic in Agile Development 2.0 belongs to.

4. Click **Submit**.

You can view the details of your settings in the Team Integration Settings in the Azure DevOps Project form.

Note:

You can associate an assignment group with only one Azure DevOps team.

What to do next

[Import work items from Azure DevOps to Agile Development 2.0](#)

.

Related topics

[Importing and exporting work items between Agile Development and Azure DevOps](#)

Import work items from Azure DevOps to Agile Development 2.0

Import work items and iterations of an Azure DevOps project into Agile Development to track and update the status of your work.

Before you begin

- Set up team integration settings for your Azure DevOps projects. For more information, see [Associate Azure DevOps projects with assignment groups in Agile Development 2.0](#).
- Role required: sn_ado_int.user

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances**.
2. Open your Azure DevOps instance record.
3. From the Azure DevOps Projects related list, open a project record.
4. Enable import and export of work items by selecting the **Enable Workitems Import** and **Enable Workitems Export** options.
5. Enable synchronization of sprint data by selecting the **Sync Sprints** option.
6. Click **Import Work Items**.
7. Select a date and time range.
8. Click **Submit**.

Note:

The bulk import action doesn't import the **Description** and **Acceptance criteria** fields. However, if there's an update on these records in Azure DevOps after the import is done, these fields are synced in Agile through webhook events.

Details of your import requests are available in the Azure DevOps Import Requests related list.

You can view all the imported work items and sprints in the Agile Development application.

- The relationship between the stories and epics stays as it is in Azure DevOps.

The **Assigned to** field of the story is set to the user based on the user's email address, which must be unique per user account.

- The mapping of states of an iteration in Azure DevOps to sprints in Agile Development is as follows:

State in Azure DevOps	State in Agile Development 2.0
Past	Completed
Future	Draft
Current	Current

- Sprints are not created in Agile Development 2.0 for the following conditions:
 - If the date fields of the iteration in Azure DevOps are empty.
 - If the iteration has a child iteration associated to it.
 - If the sprints have overlapping dates.
- If two or more teams share a backlog iteration in Azure DevOps, a separate sprint record for each team is created in Agile Development 2.0.

What to do next

[Schedule jobs to import projects, teams, areas, and work items from Azure DevOps](#)

Schedule jobs to import projects, teams, areas, and work items from Azure DevOps

Schedule jobs to automatically import new projects, teams, areas, work items, and sprints periodically from Azure DevOps into Agile Development 2.0.

Before you begin

Role required: admin

About this task

If you do not configure the scheduled job, you must manually discover projects and import areas and teams.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.

2. Open one of the following jobs:

- Discover Azure Project Job
- Import Azure DevOps Teams Areas and Iterations
- Import Azure DevOps Work Items

These jobs are inactive by default.

3. To execute the job manually, click **Execute Now**.

4. To run the job at a scheduled time, select the Active check box.

You can edit the details of the **Run** and **Time** fields according to your preference.

5. Click **Update**.

6. Repeat the procedure for the other two scheduled jobs.

Customizing your map configuration for Azure DevOps integration

Customize the table, field, or state map configuration between Azure DevOps and Agile Development 2.0 according to your organizational preferences.

- Any modifications that you do to the existing map configuration of the process types would apply to all the Azure DevOps projects that use this process map.
- Only fields of type number, select, text, date, identity, date, date time, and reference are supported for custom map configuration.

Customize your table map configuration

Configure table maps between tasks, iterations, and work areas of Azure DevOps and tables in Agile Development 2.0 and configure its fields for Azure DevOps projects of a process type.

Before you begin

- [Discover and import Azure DevOps projects](#).
- Role required: sn_ado_int.user

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances**.

2. Open your Azure DevOps instance record.

3. From the Process Mapping related list, open a process map for which you want to customize the map configuration.

4. From the Table maps related list, click **New**.

5. On the form, fill in the fields.

Table Map form

Field	Description
Internal Table	Name of the table in Agile Development 2.0.
External Table	Table ID in Azure DevOps.
External Table Name	Display name of the table in Azure DevOps.

6. Save the table configuration.
7. From the Field Maps related list of your table map record, create new field maps to map the following fields.

Field in Azure DevOps	Field in Agile Development
Title of the work item	Short description

For information on how to configure field mapping for a table, see [Customize your field map configuration](#). You can also create other field maps for your new table configuration.

What to do next

1. Validate your new table map configuration by clicking **Validate and fix mapping** from your process map form.
2. In the Table maps related list, if the Valid column of your configuration shows:
 - true, validation of your map configuration is successful.
 - false, validation of your map configuration failed. Ensure that you enter correct values for all fields and validate again.
3. Create a business rule to support export of this new table map configuration to Azure DevOps. For more information, see [Create a business rule to apply a custom table map configuration](#).

Customize your field map configuration

Create a custom field map configuration to map a field in an Agile Development 2.0 table for Azure DevOps projects of a process type.

Before you begin

- [Discover and import Azure DevOps projects](#).
- Role required: sn_ado_int.user

About this task

The following field types are supported for custom field map configuration:

- Number
- Select
- Text
- Date
- Identity
- Date time

- Reference
- List

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances**.
2. Open your Azure DevOps instance record.
3. From the Process Mapping related list, open a process map for which you want to customize the map configuration.
4. From the Table maps related list, open a record to create a field map configuration for that table map.
5. From the Field Maps relates list, click **New**.
6. On the form, fill in the fields.

Field Map form

Field	Description
Internal Field	Field name in Agile Development 2.0.
Lookup Column Name	This field is required when you select a reference field as the internal field. For more information, see Configuring a reference field in Azure DevOps .
Table Map	Table map in Agile Development 2.0, in which this field is created. This field is auto-populated based on the table map record you select.
External Field	Field ID in Azure DevOps.
External Field Name	Display name of the field in Azure DevOps.

7. Click **Submit**.

What to do next

1. Validate your new table map configuration by clicking **Validate and fix mapping** from your process map form.
2. From the Table maps related list, navigate to your new field map configuration. If the Valid column of your configuration shows:
 - true, validation of your map configuration is successful.
 - false, validation of your map configuration failed. Ensure that you enter the correct values for all fields and validate again.

Important:

If your custom map configuration is invalid or if the required fields are not mapped for that work item, the export and import action does not work.

Configuring a reference field in Azure DevOps

Understand how to configure a reference field while creating a new field map configuration.

When you select a reference field for the **Internal Field** field, you must select a value for the **Lookup Column Name** field. The value from the **Lookup Column Name** field is used during the import and export of work items between Azure DevOps and Agile Development 2.0.

During import, the integration application searches for the record in the reference table using the **Lookup Column Name** field. If the record is not found, the value in the work item will be empty in Agile Development 2.0.

Customize your state map configuration

Create a custom state map for a field of an Agile Development 2.0 table to map the workflow states of your preference for Azure DevOps projects of a process type.

Before you begin

- [Discover and import Azure DevOps projects.](#)
- Role required: sn_ado_int.user

About this task

You can map a state in Azure DevOps to multiple states in Agile Development 2.0. In such cases, the state in Agile Development 2.0 for an issue type depends on the choice order value that you provide for this state configuration.

For example, when an work item from Azure DevOps that is in the **Active** state imported, the **State** field in Agile Development 2.0 is set to **Work in progress** as it has the lowest choice order value.

You can also map multiple states in Azure DevOps to a single state in Agile Development 2.0.

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances.**
2. Open your Azure DevOps instance record.
3. From the Process Mapping related list, open a process map for which you want to customize the choice map configuration.
4. Open the workflow state map for this process type.
 - a. From the Table Maps related list, click **User Story.**
 - b. From the Field Maps related list, click **state.**
5. From the Choice maps related list, click **New.**
6. On the form, fill in the fields.

Choice Map form

Field	Description
Internal Choice	Value of the state in Agile Development 2.0. This value is an integer.
External Choice	Name of the state in Azure DevOps.

Field	Description
External Choice Name	Display name of the state in Azure DevOps.

7. Click **Submit**.

What to do next

1. Validate your new table map configuration by clicking **Validate and fix mapping** from your process map form.
2. Navigate to your new choice map configuration. If the Valid column of your configuration shows:
 - true, validation of your map configuration is successful.
 - false, validation of your map configuration failed. Ensure that you enter the correct values for all fields and validate again.

Create a business rule to apply a custom table map configuration

Create a business rule to enable export from your new custom map configuration of an Agile Development 2.0 table to your Azure DevOps projects.

Before you begin

Role required: admin

About this task

After you create a custom table map for an Azure DevOps process type, create a business rule similar to Synch Story with Azure DevOps to support export of information using this new table map to Azure DevOps.

Procedure

1. Navigate to **All > System Definition > Business Rules**.
2. From the list of available business rules, locate and open the Synch Story with Azure DevOps rule.
3. From the context menu () , perform an Insert and Stay operation on this business rule. If you have not enabled the **Insert and Stay** action in your ServiceNow instance, see [Allow insert options on records](#)  .
4. On the business rule form, edit the following fields.

Business rule form

Field	Description
Name	<p>Unique name for the business rule.</p> <p>For example, if your new table map is to map defects, name this rule as Sync Defect with Azure DevOps.</p>
Table	<p>Select the table in Agile Development 2.0 for which you've created the custom map.</p> <p>For example, Defect [rm_defect].</p>

5. Click **Update**.

Allow import and export of attachments on a custom table

Enable import and export of attachments between Azure DevOps and Agile Development 2.0 for a custom table that you added to the map configuration of a process type.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definitions > Business Rules**.
2. From the list of business rules, locate and open the Sync Attachment to Azure rule.
3. In the When to run section of the form, include your custom table map by adding it to the filter conditions.
For example, if the custom table that you added is Defect, do the following:
 - a. Click **Add "OR" Clause**.
 - b. Set the new clause to **Table name is rm_defect**.
4. Click **Update**.

Populate Azure DevOps identifier reference fields for a custom table

Enable Azure DevOps project identifier reference fields for an Agile Development 2.0 table that you added to the map configuration of a process type.

Before you begin

Role required: admin

About this task

You can display references of ID, key, Azure DevOps project, and the project URL on your custom table form by adding this table to the Populate External Identifier Reference business rule.

Procedure

1. Navigate to **All > System Definitions > Business Rules**.
2. From the list of business rules, locate and open the Set external URL for Work Items rule.
3. In the When to run section of the form, include your custom table map by adding it to the filter conditions.
For example, if the custom table that you added is Defect, do the following:
 - a. Click **Add "OR" Clause**.
 - b. Set the new clause to **Reference table is rm_defect**.
4. Click **Update**.

What to do next

Configure the form layout or personalize the list layout of your custom table to display any or all of the following fields.

- External ID
- External Key
- External Project
- External URL

Configuring Azure DevOps integration with SAFe

Understand how to set up Microsoft Azure DevOps integration with SAFe in your ServiceNow instance.

1. Identify the process in Azure DevOps that maps to SAFe.

From the Process Mappings related list of your Azure DevOps instance record, identify the process that maps to SAFe configuration.

If the Process Mappings related list is empty, [discover Azure DevOps projects](#) and try again.

2. Update the map configuration to import SAFe entities.

For information on how to create a table, field, and workflow state mapping for SAFe entities, see [Customizing your map configuration for Azure DevOps integration](#).

3. See [Configuring Azure DevOps projects for SAFe](#).

Configuring Azure DevOps projects for SAFe

Set up SAFe related configuration in Azure DevOps projects and understand the workflow of SAFe PI and Sprint integration with Azure DevOps.

After creating map configuration for SAFe entities, [import areas, teams, and iterations](#) for your Azure DevOps projects and update the following fields. These fields are mandatory if **Sync Sprints** is set to **true**.

- **ART:** Select an agile release train (ART).
- **ART Iteration Path:** Select an iteration that is an equivalent to the parent of PI.

i Note:

If the ART Iteration Path lookup () does not return any records, [import areas, teams, and iterations from Azure DevOps](#) and try again.

For the example shown in the following screenshot, **Fabrikam** must be selected as the ART Iteration path.

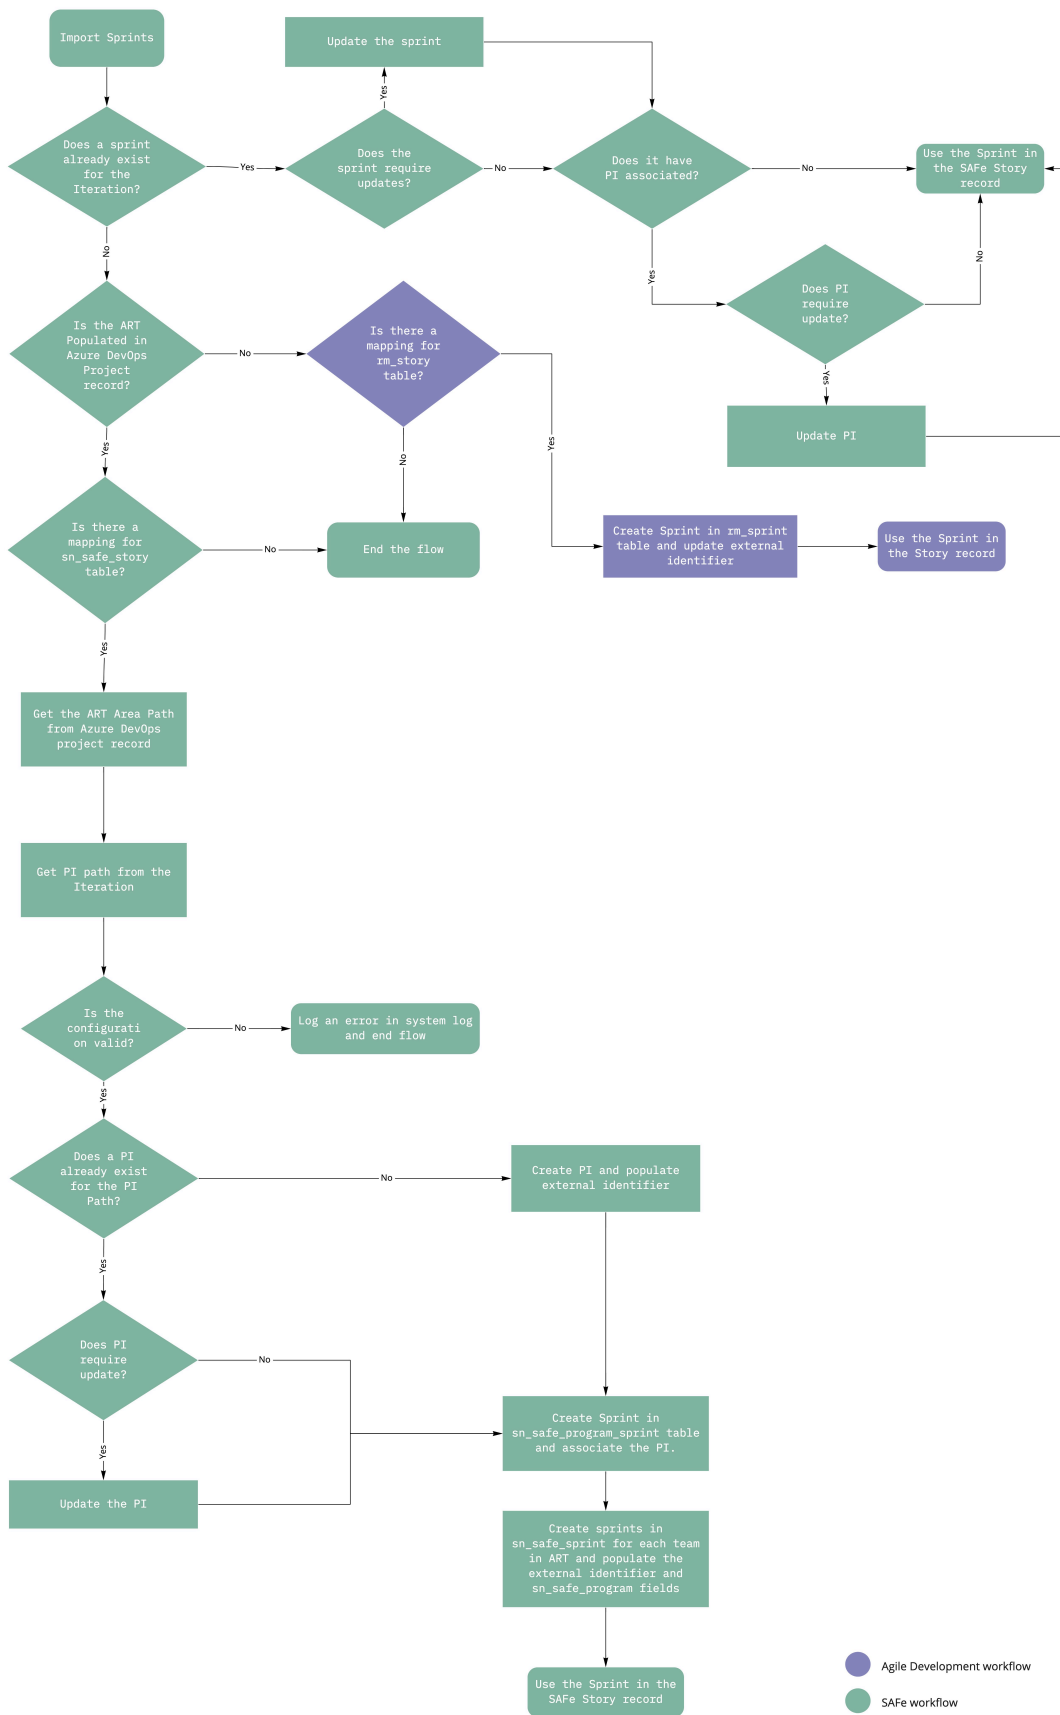

The application will then automatically identify PI 1 as the program increment and Sprint 1, Sprint 2, and so on, as the corresponding SAFe sprints in the ServiceNow instance.

Iterations		Start Date	End Date
▼ Fabrikam			
▼ PI 1		5/11/2020	7/10/2020
Sprint 1	...	5/11/2020	5/22/2020
Sprint 2		5/25/2020	6/5/2020
Sprint 3		6/8/2020	6/19/2020
Sprint 4		6/22/2020	7/3/2020
IP Sprint		7/6/2020	7/10/2020
Milestone 1		7/20/2020	7/20/2020
PI 2		7/13/2020	9/11/2020
PI 3		9/14/2020	11/13/2020

i Important:

- To create [team integration settings](#) for a project, the SAFe teams must be a part of the project's ART.
- All teams of an ART must share the same sprint cycle.

SAFe sprint and PI integration workflow

Troubleshooting issues of Azure DevOps integration with SAFe

Resolve common issues that you might face while working with the integration of Azure DevOps and SAFe.

Issue	Action
The ART and ART Iteration Path fields are not displayed in the Azure DevOps project form.	Ensure that table mapping exists for SAFe stories.
Sprint is not imported from Azure DevOps to SAFe.	<ul style="list-style-type: none"> • Check the state of the sprints. Sprints of only the states Future and Current are imported. • Ensure that there are no overlapping sprints.
PI is not imported from Azure DevOps to SAFe.	<ul style="list-style-type: none"> • Ensure that there are no overlapping PIs. • Ensure that the correct ART Iteration Path is selected in the Azure DevOps project form.
The error message <i>Ensure that the selected assignment group belongs to the ART and try again</i> is displayed in the Azure DevOps project form.	<p>The assignment groups in all the team integration settings of this Azure DevOps project must be the SAFe teams that belong to the ART selected for this project.</p> <p>If not, add these SAFe teams to the ART and proceed to create team integration settings using these SAFe teams as assignment groups.</p>
Sprints are not linked with SAFe features	Features can be linked to the PI but not with the sprints, as it's not supported in SAFe. Select the PI iteration path in the feature in the Azure DevOps portal, which should link the feature to the PI in SAFe.

Generate a default map configuration between Azure DevOps and Agile Development 2.0

Generate a default mapping for an Azure DevOps process type if you want to reset the existing map configuration.

Before you begin

- [Discover and import Azure DevOps projects.](#)
- Role required: sn_ado_int.user

About this task

You can restore the default map configuration of an Azure DevOps process type by deleting the existing table maps and then creating mappings for this process type.

When you import available work items such as epics and stories from Azure DevOps, this data is stored in tables as defined in the map configuration of the project's process type.

If the table map does not exist for a work item in your Azure DevOps process, this work item cannot be imported and exported between Azure DevOps and Agile Development 2.0.

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Azure DevOps Instances**.
2. Open your Azure DevOps instance record.
3. From the Process Mapping related list, open a process map for which you want to generate the default map configuration.
4. Click **Create Mappings**.

Note:

If a table maps already exist for this process, the **Create Mappings** button is not displayed.

A request of the type Create Mappings is created and is visible in the Azure DevOps Import Requests related list of your Azure DevOps instance.

Result

Once the state of the Create mappings request changes to **Completed**, you can see that the **Mapping Config** field of this Azure DevOps process is populated. Also, you can see the default map configuration in the Table Maps related list of this process.

[Customizing your map configuration for Azure DevOps integration](#)

Importing and exporting work items between Agile Development and Azure DevOps

Understand the workflow for the import and export of work items between Agile Development and Azure DevOps.

To enable import and export of work items between Agile Development 2.0 and Azure DevOps, you must [configure the settings](#).

Importing to Agile Development 2.0 from Azure DevOps

- When you create a work item of type epic in Azure DevOps, an epic is created for the assignment group according to the team integration settings that you configured.
- When you create a work item of type story in Azure DevOps, a story is created for the assignment group according to the team integration settings that you configured.

The relationship between the story and its epic is retained as it is in Azure DevOps.

- Only the fields that are defined in the field map configuration are retained in the story or epic. For the details of the default map configuration, see [Default map configuration for Azure DevOps integration with Agile Development 2.0](#).
- When you add an attachment to a work item in Azure DevOps, the same attachment is added to the corresponding story or epic in Agile Development 2.0.
- Any new iterations created in Azure DevOps do not create a corresponding sprint record in Agile Development 2.0 immediately.

When a work item is added for the first time to the new iteration in Azure DevOps, only then a corresponding sprint record is created in Agile Development 2.0. To ensure consistent data across the two applications at all times, create sprints in Agile Development 2.0.

- Only leaf level iterations are retained as sprints in Agile Development 2.0.
- When you add comments for an issue in Azure DevOps, they are updated in the **Work notes** field of the story or epic in Agile Development, based on the map configuration.

Note:

The images added in the comments are not supported.

- When you delete a work item in Azure DevOps, the corresponding record is deleted in Agile Development 2.0.
- When you delete an iteration in Azure DevOps, the corresponding sprint is deleted in the Agile Development 2.0.

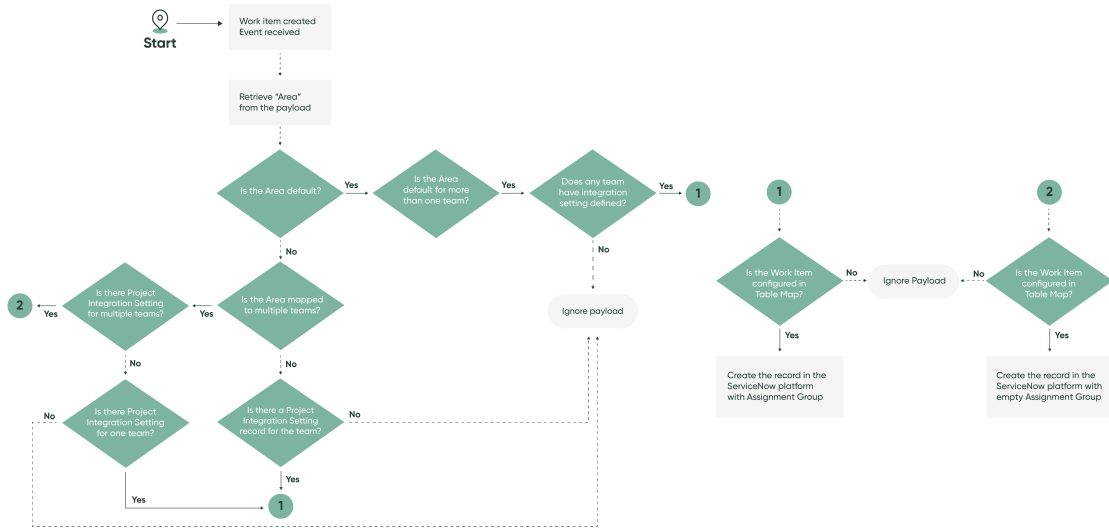

Note:

To delete records in the Agile Development 2.0, set the **Can Delete** field to **true** in the Application access of the respective tables. For details, see [Table design and runtime settings](#).

- When you restore a work item from recycle bin in Azure DevOps, a corresponding record is created in Agile Development 2.0 according to its team integration settings.

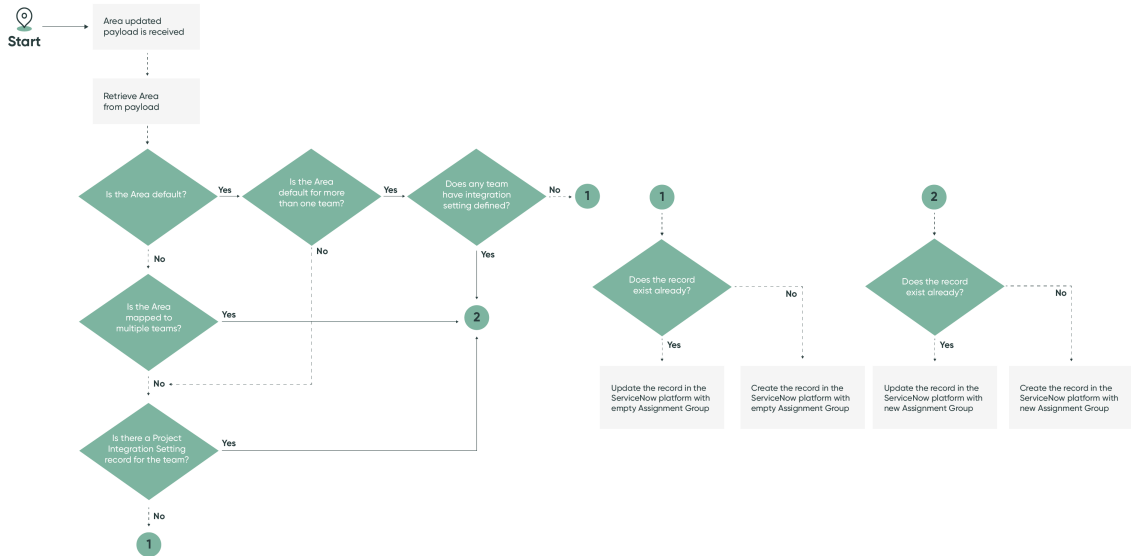

Import workflow for work items created in Azure DevOps

Import workflow for work item created in Azure DevOps

Import workflow for areas updated in Azure DevOps

Import workflow for area update in Azure DevOps

Exporting from Agile Development to Azure DevOps

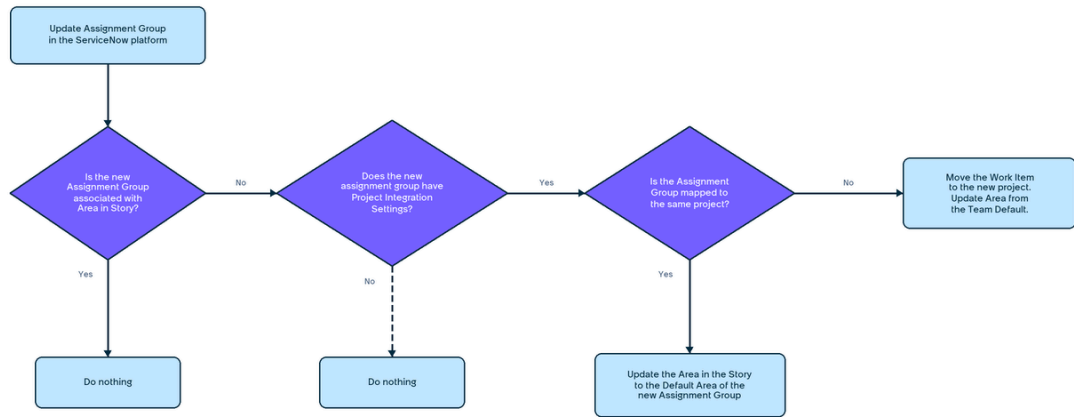

- When you create an epic for an assignment group, it is exported as a work item to the area in Azure DevOps according to the team integration settings that you configured.
- When you create a story for an assignment group, it is exported as a work item to the area in Azure DevOps according to the team integration settings that you configured.

The relationship between the story and its epic is retained in Azure DevOps.

- When you add an attachment to a story or an epic, the same attachment is added to the corresponding work item in Azure DevOps.
- When you update the assignment group of an existing story in the Agile Development 2.0, the work item is recreated for the Azure DevOps area that is associated with the updated assignment group.
- When you create a sprint for an assignment group in Agile Development 2.0, it is exported to Azure DevOps under its backlog iteration as per the team integration settings.
- When you delete a sprint for an assignment group in Agile Development 2.0, it unlinks the sprint selection from the team's iteration in Azure DevOps.
- When you update a work item in Agile Development 2.0, only the fields that are updated are sent to Azure DevOps as a part of the payload

Export workflow for assignment groups updated in Agile Development 2.0

Export workflow for assignment group update in Agile Development

Sync sprint details between Agile Development 2.0 and Azure DevOps

Sync sprint details from Agile Development 2.0 to Azure DevOps. Any change in the sprint details in Agile Development 2.0 is exported to Iteration paths in Azure DevOps, when the Sync sprint field is checked.

Sync Sprint details for a new work item in Agile Development 2.0

Sync Sprint	Export	Import
Disabled (Iteration path available in Azure DevOps)	Sends the default iteration path for the project to Azure DevOps.	Sprint value does not change in Agile Development 2.0.
Disabled (Iteration path is not available in Azure DevOps)	Sends the default iteration path for the project to Azure DevOps.	Sprint value does not change in Agile Development 2.0.
Enabled (Iteration path is available in Azure DevOps)	Sends the appropriate iteration path for the project to Azure DevOps.	Sprint value does not change in Agile Development 2.0.
Enabled (Iteration path is not available in Azure DevOps)	Sends the default iteration path for the project to Azure DevOps.	Sprint value clears in Agile Development 2.0.

Sync sprint details for an existing work item in Agile Development 2.0

Sync sprint	Export	Import
Disabled	Sends the previous iteration path to Azure. Iteration path will be same in Azure DevOps.	Sprint value in Agile Development 2.0 is selected.
Enabled	Sends the new iteration path based on the selection. Iteration will be changed based on selection.	Sprint value in Agile Development 2.0 is selected.

Troubleshooting issues for Azure DevOps integration with Agile Development

Resolve common issues that you might face while working with the integration of Azure DevOps and Agile Development 2.0.

Issue	Action
<p>The export action is not working.</p>	<ul style="list-style-type: none"> • Review your custom map configuration. If your custom map configuration is invalid or if the required fields are not mapped for that work item, export does not work. • Ensure that the Enable Export check box is selected for the project. • Check to see if your Azure DevOps password has expired.
<p>Sprint is not imported from Azure DevOps to Agile Development 2.0.</p>	<p>Sprints are not imported to Agile Development 2.0 for one of the following reasons:</p> <ul style="list-style-type: none"> • Any new iterations created in Azure DevOps do not create a corresponding sprint record in Agile Development 2.0 immediately. When a work item is added for the first time to the new iteration in Azure DevOps, only then a corresponding sprint record is created in Agile Development 2.0. To ensure consistent data across the two applications at all times, create sprints in Agile Development 2.0. • Ensure that there are no overlapping sprints.
<p>An assignment group is not populated for a story or an epic.</p>	<p>If the team is not associated with an assignment group in Agile Development 2.0, it can result in assignment group not being populated. Verify that project integration settings exist for your Azure DevOps team.</p> <p>If the area of a work item is mapped to multiple teams, the assignment group for that work item in Agile Development 2.0 is empty. In such cases, you can manually select an assignment group for this work item.</p>
<p>A value from a field in Azure DevOps is not populated in Agile Development 2.0.</p>	<p>Verify if the custom field map is configured.</p>

Issue	Action
<p>The value of Priority or State fields from Azure DevOps is not populated in Agile Development 2.0.</p>	<p>Verify if the custom state map is configured.</p>
<p>An update by a user in Azure DevOps is not updated in Agile Development 2.0.</p>	<p>Ensure that the user credentials that are used to set up the integration of Azure DevOps with Agile Development 2.0 are not used to perform record updates.</p>
<p>The work item is deleted in Azure DevOps but not deleted in Agile Development 2.0.</p>	<p>Ensure that the Can Delete field in the Application access of the respective tables is set to true.</p> <p>For details, see Table design and runtime settings .</p>
<p>Deleting a project, team, or area does not result in any action in Agile Development 2.0.</p>	<p>After deleting the project, team, or area in Azure DevOps, the Azure DevOps administrator must manually delete the corresponding Azure DevOps project and its associated stories in Agile Development 2.0.</p>
<p>New Azure DevOps projects are not imported automatically.</p>	<p>Manually discover projects from the Azure DevOps instance record to immediately synch the project updates or schedule a job to discover and import these updates on a daily basis.</p> <p>For more details on the scheduled jobs, see Schedule jobs to import projects, teams, areas, and work items from Azure DevOps.</p>
<p>Imported work items (epics and stories) of a project have no assignment group associated with them.</p>	<p>Ensure that you have team integration settings for this project. For more information, see Associate Azure DevOps projects with assignment groups in Agile Development 2.0.</p> <p>The assignment group associated to any imported work item of an Azure DevOps project is based on the team integration settings of that project. If the project does not have any team integration setting, the imported work item will have an empty assignment group.</p>
<p>Changes made to iterations in Azure DevOps are not reflecting immediately in Agile Development 2.0.</p>	<p>Manually import iterations from the Azure DevOps project record or schedule a job to discover and import these updates daily.</p>

Issue	Action
	For more details on the scheduled jobs, see Schedule jobs to import projects, teams, areas, and work items from Azure DevOps .
The UI actions for Connect, Disconnect, and Validate and Fix result in an error when using for the first time.	This error is a known issue. Retry the UI action.
When the Description field has & in Azure DevOps, it renders as & in Agile Development 2.0.	The field mapping between Agile Development 2.0 and Azure DevOps is not supported for HTML fields.
Export still works when the webhooks are de-registered.	Webhooks are only to import data from Azure DevOps to Agile Development 2.0. To stop the export of workitems, de-select the Export Work Items checkbox for the project.

Enabling detailed project logs

To view all the details on project logging, enable the integration project logging property. For more information, see [Enable detailed project logging in Microsoft Azure DevOps Integration with Agile Development 2.0](#).

Enable detailed project logging in Microsoft Azure DevOps Integration with Agile Development 2.0

Understand how to enable the integration project logging in Microsoft Azure DevOps integration with Agile Development 2.0 so that you can view detailed project logs.

Before you begin

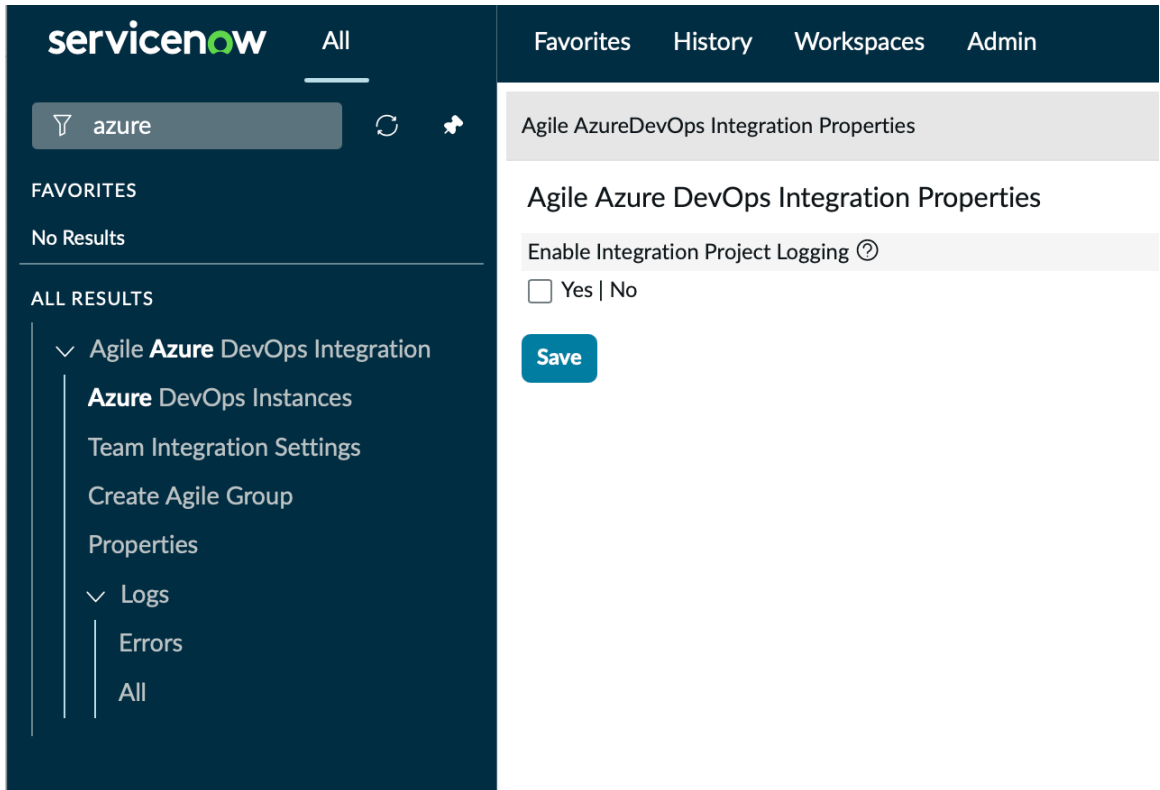

Role required: sn_jira_int.admin (with edit access) or sn_jira_int.user (with read access).

About this task

Enable the project logging property in the Agile Azure DevOps Integration application.

Procedure

1. Navigate to **All > Agile Azure DevOps Integration > Properties**.
2. Select the **Enable Integration Project Logging** check box.

3. Click **Save**.

Agile Development 2.0 reference

Reference information to provide additional details about Agile Development 2.0 application such as the fields, related lists, user roles, tables, guidelines, and domain separation information.

Components installed with Agile Development 2.0

Several types of components are installed with activation of the Agile Development 2.0 plugin, including tables, user roles, and properties.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Demo data is available for this feature.

Tables installed

Table	Description
Product Assignment Group [m2m_product_group]	Stores relationship between products and groups.

Table	Description
Release Assignment Group [m2m_release_group]	Stores relationship between releases and groups.
Application Model [cmdb_application_product_model]	Represents whole product whose releases are being managed.
Release Product [m2m_product_release]	Represents all managed products.
Story Dependencies [m2m_story_dependencies]	Represents all related stories (prerequisite and dependent) to an existing story.
Scrum task [rm_scrum_task]	Represents a discrete amount of work for a story carried out during a sprint.
Release team member [scrum_pp_release_team_member]	Represents the list of users who are part of a release.
Sprint team member [scrum_pp_sprint_team_member]	Represents the list of users who are part of a sprint.
Team [scrum_pp_team]	Represents who completes scrum tasks and stories during releases and sprints.
Team name [scrum_pp_team_name]	Represents the name of the scrum team.
Theme [scrum_theme]	Represents either a tangible product (such as a trading application) or an abstract goal (such as performance tuning).
Scrum release [rm_release_scrum]	Represents individual versions (releases) of the product. Each release contains a list of sprints with a time range in which the stories in those sprints must be completed.
Sprint [rm_sprint]	Stores sprints, which are the backlog items to be addressed together during a given time period.
Epic [rm_epic]	Represents related stories or requirements that you have not yet transformed into stories.
Story [rm_story]	Represents self-contained pieces of work that can be completed within a sprint.
Defect	Represents a deviation from the expected behavior of a product.

Table	Description
[rm_defect]	
Documentation Task [rm_doc]	Represents documentation tasks for the product.
Enhancement [rm_enhancement]	Represents an improvement to an existing product.
SDLC release [rm_release_sdlc]	Represents individual versions of the product.
Testing Task [rm_test]	Represents testing tasks for the product.

Note:

Dashboards in Agile Development require a separate plugin to be installed and configured. For information about Agile 2.0 dashboards and reports, including burndown charts and cumulative flow diagrams, see [Agile Development process flow](#) and [Performance Analytics Content Pack for Agile 2.0](#).

Properties installed with Agile Development 2.0

Properties are added with activation of Agile Development 2.0.

Agile Development 2.0 adds the following properties.

Note:

All of these properties are located in the System Properties [sys_properties] table. To access the table, enter `sys_properties.list` in the navigation filter.

Property	Usage
Draw Burndown Chart ideal line as a linear straight line com.snc.sdlc.scrum.pp.burndown.ideal.linear	Draws the burn down chart ideal line as a straight line. <ul style="list-style-type: none"> • Type: true false • Default value: false
Stories in any one of the states specified in this comma separated list will be shown in the progress board (in the order specified) com.snc.sdlc.scrum.pp.progress.story.states	Specify the story states using a comma separated list that should be shown in the story progress board. The states in the progress board follow the same order as specified here. <ul style="list-style-type: none"> • Type: integer • Default values in their order: <ul style="list-style-type: none"> ○ -6: Draft ○ 1: Ready

Property	Usage
	<ul style="list-style-type: none"> ○ 2: Work in progress ○ -7: Ready for testing ○ -8: Testing ○ 3: Complete
<p>Tasks in any one of the states specified in this comma separated list will be shown in the progress board (in the order specified)</p> <p>com.snc.sdlc.scrum.pp.progress.task.state</p>	<p>Specify the task states using a comma separated list that should be shown in the progress board. The states in the progress board follow the same order as specified here.</p> <ul style="list-style-type: none"> • Type: integer • Default values in their order: <ul style="list-style-type: none"> ○ -6: Draft ○ 1: Ready ○ 2: Work in progress ○ 3: Complete
<p>Enable the Actual Hours field for scrum tasks</p> <p>com.snc.sdlc.scrum.pp.task_uses_actual_hours</p>	<p>Enable the <i>Actual hours</i> field in the Scrum Task form. Displays actual hours of tasks on the task progress board.</p> <ul style="list-style-type: none"> • Type: true false • Default value: true
<p>The default sprint length (in days) used if the length cannot be calculated from the sprint.</p> <p>com.snc.sdlc.scrum.pp.default_sprint_length</p>	<p>Specify a default sprint duration that should be used when creating a sprint, if the sprint length cannot be calculated from the sprint.</p> <ul style="list-style-type: none"> • Type: integer • Default value: 14

Writing effective stories in Agile Development 2.0

Well-written stories are easy to understand by all developers and members of team members, such as Testing or Documentation.

Stories enable the assignment group to accurately estimate the effort required to implement the work according to the definition of done. Definition of done is the exit criteria agreed to by the group, that determines when a story is complete.

A story has the following basic conditions:

- Description: The story description relates to a user persona, such as administrator, and either describes a business value or addresses a technical debt.
- Acceptance criteria: The story acceptance criteria are measurable and testable.

Story descriptions

A good user story description identifies the following for meeting the stated requirement:

- the role of the user persona in the system
- the need expressed by the user persona
- the benefit to all stakeholders such as developers, users, and others

Typically, a story description is expressed as: "As a <role>, I want <goal or need>, so that <benefit>".

Examples of good story description

- Description: As a developer, I want to publish the current state of my application to an update set, so that I can deploy it to a production system.
- Description: As a customer, I want to receive notifications when comments are entered for an incident so that I am updated on the status.
- Description: As a change manager, I want to enable the assessment of risk for any given change by establishing a list of questions with multiple choice answers.

Example of bad story description

Description: Notifications are sent when incidents are created.

This description is poor because:

- The description does not state who or what is sending the notifications, not in what form the notification takes, such as email.
- The description does not include any benefit information, so the business value is not clear.

It could be better written as:

Description: As an incident creator, I want email notifications to be sent to a predefined set of interested parties when I create an incident, so that they can be informed when an incident affecting them is created.

Story acceptance criteria

Acceptance criteria define the boundaries of a user story, and are used to confirm when the software is working as intended, which means the story is completed. Acceptance criteria are an essential part of the 'Definition of Done' for a story.

Good acceptance criteria

Good acceptance criteria should include the following, where relevant:

- **Usability:** Be sure to include measures of usability in the acceptance criteria. Indicate how to answer the question: Is it easy to use? The key is to identify the right measurements and make sure each is quantifiable.
- **Functionality:** Identify specific user tasks, business processes, or functions that must be in place at the end of the project. A functional requirement might be: The user can choose from multiple sizes.
- **Error handling:** Enumerate error cases and how each should be handled. For example, if a user performs the steps in the wrong order, how will the software handle it?
- **Performance:** Test system performance from the perspective of an individual user. For example: Is the UI responsive?

- **Stress tests:** Describe how the system responds when it is under stress because there are many users, transactions, or queries. Acceptance criteria should define acceptable thresholds for stress testing. For example: Does the system respond within a 250-millisecond threshold when 100 users submit queries simultaneously?

Example of Good Acceptance Criteria

Description: As a customer, I want to order and pay for the book via a secure web-based form, so that my credit card information is safe.

Acceptance Criteria:

- All mandatory fields must be completed before a customer can submit a form.
- Information from the form is stored in the customer orders database.
- Payment can be made via Amex, Master Card, or Visa credit card.
- The system shall accurately calculate and apply sales tax.
- The system shall accurately calculate and apply shipping charges.
- The customer shall be able to verify the accuracy of the order.
- An acknowledgment email is sent to the customer submitting the form.
- Protection against spam is working.

Example of Bad Acceptance Criteria

Description: As a customer, I want to receive notifications when an incident is commented, so that I am updated on the status.

Acceptance Criteria: The appropriate people are notified when incidents are commented.

The acceptance criteria are poor because they do not give enough detail to test, for example, it is not clear who the appropriate people are.

The acceptance criteria could be better written as:

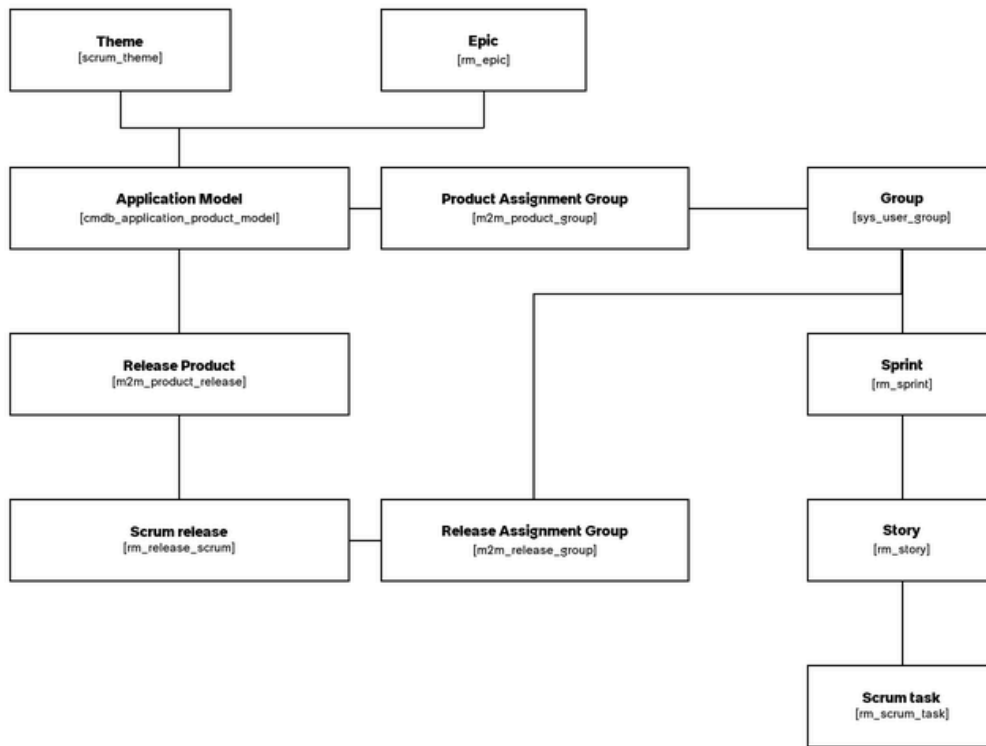

1. As an ESS user, create an incident.
2. Select **Notify interested parties**.
3. Save the incident.
4. Log in as an interested party.
5. Check that you have received an email for the logged incident.

Agile Development process data model

Learn about the relationship between tables that Agile Development 2.0 uses to manage the agile process, represent releases, and represent product backlog items to be included in a sprint.

The following diagram displays the Agile Development tables as well as their relationships to other tables.

Agile development process relationship diagram

Business stakeholder role for Agile Development 2.0

Use the business stakeholder role to read and retrieve data from any table of the Agile Development 2.0 and Scrum Programs applications to generate reports.

When you activate the Business Stakeholder plugin (com.snc.business_stakeholder) in your ServiceNow instance, the Read only roles for Agile 2.0 plugin (com.snc.agile_read_roles) is also activated. This plugin provides a business stakeholder role (sn_agile_read) with which you can access all the tables of Agile Development 2.0 and Scrum Programs applications. You can assign this role to any user in your organization who is a business stakeholder.

Plugin availability

If you are a new customer, the Read only roles for the Agile 2.0 plugin (com.snc.agile_read_roles) is activated on zBoot. However, the business stakeholder role (sn_agile_read) is available only when you activate the Agile Development 2.0 plugin (com.snc.sdlc.agile.2.0).

If you are an upgrade customer, you must manually activate the read-only roles for Agile 2.0 plugin (com.snc.agile_read_roles).

Agile Development 2.0 tables accessible by users with the business stakeholder role

When both the Read only roles for Agile 2.0 plugin (com.snc.agile_read_roles) and the Agile Development 2.0 plugin (com.snc.sdlc.agile.2.0) are active in your ServiceNow instance, the user with the business stakeholder role (sn_agile_read) has read access to the following tables.

Agile Development 2.0 tables

Table	Description
Product Assignment Group [m2m_product_group]	Stores relationship between products and groups.
Release Assignment Group [m2m_release_group]	Stores relationship between releases and groups.
Application Model [cldb_application_product_model]	Represents a whole product whose releases are being managed.
Release Product [m2m_product_release]	Represents all managed products.
Story Dependencies [m2m_story_dependencies]	Represents all related stories (prerequisite and dependent) to an existing story.
Scrum task [rm_scrum_task]	Represents a discrete amount of work for a story carried out during a sprint.
Sprint team member [scrum_pp_sprint_team_member]	Represents the list of users who are part of a sprint.
Team [scrum_pp_team]	Represents who completes scrum tasks and stories during releases and sprints.
Team name [scrum_pp_team_name]	Represents the name of the scrum team.
Theme [scrum_theme]	Represents either a tangible product (such as a trading application) or an abstract goal (such as performance tuning).
Scrum release [rm_release_scrum]	Represents individual versions (releases) of the product. Each release contains a list of sprints with a time range in which the stories in those sprints must be completed.
Sprint [rm_sprint]	Stores sprints, which are the backlog items to be addressed together during a given time period.
Epic [rm_epic]	Represents related stories or requirements that you have not yet transformed into stories.
Story [rm_story]	Represents self-contained pieces of work that can be completed within a sprint.

Agile Development 2.0 tables (continued)

Table	Description
Defect [rm_defect]	Represents a deviation from the expected behavior of a product.
Enhancement [rm_enhancement]	Represents an improvement to an existing product.

Scrum Programs tables

Table	Description
epic_backlog_definition	Stores the filter criteria that is used to create the epic backlogs.
scrum_program_m2m_group	Stores the relationship between a scrum program and its teams.

Domain separation in Agile Development 2.0

This is an overview of domain separation and how it works with Agile Development 2.0. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the customer must be able to see the SP’s response.

For more information on support levels, see [Application support for domain separation](#) .

How domain separation works in Agile Development 2.0

- The entities in Agile 2.0 extend the functions of task, so they inherit the domain behavior of tasks. The new entries you create go into the domain of the user currently logged in.
- [Agile Board](#) honors domain separation and lists the groups that the user belongs to for Sprint Planning and Sprint Tracking pages. The backlog entries that display are in the same domain as those that the current user owns or shares with other users. The stories that display in Agile Board are limited to the domain of the current logged-in user.

Related links and lists of assignment group in Agile Development 2.0

Use the related lists in the Group form for the actions that you need to perform for your assignment group in Agile Development 2.0, such as adding sprints and editing group members.

Related links in the Group form

Name	Description
Create Sprints	Create sprints for the team. New sprints are listed in the Sprints related list of the group.
Sprint Planning	Plan your sprint activities in Agile Development 2.0.

Related lists in the Group form

Name	Description
Group Members	Lists the members of the group. You can add or remove members in the agile group by selecting Edit . The Average points per sprint field rolls up to derive the group capacity for a sprint.
Sprints	Lists the sprints for the group. Click New to add a sprint to the group.

Related lists for a Product in Agile Development 2.0

Use the related lists in the Product form for the actions that you need to perform on your product record in Agile Development 2.0, such as associating releases, themes, epics, stories, or assignment groups.

The Product form related lists help you organize your agile work. Agile Development 2.0 extends the standard Scrum framework with Themes, which are a high-level organizational structure above Epics.

 **Tip:**

In Agile Development 2.0, Product > Theme > Epic > Story > Scrum Task. For detailed definitions, see [Basics of Agile Development](#).

Product form related lists

List	Description
Releases	Lists the releases associated with the product. You can create a release and associate it with this product by selecting New or add an existing release by selecting Add .

Product form related lists (continued)

List	Description
Themes	<p>A high-level area of focus with associated business value, related to one or more company goals. Themes help prioritize work and can be associated with multiple epics.</p> <p>Lists the themes that are part of the product. You can create a theme and associate it with this product by selecting New or add an existing theme by selecting Add.</p> <p>For more information, see Create a theme in Agile Development 2.0.</p>
Epics	<p>High-level definition of a requirement that provides business value, such as a new feature or significant enhancement. Epics are broken down into stories and can be worked on by single or multiple teams.</p> <p>Lists the epics associated with the product. You can create an epic and associate it with this product by selecting New or add an existing epic by selecting Add.</p> <p>For more information, see Create an epic in Agile Development 2.0.</p>
Stories	<p>Short, manageable pieces of work related to an epic. Stories capture the who, what, and why of a requirement in a simple, concise way, enabling accurate effort estimation.</p> <p>Lists the stories associated with the product. You can create a story and associate it with this product by selecting New or add an existing story by selecting Add.</p> <p>For more information, see Create a story in Agile Development 2.0.</p>
Groups	<p>Lists the groups assigned to the product. You can assign an existing agile group to the product by selecting Edit.</p> <p>You can associate one or more assignment groups (of type Agile Team) to a product.</p> <p>When you associate a product to a release, the groups assigned to the product are automatically added to the release too.</p>

Related lists for a Release in Agile Development 2.0

Use the related lists in the Release form for the actions that you need to perform for your release in Agile Development 2.0, such as associating products, stories, or assignment groups.

Release form related lists

List	Description
Products	<p>Lists the products associated with the release.</p> <p>You can create a product and associate it with this release by selecting New or add an existing product by selecting Add.</p>
Stories	<p>Lists the stories associated with the release.</p>

Release form related lists (continued)

List	Description
	<p>You can create a story and associate it with this release by selecting New or add an existing story by selecting Add.</p> <p>The stories you add here create the release backlog.</p>
Groups	<p>Lists the groups assigned to the release. You can assign an existing agile group to the release by selecting Edit.</p> <p>When you associate a product to a release, the groups assigned to this product are automatically added to the release.</p>

Related links and lists for a Story in Agile Development 2.0

Use the related links and related lists on the Story form for the actions that you need to perform on your story in Agile Development 2.0, such as adding scrum tasks, dependencies, or splitting the story.

Related links of a story

Name	Description
Split Story	<p>Splits the story into two stories by creating a new story with the same details. Any incomplete tasks from the old story are moved to this new story.</p> <p>Note: State of the Story cannot be Cancelled or Completed, and the Original task field, if present, cannot contain a non-story record such as a Catalog Task or Defect.</p>
Add Scrum Tasks	<p>Enables you to create multiple scrum tasks for the current story.</p> <p>The scrum tasks are listed in the Scrum Tasks related list of the story.</p> <p>For more information, see Create multiple scrum tasks for stories in Agile Development 2.0.</p>
Convert into epic	<p>Converts an active story into an epic and moves the story into the Cancelled state.</p> <p>If the story that you created is too large, you can convert it into an epic and then break it down into multiple stories.</p> <ul style="list-style-type: none"> If this story is already associated with an epic, then the story is turned into a child epic for this epic. <p>For example, STRY01 is converted to EPIC01. If STRY01 was associated with EPIC02, then EPIC01 becomes a child epic to EPIC02. Otherwise, EPIC01 is created as a standalone epic.</p> <ul style="list-style-type: none"> The state of the newly created epic is automatically set to Draft. The canceled story is associated with the newly created epic.
Copy Story	<p>Copies the details of an existing active story to a new story. The tests and tasks of the story are also copied.</p>

Related links of a story (continued)

Name	Description
	<p>The state of the newly created story is automatically set to Draft.</p> <p>This action is not available for stories added from the triage board.</p> <p>Note: State of the Story cannot be Cancelled or Completed, and the Original task field, if present, cannot contain a non-story record such as a Catalog Task or Defect.</p>

Related lists of a story

Name	Description
Scrum Tasks	<p>Lists the scrum tasks created for the story. Click New to create a scrum task.</p> <p>For more information, see Create a scrum task for Agile Development 2.0 stories.</p>
Prerequisite Stories	<p>Lists the stories that must be completed before the current story can be completed. Click Edit to add prerequisite stories.</p>
Dependent Stories	<p>Lists the stories that depend on the current story. Click Edit to add dependent stories.</p>
Tests	<p>Adds existing tests to the story.</p> <p>These tests are also listed on the Sprint Tracking tab of Agile Board after the sprint of this story starts.</p>

Related lists for a Theme in Agile Development 2.0

Use the related lists on the Theme form for the actions that you need to perform for your theme in Agile Development 2.0, such as associating stories or epics with the theme.

Related lists of a theme in Agile Development 2.0

Field	Description
Epics	<p>Lists the epics associated with the theme.</p> <p>You can create a new epic and associate it with this theme by selecting New</p>
Stories	<p>Lists the stories associated with the theme.</p> <p>You can create a new story and associate it with this theme by selecting New</p>

Test version form in Agile Development 2.0

Learn about the fields of the Test version form. Use this form to create and run tests for a story in Agile Development 2.0.

Test Version Form

Fields	Description
Test	Unique name of the test.
Owner	Owner who created the test.
Version	Automatically generated version of the test.
State	<p>Current state of the test.</p> <ul style="list-style-type: none"> • Draft: State of the test when it is created. • Ready: State of the test when it is not editable. When the test has multiple versions, only one test will be in Ready state at any one time • Retired: State of the test when it is no longer used.
Short description	Brief description about the test.
Add Step	Option to add step to a test.
Run	Button used to run steps, which is displayed only when the test is in the Ready state. See Run tests for a story in Agile Development 2.0.
Update	Option to update the details of a test version.
Ready	Option to change the state of the test version to ready.
Create New Version	Option to create another version of the test.
Delete	Option to delete the test version.
Change step order (☰)	Option to change the order of a test step. Select the icon and drag a step to the required location.
Needs Verification	Option to mark a test step for verification.
Delete a test step (🗑️)	Option to delete a test step.

Mobile experience for Agile Development 2.0

Track and update the status of your stories and scrum tasks of the current sprint from your mobile device using the Agile Development v2 mobile app.

With the Agile Development v2 mobile app, you track sprints for the assignment groups that you are a part of. From your mobile device, you can do the following operations for the current sprint:

- View the status and details of stories and scrum tasks from the assignment groups that you are a part of.
- Edit and update the details of stories and scrum tasks.
- Create scrum tasks for a story.
- Add work notes and attachments to a story or scrum task.
- Collaborate with other stakeholders on a story or scrum task.
- Receive mobile notifications when notes are added to your story or scrum task.

Install Agile Development v2

Install the Agile Development v2 mobile app (sn_store_agile_mob) from ServiceNow Store.

Before you begin

Role required: admin

Procedure

1. Navigate to [ServiceNow Store](#) .
2. In ServiceNow Store, search for Agile Development v2.
3. Click the application tile.
You can view detailed information about the application.

Note:

Consider reading the Other Requirements and Dependencies sections, as applicable.

4. Click **Request App** and enter your Now Support login credentials.
5. Click **Buy**.
6. Enter the **Instance Name** and **Reason for the Instance**, and click **Validate Instance**.
7. Click **Request**.
You receive an email with detailed installation instructions.
8. Log in to the instance on which you want to install the Agile Development.

9. Navigate to **System Applications > Applications**.
10. Locate the application, select it, and click **Install**.

What to do next

[Get started with Agile Development v2 mobile app](#)

Get started with Agile Development v2 mobile app

Access the Agile Development mobile app to track your sprints, stories, and tasks.

Before you begin

- Download the Mobile Agent mobile app from App Store (iOS) or Google Play Store (Android).
- [Install Agile Development v2](#) on your ServiceNow instance.
- Role required: admin

Procedure

1. Log in with your ServiceNow instance address on the Mobile Agent app on your mobile device in one of the following ways:

Existing user	<ul style="list-style-type: none"> ○ If you installed the Agile Development v2 mobile app on an instance that you already use in the Mobile Agent app, refresh the app to see Agile 2.0 as an applet launcher. ○ If you installed the Agile Development mobile v2 app on a different instance: <ol style="list-style-type: none"> a. Log out by tapping Settings > Log out. b. Tap the add icon () and log in with your new ServiceNow instance address.
New user	<ol style="list-style-type: none"> a. Enter the instance address in one of the following two ways: <ul style="list-style-type: none"> ▪ Type the instance address in the instance address field. ▪ If your administrator provided you with a QR code, tap the QR icon () and scan the QR code. b. Tap Save and log in.

2. Log in using your user name and password.
3. Tap the Agile Development v2 icon () to start tracking your sprints, stories, and scrum tasks.

What to do next

Go to

- [Managing stories on Agile Development v2 mobile app.](#)
- [Managing scrum tasks on Agile Development v2 mobile app.](#)

Managing stories on Agile Development v2 mobile app

View, edit, and update the details of stories assigned for the current sprint on your mobile device.

On your mobile device, open the Mobile Agent app and navigate to Agile Development v2. Perform the following actions with the role of `scrum_product_owner`, `scrum_team_member`, or `scrum_master`.

Tracking stories on Agile Development v2

From your mobile device, track all stories of an assignment group including the stories that are assigned to you from multiple assignment groups.

All stories of an assignment group

1. In the Sprint Tracking applet, tap **See All**.
2. Tap the name of an assignment group to open it.
3. Tap **All Stories**.

Stories assigned to you from an assignment group

1. In the Sprint Tracking applet, tap **See All**.
2. Tap the name of an assignment group to open it.
3. Tap **My Stories**.

Note:

The **My Stories** tab appears only to the users of role `scrum_team_member`.

All stories assigned to you

The My Stories applet shows all stories that are assigned to you for the current sprint, from all assignment groups.

- To view all stories as cards, swipe left in the applet.
- To view the list of all stories, tap **See All** on the applet.

Note:

The My Stories applet appears only to the users of role `scrum_team_member`.

Blocked stories

The Blocked Stories applet shows all stories that are blocked.

- To view all blocked stories as cards, swipe left in the applet.
- To view the list of all blocked stories, tap **See All** on the applet.

Note:

The Blocked Stories applet appears only to the users of role `scrum_master` and `scrum_product_owner`.

Swipe left on a story record to find quick actions that enable you to add comments to the story or update its state.

Tap a story to view more details. For example, you can view the epic, acceptance criteria, description, and so on.

Update a story on Agile Development v2

Edit and update the details of your Agile Development 2.0 stories from your mobile device.

Before you begin

Role required: `scrum_product_owner`, `scrum_team_member`, or `scrum_master`

Procedure

1. Navigate to a story from the Sprint Tracking or My Stories applet.
2. Tap the story to open it.
3. To update the story details:
 - a. Tap **Details** and then tap **Edit**.
 - b. Edit the fields that you want to update.

You can edit the fields for state, short description, story points, assigned to, priority, and the sprint to which the story belongs.

- c. Tap **Submit**.

Note:

If you update the sprint of the story to a future sprint, this story no longer appears in the app unless that sprint starts. Ensure that the state of the sprint is current.

4. To add work notes or attachments to the story:
 - a. Tap **Activity**.
 - b. Choose the activity that you want to perform.

Available options include adding work notes, files, pictures, and so on.

Managing scrum tasks on Agile Development v2 mobile app

View, edit, and update the details of scrum tasks that were created for the stories of the current sprint on your mobile device.

On your mobile device, open the Mobile Agent app and navigate to Agile Development v2. Perform the following actions with the role of `scrum_product_owner`, `scrum_team_member`, or `scrum_master`.

Tracking scrum tasks on Agile Development v2

From your mobile device, track all scrum tasks of an assignment group including the scrum tasks assigned to you from multiple assignment groups.

All scrum tasks of an assignment group

1. In the Sprint Tracking applet, tap **See All**.
2. Tap the name of an assignment group to open it.
3. Tap **All Scrum Tasks**.

Scrum tasks assigned to you from an assignment group

1. In the Sprint Tracking applet, tap **See All**.
2. Tap the name of an assignment group to open it.
3. Tap **My Scrum Tasks**.

Note:

The **My Scrum Tasks** tab appears only to the users of role `scrum_team_member`.

All scrum tasks assigned to you

The My Scrum Tasks applet shows all scrum tasks that are assigned to you for the current sprint, from all assignment groups.

- To view all scrum tasks as cards, swipe left in the applet.
- To view the list of all scrum tasks, tap **See All** on the applet.

Note:

The My Scrum Tasks applet is visible only to the users of role `scrum_team_member`.

Swipe left on a scrum task record to find quick actions that enable you to add comments to it or update its state.

Tap a scrum task to view more details such as the task type, story, assigned to, description, activity, and so on.

Create a scrum task on Agile Development v2

Add a scrum task for a story from the mobile app.

Before you begin

Role required: `scrum_product_owner`, `scrum_team_member`, or `scrum_master`

Procedure

1. Navigate to a story from the Sprint Tracking or My Stories applet.
2. Tap which story you want to add a new scrum task to.

3. Tap the more options icon ( on iOS) or ( on Android) and tap **New Scrum Task**.

4. On the form, fill in the fields.

New scrum task mobile form

Field	Description
Short Description	Brief description of the scrum task.
Description	Detailed description of the scrum task.
Planned Hours	Estimated number of hours to complete the task. A typical scrum task takes between 4 and 12 hours. If the task requires more than 12 hours, consider breaking it down into multiple tasks.

Field	Description
Priority	Priority for the task.
Type	Type of work involved.
State	Current state of the scrum task. The default state for a new scrum task is Draft .

5. Tap **Submit**

Note:
Submit appears only if all the required fields are filled.

Update a scrum task on Agile Development v2

Edit and update the details of the scrum tasks of your stories from your mobile device.

Before you begin

Role required: scrum_product_owner, scrum_team_member, or scrum_master

Procedure

1. Navigate to a scrum task from the Sprint Tracking or My Scrum Tasks applet.
2. Tap the scrum task which you want to update the details of.
3. To update the scrum task details:
 - a. Tap **Details** and then tap **Edit**.
 - b. Edit the fields that you want to update.

You can edit the fields of state, task short description, description, assigned to, actual hours, and priority of the scrum task.

- c. Tap **Submit**.
4. To add work notes or attachments to the scrum task:
 - a. Tap **Activity**.
 - b. Choose the activity that you want to perform.

Available options include adding work notes, files, pictures, and so on.

Scaled Agile Framework (SAFe)

The ServiceNow[®] Scaled Agile Framework (SAFe) application helps you apply lean and agile principles to your large enterprise enabling you to develop and deliver software products with fewer defects in the shortest viable lead time.

Scaled Agile Framework application overview. Approximately three minutes long.

SAFe overview

- Provides a broader, high-level perspective as well as the ability to manage development processes throughout all levels of your organization.
- Facilitates collaboration and streamlines the planning and monitoring of activities across business units, departments, and teams.

Note:

SAFe and Scaled Agile Framework are registered trademarks of [Scaled Agile, Inc](#), and ServiceNow is a Scaled Agile, Inc. Platform Partner.

Configurations of SAFe

ServiceNow provides applications that support two different configurations of SAFe: Essential SAFe and Portfolio SAFe. The sections below explain the features of each configuration, and will help you choose the right configuration for your organization.

Essential SAFe

With Essential SAFe, you can apply lean and agile principles to your Agile Release Trains and teams, and develop and deliver work with fewer defects in the shortest viable lead time.

Portfolio SAFe

With Portfolio SAFe, you can align your organizational goals and strategies with your portfolios, and apply lean and agile principles to seamlessly manage and deliver your portfolio work.

Domain separation and Scaled Agile Framework (SAFe)

Domain separation is supported in the Scaled Agile Framework (SAFe) application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#).

Business stakeholder role for Essential SAFe and Portfolio SAFe

Use the business stakeholder role to read and retrieve data from any table of the Essential SAFe and Portfolio SAFe applications to generate reports.

i Important:

Starting with the Xanadu release, the plugins Portfolio SAFe, Essential SAFe, Performance Analytics Content Pack for Essential SAFe, Work Progress Status for SAFe, Agile - Scaled Agile Framework - Unified Backlog, and Read only roles for SAFe are being prepared for future deprecation. These plugins will be hidden and can no longer be activated on new instances but will continue to be supported. [Enterprise Agile Planning in Strategic Planning](#) provides the latest experience for this functionality.

For more information on the deprecation process and its impact, see the [Application/Plugin Deprecation Process \[KB0867184\]](#) article in the Now Support Knowledge Base.

When you activate the Business Stakeholder plugin (com.snc.business_stakeholder) in your ServiceNow instance, the Read only roles for SAFe plugin (com.snc.sdlc.safe_read_roles) is also activated. This plugin provides a business stakeholder role (sn_safe_read) with which you can access all the tables of Essential SAFe and Portfolio SAFe applications. You can assign this role to any user in your organization who is a business stakeholder.

Plugin availability

If you are a new customer, the Read only roles for SAFe plugin (com.snc.sdlc.safe_read_roles) is activated on zBoot. However, the business stakeholder role (sn_safe_read) is available only when you activate the Agile - Scaled Agile Framework - Essential SAFe plugin (com.snc.sdlc.safe) or Agile - Scaled Agile Framework - Portfolio SAFe plugin (com.snc.sdlc.portfolio_safe).

If you are an upgrade customer, you must manually activate the Read only roles for Essential SAFe and Portfolio SAFe plugins (com.snc.sdlc.safe_read_roles).

SAFe tables accessible by users with the business stakeholder role

When the read-only roles for SAFe plugin (com.snc.sdlc.safe_read_roles) is active in your ServiceNow instance along with either the Essential SAFe plugin (com.snc.sdlc.safe) or Portfolio SAFe plugin (com.snc.sdlc.portfolio_safe), the user with the business stakeholder role (sn_safe_read) has read access to the following tables.

Essential SAFe tables

Table	Description
SAFe epic [sn_safe_epic]	Information about epics.
SAFe feature [sn_safe_feature]	Information about features.
Agile Release Train [sn_safe_program]	Information about ART.
Program Increment [sn_safe_program_increment]	Information about program increments. Stores the predictability measure data from PI objectives.
SAFe ART team [sn_safe_program_m2m_group]	Relationships between groups and ART.

Essential SAFe tables (continued)

Table	Description
SAFe ART Member [sn_safe_program_member]	Information about members within an ART.
SAFe ART Sprint [sn_safe_program_sprint]	Sprint schedules of teams within the ART.
SAFe ART VTB Board [sn_safe_program_vtb_board]	Records displayed on the ART level, Board tab.
SAFe Scrum Task [sn_safe_scrum_task]	Information about SAFe scrum tasks.
SAFe Sprint [sn_safe_sprint]	Information about sprints.
SAFe Story [sn_safe_story]	Information about stories.
SAFe Team VTB Board [sn_safe_team_vtb_board]	Records displayed on the Team level, Board tab.
SAFe PI Objectives [sn_safe_pi_objective]	Stores the SAFe PI objectives.
SAFe team predictability measure [sn_safe_pi_m2m_group]	Stores the business value achieved per team from PI objectives which is used for team-level predictability measure data.

Portfolio SAFe tables

Table	Description
SAFe epic [sn_safe_epic]	Information about epics.
SAFe feature [sn_safe_feature]	Information about features.
Agile Release Train [sn_safe_program]	Information about ART.
Program Increment	Information about program increments.

Portfolio SAFe tables (continued)

Table	Description
[sn_safe_program_increment]	
SAFe ART team [sn_safe_program_m2m_group]	Relationships between groups and ART.
SAFe ART Member [sn_safe_program_member]	Information about members within an ART.
SAFe ART Sprint [sn_safe_program_sprint]	Sprint schedules of teams within the ART.
SAFe ART VTB Board [sn_safe_program_vtb_board]	Records displayed on the ART level, Board tab.
SAFe Scrum Task [sn_safe_scrum_task]	Information about SAFe scrum tasks.
SAFe Sprint [sn_safe_sprint]	Information about sprints.
SAFe Story [sn_safe_story]	Information about stories.
SAFe PI Objectives [sn_safe_pi_objective]	Stores the SAFe PI objectives.
SAFe team predictability measure [sn_safe_pi_m2m_group]	Stores the business value achieved per team from PI objectives which is used for team-level predictability measure data.
Portfolios [pm_portfolio]	Information about portfolios.
Portfolio SAFe VTB board [sn_portfolio_safe_vtb_board]	Records displayed on the portfolio level, Board tab.
SAFe Team VTB Board [sn_safe_team_vtb_board]	Records displayed on the Team level, Board tab.

Essential SAFe

With Essential SAFe, you can apply lean and agile principles to your Agile Release Trains and teams, and develop and deliver work with fewer defects in the shortest viable lead time.

This video explains how to use Essential SAFe features

Essential SAFe is the most basic configuration of SAFe that works in two levels for both product managers and team members. At the Agile Release Train (ART) level, product managers can capture and prioritize features in a centralized backlog, and monitor the progress of features in a visual task board.

At the Team level, team members can implement stories that are decomposed from features. To learn more about the levels, see the SAFe Board section below.

To start using the features of Essential SAFe, install the Agile - Scaled Agile Framework - Essential SAFe plugin (com.snc.sdlic.safe).

SAFe Board

The table below provides an overview of how you can access the key levels of Essential SAFe on SAFe Board.

Level	Description
Agile Release Train (ART)	<p>As a product manager, you can plan and monitor activities across teams within an ART by accessing the ART level on the Scaled Agile Framework (SAFe) > SAFe Board. In addition, you can:</p> <ul style="list-style-type: none"> • manage the ART backlog in a centralized location. • define a program increment and identify the features that need to be completed within that program increment. • perform big room planning. • track all the features of the ART and view their transition from one state (lane) to another, in a visual task board.
Team	<p>As a team member, you can plan and monitor activities within the team by accessing the Team level on the Scaled Agile Framework (SAFe) > SAFe Board. In addition you can:</p> <ul style="list-style-type: none"> • manage the team backlog in a centralized location. • streamline sprint planning and completion activities. • track all stories and view their transition from one state (lane) to another, in a visual task board.

Components installed with Essential SAFe

Several types of components are installed with activation of the Agile - Scaled Agile Framework - Essential SAFe plugin (com.snc.sdlic.safe), including tables and user roles.

Roles installed

Role	Description	Contains roles
SAFe admin [safe_admin]	<ul style="list-style-type: none"> Edits, creates, and deletes SAFe ART, epics, features, stories, and program increments. Has read-only access to SAFe teams. 	<ul style="list-style-type: none"> safe_art_user safe_scrum_master safe_product_owner
SAFe scrum product owner [safe_product_owner]	<ul style="list-style-type: none"> Maintains the team backlog and can edit, create, and delete SAFe stories. Has access to create PI objectives. Has read-only access to SAFe ART, teams, epics, and features. Has read-only access to SAFe program increments. 	safe_story_creator
SAFe ART user [safe_art_user]	<ul style="list-style-type: none"> Maintains the ART backlog and can edit, create, and delete SAFe epics, features, stories, and program increments. Has access to create PI objectives. Edits SAFe teams. Has create and edit access to SAFe ART. 	safe_story_creator
SAFe scrum master [safe_scrum_master]	<ul style="list-style-type: none"> Edits, and deletes SAFe stories. Has access to create PI objectives. Edits SAFe teams. Has read-only access to SAFe ART, epics, features, and program increments. Has access to the triage board when the Scaled Agile Framework – Unified Backlog plugin (com.snc.sdlc.safe.multi_task) is activated 	safe_story_creator
SAFe scrum user [safe_scrum_user]	Can view all elements of SAFe, but cannot create, edit, or manage records of any type.	None
SAFe scrum story creator [safe_story_creator]	<ul style="list-style-type: none"> Edits, creates, and deletes SAFe stories. Has read-only access to SAFe ART, teams, epics, features, and program increments. 	safe_story_editor

Role	Description	Contains roles
SAFe scrum story editor [safe_story_editor]	<ul style="list-style-type: none"> • Arranges stories within the team backlog using the drag and drop feature. • Edits SAFe stories. • Has read-only access to SAFe ART, teams, epics, features, and program increments. 	<ul style="list-style-type: none"> • safe_scrum_user • rm_scrum_task_admin

Tables installed

Table	Description
SAFe epic [sn_safe_epic]	Information about epics.
SAFe feature [sn_safe_feature]	Information about features.
Agile Release Train [sn_safe_program]	Information about ART.
Program Increment [sn_safe_program_increment]	Information about program increments. Stores the predictability measure data from PI objectives.
SAFe ART team [sn_safe_program_m2m_group]	Relationships between groups and ART.
SAFe ART Member [sn_safe_program_member]	Information about members within an ART.
SAFe ART Sprint [sn_safe_program_sprint]	Sprint schedules of teams within the ART.
SAFe ART VTB Board [sn_safe_program_vtb_board]	Records displayed on the ART level, Board tab.
SAFe Scrum Task [sn_safe_scrum_task]	Information about SAFe scrum tasks.
SAFe Sprint [sn_safe_sprint]	Information about sprints.
SAFe Story [sn_safe_story]	Information about stories.

Table	Description
SAFe Team VTB Board [sn_safe_team_vtb_board]	Records displayed on the Team level, Board tab.
SAFe PI Objectives [sn_safe_pi_objective]	Stores the SAFe PI objectives.
SAFe team predictability measure [sn_safe_pi_m2m_group]	Stores the business value achieved per team from PI objectives which is used for team-level predictability measure data.

Quick start tests for Essential SAFe

Validate that Essential SAFe still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Essential SAFe quick start tests require activating the Agile - Scaled Agile Framework - Essential SAFe plugin (com.snc.sdlc.safe) and the Agile - Scaled Agile Framework - Essential SAFe - ATF Tests plugin (com.snc.sdlc.safe.atf).

Essential SAFe test suites

Test	Description	Release version
Essential SAFe: Feature tests	Verify feature global rank updates.	Madrid
Essential SAFe: Feature tests	For a SAFe feature, verify that: <ul style="list-style-type: none"> Actual start date is populated after the state is changed to Implementation, Validation on Staging, or Deployment. Actual end date is populated after the state is changed to Released or Cancelled. Active flag is set to the appropriate value: <ul style="list-style-type: none"> False, if the state is changed to Released or Cancelled. True, for all other states. 	Orlando
Essential SAFe: Feature tests	If the PPM Standard plugin (com.snc.financial_planning_pmo) is active, verify that a Demand can be converted to a SAFe feature using the Create SAFe	Quebec

Essential SAFe test suites (continued)

Test	Description	Release version
	<p>Feature related link on the Demand form.</p> <p>For more information on how to create an SAFe feature from a demand, see Create an artifact from a demand.</p>	
Essential SAFe: Program increment tests	Verify program increment date overlapping.	Madrid
Essential SAFe: Sprint tests	Verify the generation of ART sprints and team sprints as well as updates to sprint points and dates.	Madrid
Essential SAFe: Sprint tests	<p>Verify that any update to the Group capacity field of the assignment group results in the following changes to the Group capacity field of the various sprints associated with this assignment group:</p> <ul style="list-style-type: none"> • For the sprints that are in the Draft or Planning states: <ul style="list-style-type: none"> ◦ The group capacity is updated to the new value. ◦ The Group capacity field is editable. • For the sprints in the Current, Complete, or Cancelled states: <ul style="list-style-type: none"> ◦ The group capacity remains the old value. ◦ The Group capacity field is read-only. <p>For the sprints in the Draft or Planning state, you can individually edit the group capacity of the sprint anytime later. This would not change the group capacity of the assignment group associated with this sprint.</p>	Paris
Essential SAFe: Story tests	Verify story global rank updates.	Madrid

Essential SAFe test suites (continued)

Test	Description	Release version
Essential SAFe: Story tests	<p>Verify that active flag of the SAFe story is set to the appropriate value:</p> <ul style="list-style-type: none"> • False, if the state of the state is changed to Completed or Cancelled. • True, for all other states. 	Orlando
Essential SAFe: Story tests	<p>Verify that adding, estimating, removing, deleting, updating, or cancelling a SAFe story updates the SAFe feature-level and then the epic-level roll-ups correctly.</p>	Orlando
Essential SAFe: Story tests	<p>Verify that adding, updating, or deleting the feature on a SAFe story updates the Epic field on the SAFe story form.</p>	Orlando
Essential SAFe: Story tests	<p>If the PPM Standard plugin (com.snc.financial_planning_pmo) is active, verify that a Demand can be converted to a SAFe story using the Create SAFe Story related link on the Demand form.</p> <p>For more information on how to create a SAFe story from a demand, see Create an artifact from a demand.</p>	Quebec
Essential SAFe: Team tests	<p>Verify team association with an ART.</p>	Madrid
Essential SAFe: Epic tests	<p>For a SAFe epic, verify that:</p> <ul style="list-style-type: none"> • Actual start date is populated after the state is changed to Implementation. • Actual end date is populated after the state is changed to Complete. • Active flag is set to the appropriate value: 	Orlando

Essential SAFe test suites (continued)

[Quick start tests](#) 

SAFe entities

Learn about the various SAFe entities that are used to successfully plan, track, and deliver your software products.

Epic

Epic in SAFe is the largest unit of work, which can be continuously worked through multiple program increments. Epic captures business hypotheses and is prioritized and assessed using the WSJF (Weighted Shortest Job First is used to prioritize and sequence jobs to produce optimum business value) score.

An epic is further decomposed into features for implementation and delivery by SAFe ARTs.

Feature

A SAFe feature is equivalent to an epic in Agile Development. It must be small enough for completion within a program increment cycle. It is prioritized and sequenced in an ART backlog based on its global ranking. A feature is further decomposed into user stories for implementation and delivery by SAFe teams.

Story

A SAFe story is a brief statement encapsulating a product requirement or business case written in user-centric language. A story must be small enough for completion in one sprint. The estimated effort required to complete a story is measured in story points. More points are assigned to a story requiring more effort. Story points are arbitrary measurements of the effort (not necessarily the time) required to complete a story, based on the estimates from the SAFe team members.

Agile Release Train

Agile Release Train (ART) comprises a set of teams working towards a single solution.

Program Increment

A program increment is set period during which teams in an ART collaborate and produce to achieve agreed-upon goals. A program increment in SAFe is similar to a sprint in Agile Development, typically spanning 8–12 weeks. The most common form of program increment comprises four development sprints followed by one innovation and planning sprint.

SAFe team

SAFe team is an autonomous, cross-functional team containing members possessing different skill-sets who work in collaboration to achieve a common goal.

A user with the `safe_scrum_master` or `safe_art_user` role can create a SAFe team. You can assign these teams to SAFe work items such as stories, epics, and features.

Once a SAFe team is created, you can add members to it.

- New customers: System administrator can add members to the team.
- Existing customers: A user with the `safe_scrum_master` or `safe_art_user` role can add members to your SAFe team.

i Note:

You can restrict this function just to the system administrator by creating the `safe.disallow_scrum_add_group_member` property and setting it to **true**.

For information on how to create a property, see [Add a system property](#) .

Sprint

Program Increments in SAFe are further segmented into sprints for teams involved in it, and are measured in terms of weeks.

Define an epic in SAFe

Create an epic within SAFe. An epic is the largest unit of work that has one common objective such customer request, or business requirement. An epic is further decomposed into features for implementation and delivery by SAFe agile release trains (ARTs).

Before you begin

Role required: `safe_art_user` or `safe_admin`

Procedure

1. Create an epic using either of the following options.

2. In the form, fill in the fields:

SAFe Epic Form

Field	Description
Number	System-generated number for the epic.
Enabler	Check box identifying the epic as an enabler. Enablers do not add direct business value but help lay a foundation for future work. For example, an enabler epic might be an investigation into the architecture used to build features.
State	State of the epic: <ul style="list-style-type: none"> ○ Funnel: Created from Scaled Agile Framework (SAFe) > Epic. ○ Review: Under review considering parameters like WSJF score and WIP limited.

Field	Description
	<ul style="list-style-type: none"> ○ Analysis: Approved or rejected based on parameters like WSJF score refinement, cost estimation, alternatives, and WIP limited. ○ Backlog: Approved and assigned to an ART. In this state, the ART level user segments the epic into features. ○ Implementation: Epic is being implemented. ○ Done: Implementation is complete.
Color	Color that you attribute to the epic. Epic colours help you visually identify and group features by their epic on the ART's backlog page of the SAFe board.
WSJF Score	Weighted Shortest Job First (WSJF) score is used to prioritize and sequence jobs to produce optimum business value. A job with the highest WSJF score receives the highest priority for implementation. A job can refer to an epic, feature, or any business capability.
Short description	Brief description of the epic.
Description	A more detailed description of the epic.

Weighted shortest job first score section of the Epic form

Field	Description
User-business Value	Business value of the job based on parameters like impact on revenue or other solutions in the market offering similar capabilities.
Time criticality	Impact on the business when deadlines are missed. For example, how projected revenue gains are reduced over time when deadlines are shifted.
Risk reduction	Analyze how much risk this epic can help you avoid by answering questions such as: <ul style="list-style-type: none"> ○ Does the job add value to the business in other ways? ○ Does the job bring in new business opportunities? ○ Does the job reduce the risk for a future delivery?
Job size	Estimated duration for completion of the job.
Total story count	Number of active stories in the epic. This field is not displayed by default. Configure the field in the form layout.
Completed count	Number of stories that have been completed in the epic. This field is not displayed by default. Configure the field in the form layout.

Field	Description
Percent complete by count	Percentage of work that has been completed in the epic. Value is calculated by story count. This field is not displayed by default. Configure the field in the form layout.
Total estimate	Sum of estimates of all the active stories in the epic. This field is not displayed by default. Configure the field in the form layout.
Completed estimate	Sum of estimates of all the completed stories in the epic. This field is not displayed by default. Configure the field in the form layout.
Percent complete by estimate	Percentage of work that has been completed in the epic. Value is calculated by points (estimate) of stories in the epic. This field is not displayed by default. Configure the field in the form layout.
Missing estimates	Number of stories without estimation points. This field is not displayed by default. Configure the field in the form layout.
Top program	Program mapped to the SAFe work enabling top-down hybrid planning. All the active child SAFe features of this epic are automatically associated with the selected program. This field is visible in the SAFe view of the epic form if you activate the PPM Standard plugin (com.snc.financial_planning_pmo).

- Fill in the Planning section if you want to create benefit plans for the epic. This section is available when the Benefit view is selected.

Planning section of the Epic form

Field	Description
Planned start date	Projected start date for the epic. The planned start date can be the current date or a future date.
Planned end date	Projected end date for the epic. The planned end date must be after the planned start date.
Planned benefit	Benefit value that is rolled up from the benefit breakdown.
Actual start date	Actual start date for the epic. The actual start date can be on or before the planned start date.

Field	Description
Actual end date	Actual end date for the epic. The actual end date can be before the planned start date but not before the actual start date.
Actual benefit	Actual benefit value that is rolled up from the actual benefit in the benefit breakdown.

4. Click **Submit.**

Create a monetary benefit plan for an epic

Epic benefit plans capture the potential benefits accrued by the epic when the epic is executed. Create a monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods.

Before you begin

Role required: safe_product_owner, safe_scrum_master, or safe_admin

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan.

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Click the hamburger icon (☰) and navigate to **View > Benefit**.
4. On the form, fill in the fields in the Planning section.
This section is available when the Benefit view is selected.

Planning section of the Epic form

Field	Description
Planned start date	Projected start date for the epic. The planned start date can be the current date or a future date.
Planned end date	Projected end date for the epic. The planned end date must be after the planned start date.
Planned benefit	Benefit value that is rolled up from the benefit breakdown.
Actual start date	Actual start date for the epic. The actual start date can be on or before the planned start date.
Actual end date	Actual end date for the epic. The actual end date can be before the planned start date but not before the actual start date.
Actual benefit	Actual benefit value that is rolled up from the actual benefit in the benefit breakdown.

5. Save the record.
6. In the Monetary Benefit Plans related list, click **New**.
7. On the form, fill in the fields.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Epic to which the benefit plan belongs.
Sponsor	Sponsor for the epic.
Category	Type of benefit: <ul style="list-style-type: none"> ○ Hard: Benefits that can be measured in terms of revenue. ○ Soft: Benefits that are measured in terms of value.
Sub category	Sub-categories of hard and soft benefits. The selection in Category field determines the selections available in this field.
Benefit type	Type of benefit. Select Monetary benefits .
Offset type	Field to indicate when the benefits start realizing. Select any of the following options: <ul style="list-style-type: none"> ○ None: The default value is None. When you select None, you need to manually enter the benefit plan start and end fiscal periods. ○ Milestone: After completion of a milestone. ○ Start Date: At the start of the epic. ○ End Date: After the epic ends. <p>If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the end date of the epic changes, the benefit plan start date shifts to align with the new end date of the epic.</p>
Milestone	Epic milestones to which the benefit plan belongs. The field appears if you select Milestone in the Offset type field.
Milestone start date	Start date of the selected milestone. The field appears if you select Milestone in the Offset type field.
Work start date	Start date of the epic. The field appears if you select Start Date in the Offset type field.
Work end date	End date of the epic. The field appears if you select End Date in the Offset type field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as End Date and the offset is -2, the benefit plan is two periods prior to the epic end date. If the epic end date shifts, the benefit plan start date shifts to two periods prior to the new epic due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Work start date, or Work end date, and Duration in period values. The field is editable if you select None in the Offset type field.

Field	Description
	When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. Populated based on the value in the Offset field relative to the selected Milestone , Work start date , or Work end date , and Duration in period values. The field is editable if you select None in the Offset type field. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Non-monetary benefit that is associated to this monetary benefit plan.

Benefit Plan form - Financials details

Field	Description
Entered benefit	Benefit incurred from the epic specified in terms of entered currency.
Entered currency	Currency in which you want the benefit plan to be created.
Functional currency	Currency that is obtained from the glide.system.locale property  .
Total planned benefit	Estimated amount of potential benefit of the epic.
Benefit in functional currency	Benefit incurred from epic in terms of functional currency. The value in this field changes if the Entered currency is different from the functional currency.
Actual benefit	Actual benefit that is incurred from the epic. This value is rolled up from the Actual benefit field of all the benefit plan breakdowns.
Recurring	Option to indicate that the benefit is recurring for all the fiscal periods in the benefit plan.

8. Click **Submit**.

What to do next

On the Benefit Plan form, view the benefit breakdown by fiscal period in the Monetary Benefit Plan Breakdowns related list.

Update a monetary benefit plan breakdown for an epic

Update a monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: `safe_product_owner`, `safe_scrum_master`, or `safe_admin`

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Click the hamburger icon () and navigate to **View > Benefit**.
4. Click the Monetary Benefit Plans related list.
5. Open the required monetary benefit plan.
6. In the Monetary Benefit Plan Breakdowns related list, click the information icon for a monetary benefit plan breakdown.
7. Click **Open Record**.
8. On the Monetary Benefit Plan Breakdown form, view and update the enabled fields.
9. Click **Update**.

Create a non-monetary benefit plan for an epic

Epic benefit plans capture the potential non-financial benefits accrued by the epic when the epic is executed. Create a non-monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods.

Before you begin

Role required: `safe_product_owner`, `safe_scrum_master`, or `safe_admin`

About this task

The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: April and FY16: May. The Non-monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period for the epic.

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Click the hamburger icon () and navigate to **View > Benefit**.
4. On the form, fill in the required fields in the Planning section.
This section is available when the Benefit view is selected.

Planning section of the Epic form

Field	Description
Planned start date	Projected start date for the epic. The planned start date can be the current date or a future date.
Planned end date	Projected end date for the epic. The planned end date must be after the planned start date.
Planned benefit	Benefit value that is rolled up from the benefit breakdown.

Field	Description
Actual start date	Actual start date for the epic. The actual start date can be on or before the planned start date.
Actual end date	Actual end date for the epic. The actual end date can be before the planned start date but not before the actual start date.
Actual benefit	Actual benefit value that is rolled up from the actual benefit in the benefit breakdown.

5. Save the record.
6. Click the Non-monetary Benefit Plans related list.
7. To create a non-monetary benefit plan, click **New**.
8. On the form, fill in the fields.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Epic to which the benefit plan belongs.
Sponsor	Sponsor for the epic.
Category	Type of benefit: <ul style="list-style-type: none"> ○ Hard: Benefits that can be measured in terms of revenue. ○ Soft: Benefits that are measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The value of the Category field determines the choices available in this field.
Benefit type	Type of benefit. Select Non-monetary benefits .
Offset type	Field to indicate when the benefits start to be realized. Select any of the following options: <ul style="list-style-type: none"> ○ None: The default value is None. When you select None, you must manually enter the benefit plan start and end fiscal periods. ○ Milestone: After completion of a milestone. ○ Start Date: At the start of the epic. ○ End Date: After the epic ends. <p>If the value in the Offset type field changes, the benefit plan start date shifts accordingly. For example, if the Offset type field is set to End Date and the end date of the epic changes, the start date of the benefit plan shifts to align with the new end date of the epic.</p>
Milestone	Epic milestones to which the benefit plan belongs. This field appears only when Milestone is selected from the Offset type field.
Milestone start date	Start date of the selected milestone. This field appears only when Milestone is selected from the Offset type field.

Field	Description
Work start date	Start date of the epic. This field appears only when Start Date is selected from the Offset type field.
Work end date	End date of the epic. This field appears only when End Date is selected from the Offset type field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as End Date and the offset is -2, the benefit plan is two periods prior to the epic end date. If the epic end date changes, the benefit plan start date shifts to two periods prior to the new epic due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. This field is populated based on the value in the Offset field relative to the selected Milestone, Work start date, or Work end date , and Duration in periods field values. This field is editable if you select None in the Offset type field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. This field is populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date, and Duration in period values. This field is editable if you select None in the Offset type field. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Monetary benefit that is associated to this non-monetary benefit plan.

Non-monetary Details section of the Benefit form

Field	Description
Measure	Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score. Select the option Yes/No to track the benefits that are not quantifiable. When this option is selected, the only field available is Benefits achieved . You can select the check box to indicate that the benefits have been achieved.
Non-monetary entered benefit	Estimated value of the potential benefit. Any change in the planned benefit in the benefit plan updates the associated benefit breakdown values for future fiscal periods only.

Field	Description
Non-monetary planned benefit	Benefit value that is rolled up from the benefit breakdown.
Benefits achieved	Option to indicate if the benefit is achieved.
Breakdown type	Type of breakdown creation when you save the benefit plan. <ul style="list-style-type: none"> ○ None: No breakdowns are created. ○ Automatic: A Non-monetary Benefit Plan Breakdowns record is created automatically with data. The breakdown is calculated linearly. ○ Manual: A Non-monetary Benefit Plan Breakdown record is created automatically but without data in the Entered benefit column.
Aggregation mode	Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the Non-monetary planned benefit and Non-monetary actual benefit fields. <ul style="list-style-type: none"> ○ Sum: Aggregates data from all breakdowns. ○ Average: Average value from all breakdowns. ○ Most recent: Recent breakdown value. ○ Max: Maximum value among the breakdowns. ○ Min: Minimum value among the breakdowns.
Non-monetary actual benefit	Actual benefit value that is rolled up from the actual benefit in the non-monetary benefit plan breakdown.

9. Click Submit.

What to do next

- On the Benefit Plan form, view the benefit breakdown by fiscal period in the Non-monetary Benefit Plan Breakdowns related list.
- [Associate monetary and non-monetary benefit plans](#), so that you can capture the potential benefits (financial and non-financial) accrued by the epic for the hybrid benefit plans.

Update a non-monetary benefit plan breakdown for an epic

Update a non-monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: safe_product_owner, safe_scrum_master, or safe_admin

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Click the hamburger icon () and navigate to **View > Benefit**.
4. Click the Non-monetary Benefit Plans related list.
5. Open the required non-monetary benefit plan.
6. In the Non-monetary Benefit Plan Breakdowns related list, click the information icon for a non-monetary benefit plan breakdown.
7. Click **Open Record**.
8. On the Non-monetary Benefit Plan Breakdown form, view and update the enabled fields.
9. Click **Update**.

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the epic for the hybrid benefit plans.

Before you begin

Role required: safe_product_owner, safe_scrum_master, or safe_admin

About this task

You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

Note:

When you delete a benefit plan, any relationship with the associated benefit plan is also removed.

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Open the required epic.
3. Select **View > Benefit** from the Additional actions menu ().
4. Click the Monetary Benefit Plans or Non-monetary Benefit Plans related list.
5. Click the information icon for a benefit plan that you want to associate.
6. Click **Open Record**.
7. Associate a monetary or non-monetary benefit plan.
8. Click **Save**.

Result

The selected benefit plan is associated with another plan.

What to do next

Click the **View Associated benefit plan** related link to view the associated benefit plan.

Generate labor costs for epics

View the labor cost expenses based on the resource assignments for your epics.

Before you begin

- The epic should have the resource assignments.
- Role required: sn_spm_financial_user

Procedure

1. Navigate to **All > Agile Development > Epics**.
2. Select the required epic.
3. Select the **Generate labor costs** related link.
Refresh the page to view generated labor costs in the Cost Plan related list.

Define a feature in SAFe

Create a feature in SAFe and break it down into smaller user stories for implementation and delivery by SAFe teams.

Before you begin

Role required: safe_art_user or safe_admin

Procedure

1. Create a feature using any of the following options.
You can also convert an active SAFe story into a SAFe feature. For details, see [Related links and lists for a SAFe story](#).
2. On the form, fill in the fields.

SAFe Feature Form

Field	Description
Number	System-generated number for the feature.
Enabler	Option that identifies a feature as an enabler. An enabler does not bring any business value but helps in laying the foundation for future work. For example, you can use an enabler to investigate the architecture that is used to build stories.
Color	Color that you attribute to the feature. Feature colors help you visually identify and group stories by their feature on the team's backlog page of the SAFe board. This color also appears as a filled circle on the SAFe story cards on the SAFe PI planning board so that you can identify its feature.
WSJF score	Weighted Shortest Job First (WSJF) score that you use to prioritize and sequence jobs to produce an optimum business value. A job with the highest WSJF score receives the highest priority for implementation. A job can be an epic, feature, or any business capability.
State	State of the feature. Select one of the following: <ul style="list-style-type: none"> ○ Funnel: In this state, you can create features from approved ideas. ○ Analysis: In this state, the product management team reviews the features and considers the acceptance criteria, benefit hypothesis, technical feasibility, and scope estimates.

Field	Description
	<ul style="list-style-type: none"> ○ Backlog: In this state, you can prioritize approved features and assign them to an ART. ○ Implementation: In this state, you can break down a feature into stories that you can later assign to a team. ○ Validation on staging: In this state, you can integrate the feature in the system and present it to the product management team for approval and feedback. ○ Deployment: In this state, the deployment testing of feature is complete. ○ Released: In this state, you are ready to release the feature to the end users and assess the benefit hypotheses. ○ Cancelled: In this state, a feature has been canceled.
SAFe epic	Epic to which the feature belongs.
Agile release train	Agile release train to which the feature belongs.
Program increment	Program increment in which the feature is scheduled for completion.
SAFe team	Team that is primarily responsible for the delivery of the feature.
Short description	Brief description of the feature.
Description	Detailed description of the feature.
Work notes	Work notes that indicate the progress of the feature at various stages in its life cycle.

Weighted shortest job first section of the SAFe Feature form

Field	Description
User-business Value	Estimate of the business value of the job from this feature. Consider the impact on revenue or other solutions in the market that offer similar capabilities.
Time criticality	Estimated impact on the business when deadlines are missed. For example, consider how shifting deadlines can reduce the projected revenue gain.
Risk reduction	<p>Analysis of how much risk this feature can help you avoid. Answer questions such as the following:</p> <ul style="list-style-type: none"> ○ Does the job add value to the business in other ways? ○ Does the job bring in new business opportunities? ○ Does the job reduce the risk for a future delivery?

Field	Description
Job size	Estimated duration for completion of the job.

3. Click **Submit**.

What to do next

Use the SAFe stories related list to view and add stories to the feature.

Related topics

[Define a story in SAFe](#)

Split a SAFe feature

Split a SAFe feature into two separate features so that you can track complete and incomplete stories. You can move the feature with the incomplete stories to your backlog or to a future program increment (PI) so that you can maintain accurate metrics of the previous sprints and PIs.

Before you begin

Role required: safe_art_user or safe_admin

About this task

If your SAFe feature has incomplete stories at the end of a PI, you can split this feature into two features.

The new feature has a reference to the original feature and the field values are copied from the original feature.

The completed stories of the original feature move to a new feature whose state is set to **Released**.

Note:

To split a SAFe feature, you must have at least one complete and incomplete story each.

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top-left corner, select the level as **ART** and select your agile release train.
3. Click the **Backlog** tab.
4. Select the **List** view.
 
5. From your current PI section, locate the SAFe feature that has incomplete stories and click its number to open its form.

You can click **Complete** to get the list of incomplete features.
6. On the feature form, click the **Move completed stories to new feature** related link.
 - The updated feature form shows only those stories that are incomplete.
 - The new feature contains the completed stories from the original feature.
 - The **Original feature** field on the new feature references to the original feature that you've split.

Note:

Configure your feature form layout to view this field.

- o "- Completed" is appended to the short description of the new feature to indicate that it is complete.

What to do next

Schedule the feature that has incomplete stories to your backlog or a new PI of your choice.

Define a story in SAFe

Create high-level definitions of your requirements in the form of stories in SAFe.

Before you begin

Role required: safe_sprint_planner, safe_art_user, safe_scrum_master, safe_story_editor, safe_team_member, or safe_admin

Procedure

1. Create a story using either of the following options.

2. In the form, fill in the fields:

SAFe Story Form

Field	Description
Number	System-generated number for the story.
Feature	Feature to which the story belongs.
SAFe epic	Epic to which the story belongs.
SAFe sprint	Sprint in which the story is scheduled for completion.
Points	Number of points indicating the estimated effort required to complete the story. A larger point value indicates that a greater amount of effort is required.
State	<p>State of the story. Select one of the following:</p> <ul style="list-style-type: none"> o Draft: In this state, the story requirements, such as the description and acceptance criteria, are still being drafted. o Ready: In this state, the story is marked as ready to be picked up by the development team. o Work in Progress: In this state, the development team works on the story and records their changes in the work notes field. o Ready for Testing: In this state, the story is marked as ready to be taken up by a tester. o Testing: In this state, the tester works on testing the story based on the requirements provided in the story. o Complete: In this state, the development and testing efforts on a story are complete. o Cancelled: In this state, a story has been cancelled. <p>The default state for a new story is Draft.</p>
SAFe team	Team to which the story is assigned.

Field	Description
Assigned to	User to which the story is assigned.
Enabler	Check box identifying the story as an enabler. Enablers do not add direct business value but help lay a foundation for future work.
Short description	Brief description of the story.
Description	A more detailed description of the story.
Acceptance criteria	The functional criteria or testing results required to move the story to the state of Complete .
Work notes	Work notes indicating the progress of the story at various stages in its life cycle.

3. Click Submit.

What to do next

- Use the related links and lists of the story to create tasks for this story, or add dependencies of the current story to other stories. You can also convert this story into a SAFe feature or split this story into two, based on your requirements. For more information, see [Related links and lists for a SAFe story](#).
- You can create a story with the same details as this story using the **Insert** or **Insert and Stay** options from the story additional actions (≡).

When you use **Insert and Stay**, the form of the newly created story remains open so that you can modify its details, create more stories with these details, or do both.

On SAFe Board, the new story is positioned right below the original story and the global rank of the new story is set accordingly.

Note:

- Set the glide.ui.task.insert and glide.ui.advance properties to **true** to access these actions.
- These actions are not allowed on stories added from the triage board.

Related links and lists for a SAFe story

Use the related links and related lists in your SAFe story form based on the actions that you need to perform on your story.

The following are the related links and lists on a SAFe story form.

Related links of a SAFe story

Name	Description
Split Story	Splits the story into two stories by creating a new story with the same details. Any incomplete tasks from the old story are moved to this new story.
Convert into feature	Converts an active story into a feature and moves the story into the Cancelled state. The following changes occur:

Related links of a SAFe story (continued)

Name	Description
	<ul style="list-style-type: none"> • The default state of the newly created feature is Funnel. • The canceled story is associated with the newly created feature. <p>If the story that you created is too big, you can convert it into a feature and then break it down into multiple stories.</p>
Copy Story	<p>Copies the details of an existing active story to a new story. The tests and tasks of the story are also copied.</p> <p>The newly created story is moved set to the Draft state.</p> <p>This action is not available for stories that are added from the triage board.</p>

Related lists of a SAFe story

Name	Description
SAFe scrum tasks	Lists the scrum tasks created for the story. Click New to create a scrum task.
Prerequisites Stories	Lists the stories that must be completed before the current story can be completed. Click Edit to add prerequisite stories.
Dependent Stories	Lists the stories that depend on the current story. Click Edit to add dependent stories.
Tests	Lists the tests that are used for the story. Add existing tests to the story.

Add dependencies to your SAFe stories

Set dependencies to your SAFe story by adding prerequisite and dependent stories to it. Using the SAFe Planning board, you can distinguish these dependencies between stories during your big room planning and replan the stories as required.

Before you begin

Role required: safe_story_creator

About this task

Prerequisite stories are the stories that must be completed before the current story can be completed. Dependent stories are the stories that depend on the completion of the current story.

Procedure

1. Navigate to a story by using any of the following options.

2. In the Prerequisite Stories or Dependent Stories related lists, add stories according to the dependencies.
3. Click **Save**.
4. Click **Update**.
If you're on the SAFe planning board, click the dependencies icon to show or hide dependency lines between stories.

Define an Agile Release Train

From SAFe, define an Agile Release Train (ART) which is a group of agile teams working towards a single solution.

Before you begin

Role required: safe_admin

Procedure

1. Create an agile release train using either of the following options.
2. Enter a suitable name for the agile release train and click **Submit**.

What to do next

Use the following related lists:

Related list	Description
Members	Add or remove members from the Agile Release Train. Members are on the ART, but are not part of any specific agile team. For example, business owner, product manager, release train engineer, or system architect.
Teams	Teams that are part of the Agile Release Train.
SAFe features	View or add features to the Agile Release Train.
Program increments	View or add program increments.
PI Objectives	List of all PI objectives of this ART. View, create, and update the PI objectives. This related list is visible in the SAFe view of the ART form.

Related topics

- [Define a program increment in SAFe](#)

Define a program increment in SAFe

With SAFe, define a program increment (PI). A program increment is typically 8–12 weeks long, during which an ART delivers incremental value in the form of working, tested software and systems.

Before you begin

Role required: safe_admin

Procedure

1. Navigate to the program increment form using either of the following options.
2. On the form, fill in the fields:

SAFe Program Increment form

Field	Description
Number	System-generated number for the story.
Agile release train	ART to which the PI belongs.
Sprint length	Duration of each of the sprints in the PI.
PI Capacity	Expected PI capacity; usually the aggregate of the group capacity of each team for each sprint in the PI. Helps determine the load of planned features as compared to your expected PI capacity
Name	Name of the PI.
State	Current state of the PI. The default state is Draft .
Planned start date	Start date of the PI.
Planned end date	End date of the PI.
Number of sprints	Number of sprints included in the program increment.
Total planned business value	Planned business value score set for all the objectives in this PI. Field value is read-only and is calculated as the sum of all planned business value scores of the committed PI objectives for this PI.
Total actual business value	Realized business value score for all the objectives in this PI Field value is read-only and is calculated as the sum of all the actual business value scores of both committed and uncommitted PI objectives for this PI.
Business value achieved	Percentage of business value achieved computed using the total planned and actual business value scores.

The sprints for the teams in the PI are determined from the values provided for **Sprint length**, **Planned start date**, and **Number of sprints**.

3. Click **Submit**.

What to do next

Access the following related lists:

Related list	Description
SAFe features	List of features that are scheduled for completion in a program increment.
SAFe stories	View, add, modify, or remove stories that are scheduled for completion in a program increment.
SAFe sprints	View, add, modify, or remove sprints in a program increment.
SAFe Teams	List of all teams that participated in the PI for an ART. Gain visibility into the scores of the total planned and actual business value and percentage achieved for each team. This related list is visible in the SAFe view of the PI form.
PI Objectives	List of all the objectives for this PI. View, create, and update the PI objectives. This related list is visible in the SAFe view of the PI form.

Define a SAFe team

From SAFe, create an agile team and associate it to an ART.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Teams**.
2. Click **New**.
3. On the form, fill in the fields:

Group form

Field	Description
Name	Suitable name for the group.
Manager	Designated servant leader of the team.
Group capacity (points)	Total capacity of the team per sprint measured in story points.
Group email	Email distribution list of the group.
Description	Suitable description for the group.

4. Click **Submit**.
5. Navigate to **Scaled Agile Framework (SAFe) > Agile Release Trains**.
6. Select an ART to which you want to associate the SAFe team.

7. Click **Edit**, to you associate your team to the ART.

8. Click Save.

What to do next

Use the following related lists:

Related list	Description
Group Members	Add or remove members from the group.
Stories	Add or edit stories assigned to the group.
Sprints	View or add sprints for the group.
PI Objectives	List of all PI objectives of this team. View, create, and update the PI objectives. This related list is visible in the SAFe view of the Group form.

SAFe PI objectives

Use SAFe program increment (PI) objectives to highlight the overall goals for a team or for an agile release train (ART) in a PI.

SAFe PI objectives are created to summarize business and technical goals for the team or ART. During PI planning, the teams first create their PI objectives that they intend to accomplish in the upcoming PI. Program managers can then summarize the PI objectives into a separate set of high-level PI objectives.

PI objectives can directly relate to a feature. But sometimes, multiple features can contribute to a single objective. This situation could require a collaboration between multiple teams.

Although a team should ideally have around 7 to 10 PI objectives, there is no limit on the number of objectives that a team can have.

PI objectives can be committed or uncommitted, either at the team level or program level. A committed objective is an objective that your team is confident about reaching. In contrast, an uncommitted objective is an objective that your team is less confident about reaching because of different dependencies or other factors. The work for an uncommitted objective is planned but it can vary within the scope of the PI.

As PI planning progresses and is finalized, the business owners assign a planned business value (PBV) score to all the PI objectives. The score is on a scale of 1-10, where 1 indicates the lowest priority and 10 indicates the highest priority. As the teams complete the PIs, the business owners assign an actual business value (ABV) score to the PI objectives that are met. At the end of the PI, the PBV and ABV scores are used to compute the achievement values for each team and also for the ART as a whole.

Using the planned and actual business value scores of the PI objectives, SAFe ART members can track the historical performance of the teams. By using that performance data, the ART members can then chart the SAFe predictability measure of the PIs. These reports provide visibility into the business value that the teams and ARTs provide on a PI-to-PI basis.

Define a SAFe PI objective

Create SAFe program increment (PI) objectives so that you can summarize the goals of your team or agile release train (ART) for the upcoming PIs.

Before you begin

Role required: safe_art_user, safe_scrum_master, or safe_product_owner

About this task

Create your business and technical goals in the form of PI objectives. Associate your PI objectives to an ART or to a team for the duration of a PI.

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > PI Objectives**.
You can also use the PI Objectives related list on the SAFe team form, ART form, or PI form.
2. Click **New**.
3. On the form, fill in the fields.

SAFe Objective form

Field	Description
Number	System-generated number for the objective.
Program increment	PI that this objective is planned for.
Committed	Option to indicate if this objective is committed or not.
Type	Type of the objective. Select from either Program or Team .
Agile release train	ART that this objective is planned for.
Planned business value	Planned business value for this objective. The field is set as an integer score in the range of 1-10. A score of 1 indicates the lowest priority, whereas a score of 10 indicates the highest priority.
Actual business value	Actual business value that is realized from this objective. The field is set as an integer score in the range of 1-10. A score of 1 indicates the lowest priority, whereas a score of 10 indicates the highest priority.
Short description	Brief statement of the objective.
Description	Detailed summary of the objective. Ensure that your description is not too technical or vague.
Work notes	Work notes that indicate the progress of the objective during the PI.

4. Click **Submit**.

SAFe Board – ART level

As a product manager, you can plan and monitor activities across teams within your agile release train (ART) by accessing the ART level on the SAFe Board.

The ART level includes the following tabs:

- Board
- Backlog
- Planning

Board

The **Board** tab enables you to track all the features of your agile release train in a single view. Board is built on visual task boards, which transform the navigation of the Classic Environment into an interactive graphical experience. The visual task board interface provides a graphic-rich environment for managing and collaborating. To learn more about the actions that can be performed in the board, see [Visual Task Boards](#) ↗.

You can move a feature from one lane to another, which in turn updates the state of the feature. For example, when you move a feature from the Analysis lane to the Backlog lane, the state of the feature updates to Backlog.

Backlog

The **Backlog** tab enables you to manage your ART backlog, and pre-plan the next program increment on the level of features.

A program increment is a time frame in which various agile teams work in collaboration to deliver a substantial amount of work towards the end of the program increment cycle. Program increment in SAFe is equivalent to a sprint in Agile Development, typically spanning 8–12 weeks. The most common form of program increment comprises four development sprints followed by one innovation and planning sprint.

Planning

The **Planning** tab facilitates a detailed planning of the upcoming program increment. It allows ART members to discuss the features in the program increment, break them down into stories, and pre-plan the sprints needed to complete the program increment. The **Planning** tab surfaces the dependencies between stories and dependencies between features, which helps in the planning process.

Planning tab

Track features in a board

Track the progress of features in the ART. View their transition from one state (lane) to another.

Before you begin

Role required: safe_admin or safe_art_user

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the choice list at the top left corner, select the level as **ART**.
3. Select the Board view.
4. Move a feature to the required state by dragging and dropping the feature card.
5. **Optional:** Add a feature to a specific state:
 - a. Click **Add Card**.
 - b. On the form, fill in the fields and submit it.
For more information on the Feature form fields, see [Define a feature in SAFe](#).

Manage your ART backlog from the SAFe Board

Prioritize and manage features in your agile release train (ART) backlog. The ART backlog lists only the active features that are not assigned to any program increment.

Before you begin

Role required: safe_art_user or safe_admin

About this task

On the SAFe Board, you can perform various actions to manage your backlog, such as adding new features or managing existing features.

i Note:

Steps 1 through 3 take you to where you can manage ART backlogs. Steps 4 through 11 provide guidance on different actions that you can perform on your SAFe Board. For steps 4 through 11, choose whatever actions you want to take.

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the top-left corner of the SAFe Board, select the level as **ART** and select your ART.
3. Click the **Backlog** tab.
4. Add a feature to the backlog.
 - a. Click **Create Feature**.
 - b. Specify the required details in the Feature form.
 - c. Click **Submit**.
The feature is listed at the bottom of the backlog on the last page.

If you want to add a feature at a particular position in the backlog, select a feature just above this position, and then click **Create Feature**. The new feature is now listed below the feature that you selected.
5. Update a feature from the backlog.
 - a. Click the number of the feature that you want to update.
 - b. Edit the feature details and click **Update**.
6. To filter the list of epics in the Backlog and program Increment (PI) sections, use the epics that are listed under the Features by SAFe epic section.
The Features by SAFe epic section lists only those epics that are assigned to your ART. The section does not list epics that do not contain features.
7. Add an epic to the Features by SAFe epic section.
 - a. Select the options icon () that is next to the **Create Feature** option.
 - b. Select **Create Epic**.
 - c. On the SAFe Epic form, fill in the fields and submit the form.
For more details, see [Define an epic in SAFe](#).
8. To arrange features within a Backlog page, use one of the following options.
 - Use the mouse device to select and hold a feature, drag it to the required position, and drop it.
 - Use the keyboard. For more information, see [Arrange a feature in the SAFe backlog page using the keyboard](#).
9. To personalize the columns in a list, select the Personalize icon.
10. Perform various actions on a single feature or set of features.
 - a. Select the required features.
 - b. Click the options icon () and select one of the following options.
11. To view records in a standard list, select the standard list icon (.

Arrange a feature in the SAFe backlog page using the keyboard

Use the keyboard to move and arrange SAFe features in the **Backlog** tab of the SAFe Board.

Before you begin

Role required: safe_art_user or safe_admin

About this task

You can use the keyboard to change the order of a feature in the Backlog list or in the program increment (PI) list.

Procedure

1. Highlight the feature by pressing the Tab key.
2. Press the Tab key again.
The context menu icon () on the feature is highlighted.
3. Select the feature by pressing the Enter key.
4. Move the feature to the desired position by using the Up and Down arrow keys.
5. Fix the position of the feature by pressing the Enter key.

Arrange multiple features in the SAFe Board using the keyboard

Use the keyboard to move and arrange multiple SAFe features in the **Backlog** tab of your SAFe Board.

Before you begin

Role required: safe_art_user or safe_admin

About this task

You can use the keyboard to rearrange multiple features in the Backlog list or in the program increment (PI) list.

Procedure

1. Highlight a feature by pressing the Tab key.
2. Select the feature by pressing the Enter key.
3. Select multiple features by using the Up and Down arrow keys and the Shift or Control key.
 - To select consecutive features, use the Down arrow key to highlight the last feature that you want to select. Press the Shift and Enter keys.
 - To select features that are in different positions on the page, use the Down arrow key to go to the next feature that you want to select. Press the Control and Enter keys. Repeat this process to select other features.
4. Highlight the context menu icon () of the feature by pressing the Tab key again.
5. Press the Enter key to group all the selected features.

The multiple features that you selected now appear grouped together.

6. Move the features to your desired position by using the Up and Down arrow keys.
7. Fix the position of the features by pressing the Enter key.

Schedule features for your program increments

Define a program increment (PI) and plan the features scheduled for completion within that PI.

Before you begin

Role required: safe_art_user or safe_admin

Procedure

1. Create features for PIs.
2. View current and future program increments either in a list view or on a Visual Task Board (VTB).
3. Assess features in the backlog and move them to a PI.

Use the SAFe program list view

Use the SAFe program list view to create, organize, track, start, and complete your program increments (PIs).

Before you begin

Role required: safe_admin or safe_art_user

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top-left corner, select the level as **ART** and select your ART.
3. Click the **Backlog** tab.
4. Select the **List** view.

5. To create a PI, click **Create Program Increment**.

Fill the required fields in the [PI form](#). To edit an existing PI, click the program increment number and edit the required details in a form.

6. To schedule a feature, drag the feature in the **Backlog** section and drop it in the required PI.
7. To personalise and view columns on a list, click the Personalize icon.
8. To start the first PI, click **Start** that appears in its section.
The **Planning** tab opens.
9. To complete a PI, click **Complete** that appears in its section.

A dialog box appears to indicate the number of completed and incomplete stories, features, and sprints. Move incomplete features to a future program increment, or mark features and remaining sprints as **Complete**.

Use the SAFe program roadmap view

Use the SAFe program roadmap view to track program increments (PIs) of your agile release train (ART) and plan features for future PIs.

Before you begin

Role required: safe_admin or safe_art_user

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top-left corner, select the level as **ART** and choose your ART.
3. Click the **Backlog** tab.

4. Select the **Roadmap** view.
5. Schedule a feature by dragging the feature from the **No Program increment** lane and drop it in the required program increment lane.
You can reschedule features from one PI lane into the other by rearranging the feature cards.
6. Add a feature directly to a PI lane by clicking **Add Card** at the bottom of the list in the lane.

You can also click the more options icon () and click **Add card**.

7. Hide a PI lane by clicking the more options icon () and click **Hide lane**.

SAFe PI planning board

Use a centralized board to plan your program increments (PIs) for an agile release train (ART). You can create and assign stories to teams, add and view story dependencies, track stories by sprints, and re-plan these stories if required.

The SAFe PI planning board contains the following components that guide you during your planning process.

Stories and Features toggle

Select the **Stories** toggle to plan stories of your PI into sprints.

Select the **Features** toggle to track the progress of all features of the PI.

SAFe PI selector

Select a PI that you want to plan or review.

Feature filter

Select a feature that is associated with your PI. By selecting a feature, you can filter the stories on the program planning board and on the feature backlog pane. You can analyze the workload from this feature and understand how the workload is scheduled across sprints.

Story dependencies

Visually analyze dependencies between stories of different sprints and teams by using the story dependency lines. Use the dependencies icon () to show or hide these dependency lines. If you choose to hide the dependencies or if the dependencies involve a story that is not present on the board, you can see a colored border on the story card.

The color of the dependency indicates the way you've scheduled the stories.

Possible colors are the following:

- Green: A prerequisite story is scheduled in a sprint that's before the sprint of the dependent story.
- Yellow: A prerequisite story is scheduled in the same sprint as the dependent story.
- Red: A prerequisite story is scheduled in a sprint that's after the sprint of the dependent story. Review the dependency and reschedule the story as required.

If none of the stories are associated with a prerequisite or dependent story, the dependencies icon () is not visible. For information on how to add story dependencies, see [Add dependencies to your SAFe stories](#).

Feature Backlog pane

Use the backlog pane to view a list of all the features of the selected PI. You can do the following actions for a feature:

- View the description.
- Edit the information by clicking the feature's name.
- Add a new story to the feature by clicking **Create Story**.
- View the unassigned and unscheduled stories of this feature as cards that show the short descriptions and story points.

SAFe Teams

View all the teams of the selected ART toward the left of the planning board. At a time, the planning board can display a maximum of 15 teams. This limit is set to ensure optimum performance of the board during planning activities.

Team backlog lane

See the stories that are assigned to the team but that aren't scheduled yet into any sprint.

If you know which stories must be assigned to the team but you don't know what sprints to use, then you can move these stories from the feature backlog lane to the team's backlog lane. By doing so, you can have a clear idea of the team's workload for the upcoming sprints and then eventually add these stories to the correct sprints.

You can also unplan a story that has already been scheduled to a sprint by dragging the story card back to the team's backlog. When you later revisit the planning board, you know which team has this story and you can decide on which sprint to use.

Team sprint lanes

See the sprint cadences of the teams.

By pointing your cursor to a sprint's name, you can see the sprint details such as the duration, total story points, and filled capacity. You can click the sprint name to edit details such as group capacity, the planned start date, and the end date.

While planning your PI, if you know the sprint in which the story would be worked on, then you can move the story card to that sprint.

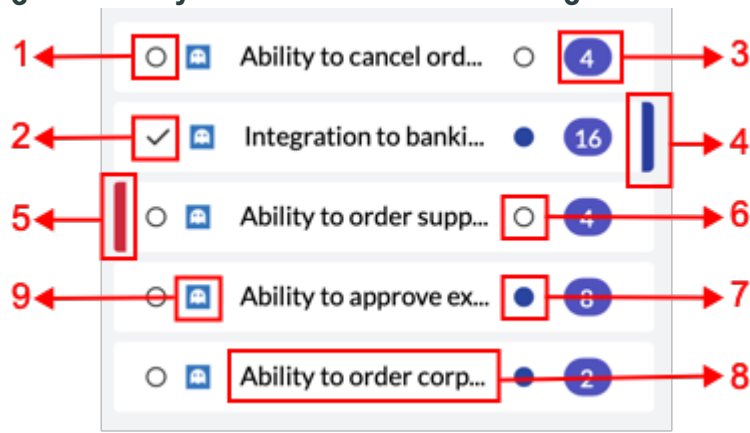

Story cards

See the stories of your SAFe features in the form of cards. You can move these cards around to assign them to teams and to plan them into sprints.

If you have activated the SAFe – Unified Backlog plugin (com.snc.sdlc.safe.multi_task), then you can also see stories that were added from the triage board into your unified backlog. From the PI planning board, you can double-click a story card to open it in a modal form and edit its details. If the story is created from a record on the triage board, such as an incident, then you can see both the story information and the defect information side-by-side.

The story cards use the following indicators:

Legend for story cards on the SAFe PI Planning board

Indicators for story cards on the SAFe PI Planning board

Number	Indicator description
1	Story is not complete.
2	Story is complete.
3	Story points.
4	Story is associated with a dependent story. If this band appears in red or yellow, the color indicates that the dependency is not set correctly and needs to be reviewed.
5	Story is associated with a prerequisite story. If this band appears in red or yellow, the color indicates that the dependency is not set correctly and needs to be reviewed.
6	Story belongs to a feature that has this color attributed to it. Point your cursor to the dot to view the feature's name.
7	Story belongs to a feature that does not have a color attributed to it. Point your cursor to the dot to view the feature's name.
8	Short description of the story.
9	Story is a regular story. This icon changes with the type of the story record. For example, you can create stories from incidents, enhancements, defects, problems, and other such records.

Note:

Stories can be created from enhancements, defects, incidents, or other such records only if you have activated the SAFe – Unified Backlog plugin (com.snc.sdlc.safe.multi_task).

Sprint workload capacity bar

Plan a sprint efficiently by using the workload capacity bar that is located under a sprint name. The bar indicates the workload that is planned for the team versus the team's capacity for that sprint.

If the group capacity of a sprint is zero, then you can't view the details of the sprint load and capacity.

Zoom in and zoom out

Adjust the board view using the zoom in icon () and zoom out icon ()

Search

Filter the stories on the planning board by using a search term. For example, you can enter a story number or a phrase from a short description.

Stories list

View the list of all stories of the program by using the standard list view icon ()

Plan a SAFe program increment

Plan your SAFe program increments (PIs) and track the progress of stories and features in an interactive planning board.

Before you begin

Roles required:

- safe_scrum_user to view the Planning tab
- safe_story_creator to create stories

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. Click **Planning**.
3. From the list on the top-left of the screen, select **ART** and select your agile release train.
4. From the PI list, select a PI.
5. Select the **Stories** tab.
6. Assign stories to teams and sprints.
 - a. Click the feature backlog icon ()
 - b. **Optional:** Add a new story to this feature by clicking **Create Story** in the backlog pane.
 - c. Drag a story card from the feature backlog pane and drop it in the required sprint or Backlog lane of the team.

You can reschedule the stories across teams and sprints by rearranging the story cards.

- If you move the story card to a team's backlog, the **SAFe team** field is updated accordingly.
- If you plan the story card into a sprint, the **SAFe team** and the **SAFe sprint** fields of the story are updated accordingly.

The sprint capacity bar below the sprint name fills up depending on the stories that are scheduled for it.

7. **Optional:** Add dependencies between the planned stories.

(Optional) Dependencies that you add between stories automatically apply to the features of the stories.

Click the dependencies icon to show or hide dependencies between the stories.

For more information on story dependencies, see [Add dependencies to your SAFe stories](#).

8. **Optional:** Update the group capacity of a team's sprint by clicking the sprint name.

Group capacity is the projected capacity of the group, in story points, for each sprint. If the group capacity of a sprint is zero, you can't view the details of the sprint load and capacity.

Note:

You can update the sprint details only if you have the `safe_scrum_master` role.

SAFe Board – Team level

As a team member, you can plan and monitor activities within your team by accessing the Team level on the SAFe Board.

The Team level includes the following tabs:

- Backlog
- Sprint Tracking

Backlog

The **Backlog** tab enables you to plan and prioritize stories for a sprint or multiple sprints by assessing stories in the backlog.

In addition, you can:

- Create stories.
- Reorder stories in the backlog using the drag feature. The story at the top of the backlog assumes higher priority with a lesser rank value. The story at the bottom of the backlog assumes lower priority with a higher rank value.
- Filter stories by a feature.
- Type a keyword in the search box to view only stories whose details match with the keyword.
- Create, organize, monitor, start, and complete sprints.
- View current and future sprints in chronological order.
- View these key aspects of a sprint: planned start and end dates, number of story points (total, complete, and pending) for the current sprint.
- Assess stories in the backlog and drag them to sprints.
- Move unfinished stories from the completed sprint to the backlog or a future sprint.

Note:

To see the backlog of your team on SAFe Board, ensure that your team is:

- Of the group type SAFe Team, with the role `safe_scrum_user` assigned to the team members
- Added to Agile Release Trains

The screenshot shows the ServiceNow Backlog interface. At the top, there are tabs for 'Program', 'Team', 'Backlog', 'Sprint Planning', and 'Sprint Tracking'. Below the tabs, there's a 'Backlog' dropdown menu set to 'New backlog', a 'Create Story' button, and a search bar. Three summary cards are displayed: '11 Records in total', '1 No story points', and '11 No acceptance criteria'. On the left, there's a 'Records by epic' section with a list of epics and their percentages: All records (selected), Records without epics, EE - Catalog (11%), HR Knowledge Management (50%), HR Portal (74%), and Knowledge Redesign (13%). The main area is a table titled 'Backlog' with columns for 'Number', 'Short Description', 'Epic', and 'Poi...'. The table contains 11 rows of story records, each with a story ID, a description, an assigned epic, and a points value.

Number	Short Description	Epic	Poi...
STRY0010003	HR: Update Content & Text for Human Resources Page		2
STRY0010051	Update HR Now portal Catalog to Human Resources catalog		1

Sprint Tracking

The **Sprint Tracking** tab provides the following views:

Story board

Story board is built on visual task boards, which transform the navigation of lists and forms into an interactive graphical experience. The visual task board interface provides a graphic-rich environment suited for managing and collaborating records. To know more about the actions that can be performed in the board, see [Visual Task Boards](#). In addition, you can:

- Track all the stories of the current sprint across lanes.
- Move stories from one lane to another, which in turn updates the state of the stories.
- Filter stories based on search criteria.

Task board

Task board enables you to track all the scrum tasks of stories of the current sprint across lanes.

- Move scrum tasks from one lane to another, which in turn updates the state of the scrum tasks.
- Filter scrum tasks based on search criteria.

List

List displays scrum tasks and tests associated to stories in each sprint. You can:

- Add scrum task and tests without leaving the context of the record.
- View the state, short description, and assignee of the scrum task without drilling down into details.

- View the short description and run result of a test.
- Assess scrum tasks and tests that are pending before the closure of current sprint.

Manage your team backlog

Manage, evaluate, prioritize, and sequence stories in your team backlog.

Before you begin

- Program, to which the team belongs, must contain an active program increment.
- The tab displays only the sprints of the current program increment.

Role required: `scrum_product_owner`, `scrum_master`, `safe_product_owner`, or `safe_scrum_master`

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the choice list at the top-left corner, select the level as **Team**.
3. Select the **Backlog** tab.
4. To add a story to the backlog.
 - a. Click **Create Story**.
 - b. Specify the required details in the story form.
 - c. Click **Submit**.
The story appears at the bottom of the backlog.
5. To add a story to the backlog and simultaneously decide its order of implementation, perform these steps.
 - a. Select a story in the backlog.
 - b. Click **Create Story**.
 - c. Specify the required details in the story form and click **Submit**.
The story is created beneath the story that was selected in the backlog.
6. The **Records by SAFe feature** section lists features that the records of the backlog belong to. Select a feature. Only records that belong to this feature appear.

7. To open the triage board of a specific task type (such as problems or defects), view the total numbers of records in the triage boards of all task types, edit the filter definition of a triage board, or create another triage definition, click **Triage Board**.

Note:

Triage Board link is displayed only when the Agile – Scaled Agile Framework – Unified Backlog plugin (com.snc.sdlc.safe.multi_task) is installed.

8. To view records in a standard platform list, click the icon to view records in a standard list

9. To personalize columns in a list, click the Personalize icon.
10. To move a triaged record from the **Backlog** tab to Triage Board.

- a. Open the record in a form.
- b. Click the **Move back to triage board** related link.

11. Use either of the following options to arrange stories that are not assigned to any sprint.

12. To perform an action on a set of stories.

- Select the required stories.
- Click  and select any of the following options:

Perform sprint planning

Perform sprint planning by evaluating stories in the backlog, selecting stories for the sprint, and estimating work effort for the stories.

Before you begin

Role required: `scrum_master`

The tab displays only the sprints of the current program increment.

About this task

In SAFe, the main portion of sprint planning occurs during the Big Room Planning process. The team backlog and the sprint planning portion of it is designed for refinement sessions. Though the overall plan of each sprint of a program increment already exists, the team still has sprint planning sessions every two weeks to add any missing stories and adjust the initial plan.

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the choice list at the top left corner, select the level as **Team**.
3. Select the **Backlog** tab.
4. To add a story to the sprint and simultaneously decide its order of implementation, perform these steps:
 - a. Point to a story in the sprint.
 - b. Click **Create Story**.

- c. Specify the required details in the story form and click **Submit**.

The story is created beneath the story that was selected in the backlog or a sprint.

- 5. To personalize columns in a list, click the Personalize icon.
- 6. To start a sprint, click **Start** that appears at right corner of the first or top sprint.
- 7. To complete a sprint, click **Complete Sprint** that appears at right corner of the first or top sprint. A dialog box appears indicating the number of completed and incomplete stories in the sprint. Move incomplete stories, if any, to the backlog or a future sprint. Click **Complete**.

Track your SAFe tasks from the Board view

Track the progress of your SAFe stories and scrum tasks. View their transition from one state (lane) to another in a visual task board.

Before you begin

Role required: safe_scrum_user or safe_admin

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top-left corner, select the level as **Team**.
3. Click the **Sprint Tracking** tab.
4. To track the progress of stories of the current sprint, select the **Story board** view.
 - a. To change the state of a story, move the story from one lane to another.
 - b. To add a story to a specific lane:
 - i. Click **Add Task**.
 - ii. In the form, fill in the fields.
 - iii. Click **Submit**.
5. To track the progress of scrum tasks of stories of the current sprint, select the **Task board** view.
 - a. To change the state of a scrum task, move the scrum task from one lane to another.
 - b. To add a scrum task to a specific lane:
 - i. Click **Add Task**.
 - ii. In the form, fill in the fields.
 - iii. Click **Submit**.

Track your SAFe team work from the list view

Create, execute, track, and complete the scrum tasks and tests of a SAFe story from the list view.

Before you begin

Role required: safe_scrum_user or safe_admin

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top left corner, select the level as **Team**.
3. From the adjacent list, select the required team value.
4. Click the **Sprint Tracking** tab, and select the **List** view.

5. To breakdown a story into scrum tasks:

- a. From the **Show** list at the top right corner, select **Scrum Tasks**.
- b. Click **Add Scrum Task**.
- c. On the form, fill in the fields.

Scrum Task form

Field	Description
Number	System generated number for the SAFe story.
SAFe story	SAFe story that is associated with the scrum task.
Priority	Priority set for the scrum task.
Type	Type of effort required to complete the scrum task.
State	Current state of the scrum task. Denotes the progress of the scrum task.
Assigned to	User to whom the scrum task is assigned.
Short description	Brief description of the scrum task.
Description	Detailed description of the scrum task.
Work notes	Work notes indicating the progress of the scrum task at various stages in its life cycle.

- d. Click **Submit**.

6. To create a test for a SAFe story:

Note:

The option to create a test is available only when Test Management 2.0 is installed.

- a. From the **Show** list at the top-right corner, select **Tests**.
- b. Click **Add Test**. For more information, see [Create a test for a SAFe story](#).

7. To run tests that are in the **Ready** state for a SAFe story:

- a. Click the **Run** button on a story.
- b. In the pop-up, select the environment on which the tests are to be run, and click **Run**. For more information, see [Run a test for a SAFe story](#).

8. To personalize columns in a list, click the Personalize icon.

Create a test for a SAFe story

Create a test, add steps to the test, and create and maintain different versions of the test. A test is a collection of conditions or steps used to determine whether a SAFe story is working correctly. A test can also include an expected result that determines whether the test passes or fails.

Before you begin

- Role required: safe_scrum_user or safe_admin
- You can create a test from the List view only when the Test Management 2.0 plugin is installed.

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top left corner, select the level as **Team**.
3. From the adjacent list, select the required team value.
4. Click the **Sprint Tracking** tab, and select the **List** view.
5. From the **Show** list at the top right corner, select **Tests**.
6. Click **Add Test**.
7. In the form, fill in the fields:

Test Version form

Fields	Description
Test	Unique name of the test.
Owner	Owner who created the test.
Version	Automatically generated version of the test.
State	Current state of the test. <ul style="list-style-type: none"> ○ Draft: State of the test when it is created. ○ Ready: State of the test when it is not editable. When the test has multiple versions, only one test will be in the Ready state at any one time. ○ Retired: State of the test when it is no longer used.
Short description	Brief description about the test.
Add Step	Button used to add step to a test.
Run	Button used to run steps, which is displayed only when the test is in the Ready state.
Update	Button used to update the details of a test version.
Ready	Button used to change the state of the test version to ready.
Create New Version	Button used to create another version of the test.
Delete Test	Button used to delete the test version.
Change the order of a step	Icon used to change the order of a test step. Select the icon and drag a step to the required location.
Needs Verification	Check box used to mark a test step for verification.
Delete a test step 	Icon used to delete a test step.

What to do next

View information in the following related lists:

Related list	Description
Other versions	Displays all the versions of a test.
Test Results	Displays the run results of each test version.
Test Sets	Displays related tests in a test set.

Run a test for a SAFe story

View the test scenario and execute all the steps of a test for verifying a SAFe story.

Before you begin

Role required: safe_scrum_user or safe_admin

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top left corner, select the level as **Team**.
3. From the adjacent list, select the required team value.
4. Click the **Sprint Tracking** tab, and select the **List** view.
5. From the list, select **Tests**.
6. Verify a story by clicking the **Run** button.
This action runs all tests of the story at once.
7. In the pop-up, select the environment on which the test has to be run.
8. In the Test Execution pop-up, mark a step as passed, failed, or blocked using the following icons.
 - To select an icon, you can also press **Tab** and then press **Enter**.
 - To pause and work on the test at a later point in time, click **Pause**.
9. Click **Done**.

Result

The test result is saved to the Test Result form. The latest test result of each test is displayed in the List view.

The overall status of the test is defined by statuses of the test steps:

- If all the test steps are passed, the status of the test is **Passed**.
- If at least one step of the test is not run, the status of the test is **Not finished**.
- If at least one step of the test fails, the status of the test is **Failed**. This rule takes precedence over the previous rule.
- If at least one step of the test is blocked, the status of the test is **Blocked**. This rule takes precedence over the previous two rules.

Troubleshoot test failures

View the history of test runs. Troubleshoot and rectify the test failures in SAFe.

Before you begin

Role required: safe_scrum_user or safe_admin

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the list at the top left corner, select the level as **Team**.
3. Click the **Sprint Tracking** tab and select the **List** view.
4. Click a test within a story.
5. Click the **Test Result** related list.
Test results related to that version of the test are displayed.
6. Click a test result to view its details in a form.

Test Result form

Field	Description
Number	Automatically generated number for the test result.
Result	Run status of the test: Passed, Failed, or Blocked .
Execution environment	Environment on which the test is run.
Run by	Name of the tester who runs the test plan.
Test	Test that is run.
Version	Version of the test that is run.
Updated	Date and time when the test result was recorded.
Test run	Name of the test run.
Short description	Brief description of the test result.

The execution status of each step of the test is also indicated at the bottom of the form.

Portfolio SAFe

With Portfolio SAFe, you can align your organizational goals and strategies with your portfolios, and apply lean and agile principles to seamlessly manage and deliver your portfolio work.

Portfolio SAFe works at three levels for portfolio managers, product managers, and team members. At the Portfolio level, portfolio managers can capture and prioritize epics in a centralized backlog, and monitor the progress of epics in a visual task board. An epic is the largest unit of work that has one common objective such as a customer request or business requirement.

At the ART level, product managers can capture, prioritize, and monitor features that are decomposed from epics. At the Team level, team members can implement stories that are decomposed from features. To learn more about the levels, see the SAFe Board section below.

To start using the features of Portfolio SAFe, install the Agile - Scaled Agile Framework - Portfolio SAFe plugin (com.snc.sdmc.portfolio_safe).

SAFe Board

The table below provides an overview of how you can access the key levels of Portfolio SAFe on SAFe Board.

Level	Description
Portfolio	<p>As a portfolio manager, you can plan and monitor activities within a portfolio by accessing the Portfolio level on the Scaled Agile Framework (SAFe) > SAFe Board. In addition, you can:</p> <ul style="list-style-type: none"> • manage the portfolio backlog in a centralized location. • track all the epics of the portfolio and view their transition from one state (lane) to another, in a visual task board.
Agile Release Train (ART)	<p>As a product manager, you can plan and monitor activities across teams within an ART by accessing the ART level on the Scaled Agile Framework (SAFe) > SAFe Board. In addition, you can:</p> <ul style="list-style-type: none"> • manage the ART backlog in a centralized location. • define a program increment and identify the features to be completed within that program increment. • perform big room planning. • track all the features of the ART and view their transition from one state (lane) to another, in a visual task board.
Team	<p>As a team member, you can plan and monitor activities within the team by accessing the Team level on the Scaled Agile Framework (SAFe) > SAFe Board. In addition you can:</p> <ul style="list-style-type: none"> • manage the team backlog in a centralized location. • streamline sprint planning and completion activities. • track all stories and view their transition from one state (lane) to another, in a visual task board.

Components installed with Portfolio SAFe

Several types of components are installed with activation of the Agile - Scaled Agile Framework - Portfolio SAFe plugin (com.snc.sdlc.portfolio_safe), including tables and user roles.

Roles installed

Role	Description	Contains roles
SAFe admin [safe_admin]	<ul style="list-style-type: none"> • Edits, creates, and deletes SAFe ART, epics, features, stories, and program increments. • Has read-only access to SAFe teams. 	<ul style="list-style-type: none"> • safe_art_user • safe_scrum_master • safe_product_owner
SAFe portfolio user [sn_portfolio_safe.safe_portfolio_user]	Maintains the portfolio backlog and can edit, create, and delete SAFe epics, features, and stories.	safe_art_user

Role	Description	Contains roles
SAFe scrum product owner [safe_product_owner]	<ul style="list-style-type: none"> • Maintains the team backlog and can edit, create, and delete SAFe stories. • Has read-only access to SAFe ART, teams, epics, and features. • Has read-only access to SAFe program increments. 	safe_story_creator
SAFe ART user [safe_art_user]	<ul style="list-style-type: none"> • Maintains the ART backlog and can edit, create, and delete SAFe epics, features, stories, and program increments. • Edits SAFe teams. • Has read-only access to SAFe ART. 	safe_story_creator
SAFe scrum master [safe_scrum_master]	<ul style="list-style-type: none"> • Edits, and deletes SAFe stories. • Edits SAFe teams. • Has read-only access to SAFe ART, epics, features, and program increments. 	safe_story_creator
SAFe scrum user [safe_scrum_user]	Can view all elements of SAFe, but cannot create, edit, or manage records of any type.	None
SAFe scrum story creator [safe_story_creator]	<ul style="list-style-type: none"> • Edits, creates, and deletes SAFe stories. • Has read-only access to SAFe ART, teams, epics, features, and program increments. 	safe_story_editor
SAFe scrum story editor [safe_story_editor]	<ul style="list-style-type: none"> • Arranges stories within the team backlog using the drag and drop feature. • Edits SAFe stories. 	<ul style="list-style-type: none"> • safe_scrum_user • rm_scrum_task_admin

Role	Description	Contains roles
	<ul style="list-style-type: none"> Has read-only access to SAFe ART, teams, epics, features, and program increments. 	

Tables installed

Table	Description
SAFe epic [sn_safe_epic]	Information about epics.
SAFe feature [sn_safe_feature]	Information about features.
Agile Release Train [sn_safe_program]	Information about ART.
Program Increment [sn_safe_program_increment]	Information about program increments.
SAFe ART team [sn_safe_program_m2m_group]	Relationships between groups and ART.
SAFe ART Member [sn_safe_program_member]	Information about members within an ART.
SAFe ART Sprint [sn_safe_program_sprint]	Sprint schedules of teams within the ART.
SAFe ART VTB Board [sn_safe_program_vtb_board]	Records displayed on the ART level, Board tab.
SAFe Scrum Task [sn_safe_scrum_task]	Information about SAFe scrum tasks.
SAFe Sprint [sn_safe_sprint]	Information about sprints.
SAFe Story [sn_safe_story]	Information about stories.
SAFe PI Objectives	Stores the SAFe PI objectives.

Table	Description
[sn_safe_pi_objective]	
SAFe team predictability measure [sn_safe_pi_m2m_group]	Stores the business value achieved per team from PI objectives which is used for team-level predictability measure data.
Portfolios [pm_portfolio]	Information about portfolios.
Portfolio SAFe VTB board [sn_portfolio_safe_vtb_board]	Records displayed on the portfolio level, Board tab.
SAFe Team VTB Board [sn_safe_team_vtb_board]	Records displayed on the Team level, Board tab.

Define a portfolio

From SAFe, define a portfolio which is a group of ARTs working towards a single solution.

Before you begin

Role required: sn_portfolio_safe.safe_portfolio_user

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > Portfolios**.
2. Click **New**.
3. In the form, fill in the fields:

Portfolio form

Field	Description
Name	Unique name for the portfolio.
Portfolio manager	Manager to whom the portfolio is assigned.
Description	More detailed description of the portfolio.

What to do next

- [Define an Agile Release Train](#)
- [Define an epic in SAFe](#)

SAFe Board—Portfolio level

As a portfolio manager, you can plan and monitor activities within your portfolio by accessing the Portfolio level on the SAFe Board.

The Portfolio level includes the following tabs:

- Board
- Backlog

Board

The **Board** tab enables you to track all the epics of your portfolio in a single view. Board is built on visual task boards, which transform the navigation of lists and forms into an interactive graphical experience. The visual task board interface provides a graphic-rich environment for managing and collaborating.

In addition, you can move an epic from one lane to another, which in turn updates the state of the epic. To learn more about the actions that can be performed in the board, see [Visual Task Boards](#) .

Backlog

The **Backlog** tab enables you to manage your portfolio backlog, which comprises epics.

Track your epics

Using the Board tab, track all epics of your portfolio and view their transition from one state (lane) to another.

Before you begin

Role required: sn_portfolio_safe.safe_portfolio_user

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the choice list at the top left corner, select the level as **Portfolio**.
3. Select the Board view.
4. Move an epic to the required state by dragging and dropping the epic card.
5. **Optional:** Add an epic to a specific state:
 - a. Click **Add Card**.
 - b. On the form, fill in the fields and submit it.
For more information on epic fields, see [Define an epic in SAFe](#).

Manage your portfolio backlog

Manage, evaluate, prioritize, and sequence epics in your portfolio backlog.

Before you begin

Role required: sn_portfolio_safe.safe_portfolio_user

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. From the choice list at the top left corner, select the level as **Portfolio**.
3. Click the **Backlog** tab.
4. To add an epic at the bottom of the backlog.
 - a. Click **Create Epic**.
 - b. Specify the required details in the form and click **Submit**.
5. To add an epic while simultaneously deciding its order of implementation in the backlog.

- a. Select an epic in the backlog.
 - b. Click **Create Epic**.
 - c. Specify the required details in the form and click **Submit**.
The epic is created beneath the epic that was selected in the backlog.
6. To search for epics by their short descriptions, type a word in the search box and press **Enter**.
 7. To arrange epics within the backlog, use either of the following options.

If the backlog contains more than 50 epics, then a pagination control appears at the bottom of the list enabling you to navigate to the first, last, previous, or next page in the list.
 8. To view the backlog as a standard platform list, click **View Standard List**.
 9. To perform any action on a set of epics.
 - Select the required epics.
 - Click  and select any of the following options:

SAFe – Unified Backlog

SAFe – Unified Backlog allows you to maintain a centralized backlog containing records of different task types, such as defects, problems, incident tasks, and stories. It facilitates in prioritizing and sequencing different task type records in one location, saving you steps. It also removes the overhead of converting records to stories.

Important:

Starting with the Xanadu release, the plugins Portfolio SAFe, Essential SAFe, Performance Analytics Content Pack for Essential SAFe, Work Progress Status for SAFe, Agile - Scaled Agile Framework - Unified Backlog, and Read only roles for SAFe are being prepared for future deprecation. These plugins will be hidden and can no longer be activated on new instances but will continue to be supported. [Enterprise Agile Planning in Strategic Planning](#) provides the latest experience for this functionality.

For more information on the deprecation process and its impact, see the [Application/Plugin Deprecation Process \[KB0867184\]](#)  article in the Now Support Knowledge Base.

The flow described below represents the common practice of creating and managing records using SAFe – Unified Backlog along with Essential SAFe.

Setting up a triage board

You can set up a triage board by defining filter criteria, and view records of a specific task type on the triage board. For example, you can create one triage board for defects and another for incidents. Records are dynamically updated in all triage boards.

Triaging and assigning records

You can move records from a triage board to the **Backlog** tab. In the **Backlog** tab, you can estimate points and assign the record to a user using the Points, and Assignment fields in the Story Information tab of the record. You can open the

triage board of any specific task type, view the total numbers of records in the triage boards of all task types, or edit the filter definition of a specific triage board.

Working with the triaged records in the Board view

As you work with stories, work with the triaged records (represented by stories) in the **Sprint Tracking** tab, Board view. When you move a triaged record from one lane to another, the state of its wrapper story changes, but the state of the original triaged record remains the same. To change the state of the original triaged record, you would need to open the record in a form and update the state.

Set up a triage board in SAFe

Set up your own triage board by defining filter criteria, and view records that are important to your team, such as problems, incident tasks, defects, or change requests. For example, you can create one triage board for defects and another for incidents.

Before you begin

You must be added to the SAFe team that would be responsible for handling work from this triage board.

Role required: safe_scrum_master

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > SAFe Board**.
2. Select the **Backlog** tab.
3. Select **Triage Board**.
4. On the form, fill in the fields:

SAFe Triage Definition form

Field	Description
Name	Suitable name for the triage board.
Table	Table from which you want to filter records.
Filter	Filter criteria to be applied on the table for refinement of records.

i Note:

When setting up a triage board, do not to remove these default conditions:

- **Active is true:** This condition ensures that the tasks on your Triage Board are relevant.
- **Agile story is empty:** This condition ensures that the task is not present in some other backlog.

5. Click **Submit**.

A triage definition is created.

What to do next

1. Select the triage definition.
2. To add a record to the triage definition, click **New**.
3. To move a record from the triage board to the **Backlog** tab, click **Add to Backlog**.

Performance Analytics Content Pack for Essential SAFe

Improve your SAFe processes and practices using the Platform Analytics Content Pack for Essential SAFe that contains preconfigured dashboards with data visualizations.

Overview of the Performance Analytics dashboards for Essential SAFe.

Important:

Starting with the Xanadu release, the plugins Portfolio SAFe, Essential SAFe, Performance Analytics Content Pack for Essential SAFe, Work Progress Status for SAFe, Agile - Scaled Agile Framework - Unified Backlog, and Read only roles for SAFe are being prepared for future deprecation. These plugins will be hidden and can no longer be activated on new instances but will continue to be supported. [Enterprise Agile Planning in Strategic Planning](#) provides the latest experience for this functionality.

For more information on the deprecation process and its impact, see the [Application/Plugin Deprecation Process \[KB0867184\]](#)  article in the Now Support Knowledge Base.

Enabling the Performance Analytics Solution

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

Note:

Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

For unlimited access to all features of this Platform Analytics Solution, purchase a Performance Analytics subscription. For more information, see [Activating your Performance Analytics subscription](#) .

To use this Platform Analytics Solution, you must activate your subscription to Performance Analytics for Business Management. For more information about entitlements to Performance Analytics, see [Activating your Performance Analytics subscription](#) .

This base system Platform Analytics Solution is available from the ServiceNow Store. To enable this solution, as an admin, navigate to **System Applications > Search ServiceNow Store**. When the landing page for the ServiceNow Store opens, search for Performance Analytics Content Pack for Essential SAFe. When you find the solution, follow the instructions in the ServiceNow Store. The ServiceNow Store has its own documentation.

Business stakeholder role support

The business stakeholder role (sn_safe_read) has read-only access to all Essential SAFe dashboards. For more information, see [Business stakeholder role for Essential SAFe and Portfolio SAFe](#).

Related topics

[Activate your Performance Analytics subscription](#) 

Enable daily data collection for Essential SAFe dashboards

Enable scheduled data collection to begin collecting scores on new data automatically for Essential SAFe dashboards. Data collection jobs automatically collect scores for automated indicators and breakdowns.

Before you begin

Role required: pa_admin or admin

About this task

Note:

Historical data collection is not supported for the underlying indicators of the [SAFe] Daily Data Collection job.

Procedure

1. Navigate to **All > Performance Analytics > Data Collector > Jobs**.
2. Find and open the [SAFe] Daily Data Collection job.
3. Start the [SAFe] Daily Data Collection job.
 - a. Scroll down to the Job parameters section.
 - b. Set the **Run as** field to pa_admin, pa_data_collector or admin roles.
 - c. Verify that the time zone in the **Run As tz** field is appropriate for your organization. This timezone is used for the following:
 - Database queries created for this job
 - Indicator conditions such as `[[Created][on][Today]]`
 - d. Enable the scheduled run of the job by selecting the **Active** checkbox.
4. Click **Update**.

Using Solution Library for Essential SAFe dashboards

Upgrade to the latest layout of Essential SAFe dashboards using Solution Library.

Existing users who upgraded to the latest version 1.1 of Performance Analytics Content Pack for Essential SAFe can install the latest layout of the dashboards from Solution Library.

For example, if you are upgrading from version 1.0.1 or earlier of the application, install the following dashboards from Solution Library to access the latest layout:

- SAFe Feature Dashboard
- SAFe Sprint Dashboard
- SAFe PI Dashboard
- SAFe Epic Dashboard
- SAFe Team Dashboard

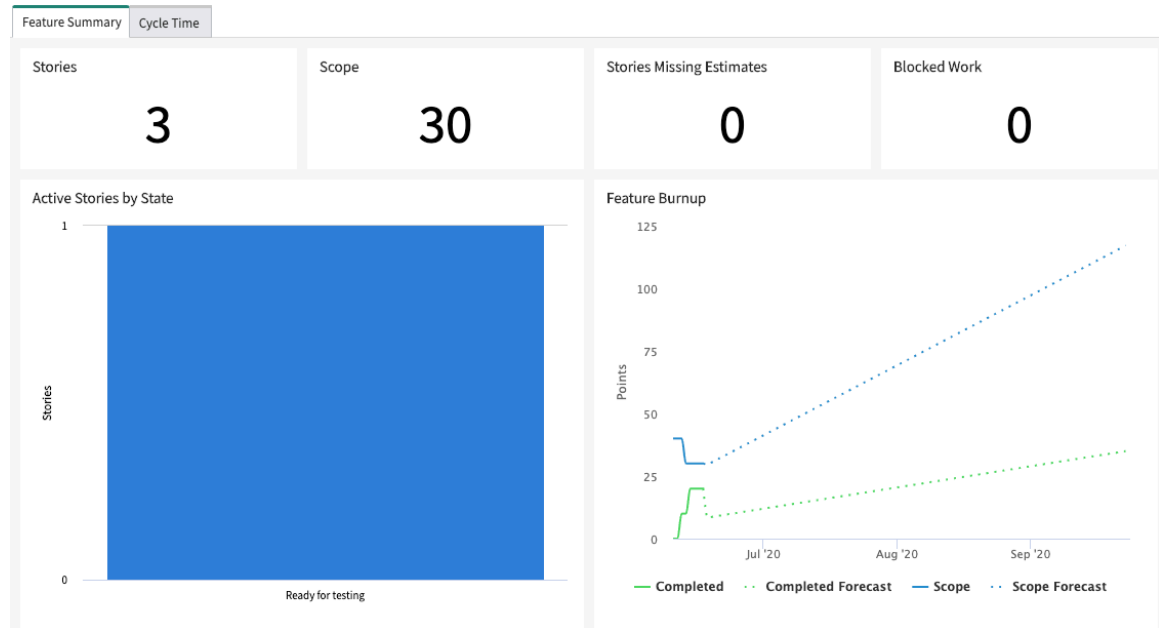

Note:

For users on the Zurich release, the **Install** and **Upgrade** buttons are not visible on the Solution Library content form. For information on resolving this issue, see [Allow PA Solution Library for Store apps](#).

SAFe Feature Dashboard

The SAFe Feature Dashboard provides a visualization of the changes in scope and the progress of the stories in the feature over a given period.

Feature Summary tab

Cycle Time tab

End user and roles

End user goal with required role

End user and goal	Required role
SAFe ART user: View the amount of work that has been completed in a feature. Gauge whether the feature can be completed on time.	SAFe_scrum_user

Indicators

SAFe: Sum of story points of all stories in the feature

Generates the completed line in the Feature Burnup report.

SAFe: Sum of story points of completed stories in feature

Generates the scope line in the Feature Burnup report.

Widgets

Stories

Indicates the total number of stories in the feature.

Scope

Indicates the scope of the feature which is in story points. This widget lets you see at a glance how much work must be completed in a feature.

Stories Missing Estimates

Indicates the number of stories in the feature that are missing estimates.

Blocked Work

Indicates the amount of work (in story points) in the feature that is blocked.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Essential SAFe, then install this dashboard from Solution Library to upgrade its layout and access the following visualizations:

- Feature Burnup
- Story Cycle Time

For more information, see [Using Solution Library for Essential SAFe dashboards](#).

Work item progress

Title	Type	Description
Stories By State	Bar chart 	At a single glance, understand the overall progress of a feature seeing all of its stories grouped by state.
Feature Burnup	Line chart 	<p>Indicates the scope changes, if any, and trends of those scope changes. You can estimate when the feature is likely to be completed.</p> <p>The Feature Burnup report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the size of the feature, as the sum of story points defined in this feature. • Scope Forecast: Predicts the possibility of scope change for the future dates, which is based on historical data.

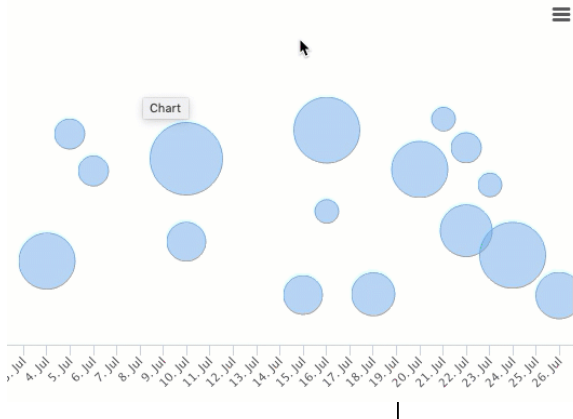

Work item progress (continued)

Title	Type	Description
		<ul style="list-style-type: none"> • Completed: Indicates the amount of work (in story points) in the feature that is complete. • Completed Forecast: Predicts the burnup for the future dates. It indicates whether you can complete the feature on time. This prediction is based on historical data. <p>Note: The point at which the Completed Forecast series intersects with or crosses the Scope Forecast series is a predictor for when the feature might be completed. If the Completed Forecast series and the Scope Forecast series do not appear to ever intersect, it is a warning that scope is being added faster than work is being completed.</p>

Cycle Time

Title	Type	Description
Story Cycle Time	Bubble chart 	Identify the time taken for each story in the feature to move from an in-progress state to completion. Each bubble on the graph represents a story. The height of the bubble from the x-axis shows how long that story took to move from an in-progress state to completion. The size of the story bubbles are relative to each other based on their story points. Hovering your mouse cursor over a bubble displays the following details about that story: <ul style="list-style-type: none"> • Story points • Date on which the story is moved to completion • Total cycle time (in days) of the story • Number of days that the story was in the Work in progress state

Cycle Time (continued)

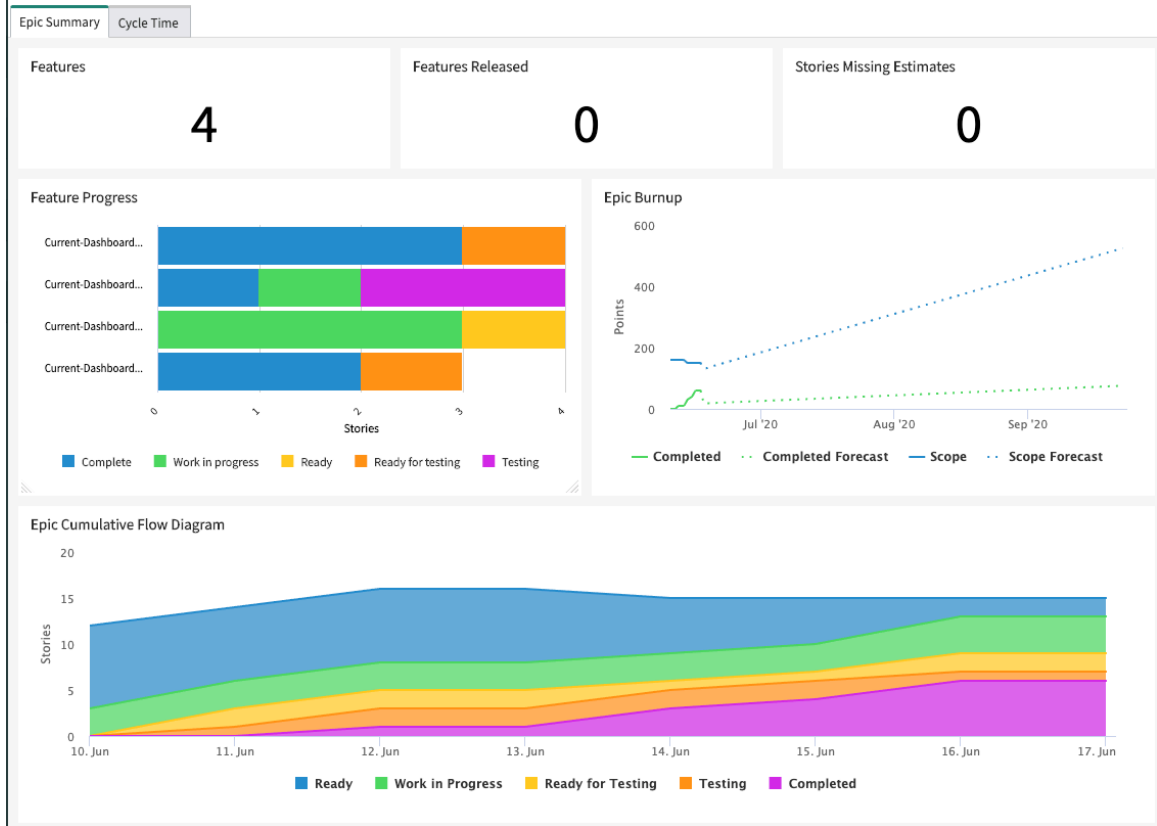

Title	Type	Description
		<ul style="list-style-type: none"> • Number of days that the story was in the Ready for testing state • Number of days that the story was in the Testing state <p>From the Story State section towards the right of the report, you can filter the report to view the cycle time of the stories for the selected states. The chart displays the cycle time for each story as the cumulative sum of all duration of the selected states.</p> <p>If there are too many stories at any area of the chart and the bubbles appear crowded on the report, you can zoom in that particular area of the report for a clearer view.</p> 

You can customize the Burnup report. For more information, see [Customizing Essential SAFe dashboard reports](#).

SAFe Epic Dashboard

The SAFe Epic Dashboard provides a visualization of how the features of an epic are progressing over a given period of time.

Epic Summary tab

Cycle Time tab

The SAFe epic dashboard displays such as total number of features that are complete, and number of stories that are missing estimates. It also indicates the pace at which the ART members are completing the features in the epic.

End user and roles

End user goal with required role

End user and goal	Required role
SAFe ART user: View the progress of every feature in the epic.	safe_scrum_user

Indicators

SAFe: Sum of story points of all stories in epics

Generates the scope series in the Epic Burnup report.

SAFe: Sum of story points of completed stories in epics

Generates the complete series in the Epic Burnup report. This series indicates the amount of work that has been completed in the epic.

SAFe: Count of all stories in current epic

Generates the area series the Epic Cumulative Flow Diagram report, which indicates the number of stories of the current epic by state.

Breakdowns

- SAFe: Epic
- SAFe: State

Widgets

Features

Indicates the total number of features in the epic.

Features Released

Indicates the number of features in the epic that have been completed.

Stories Missing Estimates

Indicates the number of stories in the epic that are missing estimates.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Essential SAFe, then install this dashboard from Solution Library to upgrade its layout and access the following visualizations:

SAFe Sprint Dashboard

Track the progress of your SAFe stories in the current sprint and forecast sprint completion using the SAFe Sprint Dashboard.

SAFe sprint dashboard widgets

SAFe sprint dashboard burndown report

SAFe sprint dashboard burnup report

SAFe sprint dashboard cumulative flow diagram

The dashboard:

- Displays important details of the sprint such as percentage of work that is complete, time elapsed, and total number of stories that are missing estimates.
- Displays the number of stories of the sprint in their current state and their progress.
- Indicates the scope changes, if any, and trends of those scope changes.
- Indicates how the team needs to progress on stories to achieve the sprint goal.
- Forecasts data showing the likelihood of completing the sprint as planned.

Note:

Canceled stories are not included in any of this data.

End user and roles

End user and goal	Required role	Benefits
SAFe scrum master: Reviews the sprint burndown trends. Resolves any bottlenecks and targets to complete the sprint on time.	safe_scrum_user	<ul style="list-style-type: none"> • Analyse the scope changes for the sprint • View current states and analyse the time in each state for the stories of the sprint • Estimate sprint completion dates

Indicators

SAFe: Sum of story points of all stories in the current sprint

Generates the scope series in the Sprint Burndown report. The scope series indicates the amount of work in story points that is planned for the sprint.

SAFe: Sum of story points of active stories in the current sprint

Generates the actual burndown series in the Sprint Burndown report. The actual burndown series indicates the amount of work left (in story points) for completion.

SAFe: Sum of story points of completed stories in current sprint

Generates the percentage of stories completed for the current sprint.

SAFe: Time elapsed in sprint

Calculates the time to be displayed in the Time Elapsed widget.

SAFe: Count of stories in the current sprint

Generates the area series in the Sprint Cumulative Flow Diagram report. It indicates the number of stories in the current sprint.

Breakdowns

- SAFe: Sprint
- SAFe: Current Sprint
- SAFe: State

Widgets

Scope

Indicates the amount of work in story points that is planned for the sprint. This widget lets you see at a glance how much work must be completed to achieve the sprint goal. It also lets you drill down to detail on the stories planned into the sprint.

Percent Completed

Indicates the percentage of work that has been completed in the sprint using story points. This widget lets you see at a glance how much work has been completed in the sprint. Together with the adjacent Time Elapsed widget, these widgets lets you easily see whether you are completing work at a rate consistent with achieving the sprint goal on schedule.

Time Elapsed

Indicates the percentage of time that has elapsed between the start date and planned end date of the sprint. Together with the adjacent Percent Completed widget, these widgets let you easily see whether you are completing work at a rate consistent with achieving the sprint goal on schedule.

Committed Points

Indicates the committed scope (in number of story points) of the sprint. Together with the adjacent Scope widget, these widgets let you see difference between the scope committed at the start of the sprint and the current scope of the sprint.

Note:

This widget is not visible by default. You can add it from Reports to your dashboard. For more information, see [Edit a responsive dashboard](#) .

Blocked Work

Indicates the amount of work (in story points) in the sprint that is blocked.

Stories Missing Estimates

Indicates the total number of stories in the sprint that are missing estimates. It is required that you use estimates for the other indicators, widgets, and reports on this dashboard to be meaningful.

Note:

If you do not estimate stories, enter a "1" in the **Story Points** field. The other indicators, widgets, and reports will then effectively function by count.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Essential SAFe, then install this dashboard from Solution Library to upgrade its layout and access the following visualizations:

- Sprint Burnup
- Sprint Cumulative Flow Diagram

For more information, see [Using Solution Library for Essential SAFe dashboards](#).

Title	Type	Description
<p>Sprint Burndown</p>	<p>Line chart</p> 	<p>Indicates the scope changes, if any, and trends of those scope changes. Indicates the ideal pace of work, how much work is remaining, and if the scope is likely to be completed before the end of the sprint. The Sprint Burndown report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is currently planned for the sprint. This can vary if stories are added to or removed from the sprint after it is started. • Scope Forecast: Predicts the possibility of scope change for the future dates based on historical changes in the current sprint. • Ideal Burndown: Indicates how the team needs to progress on stories to complete the sprint on time. • Remaining: Indicates the amount of work left for completion in the sprint. <p>If the actual burndown (Remaining) is above the ideal burndown, it implies that there is more work left than originally estimated. The team is running behind the schedule of the sprint. If the actual burndown (Remaining) is below the ideal burndown, it implies that there is less work left than originally estimated. The team is running ahead of the schedule of the sprint.</p> <ul style="list-style-type: none"> • Remaining Forecast: Predicts the burndown for the future dates based on historical changes in the current sprint.
<p>Sprint Burnup</p>	<p>Line chart</p> 	<p>Shows the sprint burnup trend indicating scope changes. Forecasts future changes in scope and the trend of work completion.</p> <p>The Sprint Burnup report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the sprint. • Scope Forecast: Predicts the possibility of scope change for the future dates, which is based on historical data. • Completed: Indicates the amount of work completed in the sprint. • Completed Forecast: Predicts the burnup for the future dates. It indicates whether you can complete the sprint on time. The prediction is based on historical data.

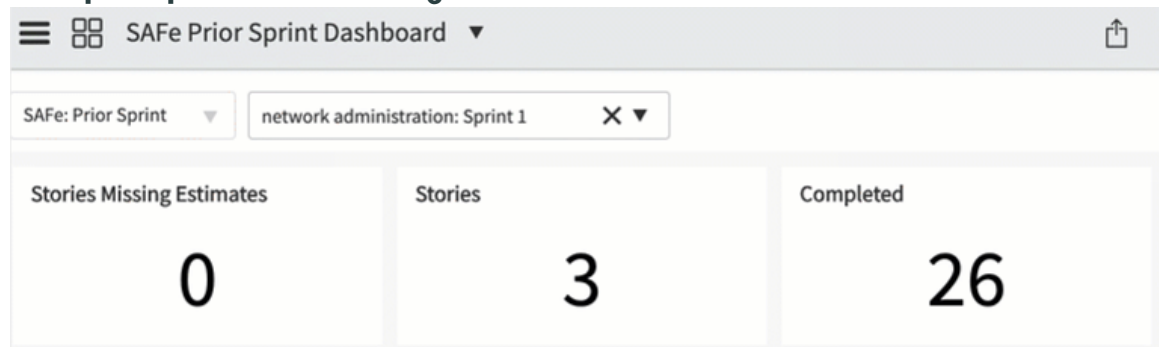

Title	Type	Description
Sprint Cumulative Flow Diagram	Area chart	<p>Monitor the progress of all the stories of your sprint between its actual start and end dates.</p> <p>View the number of stories in each state by their arrival to a state, time in this state, and its departure from this state.</p> <p>The Sprint Cumulative Flow Diagram report comprises the following areas that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Ready: Indicates the number of stories in the sprint that are ready to start work on. • Work in Progress: Indicates the number of stories in the sprint that are in development. • Ready for Testing: Indicates the number stories in the sprint that are ready to be tested. • Testing: Indicates the number of stories in the sprint that are currently being tested. • Complete: Indicates the number of stories in the sprint that are complete. <p>Note: Stories in Ready and Cancelled states are not included in this report.</p>

You can customize the Burnup, Burndown, and Cumulative Flow Diagram reports. For more information, see [Customizing Essential SAFe dashboard reports](#).

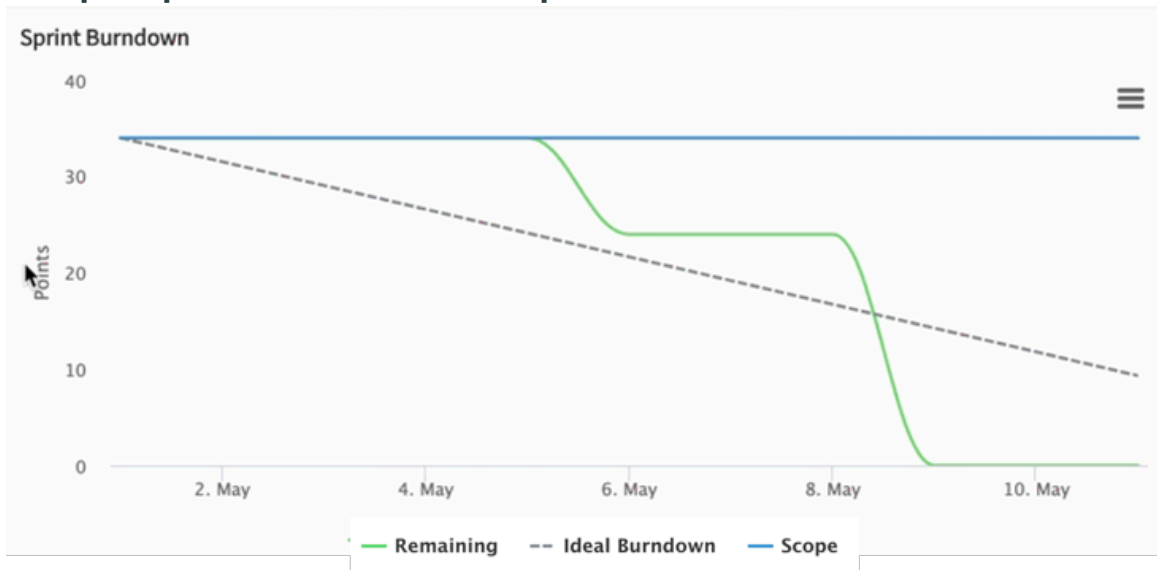

SAFe Prior Sprint Dashboard

The SAFe Prior Sprint Dashboard provides data visualization on scope, actual burnup and burndown, and forecast trends of previous sprints. Analyze the data and plan the work for upcoming sprints.

SAFe prior sprint dashboard widgets

SAFe prior sprint dashboard burndown report

SAFe prior sprint dashboard burnup report

Note: Canceled stories are not included in any of this data.

End user and roles

End user and goal	Required role	Benefits
SAFe scrum master: Analyze data on scope, actual burnup and burndown, and forecast trends of previous sprints.	SAFe_scrum_user	<ul style="list-style-type: none"> Analyze sprint burndown and burnup trends Use the data to plan for upcoming sprints

Indicators

SAFe: Sum of story points of all stories in the current sprint

Generates the scope series in the SAFe Sprint Burndown report.

SAFe: Sum of story points of active stories in the current sprint

Generates the actual burndown series in the SAFe Sprint Burndown report.

Breakdowns

- SAFe: Sprint
- SAFe: Prior Sprint

Widgets

Committed points

Indicates the committed scope (in number of story points) of the sprint.

Stories

Indicates the total number of stories that were completed in the previous sprint.

Completed

Indicates the amount of work (in story points) that was completed in the previous sprint.

Stories Missing Estimates

Indicates the total number of stories in the previous sprint that were missing estimates.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Essential SAFe, then install this dashboard from Solution Library to upgrade its layout and access the Sprint Burnup report. For more information, see [Using Solution Library for Essential SAFe dashboards](#).

Title	Type	Description
Sprint Burndown	Line chart	<p>Shows the scope and rate of scope change, the ideal rate for work completion, and the actual rate of work completion. Analyze the burndown trends and accordingly plan the workload for an upcoming sprint.</p> <p>The Sprint Burndown report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the sprint. • Ideal Burndown: Indicates how the team needs to progress on stories to complete the sprint on time. • Remaining: Indicates the amount of work left for completion in the sprint. <p>If Remaining is above the Ideal Burndown, it implies that there is more work left than originally estimated. The team is running behind the schedule of the sprint.</p> <p>If the Remaining is below Ideal Burndown, it implies that there is less work left than originally estimated. The team is running ahead of the schedule of the sprint.</p>

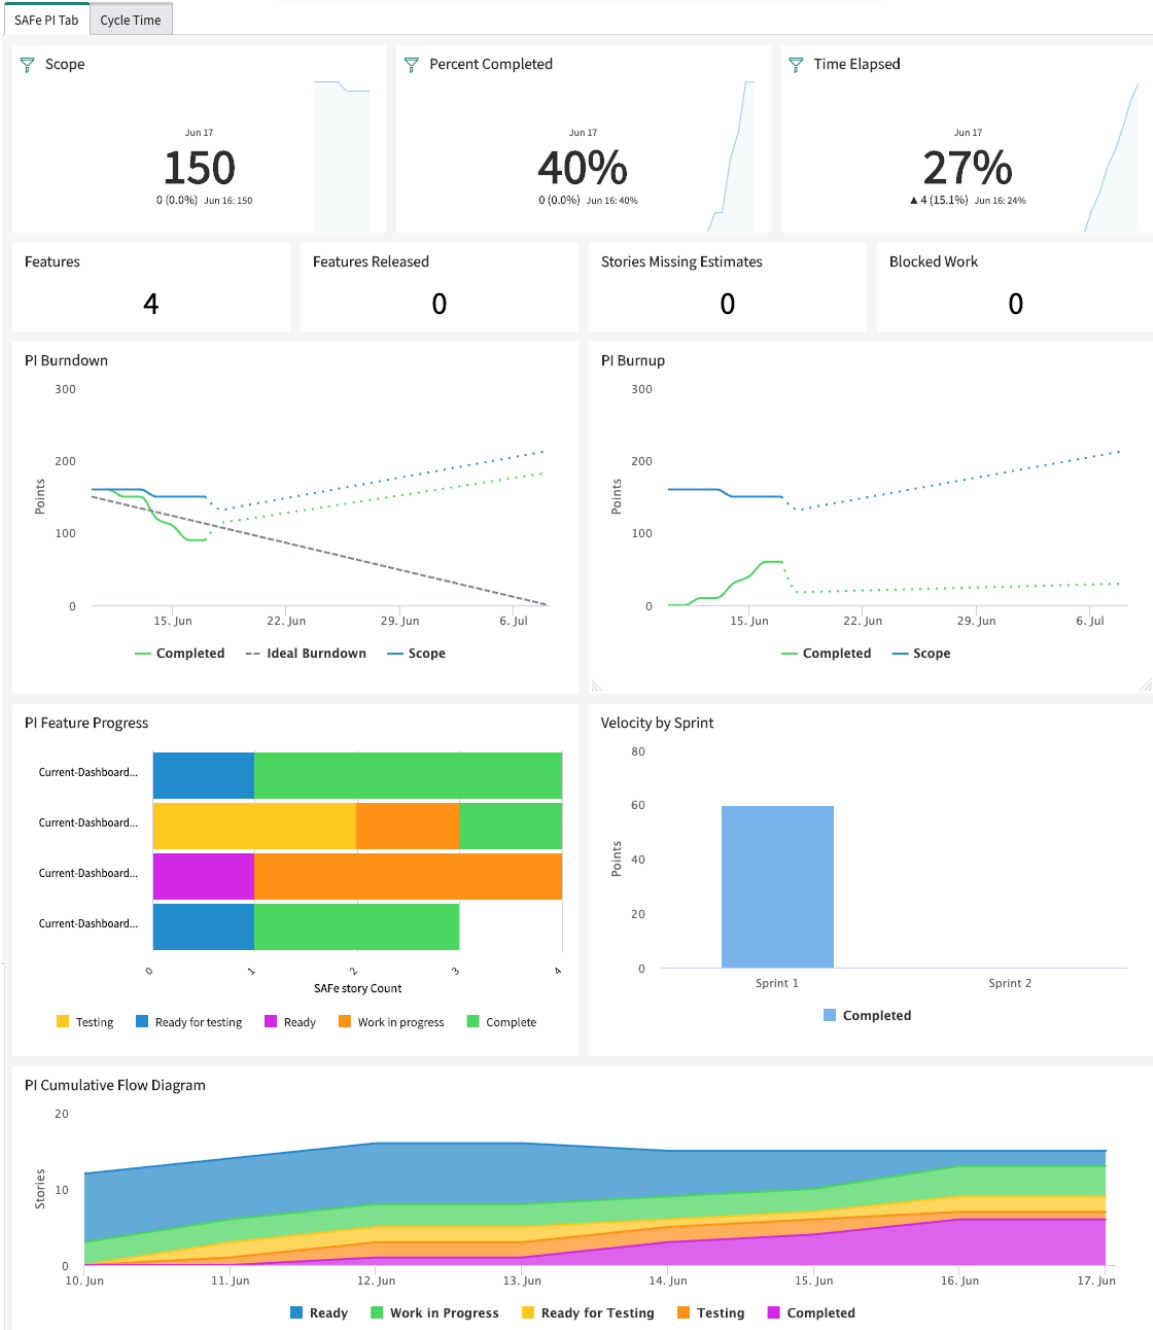

Title	Type	Description
		Analyze the burndown trends and accordingly plan the workload for an upcoming sprint.
Sprint Burnup	Line chart 	Shows the previous sprint burnup trend indicating scope changes. Analyze future changes the trend of team's work completion. The Sprint Burnup report comprises the following series that can be hidden or displayed based on your preference: <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the sprint. • Completed: Indicates the amount of work completed in the sprint.

You can customize the Burnup and Burndown reports. For more information, see [Customizing Essential SAFe dashboard reports](#).

SAFe PI Dashboard

The SAFe PI Dashboard allows you to track the progress of your features in the current program increment (PI).

PI Summary tab

Cycle Time tab

The SAFe PI dashboard provides the following details:

- Displays important details of the PI such as percentage of work that is complete, time elapsed, and total number of stories that are missing estimates.
- Displays the number of stories of the PI in their current state and their progress.
- Indicates the scope changes, if any, and trends of those scope changes.
- Indicates the pace at which the ART members are completing features that are planned for the PI.
- Forecasts data showing the likelihood of completing the PI as planned.
- Shows time elapsed for the stories of the PI to go from an in-progress state to a completed state.

End user and roles

End user goal with required role

End user and goal	Required role
SAFe ART user: Track the progress of your stories that are planned for the PI. Resolve any bottlenecks and target to complete the PI on time.	safe_scrum_user

Indicators

SAFe: Count of all stories in the current PI

Generates the area series the PI Cumulative Flow Diagram report, which indicates the number of stories of the current PI by state.

SAFe: Sum of story points of all stories in the current PI

Generate the scope series in the PI Burndown report. This series indicates the amount (in story points) of work planned for the PI.

SAFe: Sum of story points of completed stories in the current PI

Generates the actual burndown series in the PI Burndown report, and the completed series in the PI Burnup report. These series indicate the amount of work (in story points) that has been completed for the PI.

SAFe: Sum of story points of active stories in the current PI

Generates the scope series in the PI Burndown and PI Burnup reports. The scope series indicates the amount of work (in story points) that is planned for the PI.

SAFe: Time elapsed in the PI

Calculates the time to be displayed in the Time Elapsed widget.

Breakdowns

- SAFe: PI
- SAFe: State

Widgets

Scope

Indicates the amount of work in story points that is planned for the PI. This widget lets you see at a glance how much work must be completed to achieve the PI goal. It also lets you drill down to detail on the stories that are planned for completion in the PI.

Percent Completed

Indicates the percentage of work that has been completed in the PI using story points. This widget lets you see at a glance how much work has been completed in the PI. Together with the adjacent Time Elapsed widget, these widgets let you easily see whether you are completing work at a rate consistent with achieving the PI goal on schedule.

Time Elapsed

Indicates the percentage of time that has elapsed between the start date and planned end date of the PI. Together with the adjacent Percent Completed widget, these widgets let you easily see whether you are completing work at a rate consistent with achieving the PI goal on schedule.

Features

Indicates the total number of features that are planned for completion in the PI.

Features Released

Indicates the total number of features in the PI that have been completed.

Stories Missing Estimates

Indicates the total number of stories in the PI that are missing estimates. It is required that you use estimates for the other indicators, widgets, and reports on this dashboard to be meaningful.

Note:

If you do not estimate stories, enter a "1" in the **Story Points** field. The other indicators, widgets, and reports will then effectively function by count.

Blocked Work

Indicates the amount of work (in story points) in the PI that is blocked.

Data visualizations

If you are upgrading from version 1.0.2 or earlier of Performance Analytics Content Pack for Essential SAFe, then install this dashboard from Solution Library to upgrade its layout and access the following visualizations:

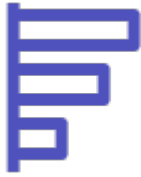

- PI Cumulative Flow Diagram
- Story Cycle Time

For more information, see [Using Solution Library for Essential SAFe dashboards](#).

SAFe PI Summary

Title	Type	Description
PI Burndown	Line chart 	<p>Indicates the scope changes, if any, and trends of those scope changes relative to the ideal pace of work, how much work is remaining, and if the scope is likely to be completed before the end of the PI. The PI Burndown report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the PI. • Scope Forecast: Predicts the possibility of scope change for the future dates in the PI. This prediction is based on historical data. • Ideal Burndown: Indicates how the ART members need to progress to deliver the PI on time. • Remaining: Indicates the amount of work completed in the PI. • Remaining Forecast: Predicts the burndown for the future dates in the PI. This prediction indicates whether you can deliver the PI on time.
PI burnup	Line chart 	<p>Analyse the burnup trends, and estimate when the PI work is likely to be completed. The PI burnup report comprises the following series that can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Scope: Indicates the amount of work that is planned for the PI. • Scope Forecast: Predicts the possibility of scope change for the future dates in the PI. This prediction is based on historical data. • Completed: Indicates the amount of work in the PI that is completed. • Completed Forecast: Predicts the burnup for the future dates in the PI. This prediction indicates whether you can complete the PI on time. <p>Note: The point at which the Completed Forecast series intersects with the Scope Forecast series is a predictor for when the PI might be completed. If the Completed Forecast series and the Scope Forecast series do not ever intersect, it is a warning that scope is being added faster than it is being completed.</p>
PI Feature Progress	Horizontal bar chart	Analyze the progress of every feature of the PI, by viewing the count of items in each state, segregated by their state.

SAFe PI Summary (continued)

Title	Type	Description
		
Velocity by Sprint	Bar chart 	View the velocity of the ART members across PIs. Understand if they are achieving a stable, predictable velocity over sprints, and meeting commitments.
PI Cumulative Flow Diagram	Area chart 	<p>Monitor the progress of all the stories of your PI between its actual start and end dates.</p> <p>View the number of stories in each state by their arrival to a state, their departure from that state, and its departure from this state.</p> <p>The PI Cumulative Flow Diagram report comprises the following areas, which can be hidden or displayed based on your preference:</p> <ul style="list-style-type: none"> • Ready: Indicates the number of stories of the PI that are ready to be pulled into development. • Work in Progress: Indicates the number of stories of the PI that are currently in development. • Ready for Testing: Indicates the number of stories of the PI that are ready to be tested. • Testing: Indicates the number of stories of the PI that are currently being tested. • Complete: Indicates the number of stories that are complete. <p>Note: Stories in Ready and Cancelled states are not included in this report.</p>

Customizing Essential SAFe dashboard reports

Customize the Burnup, Burndown, and Cumulative Flow Diagram reports of your dashboards according to the custom states of your SAFe stories.

- Configure indicators to reflect your customizations.

For example, if there are any new states introduced to the SAFe story table, then the corresponding indicators and indicator sources for the story table that rely on the **State** field must be updated as well.

For more information, see [Customize indicators of your Essential SAFe dashboard reports](#).

- Update or clone UI scripts for modifications to use your own indicators.

Add customizations by overriding methods in empty implementation (Impl) classes of UI scripts such as `SafeAreaChartImpl` and `SafeVelHistoryImpl`.

For more information, see [Update UI scripts to use your indicators for Essential SAFe dashboards](#).

Customize indicators of your Essential SAFe dashboard reports

Configure indicators to reflect your customizations in Essential SAFe dashboards.

Before you begin

Role required: admin or pa_admin

Procedure

1. Navigate to **All > Performance Analytics > Indicators > Automated Indicators**.
2. Search for and open the required indicator.
For example, if you want to customize the SAFe Burnup report, open SAFe: Sum of story points of all stories in the feature in current sprint from the list of indicators.
3. In the Additional conditions section, modify the conditions according to your preferences.
4. Click **Update**.

Update UI scripts to use your indicators for Essential SAFe dashboards

Customize UI scripts by overriding methods in empty implementation (Impl) classes.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System UI > UI Scripts**.
2. Search for and open the required UI script.
For example, if you want to customize the SAFe Sprint Cumulative Flow Diagram report, open SAFeAreaChartImpl from the list of UI scripts.
3. Overwrite the base implementation according to your preferences.
4. Click **Update**.

Customize story states of your Essential SAFe dashboard reports

Configure story states to reflect your customizations on the Essential SAFe dashboards.

Before you begin

Role required: admin or pa_admin

Procedure

1. Navigate to **All > Scaled Agile Framework (SAFe) > Stories**.
2. Open a story to which you would like to add the custom states.
3. Right-click **State** and select **Configure Choices** from the drop-down menu.
4. In the **New item text** field, enter the new custom state name.
5. In the **Numeric value** field, enter any corresponding number.
6. Click **Add**.
The new state appears in the Selected list.
7. Click **Save**.

Work Progress Status for SAFe

The Work Progress Status for SAFe application provides you with indicators such as estimated completion date and progress status (green, yellow, red) for all your SAFe epics and features.

Important:

Starting with the Xanadu release, the plugins Portfolio SAFe, Essential SAFe, Performance Analytics Content Pack for Essential SAFe, Work Progress Status for SAFe, Agile - Scaled Agile Framework - Unified Backlog, and Read only roles for SAFe are being prepared for future deprecation. These plugins will be hidden and can no longer be activated on new instances but will continue to be supported. [Enterprise Agile Planning in Strategic Planning](#) provides the latest experience for this functionality.

For more information on the deprecation process and its impact, see the [Application/Plugin Deprecation Process \[KB0867184\]](#) article in the Now Support Knowledge Base.

As a product owner or a team lead, these indicators help you understand if your SAFe team could complete the work by the planned end dates so that you can adjust your plans accordingly. As a team member working on SAFe stories, these status indicators help you understand your contribution to the overall work and your progress so that you can review your work strategy if necessary.

Note:

You must enter a value for the **Planned end date** field for a SAFe feature or epic for these work progress status indicators to populate.

Reviewing progress status for SAFe features and epics

Understand if your work would be completed by the planned end dates by reviewing progress status of your SAFe features and epics.

Navigate to **Scaled Agile Framework (SAFe) > Epics** or **Scaled Agile Framework (SAFe) > Features** and filter the records for your team.

The Status column of the list shows a Green, Yellow, or Red indicator for each record to indicate the following:

- Green: Your work is on track to be complete by the planned end date.
- Yellow: Your work is off track and your plan of execution must be reviewed.
- Red: Your epic or feature is not progressing well and might be at risk of not being complete by the planned end date.

The estimated completion date displays a date with the likelihood of the epic's or feature's completion.

SAFe epic progress status

Number	Short description	State	WSJF score	Planned end date	Percent complete by estimate	Status	Estimated completion date
SFEPI0001001	Redesign Frontend	Implementation	3	2020-08-25 11:09:53	89%	Green	2020-08-21
SFEPI0001003	Ad Platform	Implementation	7,88	2020-08-20 11:09:53	93%	Green	2020-08-18
SFEPI0001004	Tailored Ads	Implementation	2,62	2020-08-13 11:09:53	75%	Yellow	2020-08-18
SFEPI0001005	Hotel Listings	Implementation	11	2020-09-09 11:09:53	24%	Red	2020-09-23

The [\[SAFe\] daily data collection job](#) helps generate the burnup report for your epics and features. Using the data generated for these epic burnup reports, an estimated completion date is determined. You can see that this date is the intersection of Completed and Scope forecast series in the respective burnup reports.

Based on this estimated completion date, the progress status for your SAFe epics and features is determined. Progress status is calculated only under the following conditions:

- Planned end date is populated for the SAFe epic and feature.
- Percentage completion of the epic is a value greater than 0.

The color of the progress status indicator is determined using the following conditions:

- Green: Estimated completion date is on or before the planned end date.
- Yellow: Estimated completion date is beyond the planned end date by a deviation of 1% to 14%.
- Red: Estimated completion date is beyond the planned end date by a deviation of 15% or more.

Test Management applications

The ServiceNow® Test Management application streamlines the management of testing processes to help you deliver software products more efficiently and with fewer errors.

Test Management is available in two versions.

- Test Management 2.0 offers many enhancements, including integration with Agile Development 2.0 and Scaled Agile Framework (SAFe)
- Test Management 1.0 may have specific capabilities that are useful for your organization.

Use the following comparison to make an informed decision for your organization.

Differences between Test Management 1.0 and Test Management 2.0

Test Management 1.0 covers user acceptance testing. It does not include some key data model structures like test versions, test runs, or test results. In addition, you cannot structure test plans in Test Management 1.0.

Test Management 2.0 includes data model structures that match industry standards. It provides you with an intuitive user interface called the [Test Board](#) from which you can structure test plans and plan the phases of your testing effort.

 **Tip:**

If you need Agile Development integration, test versioning, or detailed test run traceability, use Test Management 2.0. If your organization requires only basic user acceptance testing without Agile integration, Test Management 1.0 may be sufficient.

Feature	Test Management 1.0	Test Management 2.0
Integration with Project Portfolio Management	no	yes
Integration with Agile Development 2.0	no	yes
Integration with Scaled Agile	no	yes

Feature	Test Management 1.0	Test Management 2.0
Framework (SAFe)		
Test version	You cannot create and maintain multiple versions of a test.	You can create and maintain multiple versions of a test.
Test relation	You can associate a test to one test suite only.	You can associate a test to multiple test sets, test plans, and test cycles.
Time duration	You can create a test plan describing how a product or a feature is to be tested.	<ul style="list-style-type: none"> You can create a test plan describing how a product or a feature is to be tested and the time frame in which the test plan must be run. You can further decompose a test plan into test cycles, test cycles into test execution sets, and specify a time range for their execution.
Traceability of test runs and test results	You can: <ul style="list-style-type: none"> run a single test at a time. view the test result. 	You can: <ul style="list-style-type: none"> run a single test at a time. view which version of test has been run. view the test result.

Note:

- If you are an existing Test Management user on a release prior to London, you are using Test Management 1.0 activated through the Test Management (com.snc.test_mgmt) plugin. See the [Test Management 1.0](#) documentation for more information.
- If you are a new user, you can activate the Test Management 2.0 (com.snc.test_management.2.0) plugin as it provides enhanced testing capabilities. See the [Test Management 2.0](#) documentation for more information.

Domain separation and Test Management

Domain separation is supported in Test Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the customer must be able to see the SP’s response.

For more information on support levels, see [Application support for domain separation](#) .

[Domain separation for service providers](#) .

Test Management 1.0

The ServiceNow® Test Management 1.0 application provides a tool for manual software testing.

With the Test Management plugin (com.snc.test_mgmt), test managers and testers can perform the following functions and manage all phases of the testing process.

- Create and maintain the test repository by creating test suites, test cases, and tests. For more information, see [Create a test suite](#).
- Enable test execution by creating test plans, adding test cases, and assigning testers to test cases. For more information, see [Create a test plan](#).
- Initiate the testing process and monitor the progress.
- Perform tests and record test results. For more information, see [Performing tests and updating the test status](#).
- Update test case status. For more information, see [Update the status of a test case](#).
- Report defects and retest, as necessary. For more information, see [Report a defect from a failed test](#).
- Evaluate test results and complete the test plan sign-off form. For more information, see [Complete the test plan sign-off](#).
- View testing reports on the Test Management dashboard. For more information, see [Test Management dashboard](#).

Activate Test Management

To activate the Test Management (com.snc.test_mgmt) plugin you must have an admin role.

Before you begin

Role required: admin

About this task

Note:

There are two ways to activate the Test Management plugin:

- [As an individual application](#)
- As part of the Project Portfolio Suite with Financials plugin.

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#).

Components installed with Test Management

Several types of components are installed with activation of the Test Management plugin, including tables and user roles.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Roles installed

Role title [name]	Description	Contains roles
Test manager [tm_test_manager]	Manages test plans and test suites (metadata). Has all privileges within test management, including planning, execution, and administration.	tm_tester
Tester [tm_tester]	Executes test cases and tests.	feature_user

Tables installed

Table	Description
Test Case [tm_test_case]	Stores the test cases.
Test Case Instance [tm_test_case_instance]	Extends the Planned Task table.
Test Suite [tm_test_suite]	Stores the test suites.
Test Environment [tm_test_environment]	Stores the test environments.
Test [tm_test]	Stores the tests.

Table	Description
Test Instance [tm_test_instance]	Stores the tests under a test plan.
Test Plan [tm_test_plan]	Stores the test plans. Extends the Planned Task table.
Test Case Defects [m2m_tm_test_case_instance_defect]	Stores the test case defects that are recorded for failed tests.

Business stakeholder role for Test Management 1.0

Use the business stakeholder role to read and retrieve data from any table of the Test Management 1.0 application to generate reports.

When you activate the Business Stakeholder plugin (com.snc.business_stakeholder) in your ServiceNow instance, the Read only roles for Test Management 1.0 plugin (com.snc.tm1_read_roles) is also activated. This plugin provides a business stakeholder role (sn_tm1_read) with which you can access all the tables of the Test Management 1.0 application. This role also allows read-only access to the Test Management dashboard. You can assign this role to any user in your organization who is a business stakeholder.

Plugin availability

If you are a new customer, the Read only roles for Test Management 1.0 plugin (com.snc.tm1_read_roles) is activated on zBoot. However, the business stakeholder role (sn_tm1_read) is available only when you activate the Test Management 1.0 plugin (com.snc.test_mgmt).

If you are an upgrade customer, you must manually activate the Read only roles for Test Management 1.0 plugin (com.snc.tm1_read_roles).

Test Management 1.0 tables accessible by users with the business stakeholder role

When both the Read only roles for Test Management 1.0 plugin (com.snc.tm1_read_roles) and Test Management 1.0 plugin (com.snc.test_mgmt) are active in your ServiceNow instance, the user with the business stakeholder role (sn_tm1_read) has read access to the following tables.

Test Management 1.0 tables

Table	Description
Test Case [tm_test_case]	Stores the test cases.
Test Case Instance [tm_test_case_instance]	Extends the Planned Task table.
Test Suite [tm_test_suite]	Stores the test suites.

Test Management 1.0 tables (continued)

Table	Description
Test Environment [tm_test_environment]	Stores the test environments.
Test [tm_test]	Stores the tests.
Test Instance [tm_test_instance]	Stores the tests under a test plan.
Test Plan [tm_test_plan]	Stores the test plans. Extends the Planned Task table.
Test Case Defects [m2m_tm_test_case_instance_defect]	Stores the test case defects that are recorded for failed tests.

Test Management key terms

Key terms describe the terminology used in Test Management.

Key terminology

Term	Definition
Test suite	A repository of test cases. Test cases in a test suite can be copied over to a test plan.
Test case	A collection of related tests. A test case is saved as part of a test suite and can be added to a test plan. Each test case within a test plan has an assigned tester.
Test	A collection of conditions or steps used to determine whether a feature is working correctly. A test also includes an expected result, which is used to determine if the test case passes or fails.
Test plan	The tasks for how a product or a feature is to be tested. A test plan includes one or more test cases and can also specify a test environment. The test manager uses the test plan to assign and execute test cases and to track the testing progress.
Test environment	The instance where testing should be performed, specified as a URL. A test environment is an optional parameter that the test manager can associate with a test plan.
Test execution	The process of performing tests. The test manager assigns testers to test cases in a test plan; testers perform the tests in the assigned test cases.
Guided test execution	An automated notification process for performing tests. The test manager assigns testers to test cases in a test plan and initiates testing from the Test Plan form. Testers receive notification to begin testing using the Assessments engine.

Test Management process flow

The tasks associated with manual software testing can be divided into several steps.

The test manager and the tester are involved in the following activities in a manual testing process for a product or feature:

- Build the test repository by creating test suites, test cases, and tests.
- Create a test plan to test a specific product or feature
- Adds test cases to the test plan.
- Assign a tester to each test case.
- If required, define a test environment.
- Perform tests for the assigned test cases.
- Record the results and update the status of each test.
- Update the status of test cases.
- Monitor the progress of the test plans, test cases, and tests.

Stakeholders review the test results and any open issues to decide on the sign-off of the test plan.

Except for completing the test plan sign-off form at the end, there is no required order for performing these testing tasks. Each task can be independently performed.

Setting up the manual testing process

Set up and monitor the test suites, test cases, and test plans.

With Test Management 1.0, you can perform the following tasks:

- Create and maintain the test repository, including test suites, test cases, and tests.
- Create test plans.
- Define test environments, if desired.
- Add test cases to a test plan.
- Assign a tester to each test case.
- Notify testers to begin testing.
- Monitor the testing process.
- Evaluate test results.
- Complete the test sign-off form.

Test suites

Use test suites to group test cases together so that you can execute your tests efficiently.

Navigate to **Test Management > Test Repository > Test Suites** to display a list of test suites. Click a test suite to display the Test Suite form, which lists all test cases included in the suite.

Create a test suite

A test suite is made up of one or more test cases that are grouped for execution purposes.

Before you begin

Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Repository > Test Suites**.
2. Click **New**.
3. On the form, fill in the fields.

Test Suite form

Field	Description
Number	System-generated unique identifier of the test suite.
Name	Name of the test suite.
Active	Option to indicate if the test suite is active. If indicated as active, this test suite is visible to users when they try to add a test case to this suite from the Test Case form.
Owner	Owner of the test suite.
Description	Detailed description of the test suite.

4. Click **Submit**.

What to do next

You can use the related links and related lists of the new test suite for the following actions:

- Add this test case to a test plan by clicking the **Add to Test Plan** related link.
- Create a copy of this test suite by clicking the **Create duplicate** related link. For more information, see [Create a copy of an existing test suite](#).
- Associate test cases to this test suite by using the Test Cases related list. For more information, see [Add a test case to a test suite](#).

Create a copy of an existing test suite

Create a test suite with the details of an existing test suite.

Before you begin

- [Create a test suite](#).
- Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Repository > Test Suites**.
2. Open the test suite that you want to create a copy of.
3. In the related links section at the bottom of the test suite form, click **Create duplicate**.

Tip:

If the **Create duplicate** related link is not visible, verify that you have the tm_test_manager or tm_tester role and that the test suite is active.

4. Enter a name in the **Test Suite Name** field.
5. Click **OK**.

What to do next

You can use the related links and related lists of the new test suite for the following actions:

- Add this test suite, with all associated test cases, to a test plan by clicking the **Add to Test Plan** related link.
- use the Test Cases related list to associate test cases to this test suite.

Add a test case to a test suite

Create and add a new test case to an existing test suite.

Before you begin

- [Create a test suite.](#)
- Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Repository > Test Suites.**
2. Open the test suite to which you want to add a test case.
3. From the Test Cases related list, click **New.**
4. On the form, fill in the fields.

Test Case form

Field	Description
Number	System-generated unique identifier of the test case.
Active	Option to indicate if the test case is active.
Test Suite	Test suite which the test case is added to.
Short Description	Detailed description of the test case.
Prerequisites	Any conditions that must be met before the test case is executed.

5. Click **Submit.**

Test cases

Use test cases to group related tests together so that you can add them to a test suite or a test plan.

A test case contains one or more related individual tests and defines the conditions under which a feature must be verified. Test cases are the primary unit for organizing and executing tests in Test Management.

Navigate to **Test Management > Test Repository > Test Cases** to view a list of test cases. Select a test case to display the Test Case form, which lists all tests in the test case.

Test organization hierarchy

Tests in Test Management are organized in the following hierarchy:

1. Tests: Individual test steps that verify a specific condition.
2. Test cases: Groups of related tests.

- 3. Test suites: Collections of related test cases.
- 4. Test plans: Structured plans that contain test suites and define how a product must be tested.

For more information, see [Create a test case](#).

Create a test case

Create a test case to group one or more related individual tests.

Before you begin

Role required: tm_test_manager or tm_tester

Procedure

- 1. Navigate to **All > Test Management > Test Repository > Test Cases**.
- 2. Click **New**.
- 3. On the form, fill in the fields.

Test Case form

Field	Description
Number	System-generated unique identifier of the test case.
Active	Option to indicate if the test case is active.
Test suite	Test suite that the test case belongs to.
Short description	Brief summary of the test case. Use a consistent naming convention such as [Feature]: [Scenario] to make test cases easy to identify in lists and reports.
Prerequisites	Conditions that must be met before the test case is executed, such as required roles or data setup.

- 4. Click **Submit**.

What to do next

You can use the related link and related list of the new test case for the following actions:

- Add this test case to a test plan by clicking the **Add to Test Plan** related link.
- Add tests to this test case by using the Tests related list. For more information, see [Add a test to a test case](#).

Add a test to a test case

Create and add a new test to an existing test case.

Before you begin

- [Create a test case](#).
- Role required: tm_test_manager or tm_tester

Procedure

- 1. Navigate to **All > Test Management > Test Repository > Test Cases**.
- 2. Open test case which you want to add the test to.
- 3. From the Tests related list, click **New**.

4. On the form, fill in the fields.

Test form

Field	Description
Number	System-generated unique identifier of the test
State	State of the test. Select from one of the following: <ul style="list-style-type: none"> ○ Draft: Test is not ready to be performed. ○ Ready: Test is ready to be performed. ○ Inactive: Test is no longer active.
Order	Order in which the test is performed, relative to other tests in this test case.
Test	Name of the test.
Expected result	Expected result of the test.
Detailed description	Detailed description of what is being tested.

5. Click **Submit**.

What to do next

You can create a copy of this test by using the **Create Duplicate** related link on the test form.

Delete a test case

Delete a test case and all the tests associated to it.

Before you begin

Role required: tm_test_manager

Procedure

1. Navigate to **All > Test Management > Test Repository > Test Cases**.
2. Open the test case that you want to delete.
3. Click **Delete**.
4. **Optional:** Read the warning message in the confirmation pop-up window.
5. Click **Delete** to confirm the deletion.

Result

The test case is removed from the list and all the associated tests are deleted.

Tests

Use tests to determine if a feature or an application is working correctly.

A test is made up of conditions, variables, or steps that are used to determine whether a feature is working correctly. A test also includes an expected result, which is used to determine whether the test passes or fails.

Related tests are grouped together in a test case. From the Tests related list on a Test Case form, you can view a list of all tests associated with the test case. Navigate to **Test Management > Test Repository > Test Cases** and select a test case to view the list of its tests.

Create a test

Create a test to see if your features are working correctly.

Before you begin

- [Create a test case.](#)
- Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Repository > Test Cases.**
2. Open a test case to which you want to add a test.
3. From the Tests related list, click **New.**
4. On the form, fill in the fields.

Test form

Field	Description
Number	System-generated unique identifier for this test.
State	Status of the test. Choose from one of the following: <ul style="list-style-type: none"> ○ Draft: Test is not ready to be performed. ○ Ready: Test is ready to be performed. ○ Inactive: Test is no longer active
Order	Order in which this test is performed, relative to other tests in this test case.
Test	Name of the test indicating what the test is for. For example, Approve Quote and convert to Order.
Expected result	Expected result of the test.
Detailed description	Description of what is being tested.

5. Click **Submit.**

What to do next

You can create a copy of this test by clicking the **Create Duplicate** related link. For more information, see [Create a copy of an existing test.](#)

Create a copy of an existing test

Create a test with the details of an existing test.

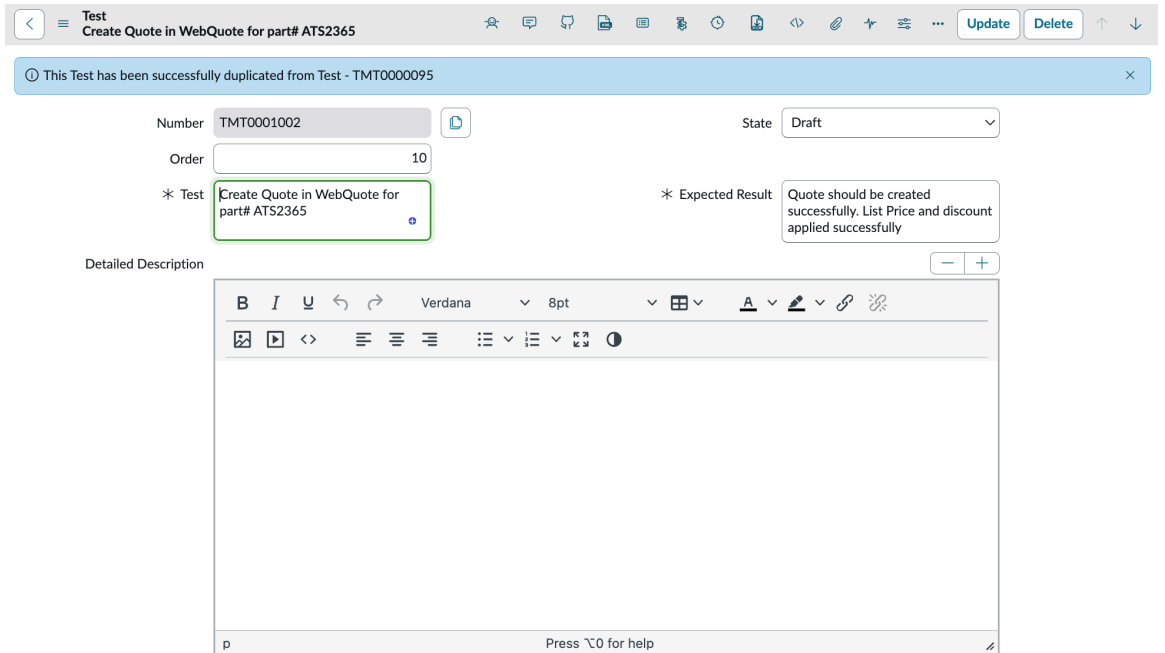

Before you begin

- [Create a test.](#)
- Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Repository > Test Cases.**
2. Open the test case which has the test that you want to duplicate.
3. From the **Tests** related list, open the test that you want to duplicate.
4. Select the **Create Duplicate** related link.

A new test is created with details from the old test and the test form is

opened.

5. **Optional:** Make any necessary changes to details of the new test.
6. Select **Update.**

Create a test environment

Create a test environment to define the setup to be used when conducting the tests in a test plan.

Before you begin

Role required: tm_test_manager

About this task

A test plan can specify the software version or the operating system to be used. The Test Environment form includes the type of environment and can also include a URL.

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Environments.**
2. Click **New.**
3. On the form, fill in the fields.

Test Environment form

Field	Description
Number	System-generated unique identifier of the test environment.

Field	Description
Name	Name of the test environment.
Type	Type of environment. Select one from the following: <ul style="list-style-type: none"> ○ Development ○ Production ○ QA ○ User Acceptance Testing (UAT) ○ Staging ○ Support
URL	URL of the test environment.
Short description	Brief description of the test environment.

4. Click **Submit.**

Test plans

Use test plans in Test Management 1.0 to plan how to test your feature or application.

A test plan includes one or more test cases and can also specify a test environment. Test plans are used to assign test cases to testers and to monitor the progress of the tests.

You can view the list of test plans by navigating to **Test Management > Test Execution > Test Plans**. This list shows the current test plans, along with the percentage of the test cases completed and the status of the test cases. Open a test plan to view more details such as the test environment that is used for this plan and a list of test cases added to this plan.

Create a test plan

Create a test plan to detail how a product or a feature is to be tested.

Before you begin

Role required: tm_test_manager or tm_tester

Procedure

- 1. Navigate to **All > Test Management > Test Execution > Test Plans**.**
- 2. Click **New**.**
- 3. On the form, fill in the fields.**

Test Plan form

Field	Description
Short Description	Brief description of the test plan indicating what the test plan is for.
Owner	Owner of the test plan.
Test environment	Specific environment to be used for testing. Users can see the details of the assigned test environment by clicking to the information icon (ⓘ) next to the Test environment field.

Field	Description
Active	<p>Option to indicate if the test plan is active.</p> <p>If indicated as active, this test plan is visible to users when they try to add a test suite to this plan from the Test Suite form.</p>
Instructions	Any specific instructions for this test plan.
Project	<p>The name of the associated project.</p> <p>This field appears on the Test Plan form if the Test Management PPM Integration is activated as part of the Project Portfolio Suite plugin (com.snc.project_portfolio_suite).</p>
Project Phase	<p>The name of the associated project phase in the Project Workbench.</p> <p>This field appears on the Test Plan form if the Test Management PPM Integration is activated as part of Project Portfolio Suite plugin (com.snc.project_portfolio_suite).</p>
Planned start date	<p>Projected start date for the test plan. The planned start date can be the current date or a future date.</p> <p>This field is automatically set to the current date. To change the planned start date, click the calendar icon (📅) and select a new date.</p> <p>You may need to configure the form to add this field. For more information, see Display test plan execution start and end dates.</p>
Planned end date	<p>Projected end date for the test plan. The planned end date must be after the planned start date.</p> <p>This field is automatically set to the current date. To change the planned end date, click the calendar icon (📅) and select a new date.</p> <p>You may need to configure the form to add this field. For more information, see Display test plan execution start and end dates.</p>
Actual start date	<p>Actual start date for the test plan. The actual start date can be on or before the planned start date.</p> <p>You may need to configure the form to add this field. For more information, see Display test plan execution start and end dates.</p>
Actual end date	<p>Actual end date for the test plan. The actual end date can be before the planned start date but not before the actual start date.</p> <p>You may need to configure the form to add this field. For more information, see Display test plan execution start and end dates.</p>

4. Save the test plan by using one of the following choices.

- Click **Submit** to return to the Test Plans list.
- Click **Save** to remain on the Test Plan form.

What to do next

You can use the related links and related lists of the new test suite for the following actions:

- Add existing test cases to this test plan from a test suite by clicking the **Add Test Cases from Test Suite** related link.
- Add new test cases to this test plan from the Test Cases related list. For more information, see [Add a new test case to a test plan](#).
- Save this test plan as a new test suite by clicking the **Save as Test Suite** related link. A new test suite is created with all the test cases of this plan making them available to add to another test plan.
- Start the test plan and notify the testers about the target end date for testing by using the **Notify Tester** related link. For more information, see [Initiate guided test execution](#).
- Cancel the test execution by clicking **Cancel test execution** related link. This link is available only if you've used the **Notify Tester** related link and started the test plan. For more information, see [Cancel guided test execution](#).
- View all the test cases in a Visual Task Board (VTB) by clicking **Show Visual task Board** related link. The VTB shows test cases in lanes organized by their execution states.
- Create a copy of this test plan by clicking **Copy Test Plan**.
- View the test execution summary and sign off the test plan by clicking the **Sign-off Test Plan** related link.
- View the Test Plan Defects related list for the list of all the defects logged from the test cases.

Display test plan execution start and end dates

Add the planned and actual start and end date fields on the Test Plan form to see the execution date information.

Before you begin

Role required: tm_test_manager or tm_tester

About this task

Configure the Test Plan form layout to display the planned and actual start and end dates for the test plan.

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Open a test plan for which you want to see the execution start and end dates.
3. Open the form layout configuration.
 - a. Right-click the form header.
 - b. Select **Configure**.
 - c. Select **Form Layout**.
4. Move the following fields from the Available list to the Selected list.
 - Planned start date
 - Planned end date
 - Actual start date
 - Actual end date
5. **Optional:** Rearrange the order of the fields in the Selected list.
6. Click **Save**.

Result

The Test Plan form is displayed with the newly added date fields.

Add a new test case to a test plan

Add new test cases to your test plans so that you can assign them to testers and start test execution.

Before you begin

Role required: tm_test_manager or tm_tester

About this task

You can add test cases that are not already a part of existing test suites. Create a test case directly from the Test Plan form through the Test Cases related list.

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Open the test plan which you want to add the test cases to.
3. In the **Test Cases** related list, click **New**.
4. On the form, fill in the fields.
For information on the Test Case form fields, see [Create a test case](#).
5. Click **Submit**.

Result

The new test case is added to the **Test Cases** related list.

Assigning testers to test cases

Assign the test cases in a test plan to users with the tester (tm_tester) role and to business users.

Test cases can be assigned to users from the Test Plan form directly, or from the Visual Task Board (VTB) view of the test cases in the test plan.

Users with the tm_tester role can choose to perform testing from the Test Plan form or the Test Case form, the VTB, or by using the guided test execution feature. Business users can only perform testing using the guided test execution.

Assign testers from the Test Plan form

Use the Test Cases related list on the Test Plan form to assign testers.

Before you begin

Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Open a test plan.
3. From the **Test Cases** related list, open a test case to which you want to assign a tester.
4. Select a user in the **Assigned to** field.
5. Click **Update**.

Assign testers from the Visual Task Board

Assign the test case to a tester from the Visual Task Board (VTB).

Before you begin

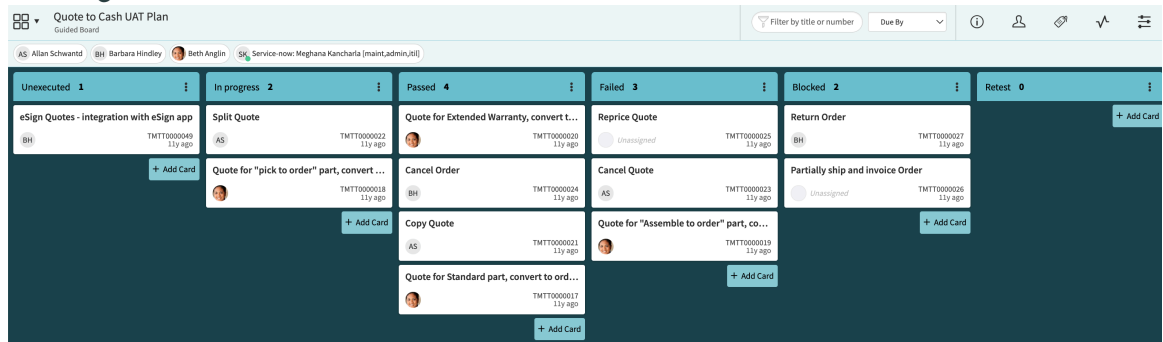

Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Open a test plan.
3. Click the **Show View Task Board** related link.

The VTB displays lanes for test case statuses. A card for each test case appears in the appropriate lane based on its status. Test cases that are not assigned to any user display Unassigned on their cards.

Unassigned test case card on the Test Plan Visual task Board

4. Click the Unassigned card to open the test case form.
5. Click **ASSIGNED TO** from the right side panel.
6. Click **Add Primary Assignee** and select a user.
7. Close the card by clicking the close icon (X).

Guided test execution

Notify testers about the test cases that are assigned to them through guided test execution by using the Assessments application to notify testers about assigned test cases.

Any user can perform tests using the guided testing feature. The tester (tm_tester) role is not required. An assessment metric category is created for each tester in a test plan.

The test manager assigns testers to test cases from the Test Plan form and initiates the testing by assigning an end date for the testing. Testers can navigate to **Self-Service > My Tests** or **Self-Service > My Assessments** to view and work on the test cases assigned to them. For more information, see [Initiate guided test execution](#).

Any changes to the test plan, test case, or tests are automatically updated in the assessment. As the tester progresses through the assessment, the test plan and test case are updated when the tester submits results.

The test manager can cancel the guided test execution at any time directly from the Test Plan form. For more information, see [Cancel guided test execution](#).

Initiate guided test execution

Create assessments for the assigned testers of each test case in a test plan by notifying them to start testing. The test manager can initiate guided test execution from the Test Plan form.

Before you begin

- [Create a test plan.](#)
- Add test cases to the test plan.
- [Assign testers from the Test Plan form.](#)
- Role required: tm_test_manager or tm_tester

About this task

If you are using guided test execution, you can notify testers to start testing directly from the Test Plan form. The testers are notified through an email about their assigned assessments. Testers can find these assessments by navigating to **Self-Service > My Tests** or **Self-Service > My Assessments**.

Procedure

1. Navigate to **Test Management > Test Execution > Test Plans**.
2. Open the test plan that you want to start executing.
3. From the Test Cases related list, use the **Assigned to** field to assign the test cases to testers.
4. Click the **Notify Tester** related link.
5. Enter a date in the **Testing end date** field and click **OK**.
This date is used as the due date for the assessment.

Result

Assessments for each tester are created and email is sent to each tester with the assessment and testing details. After the testers are notified through the email, the **Notify Tester** related link on the Test Plan form changes to **Cancel test execution**.

Cancel guided test execution

Cancel the guided testing process after it has started so that you can restart it when appropriate.

Before you begin

- [Create a test plan.](#)
- Add test cases to the test plan.
- [Assign testers from the Test Plan form.](#)
- [Initiate guided test execution](#)
- Role required: tm_test_manager or tm_tester

About this task

Use the related link on the Test Plan form to cancel a test execution that has already started.

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Open the test plan that you want to stop the testing for.
3. Click the **Cancel test execution** related link.
4. Click **OK**.

Result

A message indicates that the test plan execution has been canceled and the metric type that has been created for the test plan is deleted.

The **Cancel test execution** related link on the Test Plan page changes to **Notify Tester**.

Performing tests and updating the test status

Perform tests, record test results, and update the test status after test cases are assigned.

Testers can perform the following actions in the Test Management application:

- Perform the tests in a test case and record the results.
- Update the test status.
- Report a defect if a test fails.
- Report a blocking issue if a test is blocked.
- Retest as necessary.
- Update the test case status.

If a guided test execution feature is used, any user can be assigned to a test case and can perform the tests within that test case.

Perform tests using the Test Case form

Perform tests from an assigned test case and record results using the Test Case form.

Before you begin

Role required: tm_tester

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Click the assigned test case in the **Test Cases** related list.
3. Set the **Execution Status** field on the Test Case form to **In progress** and click **Save**.
4. In the Tests related list, open the first test.
The test order is determined by the number in the **Order** field.
5. Set the **Status** field for the test to **In progress**.
6. Right-click the form header and click **Save**.
7. Perform the steps outlined in the **Detailed description** field.
8. Record the result in the **Actual result** field.
9. Compare the actual result to the expected result and update the test status in the **Status** field to one of the following:
 - Passed
 - Failed
 - Blocked
10. Click **Update**.
11. Repeat steps 4-10 for the remaining tests in the test case.
12. After all of the tests are complete, update the test case status.
For more information, see [Update the status of a test case](#).

Perform tests using the Visual Task Board

Perform tests from an assigned test case and record results using a bulletin board-type graphical interface.

Before you begin

Role required: tm_tester

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Click the **Show Visual Task Board** related link.
3. Open the assigned test case by clicking the test case number on the card.
4. Set the **Execution Status** field on the Test Case form to **In progress** and click **Save**.
5. In the Tests related list, open the first test.
The number in the **Order** field determines the test order.
6. Set the **Status** field for the test to **In progress**.
7. Right-click the form header and click **Save**.
8. Perform the steps outlined in the **Detailed description** field.
9. Record the result in the **Actual result** field.
10. Compare the actual result to the expected result and update the test status in the **Status** field to one of the following values:
 - Passed
 - Failed
 - Blocked
11. Click **Update**.
12. Repeat steps 5–11 for the remaining tests in the test case.
13. After all tests are complete, update the test case status.
For more information, see [Update the status of a test case](#).

Perform tests using guided test execution

Perform tests from an assigned test case and record results.

Before you begin

Role required: none

About this task

When the guided testing is initiated, the testers assigned to the test cases in the test plan are notified by email and can begin testing.

Procedure

1. Navigate to the assigned test case using one of the following ways.
 - **Self-Service > My Tests**
 - **Self-Service > My Assessments**
 A card with the test plan name and assignment information appear.
2. Click the **Start Testing** button to display a list of assigned test cases and the tests included in each case.
3. Perform each of the tests in the test case by following the individual test steps.
4. Record one of the following results for each of the tests performed.

- Passed
- Failed
- Blocked

5. At the bottom of the list, choose an overall result from the following for the test case.

- Passed
- Failed
- Blocked

6. Click **Save**.

Update the status of a test case

Manually update the status of a test case. The status of the individual tests in a test case does not affect the overall status of the test case.

Before you begin

Role required: tm_test_manager or tm_tester

Procedure

1. Navigate to **All > Test Management > Test Repository > Test Plans**.
2. Open the test plan that contains your test case.
3. From the **Test Cases** related list, click your test case.
4. In the **Execution Status** field, select a status.
 - **Unexecuted**: Test is not executed yet.
 - **In Progress**: Testing is in progress for this test case.
 - **Passed**: All tests assigned to this test case have a status of **Passed**.
 - **Failed**: One or more of the tests assigned to this test case have a status of **Failed**.
 - **Blocked**: One or more of the tests assigned to this test case have a status of **Blocked**.
 - **Retest**: Test is ready to be run again as a defect resulting from a failed test has been set to Closed Complete.
5. If you select **Blocked** as the status, enter a reason for this test being blocked in the **Blocked Reason** field.
6. Save the update by using one of the following choices.
 - Click **Submit** to save and return to the Test Cases list.
 - Click **Save** to save and remain on the Test Case form.
The test results are updated in the test plan.

What to do next

If a test case has failed, you can create a defect for this test case from the failed test by clicking the **Report Defect** related link. For more information, see [Report a defect from a failed test](#).

You can link an existing defect to the test case by clicking the **Assign Defect** related link. For more information, see [Assign a defect to a test case](#).

The reported and assigned defects are listed in the Defects for Test Case related list.

Report a defect from a failed test

Report a defect from an individual test that has failed so that you can further investigate the test failure.

Before you begin

- [Activate Agile Development 2.0](#)

The ability to report a defect is available only if the Agile Development 2.0 plugin is activated.

- Perform tests and update the test status. For more information, see [Performing tests and updating the test status](#).
- Role required: tm_tester

Important:

Verify that the rm_tester role is assigned to you in your instance. This role is required to use the Report Defect link. If the role is not available, contact your system administrator to confirm the correct role for your organization.

About this task

Use the Test form to report a defect for a test that has failed. The reported defect is also linked to the test case which this test is related to.

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Open the test plan which has the failed test.
3. From the Test Cases related list, open the test case which has the failed test.
4. From the Tests related list, open the test that failed.
5. On the Test form, click one of the following links:
 - The **Report Defect** link next to the **Status** field.
 - The **Report defect** related link.
6. On the form, fill in the fields.

Report Defect form

Field	Description
Number	System-generated unique identifier for the defect.
Assignment group	Group assigned to fix this defect.
Assigned to	Individual assigned to fix this defect.
Priority	Priority of the defect. Choose one from the following: <ul style="list-style-type: none"> ◦ 1- Critical ◦ 2 - High ◦ 3 - Moderate ◦ 4 - Low ◦ 5 - Planning
State	The current state of the defect. Select one from the following:

Field	Description
	<ul style="list-style-type: none"> ○ Draft ○ Scoping ○ Awaiting Approval ○ Work in Progress ○ Testing/QA ○ Deploy/Launch ○ Closed/Complete ○ On hold ○ Canceled
Short description	Brief explanation of the defect.
Description	Detailed explanation of the defect.
Work notes	Any comments, notes, or other information related to the defect.

7. Click **Submit.**

Result

A defect is created and added to the following related lists:

- Defects for Test Case related list of the test case associated with the failed test.
- Test Plan Defects related list of the test plan associated with the failed test.

What to do next

After submitting the defect, you can modify it from the defect record. The role required to modify a defect depends on your organization's configuration. By default, the defect is assigned to the group or individual specified in the **Assignment group** and **Assigned to** fields.

Assign a defect to a test case

Assign an existing defect to a test case to track the relationship between defects and test cases.

Before you begin

- [Activate Agile Development 2.0](#)

The ability to assign a defect is available only if the Agile Development 2.0 plugin is activated.

- A defect record must exist in your instance. If no defect exists, create one first. For more information, see [Report a defect from a failed test](#).
- Perform tests and update the test status. For more information, see [Performing tests and updating the test status](#).
- Role required: tm_tester

About this task

When you link a defect to a test case, a reference to the defect is added both to the test case and the test plan of this test case.

Procedure

1. Navigate to **All > Test Management > Test Execution > Test Plans**.
2. Open a test plan which contains your test case.
3. From the Test Cases related list, open the test case to which you want to assign the defect.
4. Click **Assign Defect**.
5. Select a defect from the **Defect** field..
6. Click **OK**.

Result

The defect that you assigned to the test case is added to the following related lists:

- Defects for Test Case related list of the test case.
- Test Plan Defects related list of the test plan associated with the test case.

You can also configure the Defect form to display the Test Cases related list so that you can see the test case associated with this defect.

Monitoring the progress of testing

Track the testing progress for test plans, test cases, and individual tests using the Test Plans module or the Test Management dashboard.

Test Plans module

To understand the progress of all your test plans, navigate to **Test Management > Test Execution > Test Plans** and use the following information from the list of test plans:

- Percent complete: Amount of testing that is complete in the test plan.

This value calculated as (number of cases passed + number of cases failed)/total number of test cases.

- Test cases failed: Number of failed test cases in the test plan
- Test cases passed: Number of passed test cases in the test plan
- Number of test cases: Total number of test cases in the test plan

From here, you can drill down to the details of test cases associated with this test plan and the tests attached to each of the test cases.

From the Test Cases related list on the Test Plan form, you can view the following information for each test case:

- Tests passed
- Tests failed
- Test case execution status

When you open a test case from the Test Cases related list, you can view the following information for each of its tests:

- Expected result
- Actual result
- Test status

Test Management dashboard

Analyze the progress of all your active test plans by using multiple reports on the Test Management dashboard. For more information, see [Test Management dashboard](#).

Test Management dashboard

View test plan reports on the Test Management dashboard.

From each report on the Test Management dashboard, you can select an individual test plan or all active test plans for an overview of all testing.

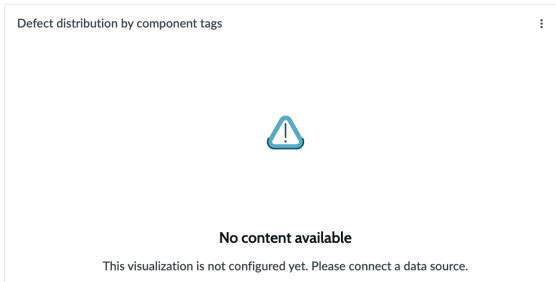

To access the dashboard, navigate to **Test Management > Overview**. Then select a test plan that you want to analyze the progress of, from the **Select a Test Plan** field in the reports. The data in the report updates automatically.

For each tag, the different colors represent the defect priority:</p> <ul style="list-style-type: none"> • Critical • High • Moderate • Low
Pending Test Cases By Assignee		Number of test cases pending for each assigned tester.

Test plan sign-off

Record approval of the test plan by using the functionality to sign off a test plan.

Navigate to the test execution sign-off report by navigating to the Test Plan form and clicking the **Sign-off Test Plan** related link. The report provides an overview of the test case results, open test cases, and any open issues as of the current date by using the following information:

- A count of how many test cases passed, failed, are blocked, or are not tested.
- A list of the open test cases. This list displays cases that are blocked, failed, in progress, and not executed.
- A list of open defects and open issues ().
- Sign-off details, including sign-off history.

The test manager can review the details and proceed to sign off the test plan.

Multiple sign-offs can be required for one test plan and a test plan can be signed off even if it has failed test cases. Each sign-off takes a snapshot of the test plan in its current state, saves the snapshot as a PDF, and attaches the file to the test plan. This snapshot captures all test cases, including failed and unexecuted test cases as well as open defects.

Complete the test plan sign-off

Review and sign off the test plan so that you can record the approval of the test plan.

Before you begin

Role required: tm_test_manager

Procedure

1. Navigate to **Test Management > Test Execution > Test Plans**.
2. Open the test plan that you want to sign off.
3. Click the **Sign-off Test Plan** related link.
4. In the Sign Off section, enter any additional information in the **Comments** field.
5. **Optional:** Review the user in the **Sign-off By** field.
6. **Optional:** Review the date in the **Sign-off Date** field.
7. Click **Submit**.

Test Management 2.0

The ServiceNow[®] Test Management 2.0 application streamlines the management of testing processes to help you deliver software products more efficiently and with fewer errors. You can create multiple versions of a test and integrate with Agile Development 2.0.

To learn about the different versions of Test Management and to choose the version that helps you meet your testing requirements, see [Test Management applications](#).

Explore	Set up	Use
<ul style="list-style-type: none"> • Test Management 2.0 overview • Testing using Test Management 2.0 • Sprint testing 	<ul style="list-style-type: none"> • Activate Test Management 2.0 • Quick start tests for Test Management 2.0 	<p>Test Board in Test Management 2.0</p>

Test Management 2.0 overview

Test Management 2.0 helps you deliver software products more efficiently and with fewer defects by managing and streamlining testing processes for both testers and managers. You can create multiple versions of a test and integrate with Agile Development 2.0.

To learn about the different versions of Test Management and to choose the version that helps you meet your testing requirements, see [Test Management applications](#).

i Important:

Test Management 2.0 is not active by default on all instances. To use Test Management 2.0, activate the `com.snc.test_management.2.0` plugin. For more information, see [Activate Test Management 2.0](#).

User	Description
Tester	<p>Can run tests and track defects for a software product by:</p> <ul style="list-style-type: none"> • Creating tests and test sets. • Performing tests and recording test results. • Updating status of tests. • Creating defect records manually and linking them to failed tests for retesting. <p>i Important:</p> <p>To record a defect for a failed test in Test Management 2.0, create a defect record manually and reference the test in the defect description.</p>
Test Manager	<p>Can set up and monitor the manual testing process of a software product by:</p> <ul style="list-style-type: none"> • Creating and maintaining tests and test sets. • Evaluating the tests, test steps, and test sets created by testers. • Facilitating test execution by creating test plans, fragmenting a test plan into test cycles, and test cycles into test execution suites. • Initiating a testing process by assigning tests to testers and then monitoring overall progress. • Assessing test results and closing a test plan.

Key terminology

The following section describes the key terms used in Test Management 2.0.

Term	Description
Test	<p>A collection of conditions or steps used to determine whether a feature is working correctly. A test can also include an expected result, which is used to determine if the test case passes or fails.</p> <p>You can use the Tests module to create and maintain different versions of a test.</p>
Test set	<p>A collection of related tests. A test can be a part of one or more test sets.</p> <p>You can use the Test Sets module to create a test set and group related tests into that test set.</p>
Test plan	<p>Plan describing how a product or a feature is to be tested and the time frame in which it must be executed. A test plan can be further broken into test cycles, and test cycles into test execution suites.</p>

Term	Description
	You can use the Test Plans module to create test plans.
Test cycle	A subdivision of a test plan that represents a phase or iteration of testing, such as a regression cycle or a sprint cycle. A test plan can contain multiple test cycles, and each test cycle can be further divided into test execution suites. Use the Planning tab on the Test Board to create and manage test cycles.
Test case	A collection of related tests. A test case is saved as part of a test suite and can be added to a test plan. Each test case within a test plan has an assigned tester.
Runs	Detailed report of tests results, such as start time and end time of test execution, environment details, result of test execution. You can use the Run module to view the test results.

Getting started with Test Management 2.0

1. Activate the Test Management 2.0 plugin. For more information, see [Activate Test Management 2.0](#).
2. Create your first test. For more information, see [Create a test in Test Management 2.0](#).
3. Create a test set to organize related tests. For more information, see [Create a test set in Test Management 2.0](#).
4. Create a test plan and assign tests to testers. For more information, see [Create a test plan using Test Board in Test Management 2.0](#).
5. Run your assigned tests. For more information, see [Run your test assignments in Test Management 2.0](#).

Activate Test Management 2.0

Activate the Test Management 2.0 plugin (com.snc.test_management.2.0) if you've the admin role.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:

When domain separation and delegated Admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

You will see a message after installation is completed. For information about the components installed with a plugin, see [Find components installed with an application](#) .

Installed with Test Management 2.0

Several types of components are installed with activation of the Test Management 2.0 plugin (com.snc.sdmc.test_management), including tables, and user roles.

Roles installed

Role	Description	Contains roles
Tester [sn_test_management.tester]	Can create tests, and group similar tests to a test set.	None
Test Manager sn_test_management.test_manager	Can create tests, group similar tests into test sets, manage test plans, and view the run results.	sn_test_management.tester

Tables installed

Table	Description
Task Test [sn_test_management_m2m_task_test]	Associates tests to multiple scrum tasks.
Test Set Test [sn_test_management_m2m_test_set_test]	Associates tests to multiple test sets.
Planned Test Task [sn_test_management_planned_task]	Extends the Planned Task table.
Steps [sn_test_management_step]	Stores details of test steps.
Step Result [sn_test_management_step_result]	Stores details of step results.
Test [sn_test_management_test]	Stores details of tests.
Test Execution Assignment [sn_test_management_test_assignment]	Stores the linking of tests to testers.
Test Cycle [sn_test_management_test_cycle]	Stores details of test cycles.
Test Environment [sn_test_management_test_environment]	Stores details of test environments.

Table	Description
Test Execution Suite [sn_test_management_test_execution_suite]	Stores details of test execution suites.
Test Plan [sn_test_management_test_plan]	Stores details of test plans.
Test Result [sn_test_management_test_result]	Stores details of test results.
Test Run [sn_test_management_test_run]	Stores details of test runs.
Test Set [sn_test_management_test_set]	Stores details of test sets.
Test Version [sn_test_management_test_version]	Stores details of test versions.

Business stakeholder role for Test Management 2.0

Use the business stakeholder role to read and retrieve data from any table of the Test Management 2.0 applications to generate reports.

When you activate the Business Stakeholder plugin (com.snc.business_stakeholder) in your ServiceNow instance, the Read only roles for Test Management 2.0 plugin (com.snc.tm2_read_roles) is also activated. This plugin provides a business stakeholder role (sn_tm2_read) with which you can access all the tables of Test Management 2.0 application. This role also allows read-only access to the Test Management dashboard. You can assign this role to any user in your organization who is a business stakeholder.

Plugin availability

If you are a new customer, the Read only roles for Test Management 2.0 plugin (com.snc.tm2_read_roles) is activated on zBoot. However, the business stakeholder role (sn_tm2_read) is available only when you activate the Test Management 2.0 plugin (com.snc.test_management.2.0).

If you are an upgrade customer, you must manually activate the Read only roles for Test Management 2.0 plugin (com.snc.tm2_read_roles).

Test Management 2.0 tables accessible by users with the business stakeholder role

When the read-only roles for Test Management 2.0 plugin (com.snc.tm2_read_roles) and Test Management 2.0 plugin (com.snc.test_management.2.0) are active in your ServiceNow instance, the user with the business stakeholder role (sn_tm2_read) has read access to the following tables.

Test Management 2.0 tables

Table	Description
Task Test [sn_test_management_m2m_task_test]	Associates tests to multiple scrum tasks.
Test Set Test [sn_test_management_m2m_test_set_test]	Associates tests to multiple test sets.
Planned Test Task [sn_test_management_planned_task]	Extends the Planned Task table.
Steps [sn_test_management_step]	Stores details of test steps.
Step Result [sn_test_management_step_result]	Stores details of step results.
Test [sn_test_management_test]	Stores details of tests.
Test Execution Assignment [sn_test_management_test_assignment]	Stores the linking of tests to testers.
Test Cycle [sn_test_management_test_cycle]	Stores details of test cycles.
Test Environment [sn_test_management_test_environment]	Stores details of test environments.
Test Execution Suite [sn_test_management_test_execution_suite]	Stores details of test execution suites.
Test Plan [sn_test_management_test_plan]	Stores details of test plans.
Test Result [sn_test_management_test_result]	Stores details of test results.
Test Run [sn_test_management_test_run]	Stores details of test runs.
Test Set [sn_test_management_test_set]	Stores details of test sets.

Test Management 2.0 tables (continued)

Table	Description
Test Version [sn_test_management_test_version]	Stores details of test versions.

Quick start tests for Test Management 2.0

Validate that Test Management 2.0 still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Test Management 2.0 quick start tests require activating the Test Management 2.0 plugin (com.snc.test_management.2.0), and the Test Management 2.0 - ATF Tests plugin (com.snc.test_management.2.0.atf).

Test Management 2.0: Test version test suite

Test	Description	Release version
Create test version should create test	Validate test creation and version.	Madrid
Should be able to mark test version as ready when it contains verification steps	Validate test state when test has verification steps.	Madrid
Should not able to mark test version as ready when it does not contain verification step	Validate test state when test does not have verification steps.	Madrid
Marking a test version as ready should retire other test version in ready state	Validate test state when marking test ready.	Madrid

Test Management 2.0: Test results rollup test suite

Test	Description	Release version
When test run closed, should update execution suite progress	Validate execution state progress.	Madrid
Should not be able to assign a test not in ready state	Validate test assignment.	Madrid
Test progress should roll up for test plan and test cycle	Validate test progress for test plan and test cycle.	Madrid

[Quick start tests](#) 

Testing using Test Management 2.0

You can use Test Management 2.0 for general testing such as testing a phase in a release, testing a set of features or products before their market launch, or performing release readiness testing on integration and accessibility (for new software).

General testing comprises the following steps:

1. Creating tests. See [Create a test in Test Management 2.0](#)
2. Creating test sets, and grouping similar tests into a test set. See [Create a test set in Test Management 2.0](#).
3. Using the Test Board feature to create a test plan. See [Create a test plan using Test Board in Test Management 2.0](#).
4. Structuring the test plan in the Planning tab of the Test Board.
 - Breaking down the test plan into test cycles to plan and schedule the phases of the testing effort. See [Add and modify test cycles and test execution suites in Test Management 2.0](#).
 - Breaking down the test cycles into test execution sets to schedule tests, and assign users to run those tests. See [Create a test execution suite in Test Management 2.0](#).
5. Running tests and viewing the test run results. See [Run your test assignments in Test Management 2.0](#).

Create a test in Test Management 2.0

Create a test specifying conditions or steps to determine whether a feature is working correctly.

Before you begin

Role required: sn_test_management.testers or sn_test_management.test_manager

Procedure

1. Create a test using either of the following options.
2. In the Test version form, fill in the test name and add steps for your test.
3. Select **Submit**.
4. From the list of Tests, open the test that you just created.
5. From the Test versions related list, open the test version that you just created.

Test Version Form

Fields	Description
Test	Unique name of the test.
Owner	Owner who created the test.
Version	Automatically generated version.
State	Current state of the test. <ul style="list-style-type: none"> ○ Draft: Initial state when a test is created. The test is editable in this state. ○ Ready: State when a test is ready for execution. The test is not editable in this state.

Fields	Description
	<p>state, create a version using button.</p> <ul style="list-style-type: none"> ○ Retired: State when the test is retired. <p>Tip:</p> <p>To edit a test, open the test in the Draft state, make your changes, and click Save.</p>
Short description	Brief description about the test.
Add Step	Button used to add step to a test.
Change step order ()	<p>Icon used to change the order of steps in a test and drag a step to the required position.</p> <p>This icon is displayed next to a step in a test.</p>
Needs Verification	<p>Check box used to mark a test as needing verification.</p> <p>This icon is displayed after a test is run.</p> <p>If this checkbox is not selected, the test is not verified. If this checkbox is selected, this step passed, failed, or is blocked.</p>
Delete a test step ()	Icon used to delete a test step.
Run	<p>Button used to run steps, which are in the Ready state.</p> <p>See Run your test assignments.</p>
Update	Button used to update the details of a test.
Ready	Button used to change the state of a test to Ready .
Create New Version	Button used to create another version of a test.
Delete	Button used to delete the test.

6. Click **Submit.**

What to do next

To add a test to a test set:

1. Select the test from the Test list.
2. Click **Add to Test Set**.

Create a test set in Test Management 2.0

Group related tests into a test set. Test sets help you find tests by category or tag.

Before you begin

Role required: sn_test_management.testers or sn_test_management.test_manager

Procedure

1. Navigate to **All > Test Management 2.0 > Test Sets**.
2. Click **New**.
3. Enter a name for the test set and click **Submit**.

What to do next

You must add tests to the test set.

1. Navigate to **Test Management 2.0 > Tests**.
2. Select the required tests.
3. Click **Add to Test Set**.
4. In the Select Test Set window, search for the required test set and click **Add**.

To reorder the tests in the test set, open the test set record and use the drag-and-drop functionality to move it to the required position.

Tip:

To change the order of steps within an individual test, see [Create a test in Test Management 2.0](#).

Test Board in Test Management 2.0

Test Board gives you a comprehensive view of your test plans and enables you to manage test plans more efficiently.

In Test Board, you can:

- Aggregate all your test plans and view them as cards at a single location. Each card displays key details of your test plan such as the start and end date, percentage of tests that have passed, percentage of tests that have failed, percentage of tests that have been blocked, and number of days left for completion.
- Search for specific test plans by defining filter conditions such as name, duration, or owner.
- Track, manage, and complete your test plans from a single interface, which saves you time and effort.
 1. [Define how a product or feature must be tested by creating a test plan](#).
 2. [Structure your test plan in the Planning tab](#). Break down your test plan into test cycles to plan and schedule the phases of testing effort. Further break down your test cycles into test execution sets, schedule the tests, and assign users to run those tests.
 3. Monitor the progress and completion of your test plans.

Planning tasks

You can structure a test plan in the Test Board **Planning** tab, which provides the following capabilities:

Test plan work item hierarchy

The Test plan work item hierarchy presents a wide variety of test plan information in expandable rows. It provides a quick overview of the test plan, with test cycles and test execution suites nested within the test plan.

In addition, you can:

- Modify the attributes (such as start and end time) of the test plan, test cycles, and test execution suites rather than opening each form and modifying the field values one by one.
- Add or delete test cycles and test execution suites, adjust their start and end dates, and then assess the overall progress of the test plan.
- Configure the columns displayed in the Test plan work item hierarchy.

Gantt chart

The Gantt chart provides a visual representation of the timeline of the test plan and its child tasks using a blue task bar. The length of the task bar pertaining to the test plan increases and decreases depending on the adjustments you make to the duration of its child tasks. You can also manually increase or decrease the duration by dragging the edge of the task bar to the required location.

Create a test plan using Test Board in Test Management 2.0

Define how to test a product or feature by creating a test plan.

Before you begin

Role required: sn_test_management.test_manager

Procedure

1. Navigate to **All > Test Management 2.0 > Test Board**.
2. Click **Create Test Plan**.
3. In the form, fill in the fields:

Test Plan form

Field	Value
Name	Unique name for the test plan.
Planned start date	Planned date and time for starting the test plan execution.

4. Click **OK**.
The **Details** tab opens.
5. Provide, review, and edit the test plan details.

Field	Value
Planned end date	Planned date and time for ending the test plan execution.
Duration	Estimated duration of test plan. This is the difference between the planned start date and the planned end date.
Number	Automatically generated unique ID number for the test plan.
Owner	Owner who created the test plan.
State	Current state of the test plan. <ul style="list-style-type: none"> ○ Pending: Test plan is not yet ready to be performed. ○ Open: Test plan is ready to be performed. ○ Work in progress: Test plan is currently being performed.

Field	Value
	<ul style="list-style-type: none"> ○ Closed complete: Test plan has been closed after completion. ○ Closed incomplete: Test plan has been closed without completion. ○ Closed skipped: Test has been closed without being performed.
Description	Description of the test plan.

Note:

The Progress section displays the overall status of the test plan indicating the percentage of tests in the test plan that have passed, failed, or been blocked.

Add and modify test cycles and test execution suites in Test Management 2.0

Add and modify test cycles and test execution suites from a single user interface without having to switch between multiple user interfaces and forms.

Before you begin

Role required: sn_test_management.test_manager

About this task

In Test Management 2.0, a test plan is broken into test cycles, and test cycles are broken into test execution suites. A test cycle represents a phase or iteration of testing within a test plan, such as regression testing or smoke testing. A test execution suite is the smallest unit of organization, containing the individual test assignments for testers.

Use the **Planning** tab to manage this hierarchy from a single view. For more information about key terms, see [Test Management 2.0 overview](#).

Procedure

1. Navigate to **All > Test Management 2.0 > Test Board**.
2. Select the test plan.
3. Select the **Planning** tab.
4. Add or modify test plans and test execution suites in the Test plan work item hierarchy.
5. View the summary or adjust the duration of a task in the Gantt chart.

Define a custom column in the Planning tab of Test Board in Test Management 2.0

Define a custom column to display information important to you in the Test plan work item hierarchy section of the Planning tab. For example, define a column to view the percentage of test plan that has been completed.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Test Management 2.0 > Settings > Planning Console**.
2. Click the gear icon () at the top right corner of the page.
3. In the System Settings window:

- a. Select the Developer section.
- b. In the **Application** list, select **Test Management** and then close the window.
- 4. In the **Planning Console Display Columns** related list, click **New**.
- 5. In the Planning Console Display Column form, provide a label and other details for the column.
- 6. Click **Submit**.

What to do next

After you create a column, associate the column to the required table.

Create a test execution suite in Test Management 2.0

Create a short test plan when the testing effort is minimal and you do not want to go through the overhead of creating a test plan and a test cycle for a test execution suite.

Before you begin

Role required: sn_test_management.test_manager

Procedure

- 1. Navigate to **All > Test Management 2.0 > Test Execution Suites**.
- 2. In the form, fill in the fields:

Test Execution Suite form

Field	Description
Name	Unique name for the test execution suite.
Planned start date	Planned date and time for starting the test execution suite.
Planned end date	Planned date and time for ending the test execution suite.
Planned duration	Estimated duration for the test execution suite. This duration is the difference between the planned start date and the planned end date.
Number	Automatically generated number for the test execution suite.
State	Current state of the test execution suite.
Assignment group	Group working on test execution suite.

Progress section of the Test Execution form

Field	Description
Percent complete	Percentage of test execution suites that have been completed. Value is calculated automatically.
Percent passed	Percentage of test execution suites that have passed. Value is calculated automatically.
Percent failed	Percentage of test execution suites that have failed. Value is calculated automatically.

Field	Description
Percent blocked	Percentage of test execution suites that were blocked. Value is calculated automatically.

3. Click **Submit**.

What to do next

- To add tests to the test execution suite, click **Add tests**. From the **Tests** list, select the required tests, and click **Add to Execution Suite**.
- To add test sets to the test execution suite, click **Add test sets**. From the **Test Sets** list, select the required test sets, and click **Add to Execution Suite**.
- In the **Test execution assignments** related list, select the test and assign it to a user.

Run your test assignments in Test Management 2.0

Run your test assignments and capture the results.

Before you begin

Before you begin, ensure the following conditions are met:

- Your test manager has set the tests to **Ready** state and assigned them to you.
- At least one execution environment is configured in your instance.

Role required: sn_test_management.tester

Procedure

1. Navigate to **All > Test Management 2.0 > Tests Assigned to me**.
2. Select the required tests and click **Run**.
Only the tests that are in the Ready state can be run.

Trouble?

If no tests appear in the **Tests Assigned to me** list, confirm with your test manager that tests have been assigned to you and set to **Ready** state.

3. In the pop-up, select the execution environment on which the tests must be run.

An execution environment specifies the hardware or software configuration on which tests run, such as a browser version or operating system. If no environments appear in the list, contact your system administrator to configure one.

4. In the Test Execution pop-up, mark a step as passed, failed, or blocked using the following icons.
To pause and work on the test at a later point in time, click **Pause**.

5. Click **Done**.

Result

Test results are saved to the Test Result form. The overall status of the test is defined by statuses of the test steps:

- If all the test steps are passed, the status of the test is **Passed**.
- If at least one step of the test is not run, the status of the test is **Not finished**.

- If at least one step of the test fails, the overall status of the test is **Failed**. This rule takes precedence over the previous rule.
- If at least one step of the test is blocked, the overall status of the test is **Blocked**. This rule takes precedence over the previous two rules.

What to do next

To view the full history of test runs and results across all test plans, navigate to **Test Management 2.0 > Test Runs**. For more information about monitoring test plan progress, see [Test Board in Test Management 2.0](#).

Sprint testing

You can use Test Management 2.0 with Agile Development 2.0 to test the work of a scrum team sprint-by-sprint.

Sprint testing lets you verify user stories sprint by sprint. The process involves the following steps:

1. Create tests for the stories in the current sprint. For more information, see [Create a test in Test Management 2.0](#).
2. Run the assigned tests and capture results. For more information, see [Run your test assignments in Test Management 2.0](#).
3. Review test results and close stories when all tests pass. For information about monitoring progress, see [Test Board in Test Management 2.0](#).

Test Management 2.0 integration with Agile Development 2.0

With the integration of Test Management 2.0 and Agile Development 2.0, you can perform sprint testing from **Agile Development 2.0 > Agile Board > Sprint Tracking**.

- Find what tests are to be run for the sprint.
- Create tests for the stories in sprints.
- Maintain multiple versions of a test.
- Run a single version of a test at one time.
- View which version of test has been run.
- Review the history of test results.
- Close stories.

When you create a test through the **Sprint Tracking** view, the test is automatically associated with the story displayed in that row. You can verify this link by opening the story record and reviewing the **Tests** related list. To view all tests linked to stories in a sprint, use the [Test Board](#).

Viewing sprint test results

After testers run their assignments, you can review results at two levels:

- In the **Sprint Tracking** view, each story row displays the test status for that story's tests.
- In [Test Board](#), the test plan card displays the percentage of tests that have passed, failed, and been blocked.

When all tests for a story pass, the story is ready to be closed. To close a story from the Sprint Tracking view, select the story and update its state to **Complete**.

Create a test for a story

Create a test from the Sprint Tracking view to automatically link it to a story and track whether the story meets its acceptance criteria.

Before you begin

- Role required: `scrum_user` or `scrum_admin`
- You can create a test from the List view only when Agile Development 2.0 is installed along with Test Management 2.0.
- You must be a member of an agile group.

About this task

Create a test, add steps to the test, and create and maintain different versions of the test. A test is a collection of conditions or steps used to determine whether a story is working correctly. A test can also include an expected result, which determines whether the test passes or fails. When you create a test from the **Sprint Tracking** view, the test is automatically linked to the story displayed in that row. To confirm the link after creation, open the story record and locate the **Tests** related list.

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. Click the **Sprint Tracking** tab, and select the **List** view.
3. From the **Show** list at the top right corner, select **Tests**.
4. Click **Add Test**.
5. **Optional:** To link an existing test to a story instead of creating a new one, open the story record from the sprint list and locate the **Tests** related list to add the pre-existing test. To create a standalone test to link later, see [Create a test in Test Management 2.0](#).
6. In the form, fill in the fields:

Test Version form

Field	Description
Test	Unique name of the test.
Owner	Owner who created the test.
Version	Automatically generated version of the test.
State	Current state of the test. <ul style="list-style-type: none"> ○ Draft: State of the test when it is created. ○ Ready: State of the test when it is not editable. When the test has multiple versions, only one test will be in the Ready state at any one time ○ Retired: State of the test when it is no longer used.
Short description	Brief description about the test.
Add Step	Button used to add step to a test.
Run	Button used to run steps, which is displayed only when the test is in the Ready state. See Run your tests from the List view .
Update	Button used to update the details of a test version.

Field	Description
Ready	Button used to change the state of the test version to ready.
Create New Version	Button used to create another version of the test.
Delete	Button used to delete the test version.
Change step order (☰)	Icon used to change the order of a test step. Select the icon and drag the step to the required location.
Needs Verification	Check box used to mark a test step for verification.
Delete a test step (🗑)	Icon used to delete a test step.

What to do next

View information in the following related lists:

Related list	Description
Other versions	Displays all the versions of a test.
Test Results	Displays the run results of each test version.
Test Sets	Displays related tests in a test set.

Tests created through this workflow are automatically linked to the story. To confirm the link, open the story record and locate the **Tests** related list, which displays all tests associated with that story.

Run your tests from the List view

View the test scenario, execute all the steps of the test, and review the test result.

Before you begin

Role required: scrum_user

Procedure

1. Navigate to **All > Agile Development > Agile Board**.
2. Click the **Sprint Tracking** tab and select the **List** view.
3. Click a test.
4. Verify a story by clicking **Run** on the story.
This step runs all tests of the story at once.
5. In the pop-up, select the environment on which the test is to be run.
 - a. Click **Lookup using list** icon.
 - b. Click **Run**.
6. In the Test Execution pop-up, mark a step as passed, failed, or blocked using the following icons.

- To select an icon, you can also use the **Tab** key. Press **Tab** and then press **Enter**.
- To pause and work on the test at a later point in time, click **Pause**.

7. Click **Done**.

Result

Test result is saved to the Test Result form, and the latest test result of each test is displayed in the List view.

The overall status of the test is defined by statuses of the test steps:

- If all the test steps are passed, the status of the test is **Passed**.
- If at least one step of the test is not run, the status of the test is **Not finished**.
- If at least one step of the test fails, the overall status of the test is **Failed**. This rule takes precedence over the previous rule.
- If at least one step of the test is blocked, the overall status of the test is **Blocked**. This rule takes precedence over the previous two rules.

Migration from Test Management 1.0 to Test Management 2.0

Migrate your test data from Test Management 1.0 to Test Management 2.0, and start using Test Management 2.0 for its enhanced testing capabilities and features.

Apply the following migration steps on a non-production instance, verify if the migration is completed as intended, and then perform the migration steps on a production instance.

Migration steps

To migrate your test data from Test Management 1.0 to Test Management 2.0, complete the following steps in order:

1. Activate the required plugins. For more information, see [Migration from Test Management 1.0 to Test Management 2.0](#).
2. Convert your test suites. For more information, see [Convert test suites](#).
3. Verify the migrated data on a non-production instance before repeating on production.

Activate plugins

Activate the Test Management 2.0 (com.snc.test_management.2.0) and Test Management 2.0 – Data Migration (com.snc.test_migration_v1_v2) plugins.

Migrate data

The migration process allows you to move test suites, test cases, and tests.

i Note:

- Test plans cannot be migrated due to significant change of data model.
- Test suites, test cases, and tests that are migrated to Test Management 2.0 will not be removed from Test Management 1.0.

Test cases that are migrated to Test Management 2.0 are converted to test versions in the following manner:

Test Management 1.0: Test case	Test Management 2.0: Test version
Short Description	Short Description
Domain	Domain
Test Suite	Creates a relationship between test and test set
Prerequisites	Link to the old test case

Tests that are migrated to Test Management 2.0 are converted to test steps in the following manner:

Test Management 1.0: Test	Test Management 2.0: Test step
Order	Order
Domain	Domain
Detailed description	Link to the old test
Test	Step
Test data	Link to the old test
Expected result	Verification step

Test suites that are migrated to Test Management 2.0 are converted to test sets in the following manner:

Test set in Test Management 1.0	Test set in Test Management 2.0
Name	Name
Owner	Owner
Domain	Domain

Add custom fields to migration

You have added custom fields to the tables of Test Management 1.0, and want to move the fields to the corresponding custom columns in Test Management 2.0. In such a case, include the custom fields into migration by overriding the mapping information in the script include **TestMigrationTableMapping**. The default mapping is provided in the script include **TestMigrationTableMappingBase**.

Convert test suites

[Convert test suites](#) with underlying test cases to test sets and tests.

Convert test suites

Convert test suites in Test Management 1.0 to test sets in Test Management 2.0. Start using Test Management 2.0 for its enhanced testing capabilities and features.

Before you begin

- Role required: admin
- Install the Test Management 2.0 – Data Migration plugin (com.snc.test_migration_v1_v2).

Procedure

1. Navigate to **All > Test Migration > Migrate Test Suites**.

A list of test suites available in Test Management 1.0 are displayed.

2. Select the required test suites and convert to them to test sets.

What to do next

After converting test suites, verify that the migrated test sets and tests appear correctly in Test Management 2.0 before performing the migration on a production instance. For more information about verifying migrated data, see [Migration from Test Management 1.0 to Test Management 2.0](#).

Appendix – Test Management 2.0

Test Management 2.0 offers a few enhancements over Test Management 1.0.

These enhancements can be divided into the following categories:

- [Functionality enhancements](#)
- [Data model enhancements](#)
- [Usability enhancements](#)

Functionality enhancements in Test Management 2.0

Test Management 2.0 offers a few functionality enhancements over Test Management 1.0.

Integration with Agile Development 2.0

Integration of Test Management 2.0 with Agile Development 2.0 provides embedded testing capabilities for scrum teams. Test Management 2.0 enables you to create tests for stories of the sprint, and also track the execution and completion of those tests. As a scrum lead or product owner, you gain an insight of the stories that are tested and are to be closed.

Data model enhancements in Test Management 2.0

Test Management 2.0 offers a few data model enhancements over Test Management 1.0.

Enhanced traceability

Each test in Test Management 2.0 can have multiple versions. When a test version is in the state Ready, it can be run but cannot be edited. Every test result is associated with a specific run and a specific version of the test. Due to this logic,

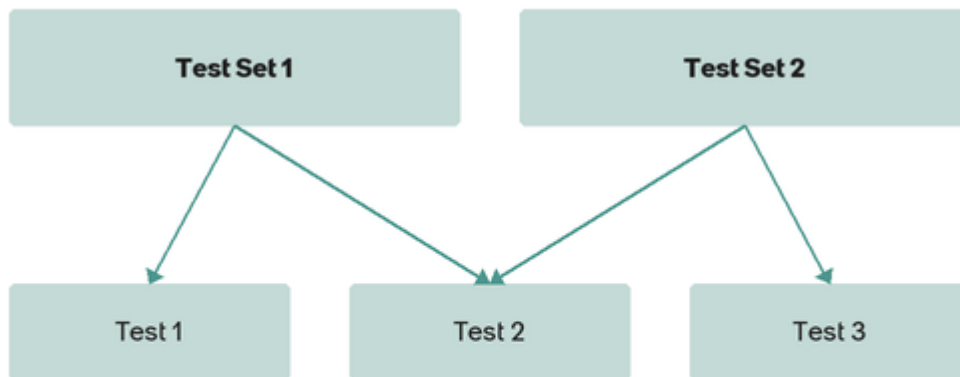

you can always be sure of the content of the test when a specific test result was

received.

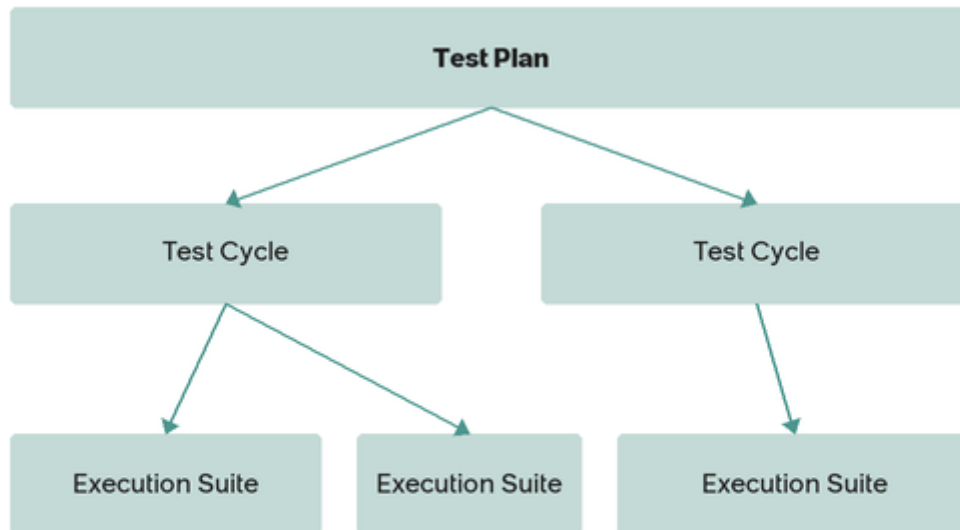

More flexible approach to organize tests

Unlike Test Management 1.0, where test cases can be placed in only one test suite, in Test Management 2.0 tests can be placed in multiple test sets. Test sets are free-form collections of tests. Tests can be grouped into test sets using any logic: by product, by component, or by release.

Test plan defines the time frame

A test plan in Test Management 2.0 captures the time frame during which the tests are to be run. In addition, a test plan can be broken down into smaller planning windows, test cycles, for more precise planning, such as user acceptance testing, and integration testing. Further test cycles can be broken down into test execution suites, which are similar to sprints in testing. A test execution suite defines when a test must be run and by

whom.

Usability enhancements in Test Management 2.0

Test Management 2.0 offers a few usability enhancements over Test Management 1.0.

Create and track the execution of tests for stories of the sprint in the **Sprint Tracking** tab in Agile Board. In addition, you can:

- View the test result of each test.
- Run all the tests for a story at one time.

Easier way to create tests

Test Management 2.0 provides a new user experience for creating tests.

- Test steps can be created without leaving the context of test form.
- Entire test scenario can be created at one time. Type in the step description, and press Enter to proceed to the next step.
- You need not create an extra record to capture expected results. Expected results can be captured as another test step that is marked as a verification step.

Enhanced user experience for running tests

Test Management 2.0 provides a new user interface for running tests. The interface opens in a small browser window, which can be placed side by side with the system that is being tested. You can go through multiple tests at one time, without having to relaunch the window. Whenever a step is marked as failed or blocked, you can add a comment and attachment to record your observation.

Visual approach of structuring test plans

Test Management 2.0 provides a designated user interface, Test Board, for creating and structuring test plans. As a test manager, you can create a test plan, test cycles, and test execution suites and define the time frame for their execution. The names of the test cycles and execution suites can be edited inline, without leaving the page. Test execution suites can then be filled with tests, and those tests can be assigned to testers.

The test plan work hierarchy item in the Test Board provides a visual representation of the timeline of the test plan and its child tasks using a blue task bar. The length of the task bar pertaining to the test plan increases and decreases depending on the adjustments you make to the duration of its child tasks. You can also manually increase or decrease the duration by dragging the edge of the task bar to the required location.

Business Planning Portal

A business plan includes a business goal and a plan to achieve that goal. Business planning involves various entities of a business such as goals, business units, business capabilities, capability map, enterprise strategies, and business unit strategies. As a business planner you can manage these entities from the business planning portal.

To access the business planning portal, the Business Planner (com.snc.apm.business_planner) plugin must be activated. This plugin is installed only when any one of the other Strategic Portfolio Management (SPM) plugins is already installed.

Access the business planning entities, goals, business units, enterprise strategy, business unit strategy, capabilities, and capability in the **Business Planner** module.

Business planning portal for the business planner

As a business planner, you can do various tasks from the business planning portal such as view, create, and update the business entities to achieve business goals. In addition, the Business Planner can . [Use capability map for planning - Legacy](#) .

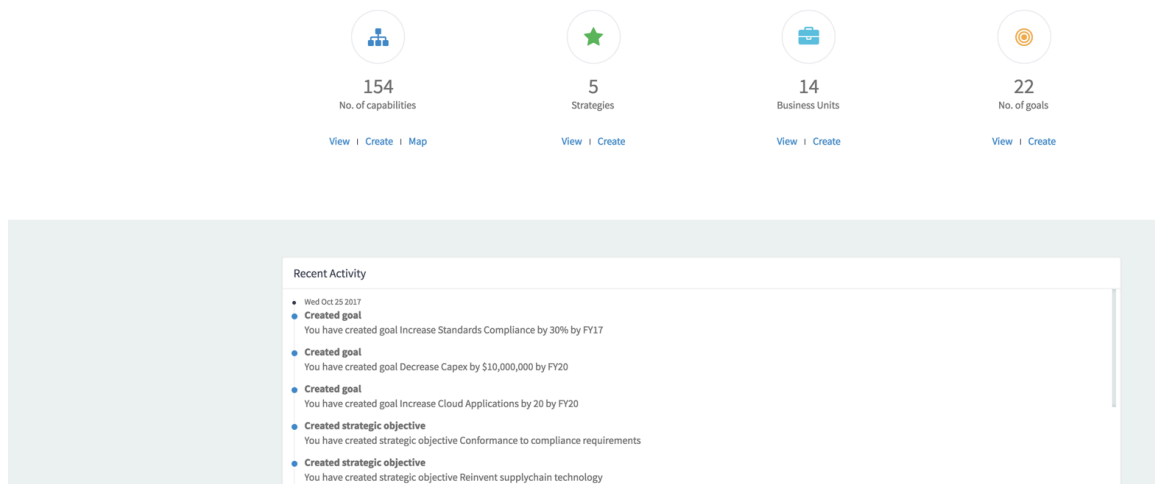

Note:

The role of a business planner involves only planning and managing the entities to achieve the business goal. It doesn't deal with the business applications or technologies that support the business.

Business planning portal

Business Planner Portal

BUSINESS PLANNING

The business planning portal helps the business planner to view and create goals, business unit, capabilities, and strategies.

Number of capabilities

Displays the number of capabilities that have been created. Click to view the list of capabilities defined for the business enterprise. [Create business capability and relate the capability with an application - Legacy](#)  if the existing capabilities don't conform to your business plan.

If you have installed Enterprise Architecture (formerly APM), then the **Map** link is available. Click **Map** to launch the capability map.

Strategies

Displays the number of objectives that have been created. Click to view the list of strategic objectives that align with your business plans. Click to [create a business unit strategy](#) or an [enterprise strategy](#) to fulfill a new business plan. You can also assign strategies to a goal.

- Enterprise strategy is at a higher level and business unit strategies can be assigned at its child level.
- Business unit strategy is at a lower level and an enterprise strategy or a business unit strategy can be assigned as a parent strategy.

Business Units

A business unit is a segment of an enterprise that represents a business function. View the existing number of business units in your organization. Click to [create a business unit](#) to define its functions.

No. of goals

View the number of goals created to achieve a business plan. You can relate goals to many enterprise and business unit strategies. Similarly, more than one enterprise and business unit strategies can be related to more than one goal. Click a goal from the list to update its status and assign a task to it. You can also [create a goal for an application strategy](#) .

Recent Activity

View the recent goals, strategic objectives, and business units that you had created.

Business units

Business units are parts of your organization that are in charge of certain operations, such as Finance, HR, IT.

Business units usually comprise departments and are associated with a company. By default, the Hierarchy of Segments includes a segment for business units, departments, and vendors, which are companies with the **Vendor** option selected. With the segment setup, you can allocate expenses to business units, departments, or vendors, or have expense allocations roll up to them. You can configure both departments and companies as part of user management.

Create business units

Create a business unit to define your organizational functions. A business unit is also necessary to set up the top-most segment in the hierarchy to create roll up rules and have expenses roll up to these business units.

Before you begin

Role required: business_planner

Procedure

1. Navigate to **All > Organization > Business Units**.
2. Click **New**.
3. Fill out the fields on the form (see table).
4. Click **Save**.

Business Unit form

Field	Description
Name	Name of the business unit.
Company	The company, if any, related with this business unit. You can choose any company, including the ones that don't have the Vendor field selected.
Business Unit Head	Person who heads the business unit.
Description	A description of the business unit.
Parent	Refers to another business unit. The Parent field makes the business unit as a hierarchy element.
Hierarchy level	Number or text to indicate the level of the business unit.

Related list section of the Business Unit form

Field	Description
Departments	Departments that comprise this business unit. Add as many departments as necessary.

The Departments related list isn't visible by default. If necessary, you can add the Departments related list on the business unit record you created. To add the Departments related list:

- a. Right-click in the form header, and select **Configure > Related Lists**.
- b. Locate the **Departments** item in the **Available** box and move it to the **Selected** box.
- c. Select **Save**.

Create an enterprise strategy

As a business planner you can manage the business entities such as goals, business units, business enterprise strategies, and business unit strategies. Create an enterprise strategy to orient your business plan toward your goal.

Before you begin

Role required: user_admin, business_planner

About this task

To understand how your organizational strategies are performing, see the [Strategic Spend Tracking for PPM dashboard](#) topic. It provides a comprehensive visual to help you understand how the planned costs, actual costs, and benefits for projects aligned to your organization's strategies trend over time.

Procedure

1. Navigate to **All > Business Planner > Enterprise Strategy**.

You can also navigate to **Organization > Enterprise Strategy**.

2. Click **New** or open a record.
3. Fill in the form fields.

Enterprise Strategy form

Field	Description
Title	A short title describing the enterprise strategy.
Number	System assigned enterprise number.
Assigned To	Person to whom the enterprise strategy is assigned.
From Date	Date from which the enterprise strategy is valid.
To Date	Date until which the enterprise strategy remains valid.
Type	Select a type of organization strategy that this strategy aligns to.
Active	Enable the check box to make the enterprise strategy active.
Description	Short description about the enterprise strategy.

4. Click **Submit**.

What to do next

Use the **Business Unit Strategies** related list to create a strategy for a business unit and associate the business unit strategy to the enterprise strategy, to another business unit, or to another business unit strategy.

Related topics

[Allocate or modify the strategy and goal percentage for a project](#)

Create a business unit strategy

Business units are segments of an enterprise that are in charge of certain operations such as Finance, HR, IT. Each of these business units can have a strategy that aligns with the enterprise or with another business unit.

Before you begin

Role required: user_admin, business_planner

Procedure

1. Navigate to **All > Business Planner > Business Unit Strategy**.

You can also navigate to **Organization > Business Unit Strategy**.

2. Click **New** or open a record.
3. Fill in the form fields.

Business Unit Strategy form

Field	Description
Title	A short title describing the business unit strategy.
Number	System assigned business unit number.
Assigned To	Person to whom the business unit strategy is assigned to.
From Date	Date from which the business unit strategy is valid.
To Date	Date until which the business unit strategy remains valid.
Business Unit	The business unit for which the strategy is being created.
Strategy	Strategic objectives of the organization that the business unit strategy complies to.
Type	Select a type of organization strategy that this strategy aligns to.
Active	Enable the check box to make the business unit strategy active.
Description	Short description about the business unit strategy.

4. Click **Submit**.

What to do next

View the strategic objectives that you've created in the [business planning portal](#). The records of business planning strategic objectives give you a clear visibility of the status, to whom they're assigned to, the period of validity, and their type.

Cost Management

The ServiceNow® Cost Management application tracks configuration item costs. The costs can be allocated to business units and used in reports.

Cost management enables these features:

- Using rate cards.
- Defining configuration item (CI) costs.
- Tracking one-time costs for CIs.
- Processing recurring CI costs to generate expense lines.
- Distributing bulk costs to multiple expense line sources.
- Tracking costs related to tasks and projects.
- Aggregating configuration item costs and charging the total cost to a business service or application.
- Allocating expense lines to business units with flexible allocation rules.
- Tracking planned and actual budget costs by cost center.

Cost Management Options

Use the following cost management options to plan and control business costs.

- Create rate cards to properly track configuration item, contract, task, and labor costs.
- Create expense lines and expense allocation rules.
- Aggregate configuration item costs and apply the total cost to a business service or application using relationship paths.
- Create distribution costs and distribution cost rules to divide costs between a group of records.

Activate Cost Management

Activate the Cost Management plugin (com.snc.cost_management) using the admin role.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install**.

Note:

When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

4. Select Activate.

Note:

To load the demo data, select the **Load demo data** check box.

Components installed with Cost Management

Several components are installed with the Cost Management application.

Demo data is available with Cost Management. The demo data provides sample budgets, distribution costs, expense allocations, contract rate cards, and rate card costs.

Tables

Cost Management adds the following tables.

Tables

Table	Description
Allocation Unit [allocation_unit]	Tracks capacity and usage for a business service. Stores reference to business service, total, allocated, and remaining units of capacity.
Budget [fm_budget]	Tracks planned and total expense allocation amounts for a collection of cost centers.
Budget Cost Center [fm_budget_cost_center]	Associates one or more cost centers to a budget.
CI Cost Center Relationship [fm_cmdb_rel_cc]	Associates a cost center to a business service that it consumes and the number of units it uses. This is used to calculate the number of allocated units to update the allocation unit record.
CI Rate Card [fm_ci_rate_card]	Links configuration items and costs. A classification can also be defined to allow for multiple rate cards for a group of CIs.
CI Rate Cards [fm_ci_rate_card_cmdb_ci_m2m]	Associates configuration items to a rate card.
Contract Rate Card [fm_contract_rate_card]	Provides detailed price information for a contract and enables you to generate recurring expenses automatically.
Distribution Cost [fm_distribution_cost]	Represents costs which can be divided among a group of records. For example, the cost of power at a datacenter which can be divided among the CIs in the datacenter.
Distribution Cost Rule [fm_distribution_cost_rule]	Determines how the costs are distributed to CIs.

Tables (continued)

Table	Description
Distribution Units [fm_distribution_units]	Stores the number of units to associate to configuration items linked to the current rate card.
Expense Allocation [fm_expense_allocation]	Associates the value of an expense to a target reference. The value is generated from an expense line by processing allocation rules. The target is the record that is responsible for that expense amount. Common targets are cost centers, departments, companies, groups, and users.
Expense Allocation Rule [fm_expense_allocation_rule]	Determines how to process an expense line into an expense allocation. The logic starts by defining a table and condition to run against. Expenses linked to the selected table will be evaluated by this rule. If the condition is met, an allocation of a defined percentage is created for the reference defined by the allocation field value. Advanced scripts can also be used to define custom allocation generation.
Financial Management Log [fm_log]	Logs financial management information for tracking and to assist with debugging. Extends the system log table.
Labor Rate Card [fm_labor_rate_card]	Defines hourly labor rates for expense line generation based on functional roles.
Rate Card [fm_rate_card]	Associates configuration items to a rate card.
Rate Card [fm_recurring_rate_card]	Represents a collection of recurring costs.
Rate Card Cost [fm_ci_rate_card_cost]	Associates a recurring CI cost to a rate card so that it is applied to all CIs associated with the rate card.
Rate Card Users [clm_m2m_rate_card_user]	Associates users to a rate card.
Relationship Path [fm_relationship_path]	Defines the relationship between configuration items, such as parent records and child records.
Task Rate Card [fm_task_rate_card]	Stores records that define task costs.

User Roles

Cost Management adds the following user roles. A user with the user_admin or admin role can assign these roles.

User Roles

Role	Description	Contains Roles
Financial User (financial_mgmt_user)	Financial users participate in financial processes and have limited access to functionality.	None

User Roles (continued)

Role	Description	Contains Roles
	Can read allocation units and expense allocations. Can create, read, and write rate cards and expense lines. Can create, read, write, and delete fixed assets, depreciation, distribution costs.	
Financial Admin (financial_mgmt_admin)	Financial administrators manage financial processes in the system. Can create, write, and delete allocation units, fixed assets, depreciation, rate cards, distribution costs, expense lines, and expense allocations.	financial_mgmt_user

Properties

Cost Management adds the following properties.

Properties

Name	Description
<i>com.snc.time_card.default_rate</i>	Sets a default hourly rate to use if no labor rate cards apply to the user.
<i>glide.cost_mgmt.calc_actual_cost</i>	Sums all task expense lines and adds the total to the Work cost field on the task record when an expense line is created for any task with a Type of Planned task .
<i>glide.cost_mgmt.debug</i>	Enables debugging of cost management processing. All logging events are recorded in the Financial Management Log [fm_log] table. This should only be enabled during initial testing or when troubleshooting because it can generate a large number of log records.
<i>glide.cost_mgmt.process_task_cis</i>	Creates expense lines to affected configuration items when creating a task expense line. The default value is false .
<i>glide.cost_mgmt.service_allocation.method</i>	Defines if business service to cost center allocation costs should be calculated based on total units or allocated units.

UI Policies

Cost Management adds the following UI policies.

UI Policies

Name	Table	Description
Control flat rate vs bill rate fields	[fm_task_rate_card]	Hides the Task rate field and displays the Default labor rate field on the Task Rate Cards form if the Use time worked check box is selected.
Hide if define condition disabled	[fm_ci_rate_card]	Displays the Table and Condition fields on the CI Rate Cards form if the Define condition check box is selected.
Hide parent class if all enabled	[fm_relationship_path]	Hides the Parent class field on the Relationship Paths form if the All parent classes check box is selected.
Hide recurring fields for one time cost	[fm_distribution_cost]	Hides the End date and Interval fields on the Distribution Costs form if the Recurring check box is cleared.
Hide relationship type if all enabled	[fm_relationship_path]	Hides the Relationship type field on the Relationship Paths form if the All relationships check box is selected.
Hide Show Advanced Field	[fm_distribution_cost_rule]	Hides the Table and Condition fields on the Distribution Cost Rules form and displays the Script field if the Advanced check box is selected.
Hide table field	[fm_labor_rate_card]	Hides the Table field on the Labor Rate Cards form at all times.
Modify value field rules on distribution method	[fm_contract_rate_card]	Changes the Value field from read-only to mandatory on the Contract Rate Cards form if the Distribute cost field is set to Allocate and distribute cost based on value .
Show script field if advanced	[fm_expense_allocation_rule]	Displays the Script field on the Expense Allocation Rules form if the Advanced check box is selected.

Client Scripts

Cost Management adds the following client scripts.

Client Scripts

Name	Table	Description
Calculate Tax Cost - Base cost	[fm_rate_card]	On the contract rate card record, calculates the tax cost and total cost based on changes to the base cost.
Calculate Tax Cost - Sales tax	[fm_rate_card]	On the contract rate card record, calculates the total cost if the Sales tax option is selected.
Calculate Tax Cost - Tax rate	[fm_rate_card]	On the contract rate card record, calculates the tax cost and total cost based on changes to the tax rate.
Set Rate Card End Date	[fm_contract_rate_card]	On the contract rate card record, sets the rate card end date to the contract end date if the contract has an end date.

Business rules

Cost Management adds the following business rules.

Business rules

Name	Table	Description
Calculate Totals with Tax	[fm_recurring_rate_card]	Updates the Tax rate , Tax cost , and Total cost fields when Sales tax , Base cost , or Tax rate field values change.
Process time card	[time_card]	Creates an expense line after a time card is approved.
fm_calcBudgetValues	[fm_budget]	Updates remaining budget amount when planned or actual values change.
fm_Disable rate card costs	[fm_ci_rate_card]	Disables all rate card costs when a rate card is disabled.
fm_InsertBudget	[fm_budget]	Shows a message with the next budget number when a new record is inserted.
fm_Populate Month Field	[fm_expense_allocation]	Fills in the Month field based on the Expense date field.
fm_processExpenseAllocation	[fm_expense_line]	Processes expense allocation rules when an expense line is created for pending items.

Business rules (continued)

Name	Table	Description
fm_Set default next process	[fm_ci_rate_card_cost]	Sets the default next process date for a new configuration item rate card cost.
fm_Set default next process	[fm_distribution_cost]	Sets the default next process date for a new distribution cost.
fm_updateAllocationAvailable	[allocation_unit]	Recalculates the number of available units when the number of allocated units is updated.
fm_updateAllocationUnits	[fm_cmdb_rel_cc]	Recalculates the number of allocated units for a business service.
Next process date validation	[fm_contract_rate_card]	If the next process date for the contract rate card is after the start date, this business rule sets the next date to the start date.
Prevent more than one allocation per ci	[allocation_unit]	Prevents more than one allocation per configuration item.
Process CI Relationships	[fm_expense_line]	Processes parent related items and generates expense lines for configuration item source expenses. Processes task cost into affected configuration item expense lines for task source expenses.
Process Task Rate Cards	[task]	Processes task rate cards when a task is set to inactive.
Update Contract	[fm_contract_rate_card]	Rolls costs from rate card to contract. Updates the contract total cost, tax cost, tax rate, and base cost when total cost, tax cost or tax rate values change.
Update Planned Task Actual Cost	[fm_expense_line]	Calculates the total actual costs from related expense lines for planned task source expenses.
Verify rate card's start and end dates	[fm_contract_rate_card]	Validates that the rate card start date is

Business rules (continued)

Name	Table	Description
		<p>specified and is not after the end date. This business rule also:</p> <ul style="list-style-type: none"> Validates that the rate card start date is not before the contract start date and that the rate card end date is not after the contract end date. Sets the rate card end date to the contract end date if a value is not entered and the contract has an end date.

Cost Management Demo Data

The demo data available with Cost Management provides samples of the data types to illustrate its use.

Demo data should be loaded only in a development or test instance to prevent conflict with production data.

High-Level Data Review

The Cost Overview module has a number of commonly requested reports.

Business Service Overview

The business service owner would like to know how much it costs to maintain the service over some period of time. This requires gathering the dependent CI costs and representing them at the business service level. For CI costs to roll up to business services, relationships must exist between CIs and services.

The demo data contains a number of services that have costs from their dependent CIs. In the **Cost Overview** homepage, the **Business Service Cost 12 Month** report shows an overview of this information:

Allocation Overview

Expense allocation rules costs allow you to allocate costs to one or more business entities such as a user, group, department, company, or cost center. The purpose of the allocation is to represent the cost that the business is responsible for. This is not considered charge-back or billing, but could be used as a source for billing. The primary purpose of expense allocation is to represent the consumer of the process that has incurred some expense.

The following diagram shows the distribution of expenses to cost centers.

Budget Overview

The amount of money allocated to cost centers can be tracked against a planned budget. A budget represents a collection of cost centers, a duration, and the amount of money that is expected to be allocated to the cost centers during that period. The administration budget contains three cost centers and has incurred \$173,610.83 so far during this period.

Cost overview module

The Cost Overview module displays various cost management reports.

It gives financial administrators and other users a summary view of key cost management information.

The Cost Overview is a type of homepage.

Only users with certain roles have access to the Cost Overview module. See [Cost overview module roles](#) for more information.

Cost overview module roles

Only certain roles can customize Cost Overview modules. In addition to viewing, roles with access can refresh, add, delete, and rearrange reports.

Cost Overview Module Role Access

Role	Access
admin	View, customize
asset	View, customize
financial_mgmt_admin	View
financial_mgmt_user	View
procurement_user	View
sam	View

CI rate cards

A configuration item (CI) rate card is a group of recurring configuration item costs associated with multiple configuration items. Rate cards make it easier to enter and track costs that are the same across multiple configuration items.

Rate cards usually follow a framework in which all costs are recorded and allocated. For example, the contract costs of a specific model server in a New York datacenter could be different than the same server model running in a Madrid datacenter. Each model would have a separate rate card detailing the costs.

Users with the Financial Admin (`financial_mgmt_admin`) and Financial User (`financial_mgmt_user`) roles can manage CI rate cards.

Create a CI rate card

You can add a CI rate card that specifies an hourly rate and associate a rate code.

Before you begin

Role required: `financial_mgmt_admin`

Procedure

1. Navigate to **All > Cost > Costs > CI Rate Cards**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Field	Description
Number	[Read-only] The CI rate card identification number. Automatically assigned.
Define condition	Check box that indicates whether to use the Condition field to filter configuration items for the rate card.
Name	The CI rate card name.
Summary type	The CI rate card category: Grow Business , Run Business , or Transform Business . Categorizing can be useful for reporting.
Active	Check box that indicates whether the rate card is available for use. Clear the check box to disable the rate card and deactivate all associated rate card costs.
Table	The table to query with conditions for configuration items. This field is available if Define condition is selected.
Condition	The condition to query on the specified Table . This field has a condition count widget to preview what records are captured by the conditions. This field is available if Define condition is selected.
Short Description	A brief description of the rate card.

Add a condition to a CI rate card

If you're adding a condition to a CI rate card, use the **Update CI List** related link to create the relationship between the configuration item or items and the rate card.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Costs > CI Rate Cards**.
2. Select a rate card.
3. Select **Define condition**.
4. Create the Condition.
5. Right-click the header bar and select **Save**.
6. In **Related Links**, select **Update CI List**.

Example

Update CI List

CI Rate Card - CIRC0009004

Allows for the modification of CI Rate Card Items based on the defined condition.

Possible Actions:

Replace - will remove any existing items that do not match the condition and add all remaining items from the condition results

Merge - will keep existing items and add all remaining items from the condition results

Replace Merge

[Return to rate card](#)

Existing items not matching condition

Items to be Removed						
Name	Manufacturer	Location	Description	Class	Updated	Maintenance schedule
*ANNIE-IBM	Lenovo	815 E Street, San Diego,CA		Computer	2026-03-04 18:37:20	
*ASSET-IBM	Lenovo	3 Whitehall Court, London		Computer	2026-03-04 18:37:29	
*BETH-IBM	Lenovo	6304 Northwest Barry Road, Kansas City,MO		Computer	2026-03-04 18:37:44	
*BOW-IBM	Lenovo	13308 Midland Road, Poway,CA		Computer	2026-03-04 18:37:47	
*BUD-IBM	Lenovo	4492 Camino De La Plaza, San Ysidro,CA		Computer	2026-03-04 18:37:08	
*CAROL-IBM	Lenovo	322 West 52nd Street, New York,NY		Computer	2026-03-04 18:38:01	
*CAROL2-IBM	Lenovo	322 West 52nd Street, New York,NY		Computer	2026-03-04 18:37:31	
*CAROL3-GATEWAY	Gateway	322 West 52nd Street, New York,NY		Computer	2026-03-04 18:36:47	

7. Select one of the choices.

- **Replace:** removes any existing items that do not match the condition and adds all remaining items from the condition results.
- **Merge:** keeps existing items and adds all remaining items from the condition results.

8. Select **Return to rate card**.

CI rate card costs

CI rate card costs generate expense lines for configuration items on the associated rate card

Costs associated with rate cards are stored in the Rate Card Cost (fm_ci_rate_card_cost) table. Each cost is applied to every configuration item associated with the rate card when the costs are processed.

Expense Line is active by default.

Add a CI rate card cost

You can add a rate card cost to the CI rate card.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Costs > CI Rate Cards**.
2. Select a rate card.
3. In the **Rate Card Costs** related list, click **New**.
4. Enter a **Start date**.
5. Fill in the fields, as appropriate.

Field	Description
Number	[Read-only] The rate card cost identification number. Automatically assigned.
Rate card	The identification number of the rate card to which this rate card cost is associated.
Name	The rate card cost name.
Active	Check box that indicates whether to enable cost processing for this cost.
Short description	A brief description of the rate card cost. The description is used to identify the processed cost on an expense line record.
Start date	The date the cost should start being processed.
End date	The date the cost should stop being processed.
Interval	The frequency at which the rate card cost recurs.
Recurring	Check box that indicates whether the cost is a repeating cost. Also sets generated expense lines to show as recurring. If this check box is cleared, no further expenses are generated automatically.
Sales tax	Check box that indicates whether to apply sales tax to the cost.
Tax rate	The tax rate to apply to the cost.
Order	Used by task rate cards.
Last processed	[Read-only] The date and time this cost was last processed.
Next process	The next date on which new expenses will be processed based on the Process FM Costs scheduled job.
Base cost	The amount that must be paid before taxes.
Tax cost	Total cost of the tax.
Total cost	Total rate card cost, including taxes.
Description	Detailed description of the rate card cost.

Remove a rate card cost

You can remove a rate card cost on the CI Rate Card form.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Costs > CI Rate Cards**.
2. Select a rate card.
3. In the **Rate Card Costs** related list, click a **Number**.
4. Click **Delete**.

Disable a rate card cost

To prevent a cost from processing, clear the *Active* option. Use the option to make a rate card cost permanently inactive or to temporarily skip a cost from processing.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Costs > CI Rate Cards**.
2. Select a rate card.
3. In the **Rate Card Costs** related list, click a **Number**.
4. Clear the **Active** check box.

Modify a rate card cost

Configuration item costs often change over time as facilities or vendor rates change.

Before you begin

Role required: financial_mgmt_admin

About this task

Expense lines are the snapshot of a given interval's costs, so changing the cost does not affect already generated expense lines. When costs change, either modify the cost amount or disable the current cost and create a new cost to represent the cost going forward. The changes are processed in the next generated expense line. To keep historical records of costs, create new costs rather than modifying existing ones and set the end date of the disabled cost to show that the cost agreement expired.

Procedure

1. Navigate to **All > Cost > Costs > CI Rate Cards**.
2. Select a rate card.
3. Click a rate card cost **Number**.
4. Modify the fields, as necessary.

Aggregate CI costs

Expense lines can be aggregated to apply all configuration item expenses to a parent business service or application with relationship paths.

Define relationship paths from a child configuration class to one or many parent classes. If a path does not match one of the relationship path record criteria, the path is not viewed as a relationship when determining expense aggregations. See [CI relationships](#).

Enable relationship aggregation

The Process Last Month CI Costs scheduled job processes costs of configuration items. To start aggregating expenses to parents, identify the relationships to use for aggregation. Because there are many options for CMDB relationships, using all available paths for aggregation is generally not efficient.

Before you begin

Role required: financial_mgmt_admin

About this task

You can have multiple relationships for each child class. For example, to enable only certain relationships or parent classes, create a new record for each type and class combination paired with the child class.

When an expense line is generated from a configuration item cost, the parents of the configuration item are evaluated. The parent class and relationship type are compared to the list of relationship path records to see if there is a match to use for aggregation. If there is a match, an expense line is generated for the parent configuration item. The process repeats for all parents until there are either no parent relationships or the relationships in place do not meet the criteria defined in the relationship path records.

Procedure

1. Navigate to **All > Cost > Administration > Relationship Paths**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Field	Description
Active	Check box that indicates whether the relationship path is enabled.
Child class	The child configuration item class. This class is the source of the expense generated during configuration item cost processing.
All parent classes	Check box that indicates whether CI relationships in the CMDB to all parent classes are processed.
Parent class	A valid parent CI class for the selected child class. Available only if All parent classes is not selected.
All relationships	Check box that indicates whether all relationship types between the child and parent classes are processed.
Relationship type	The type of relationship to process between the child and parent classes. Available only if All relationships is selected.

What to do next

When a configuration item has multiple parents that have valid relationship paths, the amount aggregated to each parent is split to prevent over-aggregation of a item cost. When evaluating parent relationships to active relationship paths, the aggregation counts the total number of valid relationships. The expense line amount from the child configuration item is evenly divided among the number valid paths and that amount is used when creating the inherited expense line for the parent.

Task and labor rate cards

In Cost Management, task rate cards and labor rate cards capture operating costs by generating expense lines representing the cost of performing a task

- Task rate cards are templates used to define the type of task and the method of calculating the associated costs.
- Labor rate cards are templates used to define worker's labor rates when calculating task cost based on time worked.

Manage a labor rate card

The labor rate card associates a rate code with a labor rate.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Labor Rate Cards**.
2. Create or edit a record (see table for details).

Field	Input Value
Name	String field summarizing the purpose of the rate card.
Rate code	For reference use only, if you want to align rates with an external system.
Rate type	The rate type that is used to determine if the labor rate card matches with the rate type on the time card.
Active	Check box which determines if the rate card will be actively used.
Hourly rate	Identifies the hourly rate to be applied to task time worked entries if the worker meets the condition defined.
Condition	Defines a filter on the user table to determine whether the task time worked user applies to this rate card. This field uses the Condition Count Widget to preview what records would be returned by the conditions.

Rate type in labor rate card

The rate type functionality is used to categorize different types of work. For example, Standard versus Overtime.

The Labor Rate Card form contains options to specify rate type, specify hourly rate for the rate type, and specify users for whom the labor rate card is applicable. A single user can be associated with multiple labor rate cards that contain different rate types.

Assume that a user logs time against a task and selects the rate type Standard in the Time Cards form. Upon approval, the expense line (cost) for the time card is derived by matching the user and rate type on the time card to a labor rate card assigned to that user, and that has the same rate type. When the user has multiple labor rate cards with the same rate type, the expense line is generated based on the labor rate card that has the lowest value in the **Order** field. When there is no labor rate card associated with the user and rate type, the default hourly rate found in the **Time Sheets > Administration > Time Sheet Policy** form is used (`com.snc.time_card.default_rate` property).

Note:

A user can enter a rate type only if it is permitted by the users [Time sheet policies](#).

Related topics

[Create a rate type](#)

Manage a task rate card

Task rate cards are rate cards associated with records in a task table.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Costs**.
2. Create or edit a record (see table for details).

Field	Input Value
Name	String field summarizing the purpose of the rate card.
Table	Which type of tasks the rate card applies to.
Order	If more than one task rate card apply to the same task, the one with the lowest order is used.
Active	Check box which determines if the rate card will be actively used.
Summary type	High-level type of expense for easier summary reports. This value will be used to set the expense line summary type field.
Condition	Filter to run on the table selected to determine whether this rate card applies to a given task. This field uses the Condition Count Widget to preview what records would be returned by the conditions.
Task rate	Rate of the task, with a currency list. To add a new currency, use the Edit link.

Field	Input Value
Use time worked	By default a flat rate per task is defined in the rate card. Selecting the check box will force the rule to calculate the task cost based on the related task time worked entries.
Default labor rate	Defines the default hourly rate to apply to the time worked entries if the worker does not have a labor rate card. Displayed when Use time worked is selected.

Process task rate cards

The business rule Process Task Rate Cards runs when tasks close and checks to see if any task rate cards apply. If they do, an expense line is created according to the rate card.

The process flow of the "Process Task Rate Cards" business rule is:

1. Task closes.
2. Business rule runs.
3. Query active task rate cards in order looking for a matching condition.
4. Qualifying rate card not using time worked.
 - Generate expense line linked to the task using the task rate value.
5. Qualifying rate card using time worked.
 - a. Get task time worked entries for the task grouped by user (worker).
 - b. For each user, check to see if they match conditions in any of the labor rate cards.
 - i. Labor rate card found, generate expense line using the time worked and labor rate.
 - ii. Labor rate card not found, generate expense line using the default labor rate from the task rate card.

Budgets and cost centers

Understand what budgets and cost centers are and how to manage them in the Cost Management application.

Budgets

Budgets allow tracking of planned and actual spending. Budgets are defined for a given time period for one or more cost centers.

Cost centers

Cost Centers are used to represent a business entity. All expense allocations assigned to the budget's cost center during the budget period are used to calculate the budget's actual expense allocations.

It is also possible to assign a cost center to a budget from the cost center record. The cost center record contains a budgets related list.

Budgets and cost centers example

The most common business entity to associate financial information is the cost center.

The example here shows how cost centers can be allocated expenses based on service usage. This example uses that information to compare with a defined budget for the cost centers.

A budget is a placeholder for an amount of planned spending for one or more cost centers. To view an example, navigate to **Financial Management > Budgets** and select the **Investments** budget:

This budget has a defined start and end date, planned amount, and actual amount. In the **Cost Center** related list, **Trading** is a member.

For all expense allocations assigned to the **Trading** cost center during the budget time periods, the allocations will be totaled to populate the actual budget field. The related expense allocation records can also be viewed in the **Expense Allocations** related list.

Create or update cost centers

Define a new cost center or update the details of the existing cost centers.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Config > Cost Center**.
2. Select a cost center record to edit or select **New** to create one.
3. On the form, fill in the fields.

Cost Center form

Field	Description
Name	Name of the cost center.
Manager	Manager of this cost center.
Account number	Account number for this cost center.
Valid from	Date this cost center is valid from. Select a date using the calendar option.
Code	Code assigned to this cost center.
Valid to	Date this cost center is valid up to. Select a date using the calendar option.
Location	Location of this cost center. Select one using the lookup option.
Parent	Parent cost center, if any. Select one using the lookup option.

4. Select **Submit**.

What to do next

Review the related lists for this cost center and update them as necessary. See [Cost centers related records](#).

Related topics

[Budgets and cost centers](#)

Create or update a budget

Cost management provides budgets for you to plan expenses for a certain time period.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Config > Budgets**.
2. Select a Budget to edit or select **New**.
3. Fill in the form (see table)

Budget form

Field	Input value
Number	System generated record number.
Name	String field for the name of the budget.
Start	Date field defining the beginning of the budget period.
End	Date field defining the end of the budget period.
Planned	Currency field representing the planned amount of expenses for the associated cost centers during the budget period. This value is inputted or imported.
Actual	Currency field representing the actual amount of expenses for the associated cost centers during the budget period. This is a calculated field using the list of expense allocations for the cost centers.
Remaining	Currency field representing the amount of planned minus actual expenses. This is a calculated field.
Projected	Currency field representing the estimated amount of expenses for the associated cost centers during the budget period. An average daily expense amount is calculated and applied to the rest of the budget period to determine the estimated projection.

What to do next

Review the related lists for this budget and update them as necessary. See [Budget related records](#).

Related topics

[Budgets and cost centers](#)

Cost centers related records

Cost centers are related to additional records, displayed as related lists on its form.

The Cost Management plugin adds the following related lists to the cost center record. You can add additional records in these related lists or remove existing ones.

- **Budgets:** Budgets that this cost center is a member of.
- **CI Cost Center Relationships:** Defines how much of a business service capacity this cost center is consuming.
- **Expense Allocations:** Shows all the expense allocation records that have this cost center as the target.

Cost center related lists

Associate cost centers to a budget

You create cost centers and associate budgets and expense allocations with them.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Open an existing budget from the **Cost > Config > Budgets** module.
2. Make sure the Cost Centers related list is displayed.
3. Use the Edit to add or remove existing cost centers from the budget.
4. Use the New button to create a new cost center record.

Using distribution costs and rules

Distribution Costs are costs which can be divided among a group of records.

For example, the cost of power at a datacenter which can be divided among the CIs in the datacenter.

Distribution Rules determine how the Distribution Costs are divided among the CIs.

Defining Distribution Costs

To define new distribution costs, navigate to **Financial Management > Cost Management > Distribution Costs**, and select **New**. Populate the following fields:

Defining Distribution Costs

Field	Input Value
Number	A system-generated unique identifier for the Distribution Cost.
Name	A human-readable identifier for the cost.

Defining Distribution Costs (continued)

Field	Input Value
Amount	The amount of the cost, with a currency list. To add a new currency, use the Edit link.
Distribution Rule	Select a Distribution Rule to determine how the costs are distributed to CIs. For more information, see Distribution Rules.
Active	Determines if the cost is actively used.
Start Date	The date of the cost, or if the cost is recurring, the first date of the cost.
Recurring	If checked, the cost will recur, and will be added regularly.
End Date	If <i>Recurring</i> is <i>true</i> , the last date to add the distribution cost.
Summary Type	Identifies a high-level type of expense for easier summary reports. This value will be used to set the expense line summary type field.
Interval	If <i>Recurring</i> is <i>true</i> , the time between each addition of the distribution cost between <i>Start Date</i> and <i>End Date</i> .
Last Processed	A read-only display of the last time the distribution cost was processed.
Next Process	A read-only display of the scheduled next process date.

Defining distribution rules

Define distribution rules to view distribution costs that are distributed according to the rules.

To define new distribution rules, navigate to **Financial Management > Admin > Distribution Cost Rules**, and select New and populate the following:

Distribution Rules form

Field	Input Value
Name	A unique name for the rule.
Active	Determines if the rule is actively used.
Advanced	If checked, the distribution rule will be determined by script. If not checked, it will be determined by table and conditions.
Description	A description of the rules and any notes on its use.
Script	If <i>Advanced</i> is <i>true</i> , the script which will determine the rule's behavior.
Table	If <i>Advanced</i> is <i>false</i> , a list list of tables to find the records to distribute the cost to.
Condition	If <i>Advanced</i> is <i>false</i> , a condition builder to determine which records will receive the distributed cost, on the table determined by the <i>Table</i> field. Cost amount will be distributed evenly across the records identified by the table and condition values. This field uses the Condition Count Widget to preview what records would be returned by the conditions.

Once submitted, the Distribution Costs related list is displayed, which helps determine which costs will be distributed according to the rules.

Scripted distribution

Scripted distributions allow for custom distribution amounts, versus the evenly split distributions when using table and condition filters.

To enable scripted processing on a distribution rule:

- Check the advanced field check box, this will display the script field.
- Build the script using the following concepts:
 - Query for target records and data to use for calculating the allocation amount.
 - Create expense line records using the ExpenseLine API.

For more information, see [ExpenseLine](#).

As noted in the default script, when the advanced field is enabled, the following variables are available during the script processing:

- *distCost* - GlideRecord for the distribution cost, allowing access to all fields.
- *distCostAmount* - cost amount in the system currency.

Processing Distribution Costs

A scheduled job called *Process FM Costs* automatically processes distribution costs daily.

Use business services with expenses

Manage the relationships between business services and their expenses with allocation units and cost centers.

Define a cost center

Cost centers are a commonly used reference between financial systems and IT. Cost center records represent business entities, and have a related list of CI Cost Center Relationships that measure the cost center's consumption of business services.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Config > Cost Center**.
2. Select a record to edit or select **New**.

Field	Description
Name	A unique name for the cost center.
Account Number	An account number associated with the cost center, if one exists.
Code	A code associated with the cost center, if one exists.
Location	A reference to the location of the cost center.
Manager	A reference to the user who manages the cost center.
Valid from	The date that the cost center is valid from.
Valid to	The date that the cost center is valid to.

CI Cost Center Relationships

Field	Description
Service	A reference to a Business Service.
Cost Center	The cost center to apply the relationship to. If reached through the related list, it should already be related to the appropriate cost center.
Allocation Percentage	Feature not yet implemented.
Allocation Type	A choice list. Should be Units .
Allocation Units	The number of units that the cost center is using. This is measured using the same type of unit used to define the total capacity of the business service in the allocation unit record. This number will be used to update the number of allocated units in the allocation unit record. It will also be used to determine the amount of expenses to allocate to the cost center based on the percentage of business service used versus the total capacity.

Default allocation rule

For every expense line generated for a business service, the default allocation rule Process Svc-CC Relationships will attempt to process the expense and create allocations for each cost center that is consuming the service.

The amount of the expense allocation is calculated by dividing the number of units the cost center is consuming by the total number of units for the business service. This calculation method is referred to as "all unit" allocation as it uses the total unit capacity to determine the allocation percentage.

Refer to the demo walk-through for a detailed example.

For a given business service expense line, it is typical that less than 100% of the expense would be allocated using this method not all units have been allocated to cost centers. The unallocated expenses could be considered IT overhead. Some organizations prefer to show 100% expense allocation regardless of how many units are in use. This method is referred to as "allocated unit" since the percent of allocation calculated by dividing the number of units the cost center is consuming by total number of allocated units from all cost centers.

Allocation calculation method	Example
all_units	Service supports 100 units but only has 50 units allocated, and cost center ABC is allocated 25 units. This method will result in an allocation cost of 25/100, or 25% of the total cost of the service. 50% of the expenses (from the 50 unallocated units) will not be allocated.
allocated_units	Service supports 100 units but only has 50 units allocated, and cost center ABC is allocated 25 units. This method will result in an allocation cost of 25/50, or 50% of the total cost of the service. 100% of the expenses will be allocated, showing full cost recovery.

This is a system wide setting that can be configured by navigating to **Financial Management > Properties** module and selecting an option from the choice list.

Define an allocation unit

Allocation unit records define the capacity and usage of a business service.

Before you begin

Role required: financial_mgmt_admin

Procedure

1. Navigate to **All > Cost > Config > Allocation Units**.
2. Select a record to edit or select **New**.

Note:

Selecting the name of the configuration item will display the CI record, not the Allocation Units.

Field	Description
Configuration Item	Select the Business Service to define allocation units for.
Total Units	The total number of units of expense available to allocate. A unit is a generic measurement which can represent anything. Should match the cost center relationship unit. What units represent can be recorded in the Unit Type field. Using the <i>Total units</i> option may result in unallocated expenses if there are unallocated business service units. Using the <i>Allocated unit</i> option always results in 100% expense allocations.
Allocated Units	How many of the total units are allocated. Populated by script.
Available Units	How many of the total units are unallocated. Populated by script.
Updated	When the units were last updated.
Unit Type (added by configuring the form)	Used to record what the units represent (e.g. seats, licenses, Gigabytes, and so on).

Cost sources

There are a several ways to generate expense lines for objects in the system.

These are generally classified as one of three types:

- CI costs
- Task costs
- Custom generated costs - these are not covered in the demo data, refer to the ExpenseLine API for more information.

CI Rate Cards

A CI rate card is a template that defines costs for a particular type of CI. This example uses only server-related costs. Since there are only a few different server models and the costs are the same for each model, CI rate cards can define a template of costs for each model.

Following is the Sun E20K Servers NY rate card:

It represents the common costs and CIs in the UNIX servers in the NY datacenter, regardless of what the server is used for.

The related lists contain information on how this rate card is used. The **Configuration Items** related list displays each of the servers that will use this rate card. This list of items can be managed manually with the **Edit** button or with the **Update CI List** related link. The rate card condition for this rate card is **Table=Unix Server**. Clicking the **Update CI List** related link shows two things:

- CIs that are a member of the rate card but do not match the condition.
- CIs that match the condition but are not a member of the rate card.

To "true-up" the rate card, use the **Replace** or **Merge** button.

In this case, there are two extra UNIX servers that are not in the rate card. Use the **Merge** button to add them. The rate card now shows nine items.

Note:

Counts may vary if there are additional CIs in the instance.

The **Rate Card Costs** related list displays the recurring costs that all of the servers will incur, in this case on a monthly basis.

Adding the **Expense Line** related list to the CI Rate Card form shows the list of expense lines that have been generated from this rate card's costs. Here are the expenses for the Server backup services for two of the servers:

Distribution Costs

For more generic bulk costs that are generated by multiple CIs, distribution costs can represent the broader costs where individual CI rate cards do not apply. Navigate to **Financial Management > Distribution Costs** to view a few examples.

Select **Datacenter Facilities (amort)** from the list:

In this example, the datacenter's power costs for a month have been amortized and represented as a monthly recurring distribution cost.

This bulk cost should be distributed to all servers evenly to enable reporting on costs per server and cost center. This is accomplished with the **Distribution Rule** listed on the cost's form. To view the distribution cost, click the reference icon for the **All Installed Servers** rule in the **Distribution rule** field:

This rule takes the \$5,500 and distributes it to each of the servers that match the rule condition. The condition here is All servers with install status of installed. The "View Condition Results" related link displays the current records matching the condition.

Task Costs

Task-related activity can also generate expense lines to track the costs associated with processing tasks. The primary method of generating task-related costs is to use **Task Rate Cards**.

Task Rate Cards

A task rate card is a condition-based record that the system uses to determine how to calculate the costs of a task.

To view an example, navigate to **Financial Management > Task Rate Card** and select **Incident P1**:

Rate cards are processed whenever a task is closed. This processing is triggered by a business rule. The rate card contains the following information:

- When an incident with priority **1 - Critical** is closed, it generates an expense line for \$150.
- This is a flat rate defined for each P1 incident.

The **Expense Line** related list displays the list of expenses that have been created by this rate card.

Return to the **Task Rate Card** list and open the **Change Request (emergency)** rate card:

This rate card for emergency change requests demonstrates an example of creating a task cost based on the amount of time it took to work the task, instead of the flat rate model in the incident rate card.

- The **Use time worked** flag in the rate card tells the system to use the task time worked records associated with the task when determining the task cost.
- Processing this rate will:
 - Query the list of task time worked records for the task.
 - Attempt to resolve an hourly rate for the user in the task time worked record, or use the default rate of \$250/hr defined in the rate card.
 - Generate an expense line for each time worked entry.

The **Expense Lines** related list shows the expenses generated from this rate card.

Labor Rate Cards

Labor rate cards are a way to define common patterns for hourly worker rates so rates need not be managed for each individual in the system.

To view the sample rates, navigate to **Financial Management > Labor Rate Cards** and select the **Development** rate card:

The conditions state that for users in the **Development** department, time worked costs will use \$100 as the hourly rate.

CI relationships

To get reports that represent the total costs for a business service, there must be some association between the service and the CIs that make up the service. This is done with CI relationships.

Before you begin

Role required: financial_mgmt_admin

About this task

Use the demo data of the Cost Management plugin to understand how to check all expense lines related to a business service.

Procedure

1. Navigate to **All > Cost > Config > Business Services**.
2. Select **Retail**.

- View the business service map by selecting the dependency views icon ().

This view shows that the dbaix901nyc server is a dependency of the Retail Adding Points, Retail POS, and Retail business services. So whenever the dbaix901nyc server incurs a cost, it would be represented at each of the business services.

The dbaix901nyc server is a member of the Sun E20K Servers NY CI rate card, so the expenses can be verified from this CI rate card.

To view them:

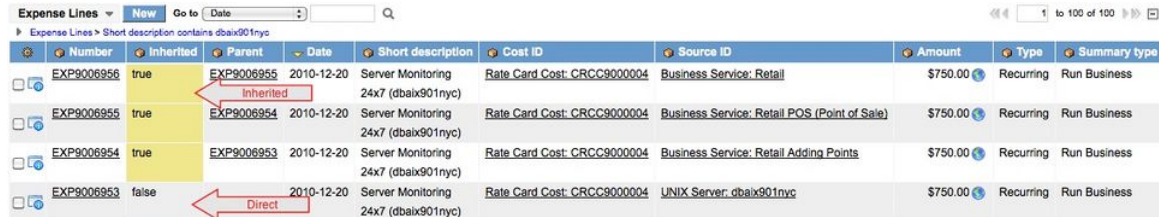

- Navigate to **All > Cost > Costs > CI Rate Cards**.
- Select **Sun E20K Servers NY**.
- Select the Expense Line related list.

If this related list is not available, configure your form layout to display the Expense Line → Rate Card related list.

- Filter the related list for **short description contains dbaix901nyc**.

The server's expenses are now visible:

Example server expenses

Number	Inherited	Parent	Date	Short description	Cost ID	Source ID	Amount	Type	Summary type
EXP9006956	true	EXP9006955	2010-12-20	Server Monitoring 24x7 (dbaix901nyc)	Rate Card Cost: CRCC9000004	Business Service: Retail	\$750.00	Recurring	Run Business
EXP9006955	true	EXP9006954	2010-12-20	Server Monitoring 24x7 (dbaix901nyc)	Rate Card Cost: CRCC9000004	Business Service: Retail POS (Point of Sale)	\$750.00	Recurring	Run Business
EXP9006954	true	EXP9006953	2010-12-20	Server Monitoring 24x7 (dbaix901nyc)	Rate Card Cost: CRCC9000004	Business Service: Retail Adding Points	\$750.00	Recurring	Run Business
EXP9006953	false		2010-12-20	Server Monitoring 24x7 (dbaix901nyc)	Rate Card Cost: CRCC9000004	UNIX Server: dbaix901nyc	\$750.00	Recurring	Run Business

This example contains one direct expense (**inherited = false**), and three inherited expenses that have been generated from other direct expenses. These inherited expenses are based on CI relationships, which allow for reporting at any business service level.

For more information on expense aggregation, see [Enable relationship aggregation](#).

Allocating expenses

Expenses can also be allocated to a business entity that is responsible for the expense.

This is not considered charge-back or billing but could be used as a source for billing. The primary purpose of expense allocation is to represent the consumer of the process that has incurred some expense. This can be accomplished by defining expense allocation rules.

Simple Example

This example demonstrates allocating every server-related expense line to the department responsible for the server.

To view the example:

- Navigate to **Financial Management > Expense Allocation Rules**.
- Remove the list filter to view inactive rules as well as active ones.
- Select the **Server - Department** rule.

The rule states that for every expense line associated (**Expense source** field) with a server that has one of the selected statuses, generate an expense location record for 100% of the expense amount and assign the allocation to the server's department.

To view expense allocations, add the **Expense Allocation** related list to the form. The **Target** field is the business unit that the expense is allocated to.

Complex Example

A more common example would be to allocate the costs of a business service to the business consumers. Since cost centers are generally used when referring to business finances, this example allocates business service costs to each cost center that is consuming the service and bases the amount allocated on the amount of the service the cost center consumes.

To view the example, navigate to **Financial Management > Business Services** and select **Retail**. Switch to the **Cost** view to gain access to additional related lists.

The **Allocation Units** record defines the amount of capacity that this service provides. In this case, the Retail service can support 50 locations (units), of which 45 are allocated. A unit is a generic concept that can represent something that makes sense for that business service. This record uses units to represent allocation. The objective is to use the unit count and the cost center unit count to determine a percentage of total to calculate the allocation amount.

The CI Cost Center Relationships list shows which cost centers are using the service and how many units they are using. This information is used to determine how much of the service expenses to allocate to each cost center. For example, the Trading department is using 10 of the 50 allocated units, so they will be allocated 20% of all Retail expenses. There's also an option to allocate based on the total (10 or 45).

To see how the expense lines are allocated, select an entry in the **Expense Lines** related list and add the **Expense Allocation** related list to the Expense Line form.

The following is an expense from the dbaix901nyc server for \$2,500. Two expense allocations are generated from the expense. The **Trading** cost center was allocated \$500 (20%) of the expense based on the CI cost center relationship seen earlier.

This type of business-service-to-cost-center allocation is accomplished through the **Process Svc-CC Relationships** expense allocation rule. This is an advanced rule that uses script to determine the allocation logic.

Budget related records

Budgets are related to additional records, displayed as related lists on its form.

The following are the related lists on a Budget record. You can add additional records to these related lists or remove existing ones.

- **Cost Centers:** Shows the cost centers that are a member of this budget.
- **Expense Allocations:** Shows all of the expense allocation records during the budget time period for all of the budget's cost centers.

Domain separation and Cost Management

Domain separation is unsupported in Cost Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see [Application support for domain separation](#).

SPM custom tables

Strategic Portfolio Management (SPM) includes several custom tables that enable you to enhance SPM according to your specific business requirements. These tables are provided without predefined business logic, allowing you to use them as fully customizable entities to suit your unique needs.

SPM custom tables

The SPM custom tables enable organizations to scale Strategic Portfolio Management by integrating custom features and business-specific functionality.

The following tables from the Strategic Planning application and the PPM Standard plugin support Microsoft Active Directory SPM implementations, with a focus on cost efficiency and scalability for large-scale deployments, particularly within financial institutions.

Table	Description	Application/Plugin
Custom planning item 1 [sn_align_core_custom_planning_item_1]	Stores information for an additional planning item type.	Strategic Planning
Custom planning item 2 [sn_align_core_custom_planning_item_2]	Stores information for an additional planning item type.	Strategic Planning
Custom planning item 3 [sn_align_core_custom_planning_item_3]	Stores information for an additional planning item type.	Strategic Planning
Custom planning item 3 [sn_align_core_custom_planning_item_3]	Stores information for an additional planning item type.	Strategic Planning
Custom planning item 4 [sn_align_core_custom_planning_item_4]	Stores information for an additional planning item type.	Strategic Planning
Custom planning item 5 [sn_align_core_custom_planning_item_5]	Stores information for an additional planning item type.	Strategic Planning
Inbound Actuals Configuration [sn_invst_pln_inbound_actuals_config]	Import and map project codes from ERP systems to SPM.	PPM Standard

Table	Description	Application/ Plugin
Inbound Actuals [sn_invst_pln_inbound_actuals]	Import expense lines from ERP systems to SPM.	PPM Standard
