You can use a connector instance to control the location and manner in which events arrive from external sources. You can optionally select to collect Metric Intelligence information from the external sources that you are connecting to. The Metric Intelligence feature is for the analysis of trends, threshold definitions, and anomaly detection. You can run a test to confirm that connector instance parameters let the MID Server receive events from a supported external event source to the Event [em_event] table. The test also confirms:

- The MID Server is running.
- The host is running on the IP address that is in the **Host IP** field.
- Both the MID Server and the host are running in the same domain.
- The connector instance value fields are valid.
- A connection can be made to the event source, using API, to retrieve events.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Connector Instance Form

Field	Description
Name	A unique name for the connector instance record, such as the name of event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Connector definition **Note:** Metric Intelligence connectors (such as the AWS CloudWatch and AzureConnector), appear in the base system only if the Metric Intelligence plugin (com.snc.sa.metric) is activated.	The vendor and protocol used to gather events from the external event source. Select the connector definition that matches the source of external events. The options available in the base system are, for example: ○ AWS CloudWatch ○ AzureConnector ○ HPOM ○ IBM Netcool ○ NagiosXI ○ NNMi ○ OMi ○ SCOM ○ SolarWinds ○ Op5 ○ PRTG ○ vCenter ○ Zabbix For a list of the connector definitions available in the base system, see Configure Event Management connectors.
Host IP	The IP address of the event source host. The system uses this IP address to select the appropriate MID Server for communicating with the event source host.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential	The record from the Credentials [discovery_credentials] table containing valid credentials to the event source host.
Event collection last run time	The date and time of the most recent event import. The value of this field is automatically populated.
Last event collection status	The status of the last import. The value of this field is automatically populated. ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the external event source. This value cannot be lower than the minimum schedule property, which by default is 120 seconds.
Last error message	Last error message received by the connector. If the test connector fails, an error message appears in this field.
Active	This option appears only after the form has been saved. Do not select this check box until after you test the connection between the MID Server and the connector. Select this check box to enable pulling events from this external event source.
Bi-directional	Select to invoke the bi-directional option. This option is available only when the specified connector definition has been configured with bi-directional values. When selected, this option enables the bi-directional exchange of values to-and-from the external event source. The **Last bi-directional status** option appears only when this option is selected. This option appears only if the connector definition that is selected is SCOM.
Last bi-directional status	The value of this field is automatically populated. The status values are: ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated. This option appears only if the connector definition that is selected is SCOM.
Metrics collection	Designates collection of Metric Intelligence metric data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The metrics connector supports working against the SCOM database (MSSQL) that is configured to work with SSL. This option appears only if the connector definition supports metric collection, such as SCOM.
Metrics collection last run time	The date and time of the most recent metric data collection. The value of this field is automatically populated.
Last metrics collection status	Status of the metric data collection activity. The value of this field is automatically populated. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and if the **Metrics collection** option is selected.
Metrics collection schedule (seconds)	The time, in seconds, to repeat the metric data collection scheduled job. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and when the **Metrics collection** option is selected.
Metrics database host	Enter either the IP address or the host name of the metrics database host. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connect using a named instance	Select to specify the MSSQL named instance to connect to. This option appears only if the connector definition that is selected is SCOM.
Metrics database named instance	The name of the metrics database instance. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database port	The port used by the metric database. The connection is made using JDBC. The base system value is 1,433. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Database login with Windows authentication	Perform database login with the credentials of the log-on user that is defined on the MID Server service. This option appears only if the connector definition that is selected is SCOM.
Metrics collection running	When selected, indicates that the Metric Intelligence collection is running.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database credential	Credentials for the metric database. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connector Instance Values	The related list containing connection parameters for the event source host. The list of parameters depends on the selected connector definition.
MID Servers for Connectors	The name of theMID Server to process events from the event server.

4. Right-click the form header and select **Save**.
5. Click **Test connector** to verify that the MID Server can communicate with the external server host.
6. If the test fails, follow the instructions on the page to correct the problem and then run another test. The description of the reason for failure is shown in the MID Server log, according to the type of error, such as Events, Metrics, or Bi-Directional.
7. After a successful test, select the **Active** check box and then click **Update**.
8. Confirm that Event Management processes events using this connector instance by manually creating an event.

Related topics

Configure Event Management connectors

Configure a default MID Server for connectors

You can set a default MID Server for connectors to ensure that there is always a MID Server available to receive external events.

Before you begin

Role required: evt_mgmt_operator

About this task

The default MID Server must have connectivity to all external event sources.

Procedure

1. Enter `sys_properties.list` in the navigation filter to open the System Property [sys_properties] table.
2. Select the `mid.server.connector_default` system property.
3. On the form, fill in the fields.

Task Template form

Field	Description
mid.server.connector_default	Default MID Server for connectors

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Determines the MID Server connectors to use when no MID Server is specified. Must match a MID Server name. ○ **Type**: select `string` from the list ○ **Value**: enter the name of an existing MID Server, for example, SNC MID Server ○ **Location**: System Property [sys_properties] table

Note:
You can reset the default MID Server by clearing the *`mid.server.connector_default`* property or by updating the value of this property to a different MID Server. This property is not automatically reset in all scenarios.

4. Click **Update**.

Configure the Dynatrace metrics connector instance

Configure the Dynatrace connector instance to receive Metric Intelligence raw data from the Dynatrace server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- Create an access token in Dynatrace with Read Metrics (metrics.read) scope permissions, to enable fetching metric data. This token is used in the connector to call the Dynatrace REST API.
- Configure the Service graph connector for Dynatrace. This is configured in the instance and discovers Dynatrace CIs. For details on configuring this connector, see Configure Service Graph Connector for Observability - Dynatrace using guided setup.

Role required: evt_mgmt_admin

About this task

By default, the Dynatrace service graph connector discovers CIs and supports metric collection for the following entity types:

- HOST
- APPLICATION
- SERVICE
- PROCESS_GROUP_INSTANCE

Configure other entity metrics for collection when creating event rules for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Dynatrace connector instance form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Dynatrace parameters.
   For details on the connector instance value parameters, see Dynatrace connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Dynatrace connector to use.
6. In the Related Links section, select **Configure metrics to collect**.
   Only metrics with the value **Active=true** are collected by the instance.
7. Configure the metrics you want the instance to collect with the value **Active=true**.
   Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metric) page.

Connector instance metrics page - New record

Field	Description
Metric name	Display name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **Dynatrace connector instance**. All metrics are collected for the Dynatrace connector instance.
Metric type	The name of the Dynatrace entity type which the metric belongs to.
Metric ID	The Dynatrace metric ID of the metric being collected.
Active	Select for the metrics to collect.

   - Ensure that the CIs related to the metrics exist in the instance.
   - Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.
9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

Configure the Datadog metrics connector instance

The Datadog Metrics connector retrieves performance metrics from your Datadog environment and sends them to your ServiceNow instance. Users can use SN anomaly detection capabilities and correlate metric anomalies with events and logs alerts.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create an API key and Application Key in Datadog. These are used in the connector to call the Datadog REST API.
- Configure the Service graph connector for Datadog. This is configured in the instance and discovers Datadog CIs. For details on configuring this connector, see .

Create a Credentials record in your ServiceNow instance:

1. Navigate to **Credentials & Connections** > **Credentials**.
2. Select **New** and select **API Key Credentials**.
3. In the **Name** field, enter a descriptive name. For example, Datadog API Key.
4. In the **API Key** field, enter your Datadog API key.
5. Select **Submit** to save the record.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. In the list, select **Datadog Metrics**.
   The form displays the default parameters for the connector. You typically do not need to modify these parameters on the definition itself.

   Note:
   The blue information banner at the top of the page serves as a permanent reminder of the automatic capping applied to key performance parameters to ensure system stability.

3. In the Connector Instances related list, click **New**.
4. On the Connector Instance form, fill in the fields.
   For details on the connector instance fields displayed on the page, see Datadog connector instance form.
5. Right-click the form header and select **Save**.
   The Connector Parameters and Connector Instance Metrics related lists appear. For details on the connector instance value parameters, see Datadog connector instance value parameters.
6. **Optional:** To add custom, select **New** and fill the form.

Connector instance metrics page - New record

Field	Description
Metric name	Display name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **Datadog connector instance**. All metrics are collected for the Datadog connector instance.
Metric type	The name of the Datadog entity type which the metric belongs to.
Metric ID	The Datadog metric ID of the metric being collected.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Select for the metrics to collect.

- Ensure that the CIs related to the metrics exist in the instance.
- Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.

7. Select **Test Connector** to verify the connection between the MID Server and the connector.
8. After a successful test, select the **Active** check box and then select **Update**.

Configure the Kafka metrics connector instance

Configure the Kafka metric consumer connector instance to read message send to Kafka server over topic.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

OAuth authentication for the Kafka Metrics Connector is supported only in the Australia release and later. Ensure your instance is upgraded to Australia or a newer version before configuring OAuth.

- Create Kafka SSL credentials on ServiceNow instance. For more information, see Kafka SSL credentials fields.
- ServiceNow does not support discovery for Kafka. Therefore, create the CI entry manually in the respective table.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Kafka connector instance form.
3. In the MID Servers for connectors section,specify a MID Server that is up and is valid.
4. Right-click the form header and select **Save**.
5. In the table presenting the connector instance values, verify the populated connector instance values based on your Kafka setup and the message (JSON payload) that you received from the Kafka topic with <field_mappings> value.
6. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Kafka parameters.
   For details on the connector instance value parameters, see Kafka connector instance value parameters.
7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the Kafka Metric Consumer connector.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Test Connector**.
- If the test connection fails, verify whether the credential is valid, and that the network is connected from the MID Server to the Kafka broker.

> **Note:**
> Kafka topic name validation occurs only in Test Connector validation.

9. After a successful test, make the connector instance active by selecting the **Active** check box.
10. Select **Update**.

Configure the Nagios metrics connector instance

Configure the Nagios metric connector instance to receive Metric Intelligence raw data from the Nagios server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- Create basic authentication credentials on ServiceNow instance with Nagios SQL database username and password.
- ServiceNow does not support discovery for Nagios. Therefore, create the CI entry manually in the respective table using the hostname configured on the Nagios platform.

Role required: evt_mgmt_admin

About this task

By default, CI binding will occur for the following entities:

- HOST HTTP Endpoint: The event rule applies to the Nagios metric HTTP if you are running a check that includes command_name as service_http.
- MySQL Instance: The event rule applies to the Nagios metric MySQL if you are running a check that includes command_name as mysql.

If you are running any other checks on HTTP endpoints or MySQL, you can edit the existing event rule to add the command_name. For other entities, configure event rules based on CI binding requirements.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Nagios connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Nagios parameters.
   For details on the connector instance value parameters, see Nagios connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Nagios connector to use.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Ensure that the CIs related to the metrics exist in the instance.
7. Create an event rule to perform CI binding, as needed.
   For details, see Create or edit an event rule.
8. Select **Test Connector** to verify the connection between the MID Server and the connector.
9. After a successful test, select the **Active** check box and then select **Update**.

Configure the Zabbix metrics connector instance

Configure the Zabbix Metric connector instance to receive Metric Intelligence raw data from the Zabbix server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Create basic authentication credentials on ServiceNow instance with Zabbix server username and password.

Role required: evt_mgmt_admin

About this task

ServiceNow does not support discovery for Zabbix, so CI entries must be manually created in the appropriate table using the hostname configured in the Zabbix platform.

- Create an Event Rule to bind specific CIs.
- Users can add tag information to Zabbix items, and the relevant tags will be included in the metric-to-CI records. These tags can also be used as filter conditions in the Event Rule for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Zabbix connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Zabbix parameters.
   For details on the connector instance value parameters, see Zabbix connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Zabbix connector to use.
6. Select **Test Connector** to verify the connection between the MID Server and the connector.
7. After a successful test, select the **Active** check box and then select **Update**.

> **Note:**
> ServiceNow supports only unsigned float and unsigned integer metric types for Zabbix.

Configure the SolarWinds metrics connector instance

Configure the SolarWinds connector instance to receive Metric Intelligence raw data from the SolarWinds server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Configure the Service graph connector for SolarWinds. This is configured in the instance and discovers SolarWinds CIs. For details on configuring this connector, see Service Graph Connector for SolarWinds.

Role required: evt_mgmt_admin

About this task

By default, the Solarwinds Metric Connector Collects metrics from the following tables:

- Orion.CPULoad
- Orion.NPM.InterfaceTraffic
- Orion.VolumePerformanceHistory
- Orion.VolumeUsageHistory
- Orion.ResponseTime

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Solarwinds connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory SolarWinds parameters.
   For details on the connector instance value parameters, see Solarwinds connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the SolarWinds connector to use.
6. In the Related Links section, select **Configure metrics to collect**.
   Only metrics with the value **Active=true** are collected by the instance.
7. Configure the metrics you want the instance to collect with the value **Active=true**.
   Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metrics_solarwinds) page.

Connector instance metrics page - New record

Field	Description
Metric name	Name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **SolarWinds connector instance**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	All metrics are collected for the SolarWinds connector instance.
Additional columns	(Optional) List of additional columns to fetch for CI-related information. For example: DateTime, Node, Resource. If **DateTime** is not provided, the current time is used as the metric timestamp. If **Node** and **Resource** are provided, they are populated accordingly. To reference fields from a parent table, use dot-walking format, such as `Interface.InterfaceName`. If a field should populate a specific standard field (like **Resource**), use an alias with the same name. For example, to use `InterfaceName` as the resource, specify it as `Interface.InterfaceName AS Resource`.
Table Name	Name of the table from which metrics are collected.

- Ensure that the CIs related to the metrics exist in the instance.
- Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.

9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

> **Note:**
> Ensure that **Registration Mode** is enabled for the SolarWinds source in the Metric Sources table.

Configure event collection from HP OMi

Configure the HP Operations Manager (OMi) connector instance to receive alerts from the HP OMi server.

Before you begin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, and 10.61.
The OMi connector is not supported on versions below version 10.

Create Basic Auth type of credential to connect to OMI.

Role required: evt_mgmt_admin

Procedure

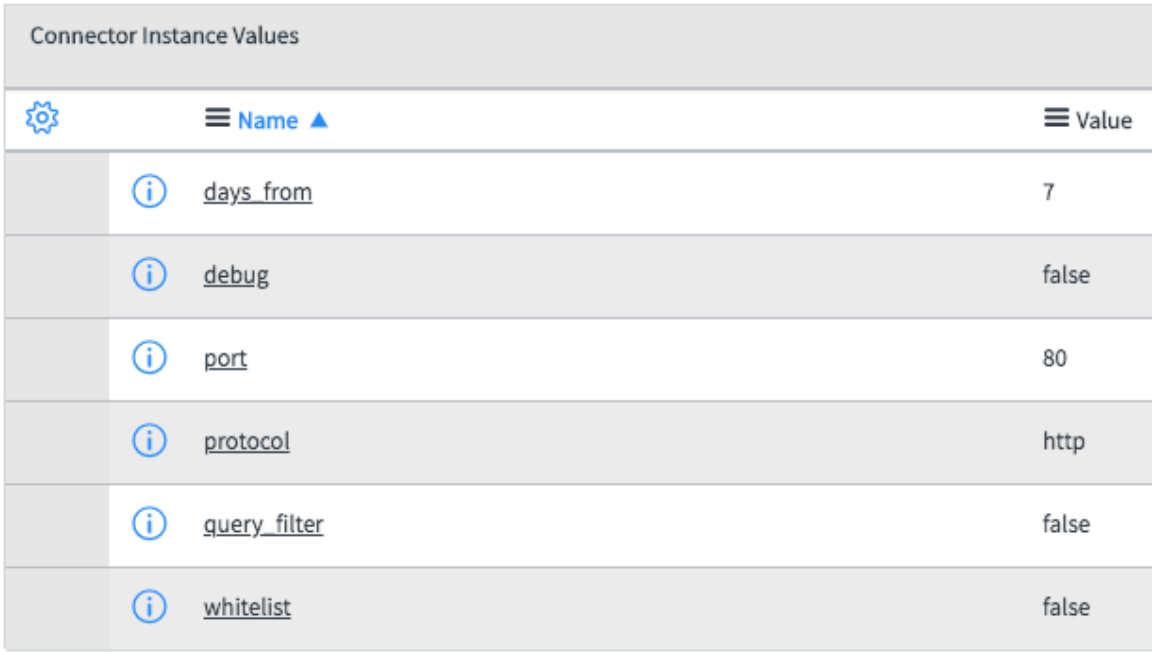
1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Name	Descriptive name for the OMi connector.
Description	Description for the use of the OMi event collection instance.
Host IP	Specify the OMi IP address.
Credential	Click in the **Credential** field. Select a Basic Auth credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials using Basic Auth type. If you create the credentials, save them using a unique and recognizable name, for example OMiOPS.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run time status. Automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.
Connector Definition	Select **OMi**.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the Connector Instance Values section, specify the OMi values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. Default `7`.

   b. **debug**.
   Default `false`. To enter debug mode, specify `true`.

   c. **port**.
   Default `80`.

   d. **protocol**.
   Default `http`.

   e. **query_filter**.
   Default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

   - A filter property that specifies an event attribute, such as, `related_ci`
   - A supported operator, for example, OR or AND
   - A value for the filter property, for example, `admin` or `integrator`

   Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OMi API call. For detailed information on how to build the filter query, see “Filtering by Event Attributes: query” in the HP OMi Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

   `event_list?query=assigned_ user%20EQ%20"admin"`

   To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. **inclusion list**.
Default value: `false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the HP OMi server.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure event collection from HPOM

Configure the HPOM connector instance to receive events from HP Operations Manager (HPOM).

Before you begin

Role required: evt_mgmt_admin
Supported version: 08.60.005.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create an HPOM connector instance with the following details:

Field	Value
Name	Specify a unique name for the HPOM connector instance.
Host IP	Specify the HPOM IP address.
Credential	Click in the **Credential** field. Select a credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, HPOMOPS.
Schedule (seconds)	The frequency in seconds that the system checks for new events from HPOM.
Description	Type a description for the use of the HPOM event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **HPOM** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.

Field	Value
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory HPOM parameters.
   - **driver**. Specify the driver to be used to make the call. This driver is specific to the type of database you are calling into.
     - For an IBM DB2 Universal driver, specify: com.ibm.db2.jcc.DB2Driver
     - For an Oracle driver, specify: oracle.jdbc.OracleDriver
     - For a Microsoft SQL driver, specify: com.microsoft.sqlserver.jdbc.SQLServerDriver
     - For a MySQL driver, specify: com.mysql.jdbc.Driver
     - For a Sybase driver, specify: com.sybase.jdbc3.jdbc.SybDriver
   - **url**. Specify a URL. The JDBC protocol uses a connection string to establish the authentication and other parameters to establish a connection between the client and the database. Each database has its own connection string format. In the following URLs, replace the variables, for example, <username> and <password>, with your values.
     - For an IBM DB2 Universal URL, specify: [jdbc:db2://sysmvs1.stl.ibm.com:<port number>/<database name>:user=<username>;password=<password>]

       For example: jdbc:db2://sysmvs1.stl.ibm.com:5021/regionsdb:user=example;password=wlrs21.
     - For an Oracle URL, specify: [jdbc:oracle:thin:@<IP address>:<port number>:<database name>]

       For example: jdbc:oracle:thin:@172.31.255.255:4028:OracleMain.
     - For a Microsoft SQL URL, specify: [jdbc:sqlserver://<IP address>;user=<username>;password=<password>]

       For example: jdbc:sqlserver://localhost;user=example;password=w3lrs2.
     - For a MySQL URL, specify: [jdbc:mysql://<IP address>/database?user=<username>;password=<password>]

       For example: jdbc:mysql://localhost/database?user=example;password=65wlrs.
     - For a Sybase URL, specify: [jdbc:sybase:Tds:<IP address>:<port number>/<database name>?user=<username>;password=<password>]

       For example: jdbc:sybase:Tds:172.31.255.255:4100/SYBMAIN?user=example;password=wlrs1m.

5. Use a network tool, such as ping, to verify that the HPOM server is running and the IP address matches the value in the *Host IP* field.
6. Click **Test connector** to verify the connection between the MID Server and the HPOM connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the HPOM server.

8. After a successful test, select **Active** and then click **Update**.

Configure a pull connector

Configure event collection from Hyperic

Configure the Hyperic connector instance to receive events from the VMware vRealize Hyperic server.

Before you begin
Role required: evt_mgmt_admin
Supported version: 5.8.4.0.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a Hyperic connector instance with the following details:

Field	Value
Name	Specify a unique name for the Hyperic connector instance.
Host IP	Specify the Hyperic IP address.
Credential	In the Credentials form, click **New** and create the required credentials. Save the credentials using a unique and recognizable name, for example, HypericOPS.
Schedule (seconds)	The frequency in seconds that the system checks for new events from Hyperic.
Description	Type a description for the use of the Hyperic event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **Hyperic** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID

Configure a pull connector

Configure event collection from IBM Netcool

Configure the IBM Netcool_V2 connector to receive events from IBM Netcool/OMNIbus Object Servers and Impact Servers. The IBM Netcool_V2 connector uses REST API calls and is bidirectional.

Before you begin

For the IBM Netcool_V2 connector:

- Role required: evt_mgmt_admin
- Perform connector validation on IBM NetCool/OMNIbus version 8.1.0.

About this task

To use IBM Netcool_V2 connector, configure a connector instance for the MID Server.

Note:
The IBM Netcool connector is deprecated and only IBM Netcool_V2 connector is supported.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Name	Specify a unique name for the Netcool connector instance.
Description	Type a description for the use of the Netcool event collection instance.
Host IP	Specify the Netcool IP address.
Credential	In the Credentials form, click **New**, and create the required credentials. Save the credentials using a unique and recognizable name, for example, NetcoolOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Netcool. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector definition	Select IBM Netcool_V2 to gather events from the external event source.
MID Servers (MID Server for Connectors section)	Specify a MID Server that is up and is valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the value of the required Netcool parameters.
5. Verify that Netcool servers are up and running:
   For the IBM Netcool_V2 connector, use this REST API call to verify that the Netcool API is up and running: `http://hostname:port/objectserver/restapi/alerts/status`
6. Right-click the form header and click **Save**.
7. Click **Test connector** to verify the connection between the MID Server and the Netcool connector.

Configure a pull connector

Configure event collection from an Icinga2 connector

Configure the Icinga 2 (Icinga) connector instance to receive events while monitoring your network resources.

Before you begin

Role required: evt_mgmt_admin

Supported version: 2.4.1.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the Icinga connector.
Description	Description for the use of the Icinga event collection instance.
Connector definition	Name of the required connector definition. Select **Icinga2**.
Host IP	IP address where Icinga is installed.
Credential	Permission to connect to Icinga. Click the search icon in the **Credential** field. Use Basic Authentication credentials. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, ICINGA2CHCK.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from Icinga. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

a. debug: Display debug messages. Default value: false. Specify true to see debug messages.

b. logPayloadForDebug: Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

Field	Description
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.
port	Number of the connector port. Default value: `5665`.
protocol	Type of protocol. Default protocol type: `https`.
alert_type	Provide the Icinga alert type details. There are 2 types of an alert in Icinga2: SOFT and HARD SOFT: Connector instance will pull a soft alert. HARD: Connector instance will pull a hard alert.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.

8. Test the connection between the MID Server and the Icinga connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from Logicmonitor

The Logicmonitor pull connector sends information from Event Management to Logicmonitor. It sends responses received from a Push connector in a bi-directional environment to Logicmonitor.

Before you begin
Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the**Apply additional matching rules**check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

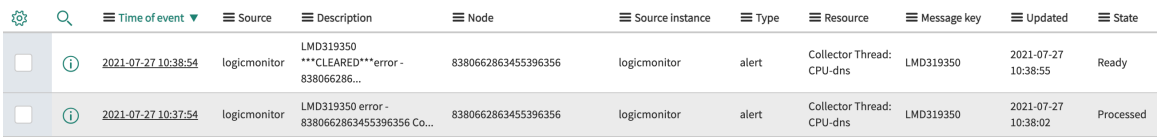
Note:
This feature applies only to active event rules.

Procedure

1. Navigate to**All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.

2. Click**New**.
The**Connector Instance New Record**page appears.

3. Enter values in the required fields, which are indicated by a red asterisk.
When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source.



Time of event	Source	Description	Node	Source instance	Type	Resource	Message key	Updated	State
2021-07-27 10:38:54	logicmonitor	LMD319350 ***CLEARED***error - 838066286...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:55	Ready
2021-07-27 10:37:54	logicmonitor	LMD319350 error - 8380662863455396356 Co...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:02	Processed

The source of events is**logicmonitor**so you should create an instance with the name`logicmonitor`.

All > Active = true

Name	Active	Event collection last run time	Connector definition	Last event collection signature	Last event collecti
logicmonitor	true	2021-07-27 11:21:41	Logic Monitor		Success

Note:
The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.

4. Select the**Active**check box and click**Save**.
The LogicMonitor pull connector does not retrieve Events or populate the Events [em_event] table.

Configure event collection from NNMi

Configure the HP Network Node Manager i (NNMi) connector instance to receive events while monitoring your network resources.

Before you begin

Supported version: 10.30.653.
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the NNMi connector.
Description	Description for the use of the NNMi event collection instance.
Connector definition	Name of the required connector definition. Select **NNMi**.
Host IP	IP address where NNMi is installed.
Credential	Permission to connect to NNMi. Click the search icon in the **Credential** field. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, NNMiCHCK. The selected credentials use basic authentication.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from NNMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.

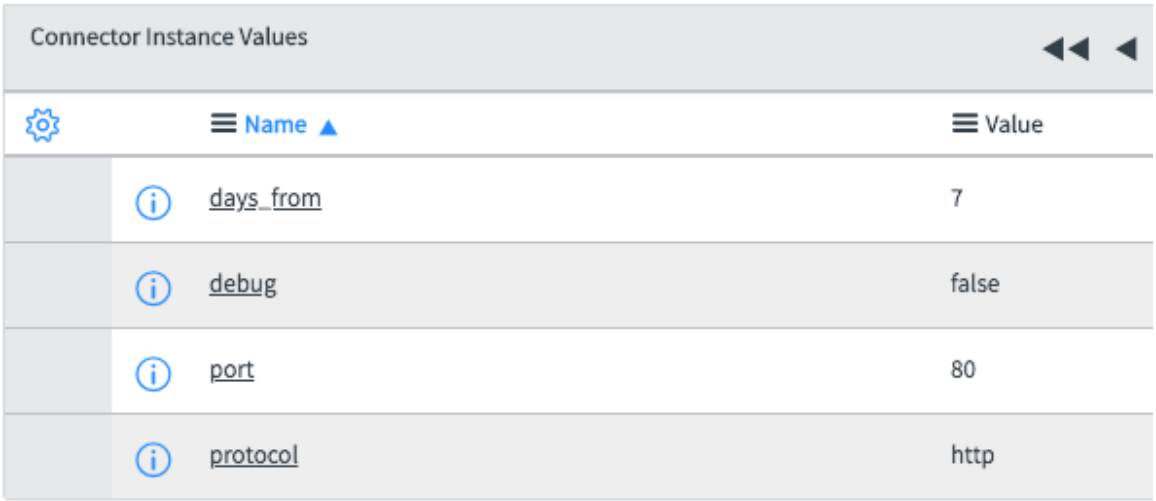
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

Field	Description
days_from	Number of days for which events must be collected at the first collection cycle. Default value: `7` days. **Note:** The maximum number of past events that can be collected is 3,000. The first time that the connector runs, it collects all events (up to the 3,000 limit) that were created from the `days_from` date until the current date.
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.
port	Number of the connector port. Default value: `80`.
protocol	Type of protocol. Default protocol type: `http`.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the NNMi connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from NagiosXI

Configure the NagiosXI connector instance to receive events from the Nagios Core monitor.

Before you begin

Supported version: 5.5.2.
The NagiosXI connector instance requires a credential that lets the instance access NagiosXI accounts. You can use an existing credential or create a new one. For more information, see Create Nagios XI server credentials.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.

2. Click **New**.

3. On the form, fill in the fields.

Field	Description
Name	Descriptive name for the Nagios connector.
Description	Description for the use of the NagiosXI event collection instance.
Host IP	Specify the Nagios XI IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create Nagios XI server credentials. Ensure that the user password contains the NagiosXI user API key, for example 04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp9OSHSRYe4QDrHPFndYbV
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency, in seconds, that the system checks for new events from Nagios. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector Definition	Select **NagiosXI**.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify the Nagios values.
   - **initial_sync_in_days**. Specify the number of days for which events must be collected at the first collection cycle. Default value `7` days.
   - **port**. Default value `80`.
   - **protocol**. The default protocol type is `http`.
   - **time_zone**. The default time zone is `GMT`; update this value to the Nagios timezone. For example, if Nagios is sending the events according to the EDT time zone, update this value to `GMT-04:00` (abbreviations such as **EDT** are not supported).
   - **severity_by_state_type**. The default value is `false`. When set to `true`, the state_type is used along with the state to determine the severity which creates less critical events as shown in the following mapping table.

Mapping Table

_state_type(Connect definition parameter)	State (Nagios JSON payload attribute)	State_type (Nagios JSON payload attribute)	ServiceNow Severity
false	2	0/1	1 (Critical)
false	1	1	1(Critical)
false	1	0	2(Major)
false	0	0/1	5(OK)
true	0	0/1	5(OK)
true	1	0	4 (Warning-soft -> Warning)
true	2	0	2(Critical-soft -> Major)
true	3	0	4(Unknown-soft-> Warning)
true	1	1	3(Warning-hard -> Minor)
true	2	1	1(Critical-hard -> Critical)
true	3	1	3(Unknown-hard -> Minor)

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector.
8. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If this message appears: `Connection test failed: Failed to connect to Nagios on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Nagios events.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Nagios Core monitor.

9. After a successful test, select the **Active** check box and then click **Update**.

Create Nagios XI server credentials

Create credentials to access Nagios XI server.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `Nagios authentication`.
User name	Name to identify the user. Ensure that the user password contains the NagiosXI user API key, for example, `04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp9OSHSRY`
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The credential for use with the Nagios XI server connector is created.

Credentials and connection information

Configure event collection from OBM

Configure the Operation Bridge Manager (OBM), also known as OMi v2, connector instance to receive alerts from the OBM server. The OBM connector script OBM v2 will be available after installing the Event Management Connectors app.

Before you begin

Role required: evt_mgmt_admin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, 10.61, and 11.01.

About this task

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OBM connector.
Description	Description for the use of the OBM event collection instance.
Host IP	Specify the OBM IP address.
Credential	Select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example OBMOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time value is automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OBM. The default value is 120 seconds.
Last error message	The last error message is automatically updated
Connector Definition	Select **OBM V2**. **Note:** This script will be available after installing the Event Management connector scoped app.
MID Servers (MID Server for Connectors section)	Specify the MID Server to run the OBM connector instance. You can configure several MID Servers. If the

Field	Value
	first server is down, the next MID Server If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and select **Save**.
   The parameters that are relevant to the OBM connector appear.
4. In the Connector Instance Values section, specify the OBM values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. The default value is `7` days and data can only be pulled a maximum of 7 days from the OBM system.

   b. **debug**.
   The default value is `false`. To enter debug mode, change the value to `true`.

   c. **port**.
   The default value is `80`.

   d. **protocol**.
   The default value is `http`.

   e. **query_filter**.
   The default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

   - A filter property that specifies an event attribute, such as, `related_ci`
   - A supported operator, for example, `OR` or `AND`
   - A value for the filter property, for example, `admin` or `integrator`

   Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OBM API call. For detailed information on how to build the filter query, see "Filtering by Event Attributes: query" in the OBM Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

   `event_list?query=assigned_ user%20EQ%20"admin"`

   To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

   f. **inclusion list**.
   The default value is `false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use a network tool, such as ping, to verify that the OBM server is running and the IP address matches the value in the **Host IP** field.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure OP5 or OP5_v2 connector

Configure the OP5 or OP5_v2 Monitor connector instance to receive alerts from an OP5 Monitor source.

Before you begin

The OP5_v2 connector is supported in Event Management connectors version 2.3.0 - August 2022, available from the ServiceNow Store.

Supported version:

- OP5: 7.3.15
- OP5_v2: 8.3.8

Role required: evt_mgmt_admin

About this task

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OP5 or OP5_v2 connector.
Description	Description for the use of the OP5 or OP5_v2 event collection instance.
Host IP	Specify the OP5 or OP5_v2 IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OP5OPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from OP5 or OP5_v2.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Last error message	The last error message is automatically updated.
Connector definition	Select **OP5** or **OP5_v2**.
Connector Instance Values section	The parameters that are specific to **OP5** or **OP5_v2** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the OP5 or OP5_v2 values.

   a. **days_from**.
   Specify the number of days for which events must be collected at the first collection cycle. Default value `7` days.

   b. **debug**.
   Displays debug messages. Default value: false. Specify true to see debug messages

   c. **logPayloadForDebug**.
   Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.

   d. **port**.
   Default value `443`.

   e. **state_types**.
   Specify filters for event collection based on the **state_types** attribute. You can filter events based on state type. Specify the type, for example, `soft` or `hard`.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
8. After a successful test, select the **Active** check box and then click **Update**.

Configure Opsview_v2 connector

Configure the Opsview_V2 connector instance to receive alerts from an Opsview Monitor source.

Before you begin

Ensure you have the supported version of the Opsview_V2 connector: 6.7.0.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the Opsview connector.
Description	Description for the use of the Opsview event collection instance.
Host IP	Specify the Opsview IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OpsviewOPS. **Note:** User should have the CONFIGUREVIEW role with access to 'VIEW ALL, CHANGE NONE'.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Opsview.
Last error message	The last error message is automatically updated.
Connector definition	Select **Opsview_v2**.
Connector Instance Values section	The parameters that are specific to Opsview_V2 display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the Opsview_v2 values.

   a. days_from.

   Specify the number of days for which events must be collected at the first collection cycle. Default value 7 days.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. **debug**.
Display debug messages. Default value: false. Specify true to see debug messages.

c. **logPayloadForDebug**.
Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

d. **eventtype_filter**.
Specify filters for event collection based on the eventtype attribute. Specify one of these values 0,1,2,3.

e. **port**.

Default value is 80.

.

f. **protocol**.
The default protocol type is HTTPS.

5. Right-click the form header and select **Save**.
6. To verify the connection between the MID Server and the connector, select **Test Connector**.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
If this message appears: `Connection test failed: Failed to connect to Opsview on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Opsview events.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Opsview Monitor source.

8. After a successful test, select the **Active** check box and then select **Update**.

Configure PRTG connector

Configure the PRTG connector instance to receive alerts from a Paessler PRTG Network Monitor source.

Before you begin

Role required: evt_mgmt_admin
Supported version: 21.3.71.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the PRTG connector.
Description	Description for the use of the PRTG event collection instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Host IP	Specify the PRTG IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, PRTG0PS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from PRTG.
Last error message	The last error message is automatically updated.
Connector definition	Select **PRTG**.
Connector Instance Values section	The parameters that are specific to **PRTG** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the PRTG values.

   a. **add_columns**.
   Specify which columns to be returned by the connector. Separate the names with a comma and without a space between the names. The output is stored in the **Additional information** field of the event. Default value `false`. If `false` is specified, only the default list of columns is retrieved: parent, name, type, objid, tags, message, status, priority, datetime, actions, baselink, basetype, modifiedby.

   > **Note:**
   > Only columns names that are applicable to the **Message** content type can be specified.

   b. **date_format**.
   The format date and time. Default format M/d/yyyy/ h:mm:ss a. If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event will not be processed correctly.

   For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *`2019/06/27/ 11:25:00 a`*, modify the **date_format** value to *`yyyy/M/d/ h:mm:ss a`* to match the format of the received event.

   In the **date_format**, `a` represents AM, and `p` represents PM.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **days_from** field, specify the number of days for which events must be collected at the first collection cycle.
Default value `7` days.

d. **debug**.
Default value `false`.

e. **port**.
Default value `80`.

f. **protocol**.
The default protocol type is `http`.

g. **prtg_api_fetched_events_num**.
Maximum number of events, per query, that can be fetched from the PRTG client into the MID Server. Default number: `50,000`.

h. **time_zone**.
The default time zone is the `GMT` time zone; update this value to the PRTG time zone. For example, if PRTG is sending events according to the `EDT` time zone, update this value to `GMT-4` (abbreviations such as EDT are not supported).

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
If this message appears: `Connection test failed: Failed to connect to PRTG on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the PRTG events.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to PRTG.

8. After a successful test, select the **Active** check box and then click **Update**.

Apache Kafka Consumer Connector

The Apache Kafka Consumer connector instance enables you to create events from messages collected from the Apache Kafka topic as a JSON payload that contains essential information in a data block.

Apache Kafka is a distributed publish-subscribe messaging system that receives data from disparate source systems and makes the data available to target systems in real time.

You can use this connector to create ServiceNow events from Kafka messages. Messages in the Kafka topic must be in JSON format.

Like other message broker systems, Kafka facilitates the asynchronous data exchange between processes, applications, and servers.

Kafka software runs on one or more servers. Each node, called a broker, in a Kafka cluster helps producer applications write data to topics, which are where records are stored and published.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consumer applications read from topics. Topics are divided into partitions to make them more manageable and Kafka guarantees strong ordering for each partition.

Configure the Apache Kafka Consumer connector

Configure the Apache Kafka Consumer connector instance to create events from streaming messages collected by the Apache Kafka connector.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New**.
3. On the form, fill in the fields.

Connector instance form

Field	Value
Name	Descriptive and unique name for the Kafka Consumer connector.
Description	Description to be used by the Kafka Consumer event collection instance.
Connector definition	Name of the required connector definition, which in this case should be Kafka Consumer.
Host IP	The host IP. **Note:** This field must contain a value to complete the creation process so the placeholder 1.1.1.1 should be entered as a temporary value.
Event collection last run time	This field is automatically set to the last runtime value.
Last event collection status	This field is automatically set to the last runtime status.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the Kafka Consumer. The default value is 60 seconds.
Last error message	This field is automatically set to the last error message.

4. For PLAINTEXT or SASL_PLAINTEXT, in the **Credential** field, create a Basic authentication credential.
   Use the **Kafka SSL credential** type for a new Kafka pull connector instance with **SASL_PLAINTEXT** authentication. Go to step 5.

   Use the **Kafka SSL credential** type when the Kafka server's **sasl.enabled.mechanisms** or **sasl.mechanism** parameter's value don't equal **PLAIN**. Go to step 5.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the Search icon next to the **Credential** field.

b. On the Credentials screen, select **New**.

c. From the list of available credentials, select **Basic Auth Credentials**.

d. On the Basic Authentication screen, give information for either PLAINTEXT authentication, which doesn't require credentials, or SASL_PLAINTEXT authentication, which requires credentials.

- For PLAINTEXT authentication, in the **Name** field, type any value and leave the **User Name** and **Password** fields empty.
- For SASL_PLAINTEXT authentication, give a name for the credential in the **Name** field, preferably prefaced by SASL. Provide the user name and password In the **User Name** and **Password** fields.

e. Select **Submit**.

5. For a SASL_PLAINTEXT, SSL, or SASL_SSL authentication credential, in the **Credential** field, create a Kafka SSL credential.

a. Select the Search icon next to the **Credential** field.

b. On the Credentials screen, select **New**.

c. From the list of available credentials, select **Kafka SSL Credentials**.

d. On the Kafka SSL Authentication screen, fill in the Kafka SSL credentials fields. For the Kafka SSL credentials fields descriptions, see .

Note:
If you clear the **Disable hostname verification** field, then in the **Additional Kafka consumer properties** field, enter the value of the *ssl.endpoint.identification.algorithm* parameter the same as of the Kafka server parameter value. For example:

```
ssl.enabled.protocols=TLSv1.2,TLSv1.1,TLSv1;
sasl.jaas.config=org.apache.kafka.common.security.plain.Pl
ainLoginModule required username=<username>
 password=<password>;
sasl.enabled.mechanisms=PLAIN;ssl.endpoint.identification.
algorithm=;
```

e. Select **Submit**.

6. To use SASL_SSL with OAuthbearer, perform the following steps:

- Select the value of the **Security protocol** field as **SASL_SSL**
- Select the value of the field **SASL mechanism** as OAUTHBEARER
- For **User name** field, provide the <client id value>.
- For the **Password** field, provide the <client_secret>.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For the **SASL JAAS config template** field, enter the value as `org.apache.kafka.common.security.oauthbearer.OAuthBearerLoginModule required clientId="${user_name}" clientSecret="${password}" scope="openid";`

  Note:
  OAuth authentication for the Kafka Event Connector is supported only in the Australia release and later. Ensure your instance is upgraded to Australia or a newer version before configuring OAuth.

7. Right-click the form header and select **Save**.
8. In the table presenting the connector instance values, verify the populated connector instance values based on your Kafka setup and the message (JSON payload) that you received from the Kafka topic.

   Change the connector instance values if necessary.

Connector instance Values table

Field	Description
authentication_type	The Kafka Consumer authentication type. The currently supported values are: ○ PLAINTEXT (no authentication) (Default) ○ SASL_PLAINTEXT (basic authentication – user name and password)
bootstrap_servers	The servers that establish the connection with the Kafka cluster. Values in this field should be in the form host1:port1, host2:port2, and so on (comma-separated). This field is required.
consumer_group_name	The Consumer group name. If the same Kafka topic is being consumed from two different instances, use different consumer group names so all events are captured for both instances. This field is required.
time_of_event_field	The name of the field in the JSON payload/ message that includes the time of the event. If a field in the JSON payload/message includes the time of the event, that value should be the value for this parameter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If no time field value is given, then the received time of the event in the ServiceNow instance is set as time_of_event. The time_of_event field should be a first-level field in the JSON payload/message. Nested field names aren't allowed.
timezone	The time zone of the time_of_event field in the JSON payload/message. The timezone value isn't used when the time_of_event field is empty. For example, if the time_of_event in the payload/message is in the IST time zone, the value would be GMT+0530. Default: GMT.
date_format	The date_time format of the time_of_event field in the JSON payload/message. If no time field value is given, then the time when the event was received in the instance in GMT time is used. The date_time value isn't used when the time_of_event field is empty. Default: yyyy-MM-dd HH:mm:sss.
debug	Displays debug messages. Default value: false. Specify true to see debug messages.
logPayloadForDebug	Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.
topic	The Kafka topic from which the messages are fetched. This field is required.

9. In the **MID Servers for Connectors** section, specify a MID Server that is up and is valid.

Note:
You can configure several MID Servers. If the first server is down, the next MID Server is used. If that MID Server isn't available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the **MID Servers for Connectors** section.

If you do not specify a MID Server, an available MID Server that has a matching IP range is used.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Right-click the form header and select **Save**.
11. Test the connection between the MID Server and the Kafka Consumer connector.
    a. Select **Test Connector**.
    b. If the test connection fails, verify whether the credential is valid, and that the network is connected from the MID Server to the Kafka broker.

    Note:
    Kafka topic name validation occurs only in **Test Connector** validation.

12. After a successful test, make the connector instance active by selecting the **Active** check box.
13. Select the **Update** button.

What to do next
After the connector is created, you must map the fields. For more information, see Map Kafka message payload attributes to alert fields.

Map Kafka message payload attributes to alert fields

Map Kafka message attributes to alert fields to make alerts based on the messages more meaningful. Use event field mapping to map Kafka severity values to appropriate ServiceNow values.

Before you begin
Role required: evt_mgmt_admin

About this task
Depending on your payload, Use event field mappings to provide more comprehensive information in an event alert by substituting values from the event field mapping rule into the event. Depending on your payload, transform information in events to populate specified alert field values and compose alert fields from various values to generate alerts for tracking and remediation. If needed, use both event field mappings and alert rules.

The following table compares a message received from a topic and a flattened payload in the event **Additional info** field. The message received from a topic is flattened as a single field and appears in the event **Additional info** field. Use these flattened messages to create event rules and mappings.

Actual versus flattened payload

Actual Payload inserted into a topic	Flattened payload in the Additional Info field

<pre>{
"version": "v0.1.0",
"name": "fibsrc",
"id": "mnop6789",
"trigger_description": "Triggers on duration_ms goes above 5K",</pre>
	<pre>{
	"flattened.alert_type": "on_true",
	"flattened.description": "Current value (12.296815 k) greater than threshold value (5 k)",
	"flattened.id": " mnop6789",</pre>

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actual versus flattened payload (continued)

Actual Payload inserted into a topic	Flattened payload in the Additional Info field

"status": "TRIGGERED",
"alert_type": "on_true",
"summary": "Triggered: fibsrc",
"description": "Current value (12.296815 k) greater than threshold value (5 k)",
"operator": "greater than",
"threshold": 5000,
"groups": [
{
"Group": "GroupA",
"Result": 12296.815478000368
}
],
"trigger": {
"Result": 12296.815478000368
}
}
	"flattened.kafkaKey": "null",
	"flattened.kafkaOffset": "28",
	"flattened.kafkaPartition": "0",
	"flattened.kafkaTopicName": "topic123",
	"flattened.name": "fibsrc",
	"flattened.operator": "greater than",
	"flattened.status": "TRIGGERED",
	"flattened.summary": "Triggered: fibsrc",
	"flattened.trigger_description": "Triggers on duration_ms goesa above 5K",

	"flattened.version": 5000,
	"flattened.groups.0.Group": "GroupA",
	"flattened.groups.0.Result": 12296.815478000368,
	"flattened.trigger.Result": 12296.815478000368
	}

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event field mappings.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
   b. In the Event Field Mapping window, select **New**.
   c. In the Name field, enter a name for the field mapping.
   d. In the Source field, enter **Kafka Consumer**.
   e. In the Mapping type field, select the appropriate mapping type
   f. For a list of the available mapping types, see Event Field Mappings.
2. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event rules.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
   b. Select **New** .
   c. In the Name field, enter a name for the event rule.
   d. In the Source field, enter **Kafka Consumer**.
   e. Select **Event Filter**.
   f. Enter the appropriate filter according to your requirement.
   g. Select **Transform and compose alert output**.

      When creating event rules, the event fields are displayed in the Event Rules Transform and Compose Alert Output tab. Because the Kafka message varies from user to user, you must transform the event fields to the alert fields to see the details in the alert.

      Note:
      Because the severity value is required to create an alert, you must map the **Severity** field using event rules or event field mappings. If the Severity field is empty, the event isn't processed and enters into an error state.

   h. Map the fields of the event and **Additional Info** field to the fields of the alert.
   i. Select **Binding**.
   j. Enter the appropriate binding according to your requirement.
   k. Select **Submit**.
      For more information, see Create or edit an event rule.
3. In the All Events screen, check whether any of the events from Kafka are in an error state due to a missing event rule and provide missing rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **Event Management** > **All Events**.

b. In the All Events table, open any Kafka consumer event that shows Error as the state in the **Severity** column.

   The message received from the Kafka consumer can vary. Because the connector cannot know the attributes that will be received, you must map the **Severity** field or other event fields to the fields in the message to ensure that alert fields are correctly populated.

c. On the All Events screen, create a new event rule by selecting **Create Event Rule**.
   For more information on creating event rules, see Event Rules.

   If no event field mappings exist to handle the new type of event, create event field mappings. For more information, see Create event field mappings.

Result

Your Apache Kafka consumer connector is configured. When new messages arrive into the Kafka topic, they are received into the ServiceNow instance as events, and alerts are then created from those events.

Configure SAP Solution Manager connector

Configure the SAP Solution Manager (Solman) connector instance to enable communication between the SAP Solution Manager and Event Management.

Before you begin

Role required: admin
Supported versions: Tested on SAP Solution Manager 7.2. Might also work on other versions.

About this task

This configuration enables you to update the SAP Solution Manager with the statuses that have been updated by ServiceNow. For general information about the SAP Solution Manager, see SAP configurations enabling the SAP Solution Manager connector.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance.
3. Fill in the fields on the form.

Connector instance form

Field	Description
Name	Descriptive name for the SAP Solman connector.
Description	Description for the use of the SAP Solman event collection instance.
Active	Option that activates the connector instance. Select this option only after running a successful test.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **SAP Solman**.
Host IP	The IP address where SAP Solman is installed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential	Required credentials entered either by selecting them from the results of a search through the search icon or by clicking **New**. or creating them. If you create credentials, save them using a unique and recognizable name, such as SAPSOLMANOPS.
Event collection last run time	The last run time value. Automatically updated.
Last event collection status	The last run time status. Automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SAP Solman.
Bi-directional	Ensure that you select this option to invoke the bi-directional exchange of values to-and-from the external event source. The **Last bi-directional** status option appears only when selecting this option.
Last bi-directional status	This field appears only when **Bi-directional** is selected. This field is automatically populated with the most recent bi-directional status.
Last error message	Last error message. Automatically updated.
Connector Instance Values section	The parameters that are specific to SAP Solman, automatically displayed when saving the form.
MID Servers (MID Server for Connectors section)	MID Server that is up and valid. You can configure several MID Servers so that if the first server is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order in which their details are entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

4. Right-click the form header and select **Save**.

   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

5. In the Connector Instance Values section, specify the default connector instance values.
   - **Client**: Default value = `001`
   - **Port**: Default value = `8000`
6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector. If the test fails, follow the instructions in the error message and then run another test.

   Note:
   Use a network tool such as *`ping`* to verify the credentials and the network connectivity from the MID Server to the SAP Solman monitor.

8. After a successful test, select the **Active** check box and click **Update**.

Use the SAP Solution Manager Push connector

SAP configurations enabling the SAP Solution Manager connector

Configure your SAP environment to work with the ServiceNow Event Management platform so you can use the SAP Solution Manager connector.

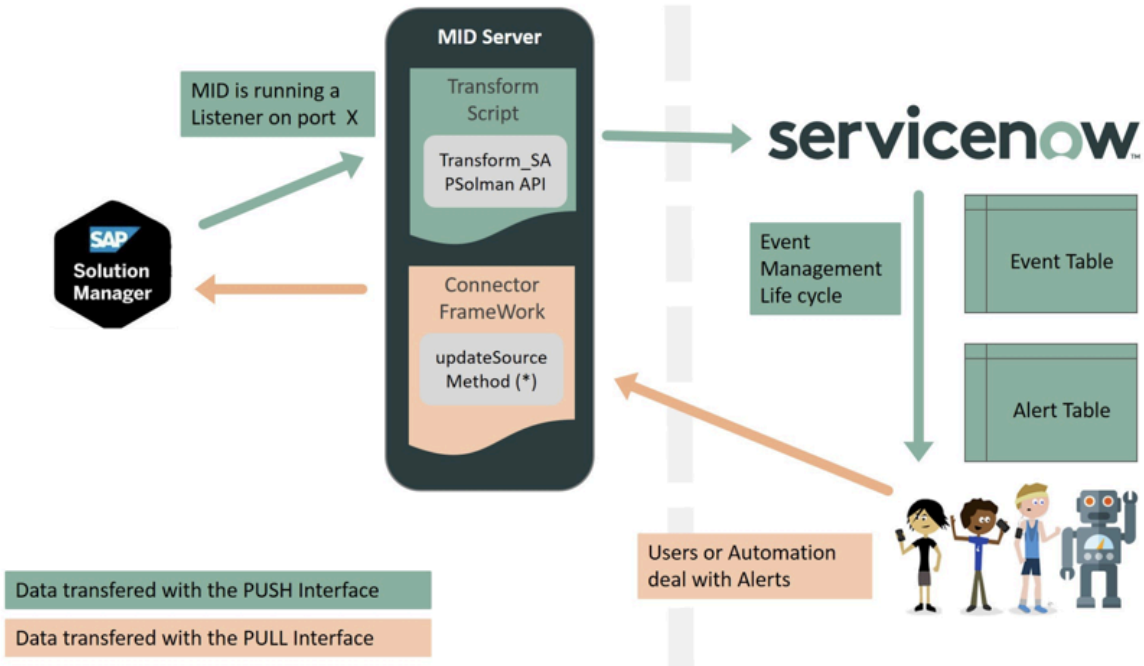
When integrating your SAP environment with Event Management, the SAP Solution Manager sends events through a MID Server to Event Management, which generates an alert from the event.

After the MID Server processes events, you can perform the following actions in the SAP Solution Manager:

- Add comments
- Confirm alerts
- Set status to **Externally Managed**

The following diagram illustrates the flow of data between SAP and Event Management.

SAP Solution Manager connector



Data moves between SAP and Event Management using both Push and Pull interfaces.

- **Pull interface**:

  The Connector Update Queues table [em_connector_update_queue] lists manual updates of alerts and sends them to the SAP Solution Manager.

  The table's business rule identifies each manual update of alerts in Event Management and updates the connector queue with these changes. By default, changes to all alert fields are tracked. For information on adjusting this setting, see the SAP Solution Manager documentation.

  The Event Management - Queue connector processor scheduled job removes alert changes from the queue and sends them to the MID Server. By default, the system performs

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

this process in batches of 1,000 alerts. You can customize this batch size by setting the *evt_mgmt.max_update_source_records* property.

Note:
You must define the Pull interface to enable bi-directional functionality in the SAP Solution Manager connector. For details, see the SAP Solution Manager documentation.

- **Push interface**: Because SAP can only push data to an external source, the integration uses the Push interface to store alerts sent from SAP to Event Management.

  SAP alerts create events in Event Management that use both event rules and CI identification rules to create Event Management alerts.

  After Event Management creates alerts, a business rule listens for a change to the alert. If it detects a change, Event Management updates the SAP Solution Manager alerts.

Event Management Integrations

Use the SAP Solution Manager Pull connector

Use the SAP Solution Manager Pull connector

The SAP Solution Manager Pull connector sends information from Event Management to the SAP Solution Manager. The Pull connector sends responses received from a Push connector in a bi-directional environment.

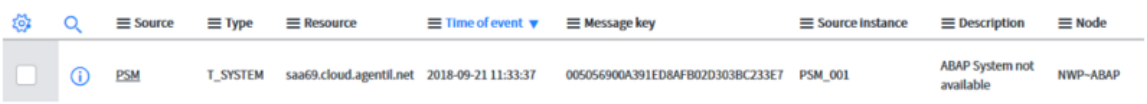
Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New**.
   The **Connector Instance New Record** page appears.
3. Enter values in the required fields, which are indicated by a red asterisk.
   The Connector Update Queues table [*em_connector_update_queue*] lists manual updates of alerts and sends an event to the SAP Solution Manager, using the Pull interface.

   Note:
   When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source. The **Connector Instance** field value is a combination of `SID + _ + Mandant`.

   For example, the following image displays an event generated by the instance source **PSM_001**. To enable sending information back, you would have to name your connector instance **PSM_001**.



Source	Type	Resource	Time of event	Message key	Source instance	Description	Node
PSM	T_SYSTEM	saa69.cloud.agentil.net	2018-09-21 11:33:37	005056900A391ED8AFB02D303BC233E7	PSM_001	ABAP System not available	NWP~ABAP

4. Set the following values for the connector instance:
   - **Client**: Represents the client value in SAP, usually 001.
   - **Port**: The SAP Solution Manager WebService port. Default value = 8000.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table lists the actions you can perform in Event Management, and the resulting updates occurring in SAP Solution Manager.

Event Management actions and SAP Solution Manager updates

Action in Event Management	Result in SAP Solman
Close an alert.	Confirms an alert in the alert inbox. The alert is removed.
Select the **Maintenance** setting in an alert.	Adds a comment indicating that the alert is in Maintenance mode.
Clear the **Maintenance** setting in an alert.	Removes the Maintenance mode comment.
Select the **Acknowledged** setting in an alert.	Adds a comment indicating that the alert is in the Acknowledged mode.
Clear the **Acknowledged** setting in an alert.	Removes Acknowledged mode comment.

Note the following behaviors:

- The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.
- The Event Management — Queue Connector Processor job removes alert changes from the queue and sends them to the MID Server. By default, Event Management performs this dequeue process in batches of 1,000 alerts. You can configure the batch size by setting the `evt_mgmt.max_update_source_records` property.

Use the SAP Solution Manager Push connector

The MID Server web service Event Collector enables you to collect alerts sent from the SAP Solution Manager through event stream notification capabilities. The interface runs both a Push and a Pull interface to interact directly with the SAP Solution Manager.

Before you begin

- Deploy and start the MID Server.
- Configure and start the MID Web Server.
- Configure and start the MID Server web service Event Collector.

Role required: evt_mgmt_admin

About this task

SAP Solution Manager sends JSON formatted event messages to the MID Server. The MID Server parses the collected alert messages and transforms them using the SAP Solman Transform [*TransformEvents_SAPSolman*] script.

JSON formatted messages are collected using basic authentication. For details on other supported authentication methods, see Configure the MID Web Server extension.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push connectors**.
2. Select the **SAP Solman Transform Script** script.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Use the following URL to push alert messages from SAP Solution Manager to the MID Server: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`, where the following are true:
   - **MID_Server_IP** is the IP address of the MID Web Server extension
   - **MID_Web_Server_Port** is the listening port of the MID Web Server extension

What to do next

Create an Remote Function Call (RFC) in the SAP Solution Manager and install a transport, as described in Configure RFC in SAP Solution Manager.

Related topics

Configuring MID Servers

Configure the MID Web Server extension

Configure the MID WebService Event Collector Context

SAP Solution Manager setup configurations

As part of the SAP Solution Manager setup, you must perform several configurations to enable SAP Solution Manager to interact with Event Management.

Configure RFC in SAP Solution Manager

As part of enabling communication with Event Management, you must create a Remote Function Call (RFC) in the SAP Solution Manager and install a transport.

Before you begin

Role required: evt_mgmt_admin

Download the following .psm files and import them into the SAP Solution Manager system.

- https://downloads.docs.servicenow.com/resource/enus/cad/K900249.PSM
- https://downloads.docs.servicenow.com/resource/enus/cad/R900249.PSM

Procedure

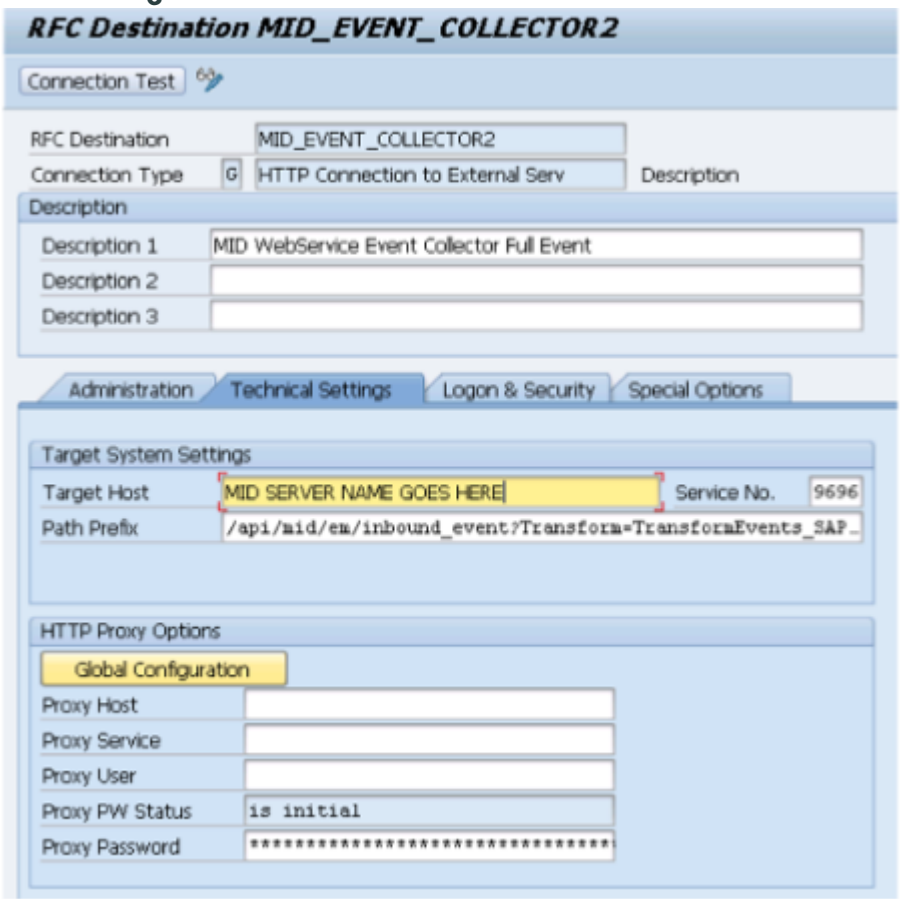
1. On the SAP UI, enter the transaction code `SM59` and create a new RFC with the following parameters on the **Technical Settings** tab:

RFC parameters

SAP Parameter	Value
Target Host	Name of the MID Server.
Service No	Listener port on the MID Server
Path Prefix	The URL of the MID Server transform script: `/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`

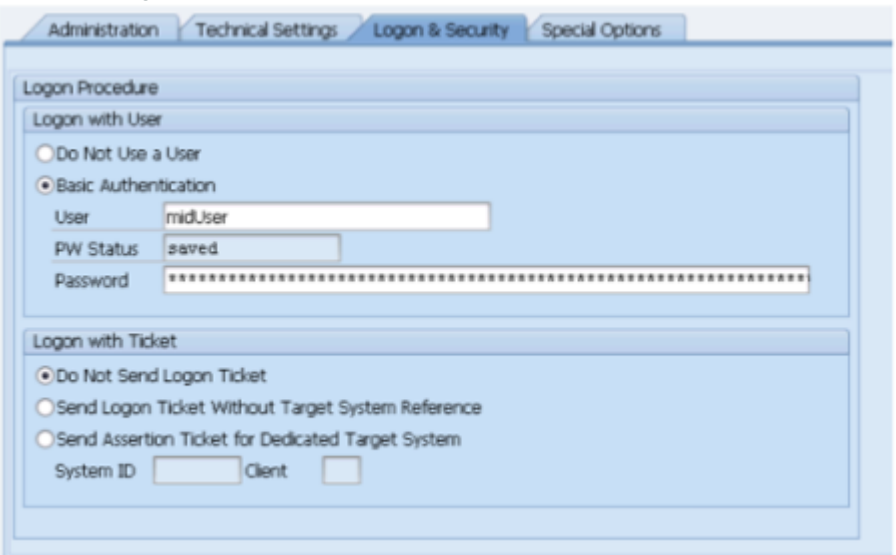
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Technical Settings tab



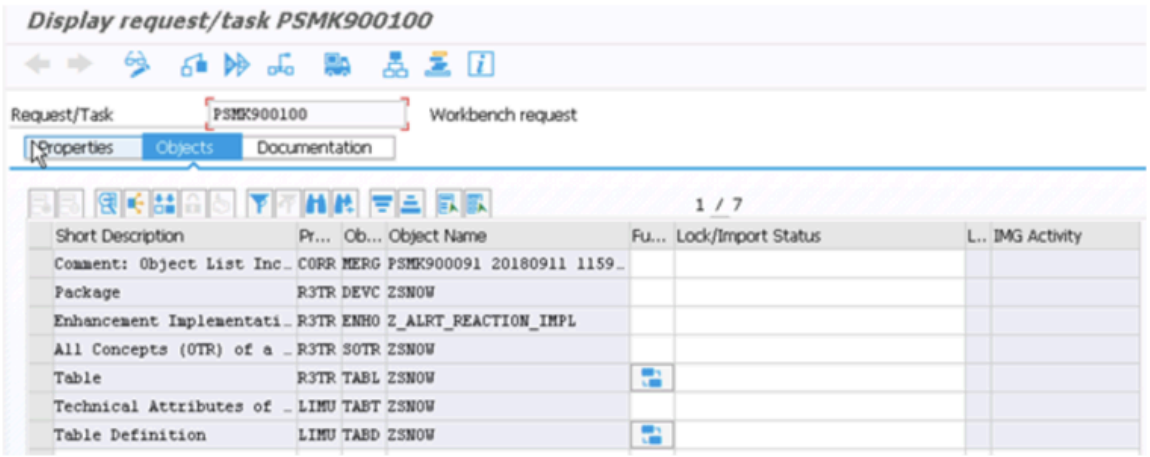
2. On the **Logon & Security** tab, select **Basic Authentication** and enter your Event Management logon credentials in the **User** and **Password** fields.

Logon & Security tab



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A custom SAP BADI (Business Add-in) named Z_ALRT_REACTION_IMPL is created and stored as a workbench transport request. After installation, this BADI calls the RFC to connect to Event Management.



Configure SAP to forward alerts to your BADI

After setting up SAP Solution Manager monitoring, you must configure SAP to forward alerts to the BADI (Business Add-in) you create as the first step in the SAP integration setup.

Before you begin

Role required: evt_mgt_admin

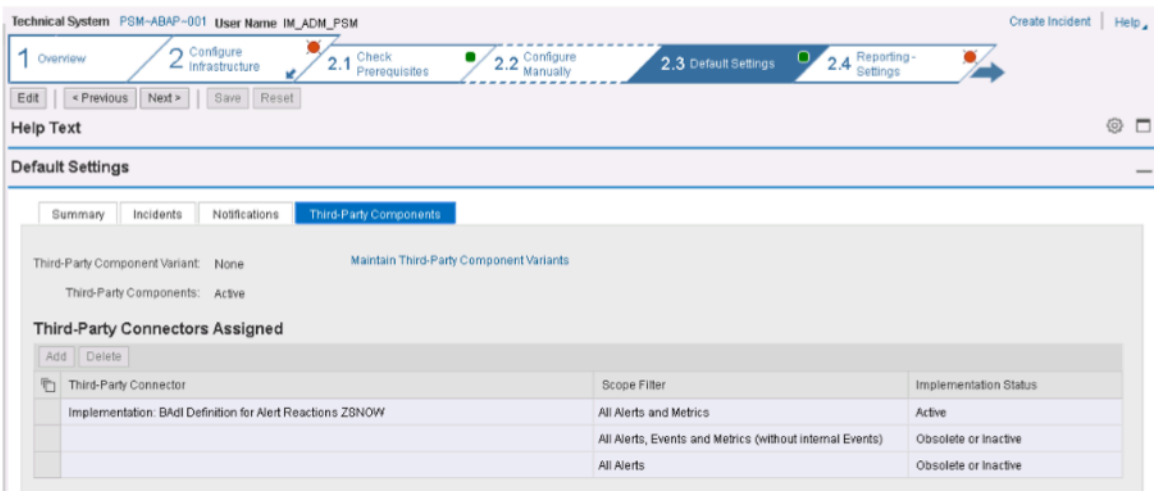
About this task

Third-party alerts get forwarded globally. You can configure the alert reaction only for a specific monitoring template.

Procedure

1. On the SAP UI, navigate to **Application Operations** > **System Monitoring**.
2. In the ribbon at the top of the System Monitoring configuration page, select **2 Configure Infrastructure** > **2.3 Default Settings**.
   The **Default Settings** page appears.

Default Settings page



3. Configure and activate a third-party component.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter edit mode by clicking the **Edit** button.

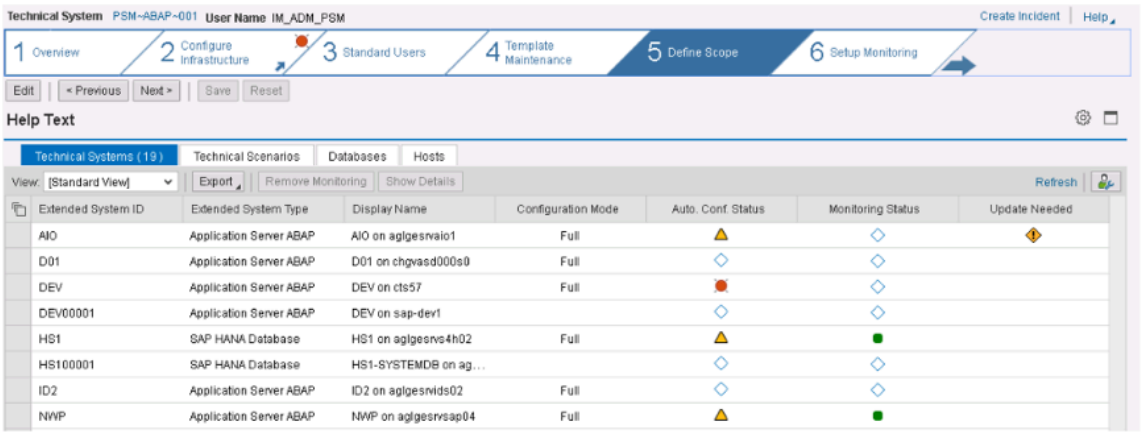
b. Select the **Third-Party Components** tab.

c. Click **Add** and add the following value as the third-party connector: `Implementation: BADI Definition for Alert Reactions ZSNOW with scope = All Alerts and Metrics`.

d. Click **Save** to activate third-party components globally.

4. Define the objects to which the monitoring template will be assigned.

a. In the ribbon at the top of the page, select **5 Define Scope**.
The Define Scope page appears.



b. Select the managed object to which you want to assign the monitoring template.
The monitoring template is assigned to the selected objects.

5. Reactivate the monitoring of templates.

a. Select ***6 Setup Monitoring***.

b. Search for and locate entries with **Setup Status = Reconfigure Required** and assign the monitoring template to those entries.

c. Select **Apply** and **Activate**.
When the jobs finish, verify that the **Assignment Status** is green.
All templates and active alerts assigned to the selected objects use the new forwarding method.

What to do next

View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

Configure the alert inbox in SAP Solution Manager

Configure SAP solution manager to retrieve alerts in the system by enabling the alert inbox with the SOA manager.

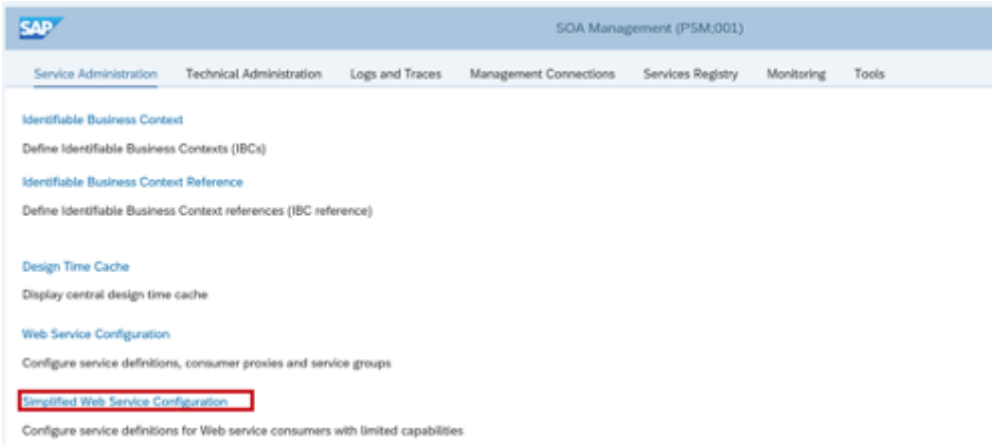
Before you begin

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to SOA MANAGER in your solution manager: `/sap/bc/webdynpro/sap/appl_soap_management?sap-client=XXX&sap-language=EN#`
2. Select **Simplified Web Service Configuration**, then validate the form to activate the service. You must use simplified mode else the resulting web services is different with other modes and not compatible with the connector.



3. Select **Search**.
4. Check the row with the creation type **Simple consumer related**.
   If anything goes wrong, check Configuring a Service Provider (Simplified)

What to do next

View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

View alerts in the SAP Solution Manager inbox

You can view alerts generated in SAP Solution Manager to see any pressing issues. All alerts also forward to Event Management automatically.

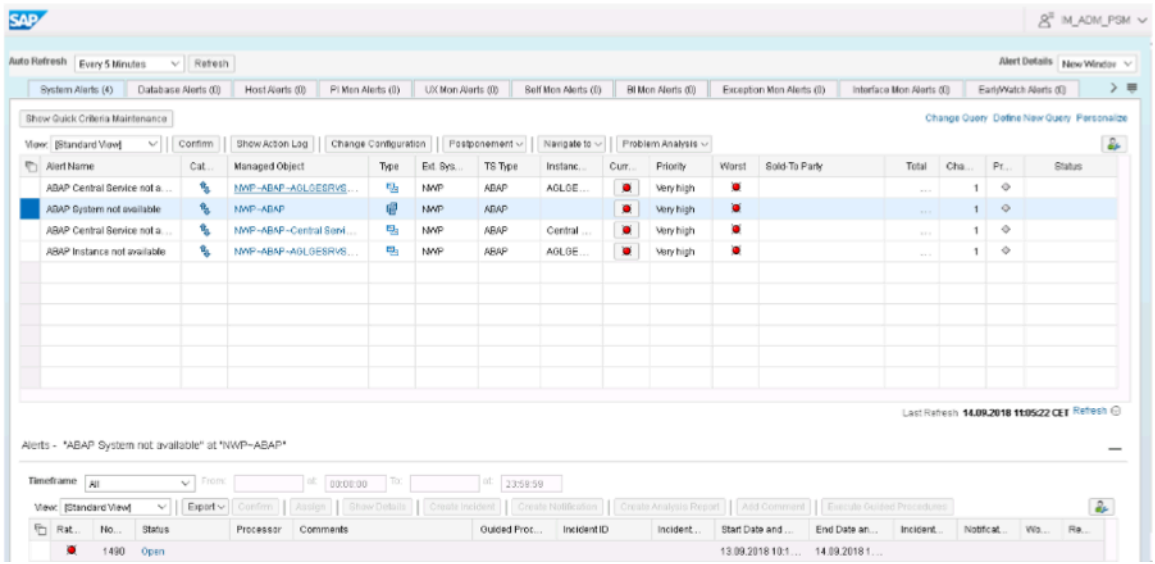
Before you begin

Role required: evt_mgt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

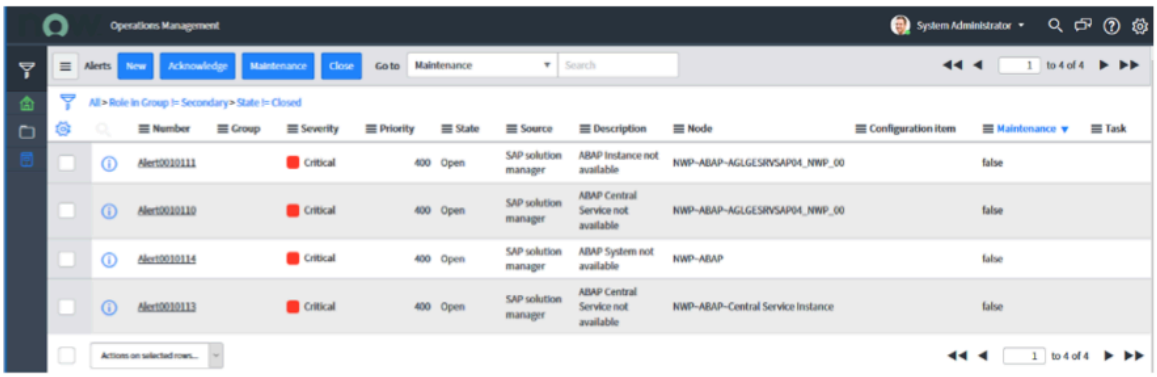
Procedure

1. On the SAP UI, open Solution Manager and select the **System Alerts** tab.



The system alerts are listed on the page.

2. Navigate to (**Event Management** > **All Alerts)** to view the alerts in Event Management.



The following table describes the field mapping between SAP Solution Manager and Event Management for alerts.

Field mapping for SAP Solution Manager and Event Management

SAP Field	Event Management Field	Description
severity	severity	SAP uses a number from 1 (less critical) to 9 (more critical)
message_key	message_key	SAP message group ID, messageGUID
description	description	Event description
source	source	SAP system ID
managed_object_type	type	The type of the object, such as Host or Instance
node	node	Object name

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAP Field	Event Management Field	Description
managed_object_name	resource	Solution manager node name
N/A (there is no value provided by SAP. Event Management generates the indicated field.)	source instance	The event class must match the connector pull instance name, with the structure <Source>_<Client>.
source	additional_info.sid	SAP system ID
rating	additional_info.rating	Event color in SAP
resource	additional_info.mandant	SAP mandant
metric_name	metric_name	Metric name for the SAP event
time_of_event	time_of_event	Time of event in SAP

Example: High CPU Usage on SAP Host

Scenario: An alert is generated in SAP Solution Manager when the CPU usage on a critical host exceeds 90% for more than 10 minutes.

SAP Solution Manager Alert

Field	Value
Severity	8 (Critical)
Message Key	CPU_Overload_12345
Description	High CPU usage on SAPHost01
Source	SAP_Prod
Type	Host
Node	SAPNode_01
Time	2024-07-31T14:23:00Z

Here's how the alert is mapped in Event Management:

Mapped Event Management alert

Field	Value
Severity	8
Message Key	CPU_Overload_12345
Source	SAP_Prod
Type	Host
Node/Resource	SAPNode_01
Source Instance	SAP_Prod_100
SID	SAP_Prod
Rating	Red

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mapped Event Management alert (continued)

Field	Value
Mandant	100

View and update your SAP Solution Manager certificate

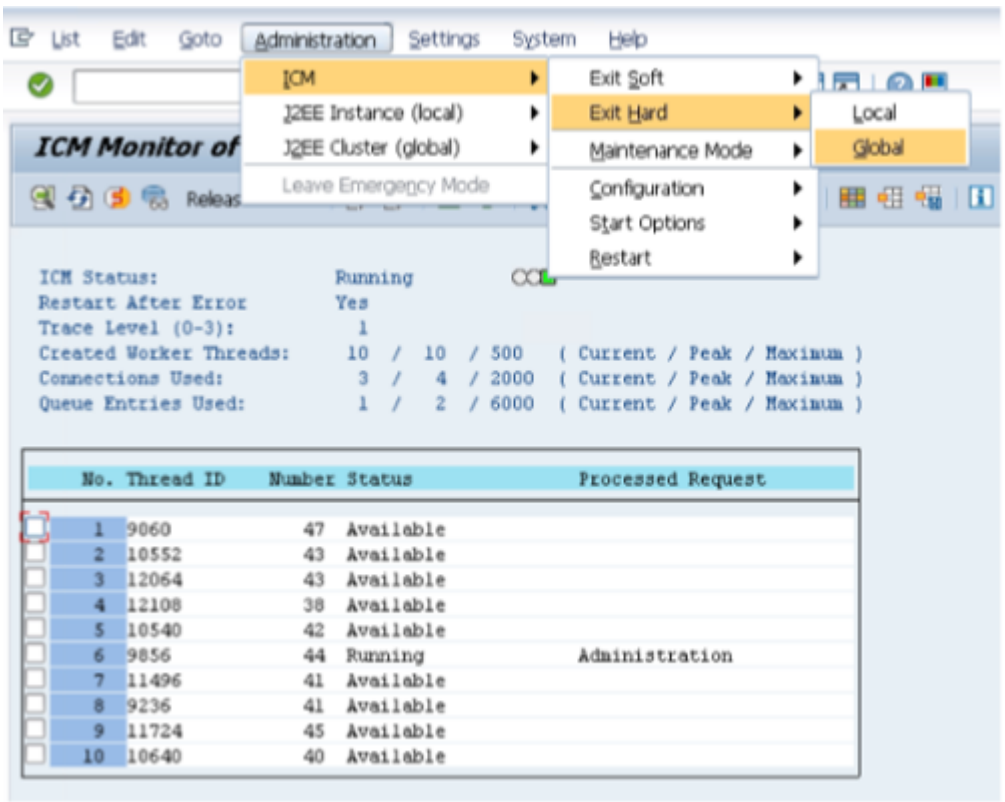
View your SAP Solution Manager certificate, and update the certificate if necessary.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Connect to SAP on client 00.
2. Enter the `strust` transaction.
3. In the Trust Manager UI, open the SSL client.
4. Import the SSL certificate and save it.
5. Use the `smicm` transaction to enable the system to work with both HTTP and HTTPS clients.
6. Navigate to **Administration** > **ICM** > **Exit Hard** > **Global**.



The ICM module restarts.

View the SAP interface log

View the SAP interface log to help you debug issues.

Before you begin

Role required: admin

Configure alert collection from SCOM

Alerts from the Microsoft System Center Operations Manager (SCOM) are collected using the SCOM connector instance.

Before you begin

Role required: evt_mgmt_admin

About this task

The SCOM connector instance requires configuration before receiving alerts and Metric Intelligence raw data from the SCOM server. You can limit the collection of SCOM alerts to only those alerts that belong to the SCOM group that you specify.

Procedure

1. Configure the SCOM connector instance.
2. Configure the Microsoft System Center Operations Manager (SCOM) connector instance to receive alerts and Metric Intelligence raw data from the SCOM server.
3. Limit collected SCOM alerts to specific SCOM groups.

Configure the SCOM connector instance

Configure the Microsoft System Center Operations Manager (SCOM) connector instance to receive alerts and Metric Intelligence raw data from the SCOM server.

Before you begin

To activate **Metric Collection**, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Windows authentication is used by the connector to access the SCOM database (OperationsManagerDW). Therefore, if **Metric Collection** is selected and the **Database login with Windows authentication** option is also selected, ensure that the MID Server service runs with a user having read access to the SCOM database. Ensure that the correct credentials are used:

1. In the local services, select and hold (or right-click) the MID Server service and select **Properties**.
2. In the **Log On** tab, ensure that **This account** is selected. Include the details of the Windows domain user that has read access to the SCOM database.

Before starting the procedure to configure the connector, ensure that:

- The MID Server is running with a user that has local admin permissions to enable the MID Server to run PowerShell.
- The MID Server user has read access to the SCOM API.
- The MID Server resides in the same domain as the SCOM server.
- The MID Server uses the same time zone as the SCOM server.
- The MID Server is running on Windows.
- The MID Server has .NET framework version 3.5.

If **Bi-directional** is selected, ensure that:

- PowerShell version 3.0 is installed on Windows.
- The MID Server is running with a user that has local admin permissions to enable running PowerShell.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To upgrade an existing SCOM connector:

1. On the Connector Instance - SCOM connector page (**All** > **Event Management** > **Integrations** > **Connector Instances**), clear the **Collect Metrics** check box.
2. Install the *em-connectors* plugin from the store.

Role required: evt_mgmt_admin

About this task

To receive SCOM alerts, you can obtain the redistributable SCOM files from your SCOM application. Add the files to the MID Server, and then configure a SCOM connector instance to collect the alerts and Metric Intelligence raw data.

The collection of Metric Intelligence is performed using JavaScript running JDBC in place of PowerShell.

You can also use this setup for the SCOM managed instance on Azure.

This connector has the *logPayloadForDebug* log parameter enabled, which logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Supported versions:

- 2007 – version 6.1.7221.0
- 2012 – version 7.1.10226.0
- 2016 – version 7.2.117190 and 7.3.13261.0
- 2019 – version 10.19.10050.0
- 2022 – version 10.22.10118.0
- 2025 - version 10.25.10132.0

Procedure

1. On the SCOM server, download the following files to a local computer.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A connection cannot be made to SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 and SCOM 2007 from the same MID Server. To work with both SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 (any of them) and SCOM 2007 in your instance, do the following before uploading files to your instance:

a. Append .2012 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file, so it becomes: `Microsoft.EnterpriseManagement.OperationsManager.dll.2012`. Do this for 2012/2016/2019/2022.

b. Append .2007 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file found in the 2007 path.

Using these modified file names enables the relevant MID Server to load the applicable DLL when both SCOM versions are deployed. Do not append 2007 to the `Microsoft.EnterpriseManagement.OperationsManager.Common.dll` file (for SCOM 2007).

At any given time, you can define connectors of either SCOM 2007, SCOM 2012/2016, or SCOM2019. Since SCOM 2012 and SCOM 2016 use the same library files, they are able to work at the same time. Although, SCOM 2019 uses the different SCOM DLL files so you cannot configure SCOM 2012, 2016, and 2019 all together. Each SCOM connector can use the database of another connector, for metric support.

2. Navigate to **MID Server** > **JAR Files**.
3. Select **New** and add a separate record for the SCOM version for each of the DLL files that you downloaded from the SCOM server.

   a. In the **Name** field, specify the SCOM version and an identifier to make the name unique, for example `2012 1`.
   If you are using SCOM 2016, specify 2012 as the version.

   b. Select the paper clip icon in the form header and then attach one of the appropriate DLL files that you downloaded.

   c. Select **Submit**.

4. Repeat step 3, creating a separate record for each of the remaining DLL files.
   Ensure that you have a unique identifier after the SCOM version for each file that you attach, for example `2012 2`.
5. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
6. Click **New** and create a new connector instance.
   For details on the connector instance fields displayed on the page, see SCOM connector instance form.
7. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
8. In the Connector Instance Values section, you can edit the values of the mandatory SCOM parameters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. **login_with_windows_authentication** Default value: **false**.
Set to **true** to enable SCOM event collection and the bi-directional exchange of event values to work with Windows authentication.

When invoking this value, ensure that you do the following on the MID Server:

i. Navigate to the list of local services, select and hold (or right-click) the MID Server service, and select **Properties**.

ii. In the **Log On** tab, ensure that **This account** is selected with the details of the user in the Windows domain with read access to the SCOM database.

b. **metric_chunk_size**: Default value: 50000.

c. **scom_date_format**: Default format: M/d/yyyy/ h:mm:ss a
If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event does not process correctly.

For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *2019/06/27/ 11:25:00 a*, modify the **scom_date_format** value to *yyyy/M/d/ h:mm:ss a* to match the format of the received event.

In **scom_date_format**, `a` represents AM, and `p` represents PM.

d. **scom_initial_sync_in_days**: Default value: 7.

e. **scom_version**: It is mandatory to specify the SCOM version.
Select from 2022, 2019, 2016, 2012, or 2007.

f. **stop_isMonitorAlert_bidirectional**: Boolean.
Set to **true** to stop only SCOM monitoring alerts bi-directionally. Stopping SCOM monitoring alerts can prevent false alarms on the SCOM console when attempting to update the alerts. When set to **false**, SCOM monitoring alerts continue running bi-directionally for all types of SCOM alerts.

Default value = false.

9. Select and hold (or right-click) the form header and select **Save**.
10. Restart the MID Server service to copy the files.
11. Select **Test connector** to verify the connection between the MID Server and the connector. If the test fails, correct the problem by following the instructions issued by the error and then run another test.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SCOM.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. After a successful test, select the **Active** check box and then select **Update**.

Note:

The default binding rules that contain SCOM as the external source, that applies to IT alerts and Metric Intelligence raw data, are the following SCOM Management Packs:

- All OS Management Packs
- MS SQL Server
- IIS

Example:
If bi-directional is configured, the bi-directional exchange of values to-and-from the external event source is enabled.
These scenarios describe the default bi-directional functionality for SCOM connectors:

- When an alert is resolved in SCOM, it is auto-closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because during each collection cycle, all alert changes are updated.
- When an alert is manually closed in ServiceNow, it is auto-closed in SCOM. If the alert state is changed to **Reopen**, SCOM is also updated.
- When an incident is created and associated to an alert in ServiceNow, SCOM receives the incident number as a ticket ID. However, the state of the incident is not available on SCOM. Therefore when the incident is resolved in ServiceNow, SCOM is not updated as the incident number remains the same. When the alert is associated with a new incident, the new incident number is updated in SCOM.

Limit collected SCOM alerts to specific SCOM groups

Limit the collection of SCOM alerts to only those alerts that belong to the specified SCOM group.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Use the SCOM Authoring workspace and Operations console to define a SCOM group and ensure that the group contains the required computers or instances.
   For further information about SCOM groups, see the SCOM documentation.
2. Create a role that has a scope of the SCOM group.
3. Add the new role to the SCOM user.
4. Assign the role to the user defined in the credentials given to the SCOM connector instance.
5. Remove all other roles from the user.

Result
Only alerts from the specified SCOM group arrive at the instance.

SCOM metric event rules

The base system comes with Microsoft System Center Operations Manager (SCOM) metric event rules. SCOM metric event rules bind event metrics to configuration items (CIs).

When an event's metrics match the event filter conditions, the metrics bind to the indicated CI. The event rules that come with the base system are:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Base system metric event rules

Rule Name	CI type
SCOM Metrics - Windows Server	cmdb_ci_win_server
SCOM Metrics - IIS Web Server	cmdb_ci_microsoft_iis_web_server
SCOM Metrics - SQL Server Reporting Services	cmdb_ci_db_mssql_reporting
SCOM Metrics - MS SQL Database	cmdb_ci_db_mssql_database
SCOM Metrics - MSFT SQL Instance	cmdb_ci_db_mssql_instance

You can create a custom event rule to bind metrics with other CI types. For details, see Create or edit an event rule.

If the event rule filter doesn't match, the default rule, *SCOM Metrics - Default* (CI type = *cmdb_ci_hardware*) is invoked. The order number of the default event rule must be higher than the order number of any SCOM event rules (both those that come with the base system and any custom rules), so that all other rules are checked for matching before invoking the default rule. For details on event rules, see Event rules.

Configure event collection from SolarWinds monitor

Configure the SolarWinds monitor connector instance to receive events from the SolarWinds monitor.

Before you begin

Supported versions:

- SAM 6.2.1
- NPM 2024.1

Note:
The SolarWinds monitor connector instance can import events from:

- Network Performance Monitor (NPM)
- SolarWinds Service & Application Monitor (SAM)

The SolarWinds monitor connector instance requires a credential that lets the instance access SolarWinds monitor accounts. You can use an existing credential or create a new one. The provided user must have access to the SolarWinds API to receive events from the SolarWinds connector.

Role required: evt_mgmt_admin and evt_mgmt_integration

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Type a descriptive name for the SolarWinds monitor connector.
Description	Type a description for the use of the SolarWinds monitor event collection instance.
Connector Definition	Select **Solarwinds_v2**.
Host IP	Specify the SolarWinds monitor IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create SolarWinds monitor credentials.
Event collection last run time	The last run time value of the scheduled job. This field is updated automatically.
Last event collection status	The last event collection status. This field is updated automatically.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the SolarWinds monitor server.
Last error message	The last error message received by the connector is automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify these fields:

Field	Value
initial_sync_in_days	Specify how many days the initial pull must contain to retrieve events. The default value is 7 days.
nodes_custom_properties	Specify the SolarWind monitor property names that are associated with the relevant node. This information is added to the **Additional Information** field of the event in JSON format. The SolarWinds monitor custom properties are user-defined fields, for example, country, building, or serial number, that you can associate with monitored network objects. Separate multiple entries with a comma.
port	Specify the value of the port. By default, the value is 17774. **Note:** For version 2023.1 and above, the port is 17774.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** Name of a MID Server.
   If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. The privileges that are required for the user account that is used for the MID Server to collect events from SolarWinds monitor is that of evt_mgmt_integration.
7. Click **Test connector** to verify the connection between the MID Server and the SolarWinds monitor connector.
   If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SolarWinds monitor.

8. After a successful test, select the **Active** check box and then click **Update**.

Create SolarWinds monitor credentials

Create credentials to access SolarWinds monitor.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `SolarWinds authentication`.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all

Configure event collection from vCenter

Configure the VMware vCenter Server (vCenter or vCenter_V2) connector instance to receive events from your VMware vSphere environment.

Before you begin
Events collected by this connector are events that match the vCenter ESX Servers event rule. Supported version: 7.0.2.00500.

Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

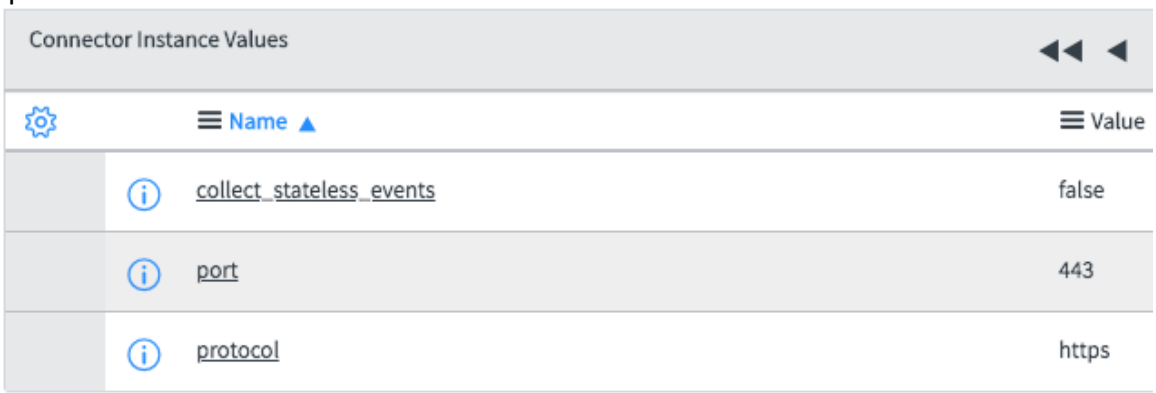
Connector Instance form

Field	Description
Name	Descriptive and unique name for the vCenter connector.
Description	Description for the use of the vCenter event collection instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connector definition	Name of the required connector definition. Select **vCenter** or **vCenter_V2** (vCenter_V2 is located in the Event Management connectors scope).
Host IP	IP address where vCenter is installed.
Credential	Permission to connect to vCenter. Click the search icon in the **Credential** field. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, vCenterCHCK.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from vCenter. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. In the Connector Instance Values section, specify the vCenter values.

Field	Value
collect_stateless_events	Events that have a status (stateful) are collected when this field is set to `false` (default). These events are of type AlarmStatusChangedEvent and AlarmClearedEvent. If this field is set to `true`, events of other types are collected as well.
port	Specify the value of the port. Default value: `443`.
protocol	Specify the protocol. Default value: `https`.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the vCenter connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from vRealize

Configure the VMware vRealize Operations (vRealize or vRealize_V2) connector instance to receive events from the vRealize Operations Log and Event Management servers. vRealize uses basic authentication. vRealize_V2 uses token-based authentication.

Before you begin

Role required: evt_mgmt_admin

Supported version: 8.10.0.

Note:
Connect to vRealize using a local account with at least Read-only vRealize Operations permission. You can use an existing credential or create a new one.

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a vRealize Operations connector instance with the following details:

Field	Value
Name	Specify a unique name for the vRealize Operations connector instance.
Host IP	Specify the vRealize Operations IP address.
Credential	Select the credential with basic authentication that you created for this connector. vRealize_V2 uses token-based authentication providing that the user can generate the token. For more information, see Create vRealize credentials.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Schedule (seconds)	The frequency in seconds that the system checks for new events from vRealize Operations.
Description	Type a description for the use of the vRealize Operations connector.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **vRealize** or **vRealize_V2** (vRealize_V2 is located in the Event Management connectors scope).
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory vRealize Operations parameters.

   a. **port**: Default value = `443`.

   b. **protocol**: Default value = `https`.

   c. **days_from**:
   Number of days worth of data to be pulled on the first event collection run. Default value = `14`. The **days_from** option is available only when using vRealize_V2.

5. Click **Test connector** to verify the connection between the MID Server and the vRealize Operations connector.
6. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to vRealize.

7. After a successful test, select **Active** and then click **Update**.

Create vRealize credentials

Create credentials to access vRealize.

Before you begin

Role required: evt_mgmt_admin

About this task

Create Basic Auth type of credential to connect to vRealize.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, `NewvRealize`.
User name	Name to identify the user. ○ If the username is internal in vRealize, use it as is. ○ If vRealize is integrated with Active Directory (AD), use the format `DOMAIN\username@sourceauth`. For example, `local\administrator@All vCenter Servers`.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result

The credential for use with the vRealize connector is created.

Configure event collection from Zabbix server

Configure the Zabbix server connector instance to receiving alerts from the Zabbix server.

Before you begin

Supported versions: from 3.0.0 up to 7.0.0
The Zabbix server connector instance requires a credential that lets the instance access Zabbix server accounts. You can use an existing credential or create a new one.

Role required: evt_mgmt_admin

About this task

This connector has the *logPayloadForDebug* log parameter enabled, which logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Descriptive name for the connector.
Host IP	IP address for the Zabbix server.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create Zabbix server credentials.
Schedule (seconds)	Frequency, in seconds, that the system checks for new events from the Zabbix server.
Description	Description for the use of the Zabbix server event collection instance.
Connector Definition	Name of the connector definition. Select **Zabbix**.
Last error message	Last error message. Automatically updated.
Last run time	Last run time value. Automatically updated.
Last run status	Last run time status. Automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

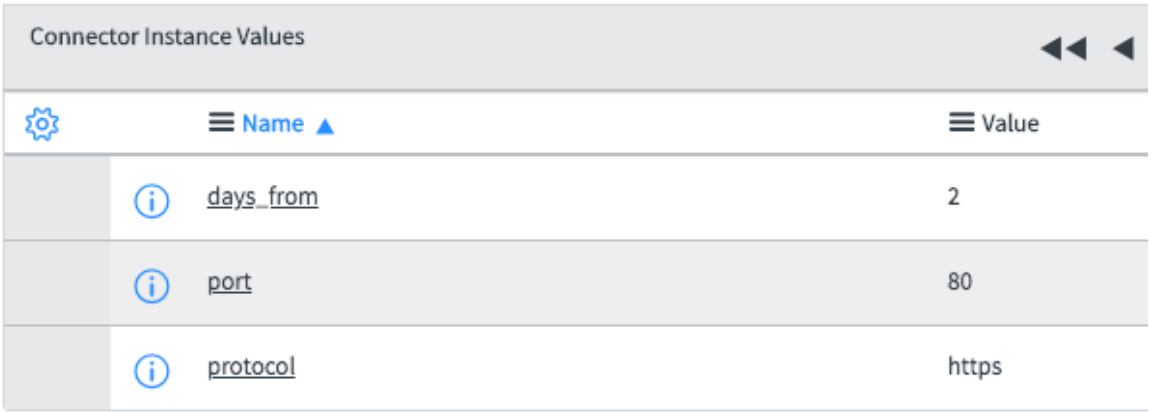
The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. Verify and modify the values, as needed.
   In the Connector Instance Values section, the default connector instance values appear.

Fields in the Connector Instance Values section

Field	Description
days_from	Number of days for which events must be collected at the first collection cycle. Default value: 2 **Note:** The maximum number of past events that can be collected is 3,000. The first time that this connector runs, the number of past events is counted in the past from the current date.
port	Port number. Default: 80
protocol	Protocol type. Default: `https`

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector.
8. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Zabbix server.

9. After a successful test, select **Active** and then click **Update**.

Credentials and connection information

Configure a push connector

You can configure listeners and connectors to push event information to the instance or MID Server.

Event Management receives external events through a push connector or script. If you are using a script to collect events, no configuration is required. All other methods of collecting events require configuration.

After event collection configuration, Event Management can collect events that are sent directly to the instance, or via the MID Server, SNMP trap, or email.

Note:
Integrating with push connectors is only available by installing the Event Management Connector plugin from the ServiceNow Store.

Standard event form

All events must use a standard event form, regardless of how they arrive at the instance. For more information, see Event field format for event collection.

Event collection

Event Management facilitates communication and movement of data between external applications, data sources, services, and the ServiceNow AI Platform instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event collection modes	Description
Provided by the base system	Listeners and connectors provided with the Event Management application: • AWS CloudWatch, see Integrate AWS platform as a data source. • Azure event messages, see Integrate Azure Monitor as an authenticated data source. • BMC TrueSight events, see Event collection from BMC TrueSight and BMC TrueSight_v2. • Datadog events, see Integrate Datadog platform events. • Dynatrace events, see Integrate Dynatrace platform events. • Google Cloud Platform (GCP) events, see Integrate Google Cloud Platform (GCP) events • New Relic events, see Integrate New Relic platform events. • Generic event collection through the MID Server. • Generic event collection through the instance. Where event messages are received in XML, you can base your script on the example XML transform script provided with the base system.
Via MID WebService	You can configure the MID WebService Event Collector to push event messages to the MID Server. For more information, see Pushing events to the MID Server using web service API.
Create your own content	You can configure your own listener: • Via MID WebServer API. See Pushing events to the instance using web service API. • Via Custom Transformation. See Event collection from custom payloads.
Via SNMP	SNMP listeners provided with the Event Management application: Generic SNMPv2. See #unique_1559. In addition, you can create your own custom listener. See Integrate with push connectors.
Via Email	Email listener. See Configure event collection from email.

Push connector instance form

Configure ServiceNow Cloud Observability event collection

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

Before you begin

- Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

Procedure

1. Create a CI.

> **Note:**
> Discovery for ServiceNow Cloud Observability services is not supported. Create a CI manually in a ServiceNow instance (cmdb_ci_service_auto table) to enable binding.

   a. Navigate to **All** > **Configuration** > **Application Service**.

   b. Select **New**.

   c. In the form, enter the name.
   The name must be the service name provided in the ServiceNow Cloud Observability platform.

   d. From the Operational Status list, set the operational status to **Operational**.

   e. Select **Next**.

   f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

   a. From the navigation bar, click#**Alerts**.

   b. Select the#**Notification destinations** #tab.

   c. Select#**Create a destination**.

   d. Select **webhook**.

   e. In the Name field, enter a name for the webhook.

   f. In the URL field,#provide the webhook URL.

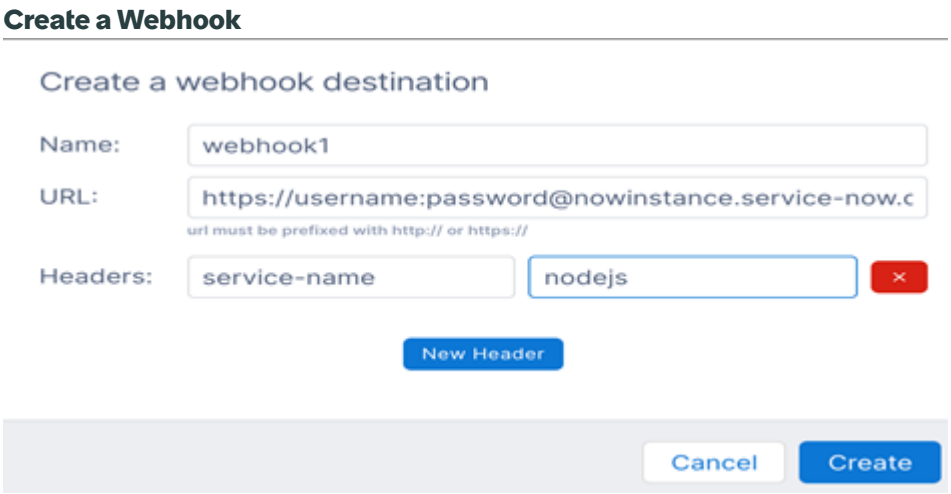
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This is the default #format of the URL to push events from#ServiceNow Cloud Observability to the#ServiceNow AI Platform Instance. Use this format: `https//<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=lightstep`

g. Select **New Header**.

h. In the Headers field, enter the **service-name** and define its **value**.

> **Note:**
> In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the**cmdb_ci_service_auto table**.



i. Click **Create**.

3. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, click#**Alerts**.

b. Select#**Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

d. In the Notification Rules area, in the Send Notifications to fields, select the notification destination as **webhook** and search for the destination name for the webhook that you created in step 2.

e. Select **Save**.
The default severity for stream based alerts is **Critical**. You can change the default in the #Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a MID Server for event collection using a push operation (listener)

The MID Server supports the collection of event messages, using the MID Web Server to collect data from external sources and transforming (parsing) them to the format required for event fields in the event [em_event] table. The transformed events are then transmitted to the instance.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Web Server extension enables external clients to push metric data and events to the MID Server. See Configure the MID Web Server extension. Use the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. See Configure the MID WebService Event Collector Context.

Configure a MID Server with either *`EventManagement`* or *`All`* in the Supported Applications List.

To ensure uninterrupted services, consider also configuring a failover MID Server cluster.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Double-click the MID Server that you want to configure, or click **New** to create a new MID Server.
3. In the **Supported Applications** section, click **Edit**.
   a. Click **Edit**.
   b. In the slushbucket, either select **Event Management** or **ALL** and click the **>** add button.
   c. Click **Save**.
4. To ensure that the MID Server is validated, under Related Links, select **Validate**. For more information, see Validate a MID Server.
5. Click **Update**.

What to do next

Configure the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. For more information, see Configure the MID WebService Event Collector Context.

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector to provide a URL method to push event messages to the MID Server.

The MID WebService Event Collector, by default, enables you to connect to an event generator and send event messages through the MID Server, using a URL in the format: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The JSON v2 format is the same as the format that clients use to send event messages to the instance. This URL provides good performance.

For more information, see Configure the MID WebService Event Collector Context.

Note:
Event Management accepts events in the timezone of the MID Server through which the listener has sent the event message. If you require a different timezone, you can configure the script as required, see Integrate with push connectors.

URL to push custom payloads

The MID Server can also receive a custom payload in JSON, XML, or plain text format. In this case, the MID Server transforms the event messages using the script include that you provide, and then sends the events to the instance. The URL in this case is:

`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}` For an example of a script include, see the default `TransformEvents_xmlSample` script include.

For an example of how the MID WebService Event Collector transforms JSON formatted event messages, see Event collection from BMC TrueSight and BMC TrueSight_v2.

To send events in generic JSON format, you can use the URL in this format:

`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform=TransformEvents_MidJsonGeneric`

In this case, the `TransformEvents_MidJsonGeneric` MID script include that is provided in the base instance transforms the event messages into the event fields. All fields are added as **Additional Information** fields into the ServiceNow event that is generated.

Note:
The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.

The REST API URL for validating connectivity is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/ping`

Script include to transform collected events

Use the required MID Server script include to transform (parse) collected event messages and populate them into the mapped event field. The MID Server script include name is composed of a prefix and suffix. The prefix is the mandatory text `TransformEvents_` and the suffix is the transform name on the URL, for example, `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/xmlSample` . The composed script name is therefore `TransformEvents_xmlSample`.

You must supply a script include that receives the event messages in a text variable. The script must have a `transform()` function that performs the transformation and prepares the return array of Event objects. When the Event Management plugin is activated, you are provided with the `TransformEvents_xmlSample` sample include script that transforms events from XML format.

Note:
Event fields that are not identical to fields in the event table are saved in the **Additional information** field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event message headers

Specify the relevant request header value for the **Content-Type** field according to the format of the event message.

Request header values for the Content-Type

Message format	Content-Type value
JSON	application/json
XML	application/xml
text	text/plain

Authentication and data security options

Options for authentication and data security:

- **Authentication type**, which can be set to either `API Key`, `mTLS`, or `Basic`.
- **Secure Connection**, which lets you choose whether incoming and outgoing data is secured when transmitted. If you choose the advanced secured option, it requires that you obtain a certificate from a well-known certificate authority, and then provide the **Keystore Certificate Alias** and the **Keystore Password**.
- **Use MID Unified Keystore**, which provides encryption protection and enables you to install a custom certificate in the MID Server unified keystore. For details, see Install custom certificates in the MID Server unified key store.
- Users must supply a script that receives the JSON, XML, or text formatted event messages in a text variable. The script must have a transform() function that performs the transformation and prepares the return array of event objects. The `TransformEvents_xmlSample` include script that transforms events from XML format is provided as an example when the Event Management plugin is activated.

For more information about authentication and data security, see Configure the MID Web Server extension.

Pushing events to the instance using web service API

Pushing events to the instance using web service API

You can use a web service interface, supported by ServiceNow, that operates on the JSON object as the data input and output format.

Before you begin

Role required: evt_mgmt_integration

About this task

To insert records in the event [em_event] table with a single call, use this web service API:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Note:
Business rules on the event table are not invoked when this URL is used.

Do not add additional fields to an event by adding a custom field to the event table [em_event]. However, additional fields should be included in the **Additional information** [additional_info] field of the event. For more information about how to include additional fields in events, see Custom alert fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The URL in the format: `http://<instancename>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple` is also supported in case you do want to activate Business rules. However, the performance of the first URL is superior.

To work with the URL that ends with `=insertMultiple`, add the following properties, with their respective values, to the MID Server:

- "mid.probe.event.queue.compress" - value: false
- "mid.probe.event.bulk_size" - value: 100
- "mid.probe.event.endpoint.url" - value: em_event.do?JSONv2%26sysparm_action=insertMultiple

Procedure

1. Send the request with these headers:

Parameter	Type	Description
Accept	String	The acceptable type for this message. The default value is `application/json`.
Content-Type	String	The content type for this message. The default value is `application/json`.
POST	String	The request type is POST, with one or more trailing records.

2. One or more events in JSON format can be sent as the payload of the web service call. Event fields that should be populated are:

Variable	Description
source	The name of the event source type. For example, SCOM or SolarWinds.
event_class	Specific instance of the *`source`*. For example, `SCOM 2012 on 10.20.30.40`
node	The **node** field should contain an identifier for the Host (Server/Switch/Router/etc.) that the event was triggered for. The value of the **node** field can be one of the following identifiers of the Host: ○ Name ○ FQDN ○ IP ○ Mac Address If it exists in the CMDB, this value is also used to bind the event to the corresponding ServiceNow CI.
resource	If the event refers to a device, such as, Disk, CPU, or Network Adapter, or to an application or service running on a Host, the name of the device or application must be populated in this field. For example, `Disk C:\` or `Nic 001` or `Trade web application`.
metric_name	Name of the metric that triggered the alert. For example, `Used Memory` or `Total CPU utilization`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable	Description
type	The type of event. This type might be similar to the **metric_name** field, but is used for general grouping of event types.
message_key	This value is used for de-duplication of events. For example, there might be two events for the same CI, where one event has CPU of 50% and the next event has CPU of 99%. Where both events must be mapped to the same ServiceNow alert, they should have the same message key. The field can be left empty, in which case the field value defaults to `source+node+type +resource+metric_name`. The **message_key** should be populated only when there is a better identifier than the default.
severity	Severity of the event. ServiceNow values for severity range from 1 – Critical to 5 – OK, with the severity of 0 – Clear. Original severity values should be sent as part of the additional information.
additional_info	This field is in JSON key/value format, and is meant to contain any information that might be of use to the user. It does not map to a pre-defined ServiceNow event field. Examples include IDs of objects in the event source, event priority (if it is not the same as severity), assignment group information, and so on. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON format when the event is processed.
time_of_event	Time when the event occurred on the event origin. The format is: yyyy-MM-dd HH:mm:ss The specified time must be according to GMT.
resolution_state	Optional – To indicate that an event has been resolved or no longer occurring, some event monitors use 'clear' severity, while other event monitors use a 'close' value for severity. This field is used for those monitors proffering the latter. Valid values are New and `Closing`.

3. To create multiple records with a single call, trigger the event web service using the following URL, where the <instance name> variable is replaced with the name of the required instance:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Example
Example showing the payload for two events that are sent in a single web service call:

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "D:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk D: on computer
 V-W2K8-abc.abc.com is running out of disk space. The value
 that exceeded the threshold is 38% free space.",
      "additional_info": {
        "scom-severity": "Medium",
        "metric-value": "38",
        "os_type": "Windows.Server.2008"
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      }
    },
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "MSSQL-database-name",
      "node": "other.node.com",
      "metric_name": "DB Allocated Size (MB)",
      "type": "Database Storage",
      "severity": "3",
      "description": "High number of active connections for
 MSSQL-database-name running on name.of.node.com. Active
 connections exceed 5000.",
      "additional_info": {
        "scom-severity": "Medium",
        "metric-value": "38",
        "os_type": "Windows.Server.2008"
      }
    }
  ]
}
```

4. To create one record with a single call, trigger the event web service using the following URL, where the <instancename> variable is replaced with the name of the required instance:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Example
Example showing the payload for one event that is sent in a single web service call:

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2007 on scom.server.com",
      "resource": "C:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk C: on computer
 V-W2K8-dfg.dfg.com is running out of disk space. The value
 that exceeded the threshold is 41% free space.",
      "additional_info": {
        "scom-severity": "Medium",
        "metric-value": "38",
        "os_type": "Windows.Server.2008"
      }
    }
  ]
}
```

Example

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector Context

Configure the MID WebService Event Collector Context to provide a URL method to push event messages from an external source to the MID Server.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The default format of the URL to push event messages from an external source to the MID Server is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`. This URL provides good performance.

From an external source, to push event messages that are not in jsonv2 format, the format of the URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Name_of_Transform_Script}`, where the *`{Name_of_Transform_Script}`* variable is the full name of the script and always begins with the text: `TransformEvents_`.

For example, assume the following values:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- {MID_Server_IP}: 10.118.69.27
- {MID_Web_Server_Port}: 8097
- Transform script name: EventsToProcess

The URL to be used is therefore: `http://10.118.69.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Note:

- The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.
- The date format for events is yyyy-M-d h:mm:ss.

  If you receive an event whose date is in a different format, you must use a `{transform_script_name}` that is appropriate for the incoming event's date format. If you do not, the event will not be processed correctly.

  For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *2019/06/27/ 11:25:00 a*, use a `{transform_script_name}` with a date format of *yyyy/MM/dd/ HH:mm:ss a* to match the format of the received event.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID WebService Event Listener**.
2. In the MID WebService Event Collector Contexts list, click **New**.
3. On the form, fill in the fields.

MID WebService Event Collectors Context form

Field	Description
Name	A unique name for this collector for easy identification.
Short description	Enter a brief, meaningful description of this collector.
MID Web Server Extension	Specify and then start the MID Web Server extension. The supported authentication methods are listed in the **Authentication Type** field of the MID Web Server extension. For information about how to configure a MID Web Server extension, see Configure the MID Web Server.
Status	This field is auto-populated with the status of the MID Web Server extension. This field is blank until the MID Web Server extension is started. After issuing a command to the MID Web Server extension, one of the following values is displayed: ○ **Started**: The collector is running. ○ **Stopped**: The collector is not running. ○ **Offline**: The MID Server is down.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Error**: The collector failed with an error (the error message is displayed in **Error Message**). ○ **Warning**: A run-time exception has occurred.
Execute on	**Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension.
MID Server	The **Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension.
Executing on	The name of the MID Server on which the MID Web Server extension is running.

4. Right-click the form heading and click **Save**.
5. Under **Related Links**, click **Start** to start the collector.

Commands in the Event Management Context form

Related Link	Description
Start	If it is not running, start the collector. This action verifies that a web service API endpoint with the Event Management application is running on the MID Server.
Stop	Stops the running collector on the configured MID Server. If the collector is not running, no action is taken.
Restart	Stops, then starts the collector on the configured MID Server.
Update parameters	Sends updated parameters to the collector. Parameters are also updated when the Event Management MID Server context extension is updated. If you click this control when the collector is not running, no update is made.

Example:
Showing the use of the URL to transform JSON v2 formatted event messages

Assume that JSON v2 formatted event messages are sent to the MID Server. When using the `jsonv2` URL, there is no need to use a script include.

Data for the JSON v2 example

Field	Value
MID_Server_IP	10.218.64.27
MID_Web_Server_Extension_Port	8097
Event message format	jsonv2

Replace the variables in the default format of the URL `http://<my-instance>.service-now.com/api/global/em/jsonv2`with values from the preceding table:`http://10.218.64.27:8097/api/global/em/jsonv2`

Example showing the URL to push messages not in jsonv2 format

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The format of the URL to push event messages from an external source that are not in jsonv2 format is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event/Transform={Name_of_Transform_Script}` where the {Name_of_Transform_Script} variable is the full name of the script and always begins with the text: TransformEvents_. The script name must be specified as the `Transform` header parameter and must always start with the prefix `TransformEvents_`.

For this example, assume that the script name is EventsToProcess, the URL is therefore:`http://10.138.64.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Example showing JSON v2 formatted event messages

Note:
When copying and pasting the text following, hidden characters might also be copied and can cause unexpected results.

```
curl -v -H "Accept: application/json" -H "Content-Type:
 application/json" -X POST --data "{
    "records":
    [ {
         \"source\" : \"Simulated\",
        \"node\" : \"nameofnode\",
        \"type\" : \"High Virtual Memory\",
        \"resource\" : \"C:\",
        \"severity\" : \"5\",
        \"description\" : \"Virtual memory usage exceeds 98%\",
        \"ci_type\":\"cmdb_ci_app_server_tomcat\",
        \"additional_info\":\"{\\\"name\\\":\\\"My
 Airlines\\\"}\"
      },
      {
      \"source\" : \"Simulated\",
      \"node\" : \"01.myairlines.com\",
      \"type\" : \"High CPU Utilization\",
      \"resource\" : \"D:\",
      \"severity\" : \"5\",
      \"description\" : \"CPU on 01.my.com at 60%\"
      }
   ]
}" -u UserName:Password
 http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2
```

- Event collection from Google Cloud Platform

Event collection from custom payloads

The MID WebService Event Collector enables you to collect event information from custom payloads in JSON, XML, or plain text format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Server transforms the collected event messages and populates the Event table fields (em_table) in the instance. The collection of formatted event messages is described in this procedure using basic authentication. For information about supported authentication methods, see Configure the MID Web Server extension.

The format of the required MID Server URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}`. The name of the MID Server script include is composed by appending a suffix to the default `TransformEvents_` prefix. For information about the collection of JSON v2 event messages, see Configure the MID WebService Event Collector Context.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.

Procedure

1. Configure the MID WebService Event Collector, see Configure the MID WebService Event Collector Context.
2. Start the MID WebService Event Collector.

Example:
Transformation of XML formatted event messages using the custom payload URL

Assume that XML formatted event messages are sent to the MID Server. Use this example to return an array of event objects from the collected event messages. The name of the MID Server script include is composed by appending a suffix to the default `TransformEvents_` prefix. For the purposes of this example, the user supplied the xmlSample script include. Using these details, the name of the MID Server script include is `TransformEvents_xmlSample`. The MID Server transforms the collected event messages by parsing the messages using the script include and then transmitting them to the instance.

Data for the XML example

Field	Value
MID_Server_IP	10.218.64.27
MID_Web_Server_Extension_Port	8097
transform_script_suffix _name	xmlSample

Replace the variables in the URL with the values from the above table:
`http://10.218.64.27:8097/api/mid/em/xmlSample`

Note:
When copying and pasting the text below, hidden characters might also be copied and can cause unexpected results.

Example showing XML formatted event messages:

```
<records>
    <event>
    <source>My Source</source>
    <node>host1</node>
    <type>type1</type>
    <severity>3</severity>
    <description>Virtual memory usage exceeds 98%</description>
    </event>
    <event>
    <source>My Source</source>
    <node>host2</node>
    <type>type2</type>
    <severity>2</severity>
    <description>Virtual memory usage exceeds 90%</description>
    </event>
    </records>
```

Configure the MID Web Server extension

Configure the MID WebService Event Collector Context

Integrate with push connectors

Integrate with a push connector to connect to an external event source. Push connectors process the collected event messages and transform them to the required event format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed.

Role required: evt_mgmt_admin

Note:
If you are upgrading a ServiceNow AI Platform instance from Paris or earlier, you can use legacy listener transform scripts. See Use legacy listener transform scripts for further information.

About this task

The push connectors accept event messages that are generated by external event sources. Configure a connector to listen to an external event source. Using a custom push connector, send the event messages through either the MID Server or the instance.

Note:
You can use this generic JSON target URL to collect events:`https : /<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source=genericJson`. This URL can be used as-is and requires that an event rule be configured.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Click **New** or click the push connector that you want to modify, for example, AWS or Azure.
3. On the form, fill in the fields.

Field	Description
Name	Unique name for this push connector for easy identification.
Description	Enter a description for the use of the push connector.
Header name	Specify the name of the header that you want the value for, such as Set-Header.
Header value	The value of the header name that you want the value for, such as Set-Header.
Type	Select to send events either `Instance` or `MID`. In each case, use the URL of the selected type. See the description of the **URL parameter value** field.
Active	Select to enable pulling events from this external event source.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
URL parameter value	○ Send events to the instance. Use the URL in this format for all connectors: `https://<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source={URL_parameter_value}` ○ Send events through the MID Server. Use the URL in the format:`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script}` **Note:** Sending events to the MID Server requires the prior configuration of the MID WebService Event Listener extension.

4. In the Script section:
   - If the value selected for the **Type** field is `MID`, the **Transform script** field appears. In this field, specify or search for the name of the MID script include that accepts event messages that the required external event source generates and that the script parses into the required event format. Use this naming convention for the script: `TransformEvents_<your source>`
   - If the value selected for the **Type** field is **Instance**, the **Script** editor appears. In the **Script** editor, enter the customized script that accepts event messages that the required external event source generates and that the script parses into the required event format.

Example
This example shows the fields that have been transformed, being added to an event form.

```
(function process(/*RESTAPIRequest*/ request, body) {
 /*Function that receives a JSON object, adding all its fields
 to the Additional information object. The field name is a
 concatenation of the field key and the parent field key if it
 exists.*/
 function updateAdditionalInfo(event,
 field,jsonObject,additionalInfo) {
        for (var key in jsonObject) {
            var newKey = key;
            if (field != "") {
                newKey = field + '_' + key;
            }
   // You can do some transformation here and set fields on the
 event
   //if(key == "MySource")
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  //   event.source = jsonObject[key];
           additionalInfo[newKey] = jsonObject[key];
       }
    }

   try
{
       gs.info("TransformEvents_generic received body:" +
body);
 var jsonObject = JSON.parse(body);
       var event = new GlideRecord('em_event');
 event.source = "GenericJson"; //TODO: Need to define
       event.event_class = "GenericJsonClass"; //TODO: Need to
define
       event.severity = "5";

       var additionalInfo = {};
       updateAdditionalInfo(event,
"",jsonObject,additionalInfo);
 /*Iterates over Additional information JSON object and
adds all nested objects' fields as fields of the Additional
information object*/
       var notDone = true;
       while (notDone) {
           notDone = false;
           for (var key in additionalInfo) {
               if
(Object.prototype.toString.call(additionalInfo[key]) ==
'[object Object]') {
                   notDone = true;
                   updateAdditionalInfo(event,
key,additionalInfo[key],additionalInfo);
    additionalInfo[key] = "";
               }
           }
       }
 gs.info("TransformEvents_generic generated additional
information:" + JSON.stringify(additionalInfo));
       event.additional_info = JSON.stringify(additionalInfo);
       event.insert();
}
catch(er){
 gs.error(er);
 status=500;
 return er;
}
return "success";
})(request, body);
```

Use legacy listener transform scripts

Use legacy listener transform scripts when upgrading a ServiceNow AI Platform instance from Paris or earlier. These scripts can be run as part of existing integrated systems, or in unison with Event Management push connectors.

You can use listener transform scripts to ensure that previous integrations are supported. For example, if you are using the `https://<instance-name>.service-now.com/api/`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`global/em/inbound_event` endpoint in various existing integrations, you can continue to use this endpoint in a Quebec or later ServiceNow AI Platform instance.

If you want to use the Event Management push connectors, download the plugin from the ServiceNow Store website. You can then access the push connectors in the ServiceNow AI Platform instance, and the `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint is also created.

Use the legacy endpoint with push connectors

You can continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint with the push connectors, by deactivating the relevant transform scripts. To deactivate a script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**. Then click the relevant script in the displayed list, and clear the **Active** check box in the form.

Use the legacy endpoint and deactivate all listener transform scripts

You can also continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint but deactivate all listener transform scripts to use the push connectors instead. To deactivate all scripts, navigate to **System Properties** > **All Properties**, locate the *sn_em_connector_listener_table_for_InboundEvent* property, and set its value to **True**.

Migrate custom listener transform scripts to the push connectors module

If you have created custom listener transform scripts, they must be migrated to the push connectors module if you want to use the new `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint. To migrate the custom script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**, click the relevant listener transform script, and select the displayed script. Then navigate to **Integrations** > **Push Connectors**, click **New**, and paste in the script you copied from the listener transform script.

Integrate AWS platform as a data source

Integrate Amazon Web Services (AWS) with Event Management. To add AWS platform as a data source, configuration is required in the AWS platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Download the Event Management Connectors plugin from the ServiceNow Store.

Role required: evt_mgmt_admin

About this task

When an AWS platform alarm arrives, Event Management:

- Extracts information from the original AWS platform alarm to populate the required event fields and inserts the event into the database.
- Captures the content in the **additional_info** field.

The AWS platform push connector is located in **Event Management** > **Integrations** > **Push Connectors**. In the Push Connectors page, click **AWS Events Push Connector**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The AWS push connector that is provided in the base system handles AWS CloudWatch alarms only and not CloudWatch events created through event rules. To handle Simple Notification Service (SNS) alarms that are other than AWS CloudWatch, create a new push connector or customize the AWS push connector.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the AWS platform console, select **Simple Notification Service** .
   If an SNS topic does not exist, create one.
2. Under the SNS topic, create a new subscription.

   a. Take **Topic ARN** from the topic that you created.
   The Amazon Resource Name (ARN) is necessary for binding an Event Management alert to a CI.

   b. Set **Protocol** to: *`https`*.

   c. In the ServiceNow instance, create a user account or identify an existing ServiceNow user for this integration.
   Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Set **Endpoint** to: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=aws`

   If AWS platform multi-factor authentication (MFA) is enabled, when signing in to the AWS platform website, you're prompted for the user name and password, as well as an authentication code from the AWS platform MFA device of the user.
3. Wait until the subscription changes from `Pending` to `Confirmed` and the subscription ARN is populated.
   This can take a few minutes.
4. Create alarms in AWS platform to send to Event Management and link the alarms to the SNS topic that you created.
   Raw message delivery must not be enabled in AWS alarm. These following event rules are provided with the base system:

Event rule	Description
AWS host binding	Bind AWS platform alarms, on either the host or virtual machine (VM), to the host Hardware CI.
AWS - General	Bind AWS platform alarms on the Load Balancer (LB) to the Cloud Load Balancer CI, Amazon Relational

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event rule	Description
	Database Service (RDS) to the Cloud Database CI, and Host or Virtual Machine (VM) to the Virtual Machine Instance CI. **Note:** To bind events from the Host or Virtual Machine to the Virtual Machine Instance CI, disable the AWS host binding rule.

Note:
For the push connector to handle the incoming event, you must sent a request header **x-amz-sns-message-type** with value **Notification**.

This example shows a JSON string for AWS VM binding:

```
{
"Type" : "<type>",
"MessageId" : "<message ID #>",
"TopicArn" : "<topic arn>",
"Subject" : "ALARM: \"<alarm type>\" in <location>",
"Message" : "{\"AlarmName\":\"<alarm
 name>\",\"AlarmDescription\":<alarm
 description>,\"AWSAccountId\":\"<account ID
 #>\",\"NewStateValue\":\"ALARM\",\"NewStateReason\":
\"Threshold Crossed: <threshold and datapoint which
 it crossed>.\",\"StateChangeTime\":\"<date and
 time>\",\"Region\":\"<location>\",\"OldStateValue\":\"OK\",
\"Trigger\":{\"MetricName\":\"CPUUtilization\",\"Namespace\":
\"<namespace>\",\"Statistic\":\"<statistic
 name>\",\"Unit\":null,\"Dimensions\":[{\"name\":
\"InstanceId\",\"value\":\"<dimension
 value>\"}],\"Period\":<period
 number>,\"EvaluationPeriods\":<number of evaluation
 periods>,\"ComparisonOperator\":
\"GreaterThanOrEqualToThreshold\",\"Threshold\":<threshold
 number>}}",
"Timestamp" : "<date and time>",
"SignatureVersion" : "<version number>",
"Signature" : "<signature>",
"SigningCertURL" : "<URL>",
"UnsubscribeURL" : "<URL>"
}
```

5. To enable multiple member accounts to forward CloudWatch or EventBridge events to a centralized account, where a single SNS topic delivers them to the ServiceNow Event Ingestion endpoint, you need to make configuration on AWS side.
   To configure it, see https://repost.aws/knowledge-center/cloudwatch-cross-account-sns.
   This design simplifies integration, avoids duplicating SNS topics across accounts, and provides a single entry point for all monitoring events flowing into ServiceNow.

Event field format for event collection

Integrate with push connectors

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate AWS with REST API key token

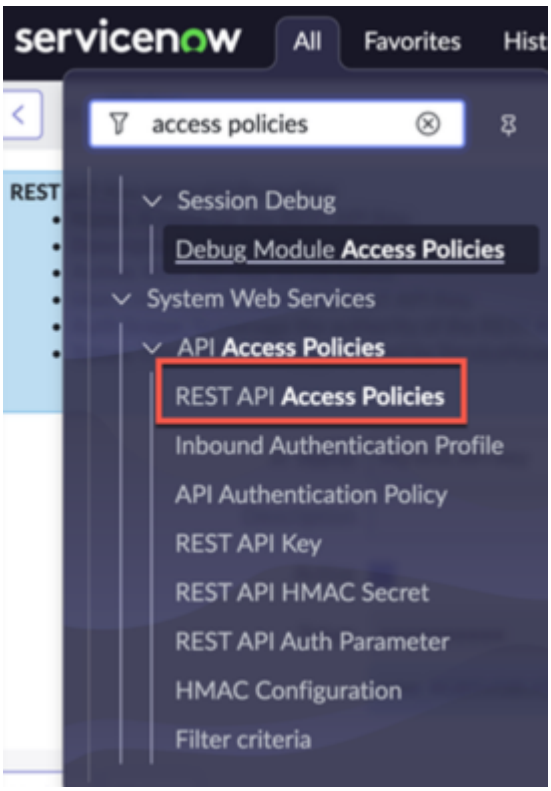
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

Note:
The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

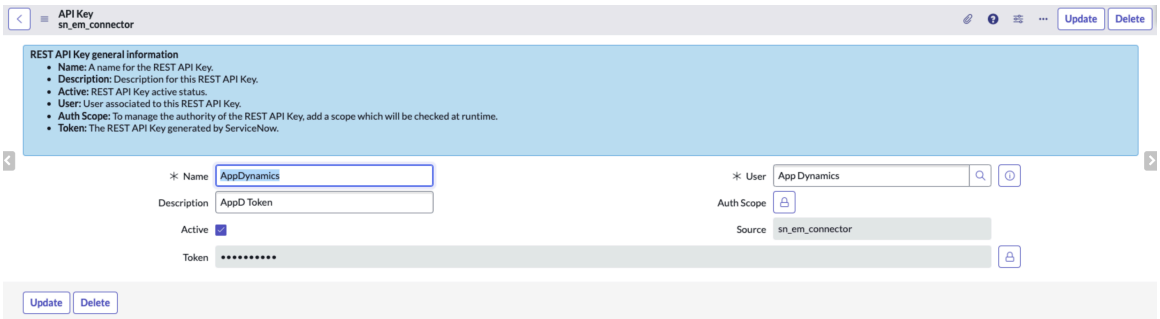
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



6. In the AWS environment, under **Simple Notification Service**, create a new topic and then create a new subscription by selecting the topic that you have created.
7. In the Create Subscription window, enter the ServiceNow endpoint value in the **Endpoint** field. Format of the api-key value must be: `https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]`.

   The [AUTH TOKEN] value is the system-generated token displayed in the **Token** field.

Integrate Azure Monitor as an authenticated data source

Integrate Microsoft Azure with Event Management by adding the Azure Monitor as an authenticated data source.

You can configure the Event Management environment for the collection of events from Azure Monitor by setting your ServiceNow AI Platform instance as the rest endpoint.

Once the endpoint is configured, when an Azure Monitor alert message arrives, Event Management:

- Authenticates the Azure Monitor alert message with the relevant ServiceNow user, using OAuth configuration or a standard webhook.
- Extracts information from the original Azure Monitor alert message to populate required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Azure Monitor V1 or V2 access tokens. For more information, see Integrate Azure Monitor with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Azure Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Azure Monitor with basic authentication.

What to know before you begin

You can use your integrated Azure Monitor as a data source only after you have verified the following:

- For both methods of authentication, the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.
- The Event Management Connectors plugin is installed in the ServiceNow AI Platform instance. You can download the plugin from the ServiceNow Store website.
- Azure Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Discovery for Microsoft Azure Cloud.

Event Rules and Event Field mappings

These event rules and event field mappings are provided with the base system:

Module	Description
Event Rules	**Azure Monitor**: A general event rule to handle all Azure Monitor events.
Event Field Mappings	**Azure Monitor - ci_type**: To map ci_type of events based on resourceType field. A base set of mapping pairs are provided.

These are the mappings provided with the base system in **Azure Monitor - ci_type**:

Transform Value Pairs

Event Mapping Pairs

Key	Value
microsoft.compute/virtualmachines	cmdb_ci_vm_object
microsoft.documentdb/databaseaccounts	cmdb_ci_cloud_database
microsoft.sql/servers	cmdb_ci_cloud_database
microsoft.web/sites	cmdb_ci_cloud_webserver
microsoft.cache/redis	cmdb_ci_cloud_database
microsoft.documentdb	cmdb_ci_cloud_database
microsoft.sql/servers/databases	cmdb_ci_cloud_database

Note:
You can add new mapping pairs to the Event Field Mapping - **Azure Monitor - ci_type** as per the requirement, to map events to the respective ci_type based on resourceType.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note:
This feature applies only to active event rules.

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Severity mapping from Azure severity to ServiceNow event severity

Azure severity condition	ServiceNow event severity
When an Azure alert monitorCondition is Fired	
Azure Sev0	ServiceNow Critical (severity "1")
Azure Sev1	ServiceNow Major (severity "2")
Azure Sev2 and Sev3	ServiceNow Warning (severity "4")
Azure Sev4	ServiceNow OK (severity "5")
When an Azure alert monitorCondition is resolved	
Any Azure severity	ServiceNow CLEAR (severity "0")

Integrate Azure Monitor with basic authentication

Integrate Microsoft Azure with Event Management by adding a standard webhook in Azure Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Roles required: evt_mgmt_admin and web_service_admin

About this task

Configure the Event Management environment for the collection of events from Azure by authenticating Azure Monitor as a data source. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Procedure

1. In the ServiceNow AI Platform, create a user account or identify an existing ServiceNow user for this integration.
   Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In your Azure Monitor portal, update the Azure Monitor alert rules to use an action group with a standard webhook:

   a. Create an action group with *`action type=webhook`*, and provide the URL that includes the user ID and password of the ServiceNow user in the endpoint.
   For example:

   ```
   https://<username>:<password>@<instance-name>.service-now.com/
   api/sn_em_connector/em/inbound_event?source=azuremonitor
   ```

   Note:
   If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

   b. In the Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

Result
Alerts start flowing from the Azure Monitor into the Event Management plugin. The plugin extracts information from the original Azure Monitor alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

What to do next
If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Integrate Azure with REST API key token

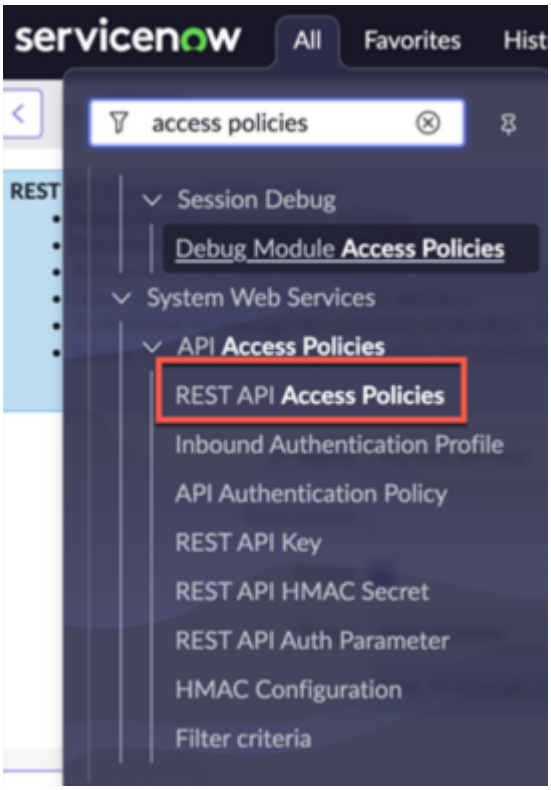
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin
Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

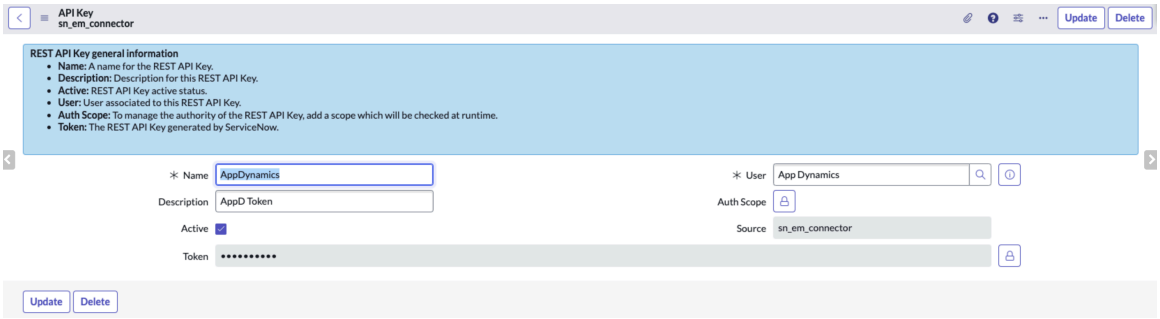
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Azure Monitor with OAuth authentication

Integrate Microsoft Azure with Event Management by authenticating Azure V1 or V2 tokens in the Azure Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Roles required: evt_mgmt_admin, web_service_admin, and oauth_admin

About this task

Configure the Event Management environment for the collection of events from Azure Monitor. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using V1 or V2 tokens.

Procedure

1. In the Azure Monitor portal:

   a. Perform app registration and expose an API.
   For more information about registering an app and exposing an API in Azure, see https://docs.microsoft.com/en-us/azure/active-directory/develop/quickstart-configure-app-expose-web-apis.

   b. Create an action group with a secure webhook, and provide the rest endpoint as `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the secure webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

For servicenowservices.com instances, the rest endpoint has to be `https://<instance-name>.servicenowservices.com/api/sn_em_connector/em/inbound_event?source=azuremonitor`.

For more information about adding a secure webhook to an action group, see https://docs.microsoft.com/en-us/azure/azure-monitor/platform/action-groups.

c. Navigate to **Alerts** > **Manage Alert Rules**.

d. In the Secure Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

e. Add the action group with the secure webhook to an alert rule.

2. In the Azure Monitor portal, verify which Azure token is in use by your registered application.

a. Navigate to **App Registration**, and select the registered application.

b. In the Manage section, click **Manifest**.

c. In the editor screen, select the **Microsoft Graph App Manifest** tab and locate the *requestedAccessTokenVersion* parameter or select the **AAD Graph App Manifest** tab and locate the *accessTokenAcceptedVersion* parameter.
If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **2**, the integration must use V2 tokens.

If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **1** or **null**, the integration must use V1 tokens.

3. In your ServiceNow AI Platform instance, ensure that the ServiceNow user is assigned with the correct Application (client) ID or Application ID URI.
Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.

a. Navigate to **System Security** > **Users and groups** > **Users**.

Note:
To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

b. Verify that the **Source** field for the ServiceNow sys_user is populated with the correct Application (client) ID or Application ID URI, as defined in the Azure Monitor portal.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the application is using an Azure V1 token, the **Source** field must be populated with the Application ID URI of the registered application. If the application is using an Azure V2 token, the **Source** field must be populated with the Application (client) ID of the registered application.

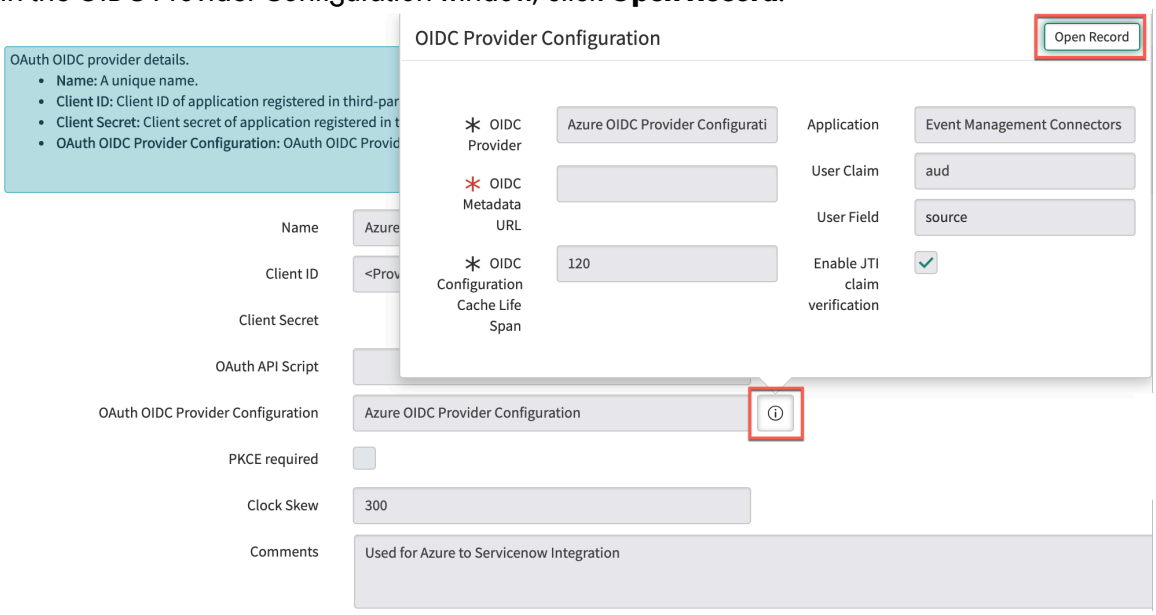
If the **Source** field is not displayed, change the form layout to display this field. Click the context menu icon ( ) and select **Configure > Form Layout**. Move **Source** to the Selected list.

Note:
If your ServiceNow AI Platform instance version is earlier than Paris Patch 2 or Orlando Patch 9, the **Source** field value must be enclosed in square brackets. For example, `[api://azuretest]`.

4. In your ServiceNow AI Platform instance, navigate to **Event Management** > **Integrations** > **Azure OAuth Config**.
5. Click **Azure OAuth OIDC Entry** and enter the `Client ID`.
   If the registered application is using an Azure V2 token, the `Client ID` should be the same as the `Application (client) ID` of the app registrations defined in your Azure Monitor portal.

   If the registered application is using an Azure V1 token, the `Client ID` should be the same as the `Application ID URI` of the app registrations defined in your Azure Monitor portal (the exposed API).

6. In the **OAuth OIDC Provider Configuration** field, click the info icon ( ).
7. In the OIDC Provider Configuration window, click **Open Record**.



8. Enter the `OIDC Metadata URL` according to the Azure token used by the registered application, as shown in the following table.

Result

When an alert is created in Azure Monitor as part of the alert rule, the notification is sent to the ServiceNow AI Platform using the secure webhook endpoint. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events. If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector .

Configure Azure Monitor Bi-directional connector

The Azure Monitor Pull connector sends information from ServiceNow Event Management to the Azure Portal. The pull connector sends the alert state changes from the ServiceNow environment to the Azure Portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

When an alert is triggered in the Azure Portal a Secure Webhook is created to send the alert notifications into ServiceNow. The Azure Monitor Connector will receive the alert notification as an event in the ServiceNow instance.

The Azure Monitor Bi-directional connector is supported in the following ServiceNow AI Platform versions:

- Quebec Patch 9 or later.
- Rome Patch 3 or later.
- San Diego.

Role required: evt_mgmt_admin

About this task

When you configure the Azure Monitor Bi-directional Connector, the bi-directional exchange of values to and from the external event source is enabled. When an alert is **Acknowledged**/**Closed**/**Reopened** on the ServiceNow instance, the state changes in the Azure Portal alert using the bi-directional connector.

These scenarios describe the default bi-directional functionality for the Azure Monitor connector:

- When an alert is closed in the Azure Portal, it is automatically closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because closing the event received from the Azure Portal will close the alert.
- When an alert is manually closed in ServiceNow, all the associated Azure alerts will be closed in the Azure Portal.
- If the alert state is changed to **Reopen** in ServiceNow, all the associated Azure alerts will be opened in the Azure Portal.
- When an alert is **Acknowledged** in ServiceNow, all the associated Azure alerts will be acknowledged in the Azure Portal.

Note:
For changing the alert state on the Azure Portal, Mid Server gets access token connecting to https://login.microsoftonline.com/ and to change the alert state on the Azure portal Mid Server calls changestate API on URL https://management.azure.com/ as described in https://learn.microsoft.com/en-us/rest/api/monitor/alertsmanagement/alerts/change-state?view=rest-monitor-alertsmanagement-2023-07-12-preview&tabs=HTTP.

Procedure

1. For a single tenant, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **Azure Monitor**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the **Active** check box.

  For this configuration, the **Host IP** field has no functional impact and is not used, so a dummy IP address (1.1.1.1) is provided.

- In the **Credential** field, add the Azure Service Principal credentials that has authorization to perform actions.

  To change the alert state, the service principal must have the Microsoft.AlertsManagement permissions and the Monitoring Contributor role.

- Select or add the MID Server to be used for this connector.

  If alerts on the MS Azure portal are not updating as expected, check the MID Server logs for errors.

2. For multiple tenants, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **New**.
   - In the **Name** field, enter the name of <new_connector_instance_name> that you have mentioned in the URL for secure webhook at Integrate Azure Monitor with OAuth authentication.
   - In the Host IP, enter any dummy IP address such as 1.1.1.1.
   - In the **Credential** field, add the Azure Service Principal credentials of that tenant that has authorization to perform actions.
   - Select the **Bi-directional** check box.
   - Select or add the MID Server to be used for this connector.
   - Select **Submit**.
   - Select the **Active** check box.
   - Select **Update**.

What to do next

Multiple alerts from the Azure Portal may be mapped to a single ServiceNow alert by de duplication. The mapping between the ServiceNow alert and Azure alerts will be maintained in the sn_em_connector_event_data table. The retention of records will depend on the alert's state:

- If the Azure Bi-directional Connector is not active, the records will be deleted in 2 days.
- When the Azure Bi-directional Connector is active:
  - If the alert is in a closed state, then it will retain the data for 7 days. This duration can be customized by the sn_em_connector.eventdata_closedevent_interval system property.
    - If the closed alert is re-opened in 7 days then it will reopen the corresponding closed alerts from the Azure Portal.
    - If the closed alert is re-opened after 7 days then it will not reopen the corresponding closed alerts from the Azure Portal.
  - If the alert is in an open state, then it will retain the data for 30 days. . This duration can be customized by the sn_em_connector.eventdata_openevent_interval.
    - If you want to close or acknowledge an open ServiceNow alert in 30 days, you will be able to close or acknowledge all corresponding Azure alerts on the Azure Portal.
    - If you want to close or acknowledge an open ServiceNow alert after 30 days, you will not be able to close or acknowledge all corresponding Azure alerts on the Azure Portal.

Event collection from Microsoft Azure Monitor

The MID WebServer Event Collector enables you to collect JSON formatted event messages sent from the Microsoft Azure portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

JSON formatted event messages are sent from Microsoft Azure. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidAzureMonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Azure Monitor Mid Push Connector**.

The default format of the URL to push event messages from Microsoft Azure to the MID Server is `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Serv api/mid/em/inbound_event?Transform=TransformEvents_MidAzureMonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

Procedure

1. In the Azure Monitor Portal, make sure the MID Server IP is accessible from the Azure portal and the MID rest point is accessible from Microsoft Azure or install the MID Server on a Azure VM and provide the Azure VM public address in the URL and allow the mid_web_Server_port in **Azure VM** > **Networking Settings** > **Inbound port rules**.
2. Create an action group with a webhook and provide the rest endpoint as `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Se`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
api/mid/em/inbound_event?
Transform=TransformEvents_MidAzureMonitor
```

Note:
For more information about adding a webhook to an action group, see Create and manage action groups in the Azure portal on the Microsoft documentation site.

3. In the Webhook section, make sure **Yes** is selected for the **Enable the common alert schema** option.
4. Navigate to **Alerts** > **Manage Alert Rules**.
5. Add the action group with the webhook to an alert rule.

What to do next
If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Event collection from BMC TrueSight and BMC TrueSight_v2

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from BMC TrueSight Operations Management (TrueSight), previously known as BMC ProactiveNet Performance Management (BPPM), utilizing event stream notification capabilities.

Before you begin
Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task
JSON formatted event messages are sent from BMC TrueSight. The MID Server transforms the collected event messages by parsing them using the TransformEvents_bmcTrueSight script include, located here: **Event Management** > **Integrations** > **Listener Transform Scripts**. In the Listener Transform Scripts page, click **TransformEvents_bmcTrueSight**.

The default format of the URL to push event messages from BMC TrueSight to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight`.

The default format of the URL to push event messages from BMC TrueSight_v2 to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight_v2`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server Extension. However, encode the password in BASE64. For example, if the MID Web Server Extension password is `admin`, in this case use `YWRtaW4=` as the password for MID_Web_Server_Password. To determine the BASE64 value, you can use the utility at this website: https://www.base64encode.org/

The following procedure describes the collection of JSON formatted event messages using basic authentication. For more information about supported authentication methods, see Configure the MID Web Server extension.

Procedure

1. In BMC TrueSight, set the MID WebService Event Collector as the target for BMC TrueSight notification, using these parameters:

Variables in the generic BMC URL

Variable	Description
serverHost	Name of the BMC TrueSight server.
port	Number of the BMC TrueSight port.

2. In the message body and generic BMC URL, replace the parameters with the values in the preceding table and connect to BMC TrueSight.
Use the BMC Publish-Subscribe REST approach to create a stream event subscription and send event messages in JSON format. The generic format of the BMC URL to create a stream event subscription is: `http|https://<serverHost>:<port>/bppmws/api/stream/subscribe?dataType=event`. For example: `http://TrueSight1server:40/bppmws/api/stream/subscribe?dataType=event`.

Result

Example of mapping event messages to event fields in the Event (em_event) table

Event field	Event message
node	mc_host
type	mc_object_class
metric_name	mc_parameter
resource	mc_object

Integrate Dynatrace platform events

Integrate Dynatrace with Event Management by adding the Dynatrace Monitor as an authenticated data source.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Dynatrace Monitor V1 or V2 access tokens. For more information, see Integrate Dynatrace with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Dynatrace Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Dynatrace with basic authentication.

Note:
When a problem is reopened in Dynatrace, the original start time is retained and not updated to the time of reopening. This behavior is intentional and reflects how Dynatrace manages the problem lifecycle. Problems reopened within the defined reopening period (typically 30 minutes) are treated as a continuation of the original issue. The start time continues to reflect the timestamp of the earliest triggering event, even after reopening.

Do not use the evidence details timestamp as a substitute for the problem start time. The evidence timestamp refers to individual contributing events within the problem. It is part of the Root Cause Analysis (RCA) and does not indicate the start or duration of the overall problem.

Starting from the Xanadu release, the base system rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note:
This feature applies only to active event rules.

Integrate Dynatrace with basic authentication

Integrate Dynatrace with Event Management by adding a standard webhook in the Dynatrace console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that configuration items for the hosts managed by Dynatrace exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required: evt_mgmt_integration and web_service_admin

About this task

Configure the Event Management environment for the collection of events from Dynatrace by authenticating Dynatrace as a data source. In your Dynatrace console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Procedure

1. In your Dynatrace console, define Host Naming rules:
   a. Navigate to **Settings** > **Monitoring** > **Host Naming**.
   b. Define the Host Naming rules for each cloud provider (Azure/AWS/GCP) to uniquely identify a CI from ServiceNow.
   This ensures the ServiceNow CIs can be uniquely identified from the payload received from Dynatrace.

   Note:
   You do not need to create a Host Naming rule for VMware machines because Dynatrace manages them as physical servers.

2. Define anomaly detection rules:
   a. Navigate to **Settings** > **Anomaly Detection** > **Infrastructure**.
   b. In the **Hosts** tab, define rules on when to create alerts on the managed hosts.
3. Define the integration settings:
   a. Navigate to **Settings** > **Integration** > **Problem notifications** > **Add notifications**.
   b. In the Set up custom integration form, add the Webhook URL: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace`
   For basic authentication, select **Create basic authorization header**. You can see the username and password fields for the user.
   c. Enter the user name and password of the relevant user.

      Note:
      Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. In the Custom payload section, add in the following payload structure for the events that will be generated.

```
{
  "connectionId": <connections_alias_sys_id>,
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

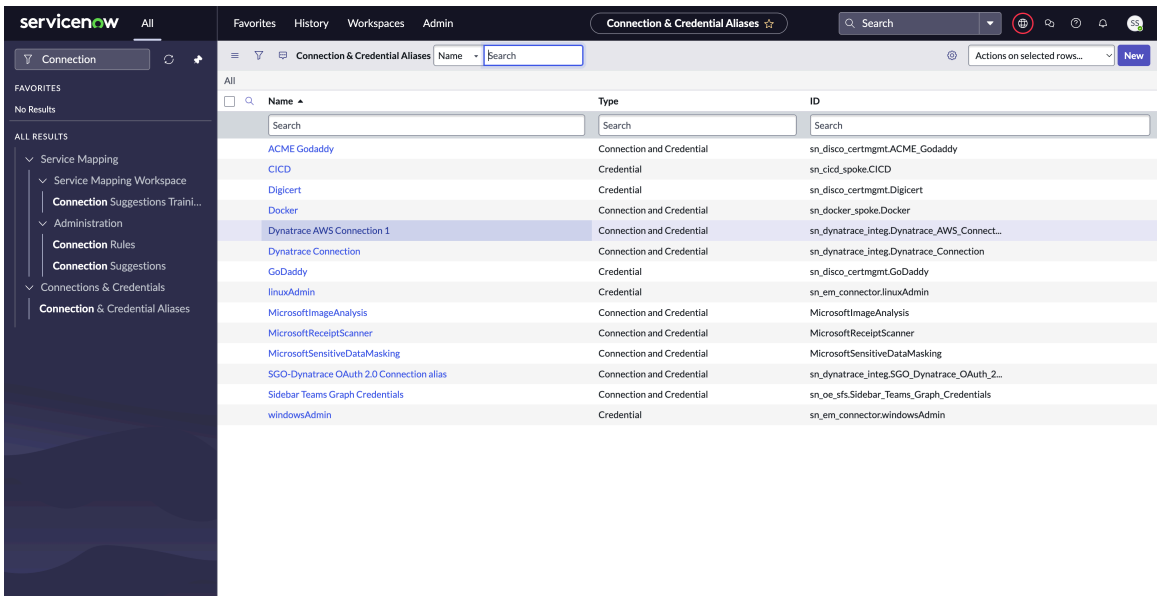
```
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
  "Tags": "{Tags}"
}
```

Note:

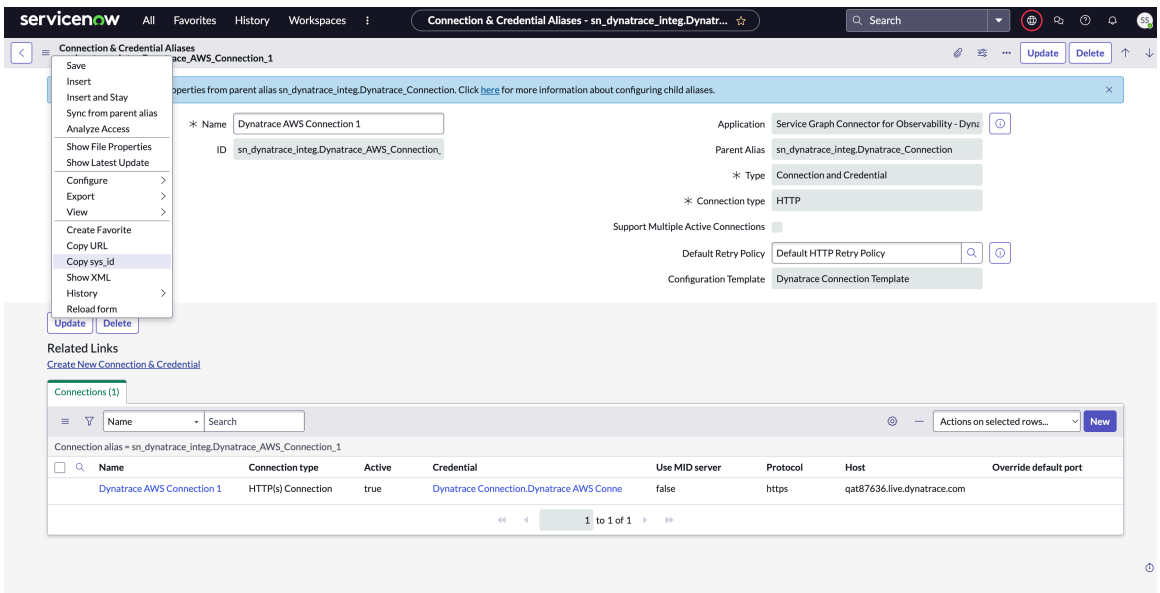
For the <connections_alias_sys_id>:

i. Navigate to **All** > **IntegrationHub** > **Connection & Credentials** > **Connection & Credential Aliases**.

ii. Select to open the connector for which you want to get the <connections_alias_sys_id>.



iii. Right-click the context menu (☰) and then select **Copy sys_id**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Alerts start flowing from the Dynatrace console into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

Note:
By default, host binding is enabled for Dynatrace events for all providers (Azure/AWS/Google). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Dynatrace - General** event rule. For further information about Event rules, see Event rules.

Integrate Dynatrace with OAuth authentication

Integrate Dynatrace with Event Management by authenticating Dynatrace V1 or V2 tokens in the Dynatrace Monitor.

Before you begin
Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Dynatrace exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task
Dynatrace integration with OAuth authentication is available starting from the Washington DC platform release or later.

Procedure
1. Configuration on the ServiceNow instance.

   a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.
      - Type: true|false
      - Value: true

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. From the page header, select the **More** options icon.

iv. Select **Configure** > **Form Layout**

v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

vi. **Save** or **Update** the form.

vii. For the **OAuth Application User** field, select the user.

The user must have the evt_mgmt_integration role that will be used to create the events sent by Dynatrace.

> **Note:**
> To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Dynatrace console, define the integration settings.

a. Navigate to **Settings** > **Integration** > **Problem notifications** > **Set up notifications**.

b. In the Set up custom integration form, webhook URL.

```
https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace
```

c. Enable **Use OAuth 2.0 for authentication**.

d. In the OAuth 2.0 credentials section, perform the following steps.

i. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.

ii. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.

iii. Provide “Client secret” with the client secret of the OAuth Entity Client created in ServiceNow instance.

iv. Select **Save**.

e. In the Custom payload section, add in the following payload structure for the events that will be generated. Ensure that `ImpactedEntities` and `ProblemDetailsJSONv2` are passed as JSON objects, not strings.

```
{
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
```

```
  "Tags": "{Tags}"
}
```

Result

Alerts start flowing from Dynatrace agents into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

Note:
By default, host binding is enabled for Dynatrace events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Dynatrace - General event rule. For further information about Event rules, see Event rules.

Integrate New Relic platform events

Integrate New Relic with Event Management by adding a standard webhook in the New Relic old and new consoles.

Before you begin

Verify that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from New Relic by authenticating New Relic as a data source. Set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook. Use procedure step 1 for the new console. Use procedure step 2 for the old console.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. For the new console:

   a. Create a destination.

      i. Navigate to **Alerts & AI** > **Destinations**.

      ii. In the **Add destinations** section, select the **Webhook** channel type.

      iii. In the **Webhook name** field, enter the webhook name.

      iv. In the **Endpoint URL** field enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

      v. In the **Basic Auth** section, enter your user name and password.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

vi. Select **Save destination**.

b. Create a policy.

i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

ii. Select **New Alert policy** and define a policy.

iii. Select **Set up Notifications**.

iv. In the **Add Channel** section select **Webhook**, and then select the destination that you created in the previous substep.

v. In the **Payload template** section, paste the following JSON payload.

```
{ "account_id": {{nrAccountId}}, "account_name": {{json
 accumulations.tag.account.[0]}}, "closed_violations_count":
 {{closedIncidentsCount}}, "open_violations_count":
 {{openIncidentsCount}}, "condition_description":
 "{{escape accumulations.conditionDescription.[0]}}",
 "condition_family_id":
 {{accumulations.conditionFamilyId.[0]}}, "condition_name":
 "{{escape accumulations.conditionName.[0]}}",
 "current_state": {{json state}}, "details":
 {{json issueTitle}}, "duration": {{#if
 issueDurationMs}}{{issueDurationMs}}{{else}}0{{/if}},
 "event_type": "INCIDENT", "incident_acknowledge_url":
 {{json issueAckUrl}}, "incident_id": {{json issueId}},
 "incident_url": {{json issuePageUrl}}, "metadata":
 { {{#if locationStatusesObject}}"location_statuses":
 {{json locationStatusesObject}},{{/if}} {{#if
 accumulations.metadata_entity_type}}"entity.type":
 {{json accumulations.metadata_entity_type.[0]}},{{/if}}
 {{#if accumulations.metadata_entity_name}}"entity.name":
 {{json accumulations.metadata_entity_name.[0]}},{{/if}}
 "section": "metadata" }, "owner": {{json owner}},
 "policy_name": {{json accumulations.policyName.[0]}},
 "policy_url": {{json policyUrl}}, "runbook_url": {{json
 accumulations.runbookUrl.[0]}}, "severity": {{json
 priority}}, "targets": [ { "id": "{{labels.targetId.[0]}}",
 "name": "{{#if accumulations.targetName}}{{escape
 accumulations.targetName.[0]}}{{else
 if entitiesData.entities}}{{escape
 entitiesData.entities.[0].name}}{{else}}N/A{{/if}}",
 "link": "{{issuePageUrl}}", "product":
 "{{accumulations.conditionProduct.[0]}}", "type": "{{#if
 entitiesData.types.[0]}}{{entitiesData.types.[0]}}{{else}
}N/A{{/if}}", "labels": { {{#each
 accumulations.rawTag}}"{{escape @key}}": {{#if
 this.[0]}}{{json this.[0]}}{{else}}"empty"{{/if}}{{#unless
 @last}},{{/unless}}{{/each}} } } ], "timestamp":
 {{updatedAt}}, "violation_callback_url": {{json
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
issuePageUrl}}, "violation_chart_url": {{json
violationChartUrl}} }
```

vi. Select **Send test notification** to get the test event in your ServiceNow instance.

vii. Select **Save message**.

viii. Select **Activate workflow** to activate the workflow.

c. Create alert conditions to apply to the policy:

i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

ii. Select **Create alert condition**, define the required alert details, and add it to the policy you created in the previous step.

iii. Select **Save Condition**.

2. For the old console.

a. Create a notification channel.

i. Navigate to **Alerts & AI** > **Notification channels**.

ii. In the **Channel details** tab, select the **Webhook** channel type.

iii. In the **Base Url** text box, enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

iv. In the Basic Auth section, enter the user name and password of the relevant user.

> **Note:**
> Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

v. In the **Custom Payload** section, select **Add Custom Payload**, and select the **JSON** payload type.

vi. Paste the following JSON payload into the **Custom Payload**.

```
{ "account_id": "$ACCOUNT_ID", "account_name":
 "$ACCOUNT_NAME", "closed_violations_count_critical":
 "$CLOSED_VIOLATIONS_COUNT_CRITICAL",
 "closed_violations_count_warning":
 "$CLOSED_VIOLATIONS_COUNT_WARNING",
 "condition_description": "$DESCRIPTION",
 "condition_family_id": "$CONDITION_FAMILY_ID",
 "condition_name": "$CONDITION_NAME", "current_state":
 "$EVENT_STATE", "details": "$EVENT_DETAILS",
 "duration": "$DURATION", "event_type":
 "$EVENT_TYPE", "incident_acknowledge_url":
 "$INCIDENT_ACKNOWLEDGE_URL", "incident_id": "$INCIDENT_ID",
 "incident_url": "$INCIDENT_URL", "metadata":
 "$METADATA", "open_violations_count_critical":
 "$OPEN_VIOLATIONS_COUNT_CRITICAL",
 "open_violations_count_warning":
 "$OPEN_VIOLATIONS_COUNT_WARNING", "owner": "$EVENT_OWNER",
 "policy_name": "$POLICY_NAME", "policy_url": "$POLICY_URL",
 "runbook_url": "$RUNBOOK_URL", "severity": "$SEVERITY",
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"targets": "$TARGETS", "timestamp": "$TIMESTAMP",
"violation_callback_url": "$VIOLATION_CALLBACK_URL",
"violation_chart_url": "$VIOLATION_CHART_URL" }
```

b. Create a policy.

i. Navigate to**Alerts & AI** > **Policies**.

ii. Select**New Alert policy**and define a policy.

iii. In the**Notification Channels**section, select**Add**, select**Webhook**, and then select the channel you created in the previous step.

c. Create alert conditions to apply to the policy:

i. Navigate to**Infrastructure** > **Settings** > **Alerts**.

ii. Select**Create alert condition**, define the required alert details, add it to the policy you created in the previous step.

iii. Select**Create**.

Result

Alerts start flowing from the New Relic console into the Event Management plugin. The plugin extracts information from the original New Relic alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to**All Events**to see the events.

Note:
By default, host binding is enabled for New Relic events for all providers (Azure/AWS/GCP). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the**New Relic - General**event rule. For further information about Event rules, see Event rules.

Integrate New Relic with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

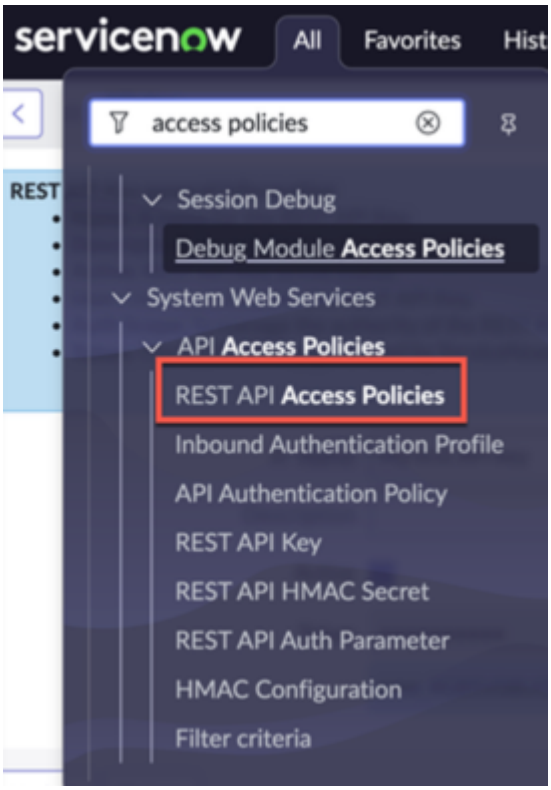
Before you begin

Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

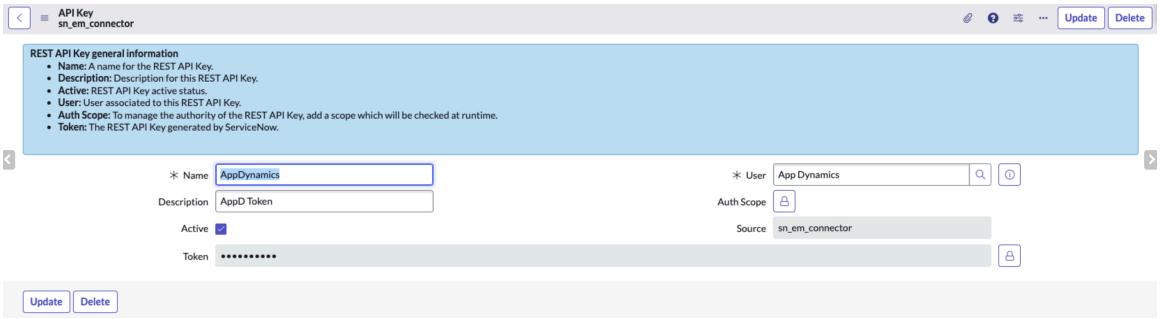
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Catchpoint events

Integrate Catchpoint with Event Management by adding an alert webhook in the Catchpoint platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from Catchpoint by authenticating Catchpoint as a data source. In the Catchpoint platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

Procedure

1. In the Catchpoint platform, create an alert webhook destination.

   a. Login to the Catchpoint platform.

   b. Navigate to **Catchpoint** > **Setting** > **API** > **Alert Data Webhook** to set the webhook endpoint.

   c. In the API Alert Webhook, provide the following details.

API Alert Webhook form

Field	Value
Name	Any name based on your requirement.
URL	The default format of the URL to push events from Catch Point to the ServiceNow AI Platform instance, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	em/inbound_event?source=catchpoint.
On Failure Alert	The email address for the API Alert webhook.
Notification Trigger	Select based on your requirement. The default value is 3.
Add the following headers	▪ Authorization: **Basic {Base 64 | username:password}** ▪ Content-Type: **application/json**
Format	Select **Template** and add the following template: `{ "Source": "CatchPoint", "severity": "${notificationLevelId}", "alertType": "${AlertType}", "time_of_event": "${alertCreateDateUtc(YYYY-MM-DD HH:MI:SS)}", "monitorType": "${Switch(${MonitorTypeId},'0', 'IE','2', 'Object','3','Emulated','8', 'Ping','9', 'Tracert','10', 'DNS-Traversal','11', 'Ping-TCP','12', 'DNS-Exp', '13','DNS-Direct', '14','Tracert-UDP', '15', 'Port-TCP','16', 'FTP','17', 'Data-Push-API','18', 'Chrome','19', 'Playback', '20', 'Playback-Mobile', '21', 'SMTP', '22', 'Port-UDP', '23', 'Ping-UDP', '24', 'Streaming', '25', 'API', '26', 'Mobile', '27', 'SFTP', '28', 'SSH', '29', 'Tracert-TCP')}", "testName": "${TestName}", "testId": "${TestId}", "testUrl": "${TestUrl}", "testPath": "${testPath}", "testLink": "${testLink}", "productName": "${ProductName}", "clientId": "${ClientId}", "productId": "${productId}", "nodeName":"${nodeDetails("${nodeName}")}",`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	"nodeClientServerAddress":"${nodeDetails(\"${NodeClientAddress},\"),}", "nodeServerAddress": "${nodeDetails(\"${nodeServerAddress},\"),}", "Labels" : "${testLabels}", "addtionalInformation": "Test initial URL: ${testUrl}\n\nAlert type: ${AlertType}\n\nScatter Chart: ${scatterplotChartURL}\n\nWaterfall Chart: ${waterfallChartURL}\n\nTest properties: ${testLink}\n\nTest time of run / Test time of alert (Central Time): ${reportDateLocal(YYYY-MM-DD HH:MI:SS)} / ${alertCreateDateLocal(YYYY-MM-DD HH:MI:SS)}"}

2. For the HTTP Endpoint monitoring tests, in the ServiceNow instance, create a CI.

> **Note:**
> The Catchpoint connector supports multiple types of monitoring tests such as Endpoint, Networking, and others. The following steps apply only to the HTTP Endpoint monitoring tests.

   a. Navigate to **Configuration** > **CI Class Manager**.

   b. Click **Hierarchy** and search for **HTTP(S) Endpoint**.

   c. In the CI Type field, select **cmdb_ci_endpoint_http**.
   If the services are not modeled, then you should manually add the CIs under the [cmdb_ci_endpoint_http] table. Also, the manual endpoint should be removed before the automatic discovery of services. For other type tests CI bindings, you can create Event rules based on their requirements.

Result

Alerts start flowing from the Catchpoint connector into the Event Management plugin. The following table shows how the Catchpoint severity mapping translates into the ServiceNow mapping.

Severity levels between Catchpoint and ServiceNow

Catchpoint severity	ServiceNow severity
0	Warning
1	Critical
2/3	Clear

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate Datadog platform events

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Datadog Monitor V1 or V2 access tokens. For more information, see Integrate Datadog with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Datadog Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Datadog with basic authentication.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Integrate Datadog with basic authentication

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

- Role required: evt_mgmt_integration
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

About this task

Configure the Event Management environment for the collection of events from Datadog. In your Datadog console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Procedure

1. In the Datadog console, add cloud provider tags:

   a. Navigate to **Menu** > **Infrastructure** > **Infrastructure List**

   b. Click **Inspect** for the VM on which the Datadog agent is installed.

   c. Click **Edit Tags** and add the *`cloud_provider`* tag.
   The tag should be suffixed with the value of **aws**, **azure**, or **gcp** to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click **Save Tags** to save the new tag.

> **Note:**
> Datadog adds the *cloud_provider* tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

2. In the Datadog console, add a webhook:

a. Navigate to **Menu** > **Integration** > **Integrations**, and search for webhooks.

b. Create a webhook that includes the user ID and password of the ServiceNow user in the endpoint.
For example, use `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=datadog`.

> **Note:**
> Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

c. Add in the following payload structure.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

3. In the Datadog console, define rules:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Menu** > **Monitors** > **Manage Monitors**, and configure rules on when to create a problem from Datadog on the managed hosts.

b. In the **Notify your team** section, select the webhook on which the problem should be notified.

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

Note:
By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Datadog - General** event rule. For further information about Event rules, see Event rules.

Integrate Datadog with OAuth authentication

Integrate Datadog with Event Management by authenticating Datadog V1 or V2 tokens in the Datadog Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task

Datadog integration with OAuth authentication is available starting from the Washington DC platform release or later.

Procedure

1. Configuration on the ServiceNow instance.

a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.

- Type: true|false
- Value: true

b. Create an OAuth Entity endpoint for clients to access the instance.

i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

iii. To create an OAuth client record, select **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

ii. Open the created OAuth client record.

iii. From the page header, select the **More** options icon.

iv. Select **Configure** > **Form Layout**

v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

vi. **Save** or **Update** the form.

vii. For the **OAuth Application User** field, select the user.

The user must have the evt_mgmt_integration role that will be used to create the events sent by Datadog.

Note:
To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Datadog console, add cloud provider tags.

a. Navigate to **Menu** > **Infrastructure** > **Infrastructure List**.

b. Select **Inspect** for the VM on which the Datadog agent is installed.

c. Select **Edit Tags** and add the cloud_provider tag.

The tag must be suffixed with the value of aws, azure, or gcp to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws.

d. Select **Save Tags**.

Note:
Datadog adds the cloud_provider tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

3. In the Datadog console, add a webhook.

a. Navigate to **Menu** > **Integration** > **Integrations** and search for webhooks.

b. On the webhook tile, select **Configure**.

c. Select the **Auth Methods** tab and then select **New Auth Method**.

d. Enter the name and select the protocol as **OAuth 2.0 Client Credentials**.

e. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.

f. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.

g. Provide “Client secret” with the client secret of the OAuth Entity Client created in ServiceNow instance.

h. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Create webhook URL as

```
https://<instance-name>.service-now.com/api/sn_em_connector/
em/inbound_event?source=datadog
```

j. Select the OAuth Method created in the previous steps in AuthMethod dropdown.

k. Add in the following payload structure.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

Note:
By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Datadog - General event rule. For further information about Event rules, see Event rules.

Integrate Google Cloud Platform (GCP) events

Integrate Google Cloud Platform (GCP) with Event Management by adding a standard webhook in the GCP console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify Configuration Items for the hosts managed by GCP exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- The Event Management Connector plugin supports GCP alert data in JSON 1.2 format only.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from GCP. In your GCP console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the GCP console, add a webhook.
   a. Navigate to **Monitoring** > **Alerting**, and click **Edit Notification Channels**.
   b. In the Webhooks section, click **Add New**.
   c. Select the **Use HTTP Basic Auth** check box, and enter the user name and password of the relevant ServiceNow user.

      Note:
      Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Enter the endpoint URL.
      For example, use`https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=googlemonitor`.
2. In the GCP console, create an alerting policy.
   a. Navigate to **Monitoring** > **Alerting**, and select **Create Policy**.
   b. Configure policy conditions that initiate alerts when the conditions are violated.
   c. Select the webhook on which the problem should be notified.

      Note:
      If you need to directly open an incident in the GCP console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**.

Result

Alerts start flowing from GCP into the Event Management plugin. The plugin extracts information from the original GCP alert message to populate the required event fields and inserts the event

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

into the database. In your ServiceNow AI Platform instance, navigate to**All Events** to see the events.

GCP does not send values such as the severity level in the payload. The default severity is Minor, which can be changed in the*Push Connector Configuration* section of **Push Connectors** > **Google Monitor Push Connector**. The valid values of severity are**1- Critical**,**2- Major**,**3- Minor**,**4- Warning**, and**5- Info**.

Note:

To map the GCP hosts to the**cmdb_ci_server**record instead of**cmdb_ci_vm_object**, disable the**Google Monitor - General**event rule created for GCP. For further information about event rules, see Event rules.

Event collection from Google Cloud Platform (GCP)

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from Google Cloud Platform (GCP).

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from Google Cloud Platform. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidGoogleMonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Google Monitor Mid Push Connector**.

The default format of the URL to push event messages from the GCP to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Google Cloud Platform (GCP) console, make sure the MID Server IP is accessible from the GCP console and MID rest point is accessible from GCP or install the MID Server on a GCP VM and provide the GCP VM external IP address in the URL.
   In the GCP console, create a firewall rule.
   a. Navigate to **VPC Network** > **Firewall** > **Create Firewall**.
   b. Set the direction to **ingress** to allow the mid_web_server_port to connect.
   c. Add the GCP VM that the MID Server is installed on to the **Applicable to instances** list.
2. In the GCP console, add a webhook.
   a. Navigate to **Monitoring** > **Alerting** and click **Edit Notification Channels**.
   b. In the Webhooks section, click **Add New**.
   c. Select the **Use HTTP Basic Auth** check box, and enter the username and password of the MID Webserver User.

      Note:
      Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Enter the endpoint URL.
      For example, use `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`
3. In the GCP console, create an alerting policy.
   a. Navigate to **Monitoring** > **Alerting** and click **Create Policy**.
   b. Configure the policy conditions that initiate alerts when the conditions are violated.
   c. Select the webhook notification channel on which the problem should be notified.
   d. Select the **Notify on incident closure** check box to send the closure events to the MID Server and save the alert policy.

      Note:
      If you need to directly open an incident in the GCP Console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**. For more information about creating an alert policy, see Managing alerting policies on the Google Cloud documentation site.

Result

GCP does not send values such as the severity level into the payload. The default severity is Minor, which can be changed in the *Push Connector Configuration* section of **Push Connectors** > **Google Monitor MID Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

© 2025 ServiceNow, Inc. All rights reserved.

Integrate Grafana events

Integrate Grafana with Event Management by adding a standard webhook in the Grafana console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- The CI binding happens through the IP, instances should be discovered as servers to initiate the binding. CIs discovered through cloud or CIs in **cmdb_ci_vm_object** don't get bounded as Grafana doesn't provide any information for object IDs.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Grafana. In your Grafana console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Note:
Perform steps 1 and 2 for Grafana v7.4.3. For Grafana v9.3.2. skip to step 3.

Procedure

Grafana v7.4.3

1. In the Grafana console, create a notification channel.
   a. Navigate to **Alerting** > **Notification Channels**.
   b. Click **New Channel** and select the type as **Webhook**.
   c. Enter a URL.
   For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.
   d. Under the **Optional WebHook** settings, select the HTTP Method, **POST**, and enter the user name and password of the relevant ServiceNow user.

      Note:
      Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   e. Click **Test** to verify the connection.
2. In the Grafana console, create alerting rules.
   a. Click **Edit** on the required panel and then **Create Alert**.
   b. In the **Alert** tab, add the following tags:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tags	Description
Severity	(This tag is optional and has to be lower cased.) Severity with which the alert has to be created.
Count	(This tag is required, otherwise the alerts don't close automatically in ServiceNow.) The number of devices, hosts, or servers monitored by this alert rule.

c. Add the notification channel under **Notifications** in the alert rule.

d. Click **Save**.

e. Navigate to **Alerting** > **Alert Rules** to access the created rule.

Grafana v9.3.2.

3. In the Grafana console, create a contact point.

a. Navigate to **Alerting** > **Contact Points**.

b. Click **New Contact Point**, enter a name, and select the type as **Webhook**.

c. Enter a URL.
For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.

d. Under the **Optional WebHook** settings, select the HTTP Method, **POST**, and enter the user name and password of the relevant ServiceNow user.

> **Note:**
> Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

e. Click **Save** and **Test** to verify the connection.

4. In the Grafana console, create a notification policy.

a. Navigate to **Alerting** > **Notification Policies**.

b. Select **New Policy**, add matchers.
Matchers are labels that direct alert rules to the contact point.

c. Select your contact point.

d. Select **Save Policy**.

5. In the Grafana console, create alert rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Alerting** > **Alert Rule**.

b. Select **New Rule**.

c. Set the Query and Alert Condition.

d. Set the data source, metrics, and the necessary filters.

e. Set the alert evaluation behavior.

f. Enter the rule name.

g. In the summary and annotations section, add a summary or a description.

h. From the scroll down, select **+Add New**.

i. Enter the node, resource, and metric information.
This information is required for the node, resource, and metric_name fields for the event.

> **Note:**
> Use the value string to pass these values. For example, a node can be {{ $values.C0.Labels.instance }}.

j. Under custom labels, provide the required labels to direct your notifications to the appropriate contact point.

> **Note:**
> You can also pass the severity under custom labels. The same is used for events. The available severity options are: critical, major, minor, warning.

k. Click **Save**.

Result
Alerts start flowing from Grafana into the Event Management plugin. The plugin extracts information from the original Grafana alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

> **Note:**
> - For Grafana v7.4.3, you may see extra clear events coming into ServiceNow which aren't bound to an alert. Ignore them as they're created to overcome the issue of Grafana not sending information in the clear notification.
> - A severity parameter is added which is used only for Grafana 8 and above. The provided value is used as a severity for an event if the severity isn't passed in custom labels.

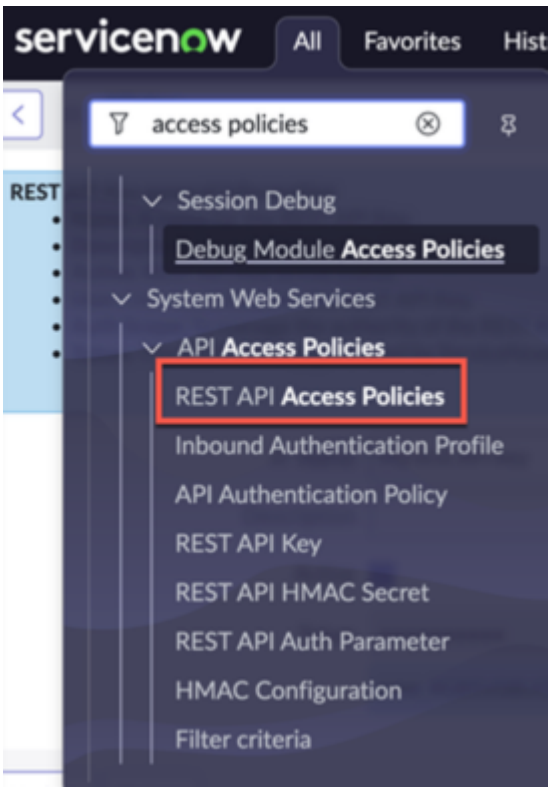
Integrate Grafana with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_integration

Procedure
1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

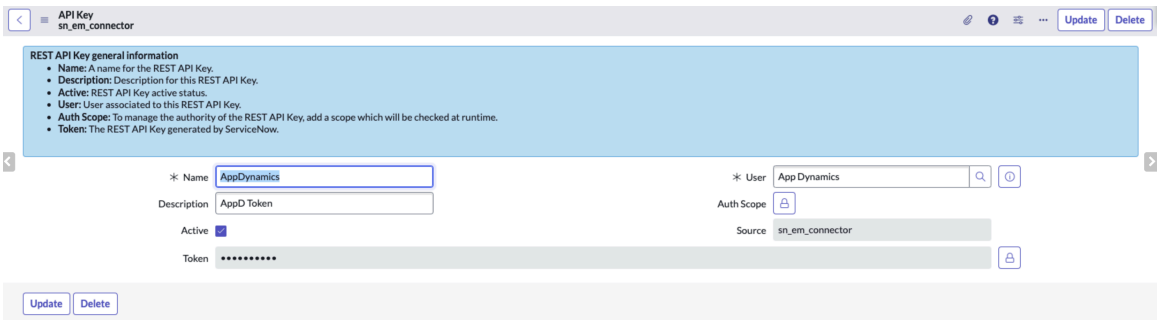
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Honeycomb events

Integrate Honeycomb with Event Management by creating a webhook and configuring it as a trigger in the Honeycomb platform.

Before you begin

Discovery for Honeycomb services and datasets is not supported. For event/CI binding to work, manually create a CI in the ServiceNow instance.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from Honeycomb by authenticating Honeycomb as a data source. In the Honeycomb platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

Procedure

1. In the Honeycomb platform, create an integration of *`type=webhook`*.

   a. Navigate to **Usage** > **Integrations**.

   b. Select the **Add Integration** button.

   c. Enter values in the **Name** and **Webhook URL** fields.
   When enting the Webhook URL, use the following format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=honeycomb`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the **Provider** field, select **Webhook**.

e. Select **Add** to complete webhook creation.

2. Add the webhook to a trigger.
   a. Navigate to **Triggers** > **Create New Trigger**.
   b. Add a name and description for the trigger in the relevant fields.
   c. In the **Alerts** section, configure the threshold and frequency in the relevant fields.
   d. In the **Recipients** section, select **Add Recipient** and select the webhook created in step 1.
   e. Select **Save Trigger**.

> **Note:**
> To view the trigger in the Honeycomb platform, navigate to **Quick Response (in Alert)** and select **Show Trigger in Honeycomb**.

Result

Alerts flow from the Honeycomb connector into the Event Management plugin. The plugin extracts information from the original Honeycomb trigger message to populate the required event fields, and inserts the event into the database. You can view the events in your ServiceNow AI Platform instance by navigating **All Events**.

Honeycomb does not send severity information in the trigger message. The default severity for the Honeycomb alert is *`3 - Minor`*, which can be changed in the Push Connector Configuration section of **Push Connectors** > **Honeycomb Push Connector** . The valid severities are: *`1- Critical`*, *`2- Major`*, *`3- Minor`*, *`4- Warning`*, and *`5- Info`*.

Integrate Instana events

Integrate Instana with Event Management by adding a standard webhook in the Instana console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. In the Instana console, navigate to **Settings** > **Events & Alerts** > **Alert Channels**.
2. Open the **Add Alert Channel** dropdown and select the **Generic Webhook** option.
3. In the **Webhook URLs** field, create an alert channel by entering the following URL:
   `https://<instance>.service-now.com/api/sn_em_connector/em/inbound_event?source=instana`
4. To authenticate the ServiceNow URL, enter the following in the **Custom HTTP Request Headers**:

Field	Value
Key	Authorization
Value	Basic <base64_encoded username:password>

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure Instana to create alerts for event types or events.

   a. Navigate to **Settings** > **Events & Alerts** > **Alerts**.

   b. Select **New Alert**.

   c. In the **Events** section, select one of the following:
      - Alert on Event Type(s)
      - Alert on Event(s)

   d. When creating alerts for event types:
      i. Select the type of events for which you want alerts to be created, such as **Critical Issues**, **All Incidents**, **Warning issues**, and so forth.
      ii. In the **Alerting** section, select the **servicenow** alert channel.

   e. When creating alerts for events:
      i. Select the events for which you want alerts to be created.
      ii. In the **Alerting** section, select the **servicenow** alert channel.

   When Instana creates an alert, the alert is sent to the ServiceNow instance. Alerts created for the host entity are bound to the Server (cmdb_ci_server) table, and alerts created for the website entity are bound to the HTTP(S) (cmdb_ci_endpoint_http) table.

   Add other entity types in the Instana - ci_type Event Field Mapping table to ensure that the entity binds with the correct CI in the ServiceNow instance.

6. To view the event in the Instana source system, you can access it from a ServiceNow instance:

   a. Navigate to **All** > **Event Management** > **Service Operations Workspace**.

   b. Select **All Alerts**.

   c. Select the relevant alert.

   d. On the **Details** tab, locate the **Actions** section on the right side of the page and in the **Show Event on Instana UI** cell, select **Launch app**.

Integrate ServiceNow Cloud Observability Events

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

Before you begin

- Role required: evt_mgmt_integration

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. Create a CI.

   Note:
   Discovery for ServiceNow Cloud Observability services isn't supported. Create a CI manually in a Service Instance (cmdb_ci_service_auto) table to enable binding.

   a. Navigate to **All** > **Configuration** > **Application Service**.

   b. Select **New**.

   c. In the form, enter the name.
   The name must be the service name provided in the ServiceNow Cloud Observability platform.

   d. From the Operational Status list, set the operational status to **Operational**.

   e. Select **Next**.

   f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

   a. From the navigation bar, select **Alerts**.

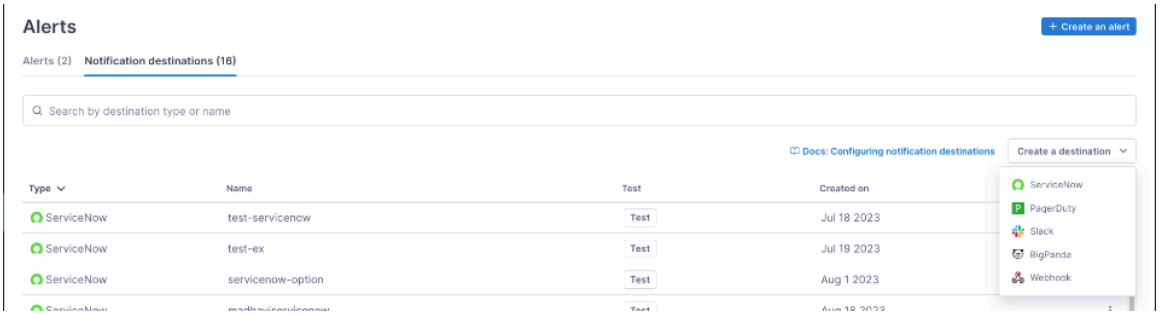
   b. Select the **Notification destinations** tab.

   c. Select **Create a destination**.

   d. Select **ServiceNow** or **webhook**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the ServiceNow destination to connect only with the ServiceNow platform. If you have any issues with the ServiceNow destination, then use the **webhook** destination option.



3. In your ServiceNow Cloud Observability platform, create a ServiceNow notification destination.

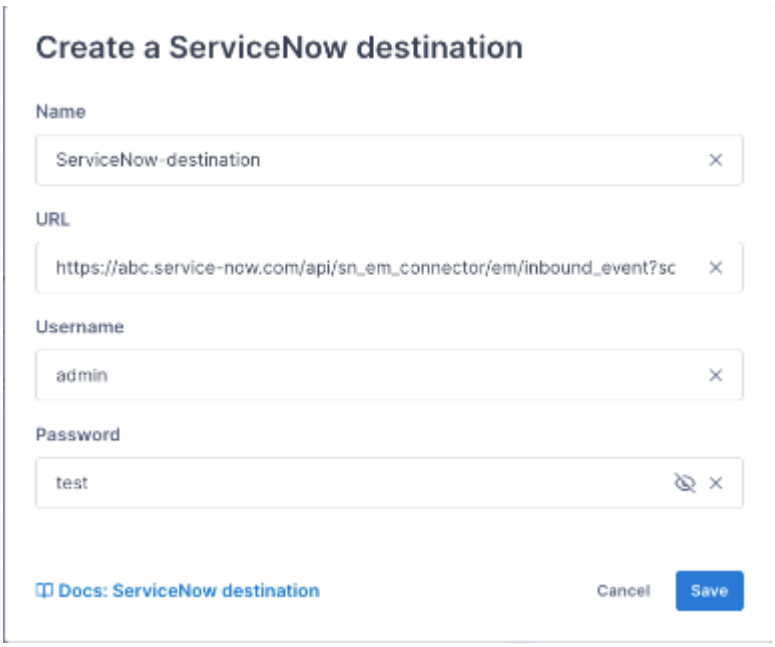
   a. In the **Name** field, enter a name for the ServiceNow destination.

   b. In the **URL** field, provide the ServiceNow instance URL.
   This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<instance-name>.servicenow.com/api/sn_em_connector/em/inbound_event?source=lightstep`

   c. In the **Username** field, enter your ServiceNow user name.

   d. In the **Password** field, enter your ServiceNow user password.

Create a ServiceNow destination



Note:
In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *`cmdb_ci_service_auto`* table.

   e. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Note:**
   If you have any issues with the ServiceNow destination in the previous step, then use the **webhook** destination option.

   In your ServiceNow Cloud Observability platform, create a **webhook** notification destination.

   a. In the **Name** field, enter a name for the webhook destination.

   b. In the **URL** field, provide the webhook URL.
   This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=lightstep`

   c. Select **Payload Template**.

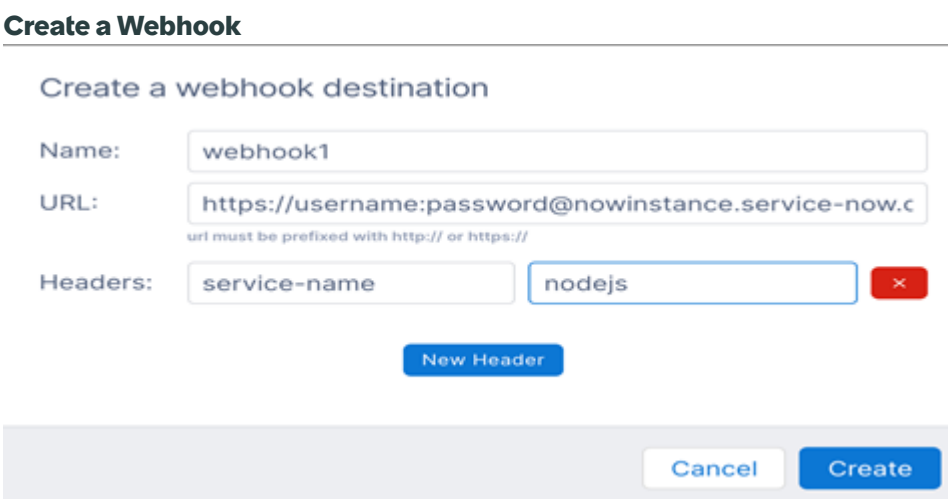
   d. Select the **ServiceNow Event Management** option.

   Note:
   In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *`cmdb_ci_service_auto`* table.

   e. If you selected the **Default Template** option in the previous substep, then select **New Header** and in the **Headers** field, enter the **service-name** and define its **value**.

   Note:
   In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the **cmdb_ci_service_auto table**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Select **Create**.

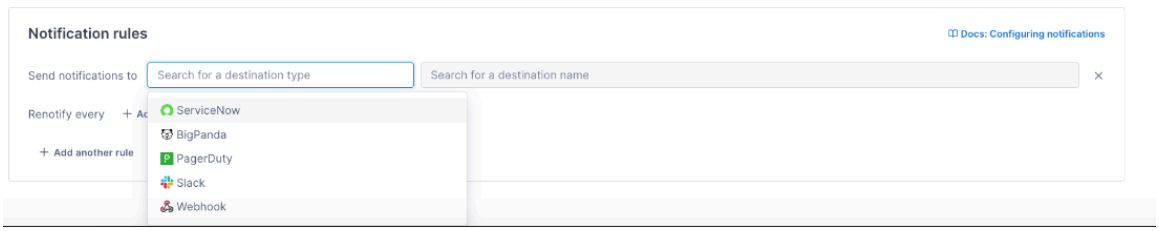
5. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, select **Alerts**.

b. Select **Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

d. According to the destination that you created, in the **Notification Rules** area, in the **Send Notifications to** field, select your notification destination type and search for the destination name.



e. Select **Save**.
The default severity for stream-based alerts is **Critical**. You can change the default in the Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

Integrate Logicmonitor events

Integrate Logicmonitor with Event Management to send events into ServiceNow by adding a webhook using Basic Authentication, it will also be available with bi-directional functionality.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Logicmonitor. In your Logicmonitor console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.

      Note:
      If you are using the bi-directional Connector update, do not select the **Acknowledged** check box. Doing so can trigger a loop back to the Alert and close the Alert record unintentionally.

   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `https://{Instance-name}.service-now.com/api/sn_em_connector/em/inbound_event?source=logicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.

b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.

c. Under the Stages section, select the Add icon to add a stage and click **Save**.

d. When you create the new stage, select the Add icon again to search for the user and add the integration as the Contact Method and click **Save**.

3. After creating the escalation chain, configure alert rules for the chain you created.

a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.

b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.

c. Under the Escalation chain menu, select the escalation chain you created.

d. Click **Save**.

Note:
To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

Event collection from Logicmonitor

The MID WebService Event Collector enables you to collect JSON formatted event messages from the Logicmonitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from Logicmonitor. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidLogicmonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Logicmonitor Mid Push Connector**.

The default format of the URL to push event messages from Logicmonitor to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.
   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.
   a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.
   b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.
   c. Under the Stages section, select the Add icon to add a stage and click **Save**.
   d. When you create the new stage, select the Add icon again to search for the user and add the integration as the Contact Method and click **Save**.
3. After creating the escalation chain, configure alert rules for the chain you created.
   a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.
   b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.
   c. Under the Escalation chain menu, select the escalation chain you created.
   d. Click **Save**.

Note:
To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

Integrate Oracle Cloud Infrastructure alarms

Integrate Oracle Cloud Infrastructure (OCI) alarms with Event Management to send events into ServiceNow by adding a https subscription using Basic Authentication.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Oracle Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Oracle Cloud Infrastructure Discovery.
- Role required: evt_mgmt_integration

About this task

The Oracle Cloud Notifications service enables you to set up communication channels for publishing messages using topics and subscriptions. When a message is published to a topic, the Notifications service sends the message to all of the topic's subscriptions.

When an Oracle Management Cloud alert is raised, worsens in severity, or clears, you may want to be actively notified through an https custom URL to the ServiceNow instance. The Oracle Cloud connector will be used to create events in ServiceNow®.

You can configure the Event Management environment for the collection of alarms from Oracle Cloud by setting your ServiceNow AI Platform instance as the https subscription.

Procedure

1. In the Oracle Cloud console, set up a https subscription.

   a. On the Create Subscription form, under the Configure Subscription section in the Protocol list, select **HTTPS (Custom URL)**.

   > **Note:**
   > When the subscription is created, the password will not be shown in clear text.

   b. In the URL field, enter a URL with the format: `https://<username>:<password>@<instancename>.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   For example, `https://oracleevents:oracleevents@instance1.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   When the subscription is created with the ServiceNow instance URL, the Oracle Cloud Push connector will receive a payload that will confirm the subscription and is moved to an **Active** state in the Oracle Cloud console.

2. In the Oracle Cloud console, you can create an alarm definition and set the notification destination with the topic containing the https ServiceNow subscription.

   a. Navigate to **Observability & Management** > **Alarm Definitions**.

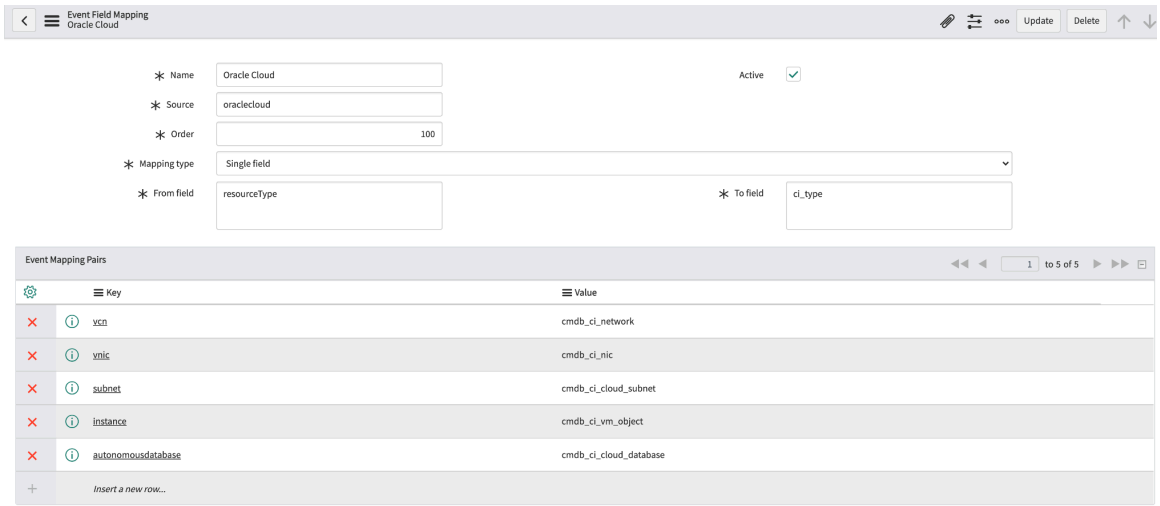
   b. Click **Create Alarm** or select an existing alarm that you want to set the topic containing the https ServiceNow subscription.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Destinations section in the Topic list, select the topic with the https ServiceNow subscription.
When an alarm is triggered in the Oracle Cloud console, the same alarm will be received in the Oracle Cloud Push connector in the ServiceNow instance and an event will be created.

Result

Depending on the Oracle Cloud alarm resource, the alert will bind to the CI using the following Event Field Mapping:



You can create other event rules or modify the Event Field Mapping to map to other resource types.

Once the https subscription is configured and an Oracle Cloud alarm triggers a message in Event Management the message:

- Authenticates the Oracle Cloud alarm message with the relevant ServiceNow user given in the https subscription.
- Extracts information from the original Oracle Cloud alarm message to populate the required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

Integrate Prometheus events

Integrate Prometheus with Event Management by adding a standard webhook in Prometheus's Alert Manager.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Prometheus exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Prometheus.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the Prometheus instance, add a webhook.
   a. Navigate to Alertmanager.yml and add a webhook entry under the recievers.
   b. Enter the endpoint uRL. For example, use `https://<instance-name>/service-now.com/api/sn_em_connector/em/inbound_event?source=prometheus`.
   c. Type `basic_auth` underneath *`http_config`*.
   d. Add a username and password under *`basic_auth`*, then add the created webhook name in the receiver under *`route`*.
2. In the Prometheus instance, create an alert rule.
   a. Create a file for the alert rule and add its' path inside prometheus.yml under *`rules_files`*.
   b. Create the alert rule as per the prometheus format using PromQL.
   c. Restart AlertManager and Prometheus to reflect the changes.

Result
Alerts start flowing from Prometheus into the Event Management plugin. The plugin extracts information from the original Prometheus alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

If severity isn't received in the payload, the default severity is Major, which can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **Prometheus Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

Note:

To map hosts to the *`cmdb_ci_vm_object`* record instead of *`cmdb_ci_hardware`*, enable the **Prometheus VM Binding** event rule created for Prometheus. For further information about event rules, see Event rules.

Integrate Sentry events

Integrate Sentry with Event Management by adding a standard webhook in the Sentry platform.

Before you begin
Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for Sentry services are not supported. You must create a CI manually in the [cmdb_ci_service_auto] table to enable binding by completing the following steps:

1. From the navigation bar, go to **Configuration/Application Service**.
2. Provide the project name you are monitoring on the Sentry application.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Set the operational status to **Operational**.
4. Click **Next** then **Done**.

Role required: evt_mgmt_admin

About this task

Configure Event Management for the collection of events from Sentry by authenticating Sentry as a data source. In your Sentry platform, use a standard webhook to set your ServiceNow AI Platform as the rest endpoint.

Procedure

1. In the Sentry console, create an internal integration.

   a. Navigate to **Settings** > **Developer Settings**.

   b. Click **New Internal Integration**.

   c. In the Internal Integration Details section, on the Sentry Integration Details page, fill in the fields.

Sentry Integration Details

Fields	Description
Name	Name of your integration.
Webhook URL	The default format of the URL to push events from Sentry to the ServiceNow AI Platform instance. For example, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sentry`.
Alert Rule Action	Option to enable the integration. **Note:** When enabled, the integration becomes available in the Issue Alert and Metric Alert rules in Sentry. The alerts will be sent to the ServiceNow instance.
Schema	Schema for your UI components. This field should be left empty.
Overview	Description for the integration.
Authorized JavaScript Origins	Auth Tokens from the browser to enable the origins of the pages making the requests. This field should be left empty.

   d. In the Permissions section, under Issue & Event, specify the level of access you want. You can select **Read**, **Read & Write**, or **Admin**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. In the Webhooks section, select the **Issue** check box.

f. Click **Save Changes**.

2. In the Sentry console, create alert rules and configure them to receive alerts for issues from Sentry to the ServiceNow instance.

a. Navigate to **Alerts** > **Create Alert Rule**.

b. Select the alert type and click **Set Conditions**.

> **Note:**
> The Issues alert type creates issue alerts. The other alert options create metric alerts.

c. On the Alert Rule page, create either an issue alert or a metric alert.

Alert Rule

Option	Description
Issue alert	i. Enter the environment, team, and alert name for your alert. ii. Under Set conditions, enter the **When** and **If** conditions that will trigger the alert. iii. For the **Then** condition, select **Send a notification via an integration** and select your internal integration from the list. iv. Set the action interval for the alert.
Metric alert	i. Add a filter to your transactions. ii. Select the function and time interval. iii. Set the thresholds that will trigger the alert. iv. Add the actions to be performed when the thresholds defined are met. v. Add your internal integration from the list to the list of actions to receive the alerts. vi. Add a rule name and team for the alert.

d. Click **Save Rule**.

Integrate Scout APM events

Enable the collection of events from Scout APM by authenticating Scout APM as a data source to integrate it with Event Management.

Before you begin

The Event Management plugin (com.glideapp.itom.snac) must be installed.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery for Scout APM applications is not supported. To enable binding, you must manually create a CI in a ServiceNow instance in the Service Instance [cmdb_ci_service_auto] table.

Role required: evt_mgmt_admin

Procedure

1. Enable Scout APM monitoring as an application service on your ServiceNow instance.
   a. Navigate to **Configuration** > **Application Service**.
   b. Provide the application name that you are monitoring.
   c. Set the operational status to Operational.
   d. Select **Next**
   e. Select **Done**.
2. Log in to the Scout APM console.
3. Create a notification channel.
   a. Navigate to **Organization** > **Alerts & Notifications**.
   b. Select **New Webhook**.
   c. Provide the name of the webhook and the webhook URL.
      Use the following URL format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=scout`
   d. Validate whether the webhook is operational by selecting **Send Test Alert**.
      A new event appears on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.
4. In the Organization section, create a new notification group.
   a. On the **Alerts & Notifications** page, navigate to **Organization** > **Notification Groups**.
   b. Add a name for the group and select the webhook channel you created.
   c. Select the **Create Notification Group** button.
5. In the application section, create alert conditions and configure them to receive alerts for notifications from Scout APM to the ServiceNow instance.
   a. Navigate to **Applications** > **Alert Conditions**.
   b. Select the type of alert condition.
      For more information, see the Scout APM documentation.
   c. Select **Create Alert condition**.
   d. In the Alert Conditions table, select the notification group you created.
      The alert condition is displayed on the Scout console.
6. Configure error notifications to receive alerts for errors from the Scout APM to the ServiceNow instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Application** > **Error Notifications**.

b. Add a name and description for the notification.

c. Select the notification group that you created.
The Scout APM notification channel is configured with the error notifications.

d. Select the **Add Notification Group** button.
For any new error notifications in the Scout APM application, a new event will be generated in the Events [em_event] table.

Result
You can view all notifications on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.

Integrate Sumo Logic events

Use the Sumo Logic push connector to integrate Sumo Logic with Event Management by adding a standard webhook in the Sumo Logic platform.

Before you begin
Ensure that the Event Management connector's plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task
Configure the Event Management environment for the collection of events from Sumo Logic by authenticating Sumo Logic as a data source. In the Sumo logic site, set your ServiceNow AI Platform instance as the rest endpoint using a webhook.

Procedure
1. In the Sumo Logic site, create a notification destination.
2. Go to Monitoring and select **Custom Webhook**.
3. Fill in the form with the Name, Description, and the URL.

   Use this URL format to push events from Sumo logic to the ServiceNow Instance `.https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sumologic`

   Note:
   Use a credential having the evt_mgmt_integration role as the username and password.

   In the Payload section, use the following template:

```
{
    "type": "{{MonitorType}}",
    "node": "{{ResultsJSON._sourceHost}}",
    "metric_name": "{{Name}}",
    "description": "monitor Query: {{Query}}\n
 Trigger Condition:{{TriggerCondition}}\n
 Trigger Value:{{TriggerValue}}\n Trigger Time
 Range:{{TriggerTimeRange}}\n View Trigger
 Query:{{TriggerQueryURL}}\n View Monitor:{{QueryURL}} \n
 Results:{{ResultsJSON}}",
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "name": "{{Name}}",
    "short_description": "{{Description}}",
    "MonitorType": "{{MonitorType}}",
    "Query": "{{Query}}",
    "QueryURL": "{{QueryURL}}",
    "ResultsJson": "{{ResultsJson}}",
    "NumQueryResults": "{{NumQueryResults}}",
    "Id": "{{Id}}",
    "DetectionMethod": "{{DetectionMethod}}",
    "TriggerType": "{{TriggerType}}",
    "TriggerTimeRange": "{{TriggerTimeRange}}",
    "time_of_event": "{{TriggerTime}}",
    "TriggerCondition": "{{TriggerCondition}}",
    "TriggerValue": "{{TriggerValue}}",
    "TriggerTimeStart": "{{TriggerTimeStart}}",
    "TriggerTimeEnd": "{{TriggerTimeEnd}}",
    "SourceURL": "{{SourceURL}}",
    "alertResponseUrl": "{{alertResponseUrl}}"
  }
```

Log Monitors Type events can be created without CI binding since you're receiving the node value as "node": "{{ResultsJSON._sourceHost}}" in the event payload from Sumo Logic. You can create events but you can't bind them since you don't get them as host names for the log monitor type. A push connector parameter was created - "create_log_monitorType_events" with a value of False. If the param value is False, the payload is ignored, and "log" events aren't created. If you change the param to True, events are created, and then you must define event rules for CI binding.

Refer to the following ServiceNow Severity Mapping with Sumo logic TriggerType table:

Severity Mapping

Sumo Logic Trigger Type	Severity
Critical	Critical
Warning	Minor
MissingData	Warning
ResolvedCritical/ResolvedWarning/ ResolvedMissingData	Clear

Integrate Sumo Logic with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

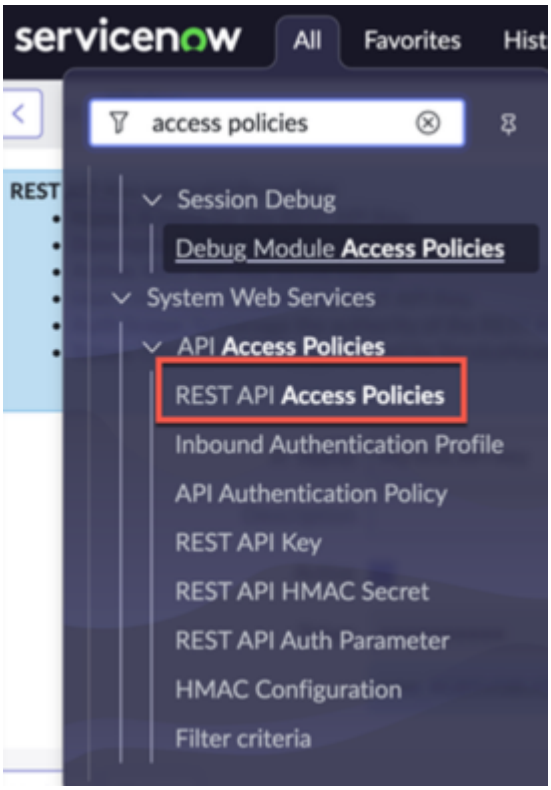
Before you begin

Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

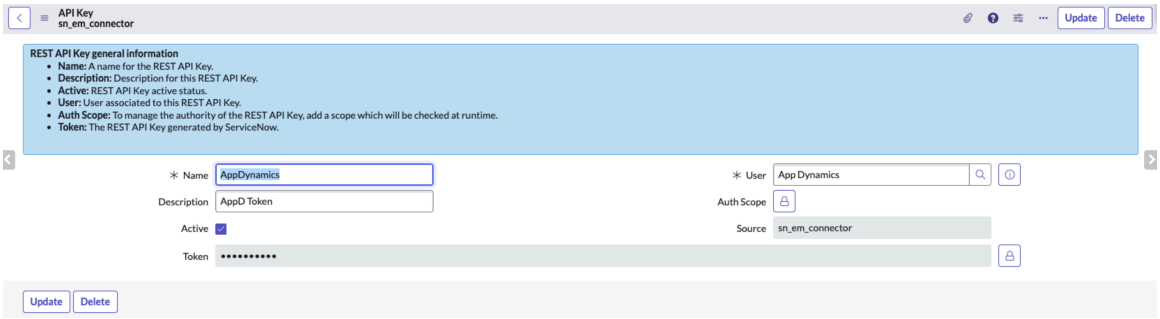
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate ThousandEyes platform events

Integrate ThousandEyes with Event Management by adding a standard webhook in the ThousandEyes console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using ThousandEyes Monitor V1 or V2 access tokens. For more information, see Integrate ThousandEyes with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for ThousandEyes Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate ThousandEyes with basic authentication.

Integrate ThousandEyes with basic authentication

Integrate ThousandEyes with Event Management by adding a webhook in the ThousandEyes platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for ThousandEyes services is not supported, so you must create a CI manually in the ServiceNow instance for event binding to work.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from ThousandEyes by authenticating ThousandEyes as a data source. In your ThousandEyes platform, set your ServiceNow AI Platform instance as a rest endpoint using a webhook.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the ServiceNow instance, complete the following steps to create a CI.
   a. From the navigation bar, navigate to **All** > **Configuration** > **CI Class Manager**.
   b. Click **Hierarchy** and search for `HTTP(S) Endpoint`.
   c. Select **CI List** and create a new CI.
2. In the ThousandEyes platform, create a notification destination.
   a. From the navigation bar, navigate to **Alerts** > **Alert Rules**.
   b. Click on any existing alert rule and select the **Notification** tab.
   c. Select **Edit Webhook** and enter the following information.

Edit Webhooks

Field	Description
Name	Enter a name for the webhook.
URL	Provide the webhook URL. **Note:** The default format of the URL to push events from ThousandEyes to the ServiceNow instance is `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=thousandeyes`.
Auth Type	Select **Basic**.

   d. Click **Add New Webhook**.

Result

The default severity for the ThousandEyes alert is **Major -2**, which can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

The default timezone of the ThousandEyes alert is GMT, if you want to send the alert in a different timezone, it can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid value format is **GMT+01:00**, **GMT +02:00**, **GMT-05:30**, **GMT-02:00**, etc.

Integrate ThousandEyes with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

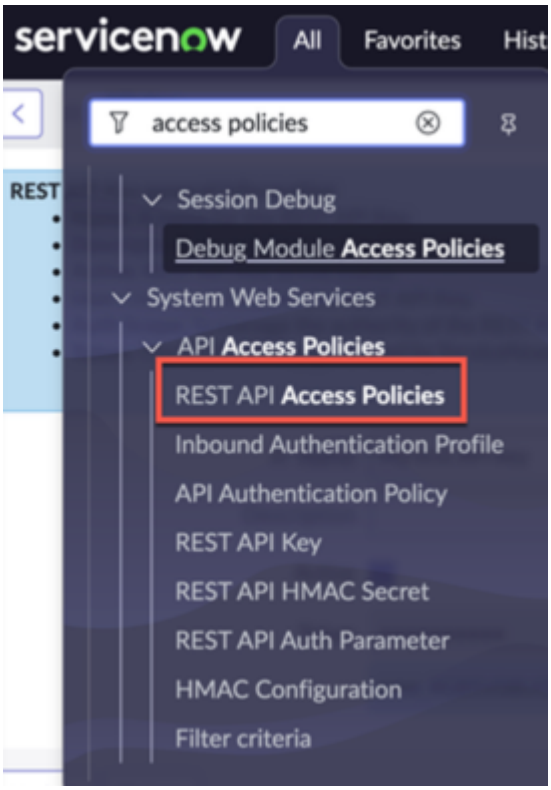
Before you begin

Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

Note:
The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

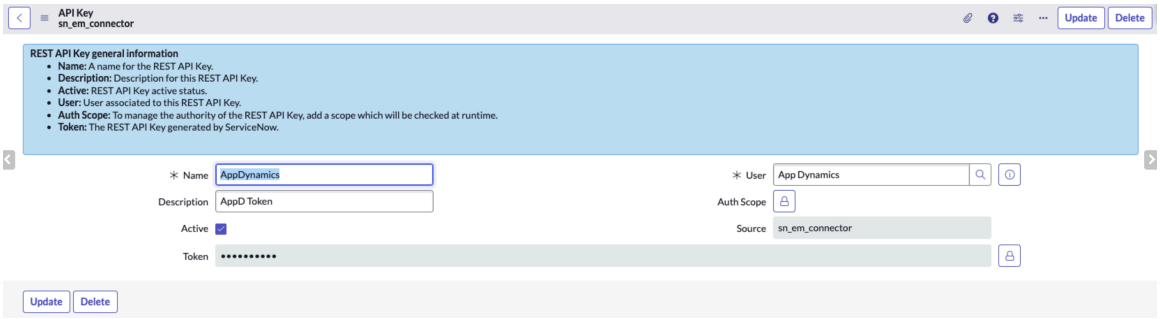
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Result

Now you are ready to start sending events. In your monitoring tool you can send events either with the header or the query `param: x-sn-apikey`. For example:

```
https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]
```

Integrate ThousandEyes with OAuth authentication

Create credentials in the instance and configure the ThousandEyes webhook.

Before you begin

Role required: web_service_admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.
2. Select **Create an OAuth API endpoint for external clients**.
3. Copy the automatically generated field **Client ID**.
   The **Client ID** is used when configuring the ThousandEyes SeviceNow integration.
4. Unlock the **Redirect URL** field and assign the value: **https://app.thousandeyes.com/webhooks-oauth-callback/**
5. Configure the Access and Refresh token lifespans by providing a value in seconds.
6. Open the ThousandEyes webhook configuration and complete the following fields:

   Name

   Any name

   URL

   ServiceNow ThousandEyes Push connector end point

   Select Auth Type

   OAuth

   Grant Type

   Implicit

   Auth URL

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

https://servicenow_insatnce>.service-now.com/oauth_auth.do

Client ID

Paste the Client ID automaticcally generated in Step 3.

7. Select **Get Token**.
8. Once the ThousandEyes connector navigates to a webpage requesting to connect to your ServiceNow account, select **Allow**.
9. Provide account credentials which have the **web_service_admin** role.

Integrate Panopta as a data source

Integrate the Panopta cloud-based monitoring solution with Event Management. To add Panopta as a data source, configuration is required in Panopta.

Configure Panopta

To prepare Panopta as a datasource, follow the procedure described in this link: How do I integrate with ServiceNow.

When the Event Management integration is configured in Panopta, add the integration to any of your Panopta Alert Timelines so that the ServiceNow instance receives incident events accordingly.

Optional Event Management configuration

Configure an alert action rule for launch in context of Panopta. For more information, see Launch web application from alert and Create or edit an alert action rule.

Related topics

Configure Event Management connectors

Integrate Event Integration (EIF) format event connector

Use the push connector that allows events to be forwarded from products, generally from IBM, that support the Event Integration (EIF) format to a MID Server.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure the MID Server is assigned with `EventManagement` or `ALL applications`.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from products that support the EIF format to a MID Server.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **EIF listener context**.
2. Click **New**.
3. Create a new EIF listener context by completing the EIF listener context form:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the form, fill in the fields.

EIF listener context form

Field	Description
Name	Unique name for the EIF listener context.
Short Description	Short description of the MID Server extension execution context.
Port	Port for the EIF listener to receive EIF events. The default value is **9998**. However, if the port is already in use, you can use any other free port instead.
Status	The status of the EIF listener. This field is blank until the listener is run. After the listener has run, the value is automatically populated to one of the following statuses: ▪ Started: The listener is running. ▪ Stopped: The listener is not running. ▪ Offline: The MID Server is down. ▪ Error: The listener failed with an error.
Execute on	The MID Server location for running the listener.
MID Server	The name of the designated MID Server when you select **Specific MID Server** in the **Execute on** field.
Executing on	The name of the MID Server on which the extension is running. This field is automatically populated with the name of the MID Server even if it's down. If you stop the extension, this field is empty.

b. On the form, you can select the related links on the EIF listener context form.

Commands available on the EIF listener context form

Related Link	Description
Start	Select this option if the listener is not running. The listener is started on the configured MID Server and port number.
Stop	Select this option to stop the running listener on the configured MID Server.
Restart	Select this option to stop then start the listener on the configured MID Server and port number.
Update Parameters	Select this option if you want to make changes to the listener configuration of the current running listener. If the parameters

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Link	Description
	are valid, the listener disconnects and reconnects with new parameters.
Test Parameters	Select this option to test if the port is a valid number.

4. When you're finished, right-click the form header and select **Save**.
5. Click **Update**.
6. If you want to check the incoming EIF traffic, complete the following steps:
   a. Navigate to **MID Server** > **Servers**.
   b. Select the MID Server the EIF extension is running.
   c. Under the **Configuration Parameters** tab, add the **mid.log.level** properties.

What to do next
If the MID Server fails to start, you can review the MID Server log errors.

EIF events warning severity

If the EIF event payload has a warning severity, it will be mapped differently in the ServiceNow instance.

EIF events severity	ServiceNow events severity mapping
UNKNOWN	Warning
Warning	Minor
Minor	Major
Critical	Critical
Fatal	Critical

Create a push connector configuration parameter

Some connectors have no parameters that are shipped out of the box. Therefore, it's necessary to create and add the parameter to the push connector configurations list in the form layout before adding the new parameter.

Before you begin
Role required: evt_mgmt_admin, personalize_form

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Open a push connector.
3. On the **Push Connector** form, right-click on the form header and select **Configure** > **Form Layout**.
4. In the **Available** list, search for **Push Connector Configurations** > **Push Connector**, and move it to the **Selected** list.
5. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Push Connector Configurations [sn_em_connector_push_config] table, double-click on **Insert a new row** to add a new push connector configuration parameter.
7. Select **Update**.

Result
Push Connector Configurations list added to push connector form layout. You can now create push connector parameters.

Configure a push connector instance

Configure a push connector instance to receive the events from an external system.

Before you begin
Ensure that you've defined a push connector definition.

Role required: evt_mgmt_admin

About this task
You can use a connector instance to receive the events coming from external sources. You can create the following type of push connector instances:

- Instance type
- MID type

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connector Instances**.
2. Select the connector instance that you want to configure, or select **New** to create a push connector instance.
3. On the **Push Connector Instance** form, fill in the fields.

   For more details, see Push connector instance form.
4. Select **Submit** or **Update**.

Result
The push connector instance form is saved and now you can receive the events from an external system.

Configure event collection from email

Configure an inbound email action to send email notifications when events and alerts are triggered.

Before you begin
Role required: evt_mgmt_admin

About this task
When you add an inbound email action to send email, Event Management uses inbound email actions to process inbound email in the same manner as any external event. The email content is used to generate and update events, use rules to generate alerts, or change event severity. The severity is updated after the impact calculation and stored in the em_impact_status table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Inbound Email Configuration** section, in the **Email receiving enabled** option, select **Yes** to enable the collection of events from email.
3. To configure the email information to pass to Event Management for event and alert processing, navigate to **System Policy** > **Email** > **Inbound Actions** and in the list of Inbound Email Actions records search for and open the default **create event** form.

   a. On the **Inbound Email Actions** form, specify these values.

Field	Value
Active	Select the check box to enable the email notification.
Target table	Select **Event [em_event]**.
Action type	Select **Record Action**.

   b. Select the **Description** tab and enter a description for the email message.

   c. Select the **Actions** tab and select these **Field Actions**.
   - **[Severity] [To] [<the event severity>]**
   - **[Type] [From email] [<portion of the email>]**

     For example, you can select **Subject** as the portion of the email to use.

4. To customize the inbound parameters and map the text to event variables, add a **Script**.

   Example
   For example:

```
current.source = 'email';
current.event_class = 'email';
current.description = email.body_text;
current.time_of_event = new GlideDateTime();
current.insert();
```

5. From the instance, send an email that contains matching data, and then confirm that the event or alert information appears in Event Management.
   For more information sending email messages to create an instance, see Inbound email actions.

   Note:
   Ensure that the user who sends the email has the role **evt_mgmt_integration**.

6. Select **Submit**.

Result

The inbound email is sent to the em_event table and regular Event Management processes continue, for example, event rules and alert management rules run.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event forwarding

Accelerate the event processing testing life cycle by forwarding a stream of events from your ServiceNow production environment to your non-production environment.

Use event forwarding to forward events from one instance to another, for example, from a production to a non-production instance. Event forwarding enables you to test and evaluate event rules, event field mappings, alert management rules, alert correlation, and so on, without having any impact on your production environment.

Not all monitoring sources can send events to multiple target instances. In such cases, you can configure a scheduled job to periodically forward the event stream from your ServiceNow instance that is connected to the monitored source to other instances.

Set up event forwarding

Create an event forwarding configuration record to enable events to flow from one ServiceNow instance to another instance. Forwarding events to multiple target instances requires creating separate configuration records for each target instance.

Before you begin

You must have a credential with the evt_mgmt_integration role, which enables you to create events in the target instance. If you don't have this credential, see Create basic auth server credentials for information on how to create it.

Role required: evt_mgmt_admin

About this task

The source instance, which forwards events to a target instance, must have a user with the evt_mgmt_integration role, a password for the credential, and a new event forwarding record. The target instance, which receives events from the source, must have a credential with the same user name and password as the source instance.

The event forwarding record contains details about the target ServiceNow instance URL to which events are to be forwarded along with the credentials to connect it.

You must create a separate configuration record for each target instance to forward events to multiple target instances. Events are then sent to each target instance with an active event forwarding configuration.

Procedure

1. On your source instance, navigate to **All** and enter `sn_em_connector_event_sync_configuration.list` in the filter navigator.
2. On the **Event Sync Configurations** page, select **New**.
3. On the **Event Sync Configuration** page, in the **Instance url** field, enter the target ServiceNow URL to receive events in the format `https://<your_instance>.service-now.com`.
4. In the **Credentials** field, provide the credentials for the target instance by either entering them or searching for them.
   - To enter your credentials, start typing and then select the credential from the drop-down list.
   - To search for your credentials, select the Lookup using list icon ( ) to select your credential from the credentials lookup table.
5. Select **Save**.
6. Select **Test Connection** to validate the connection to the target ServiceNow instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the connection succeeded, a confirmation message displays.
- If the connection didn't succeed, check your credentials and the instance URL.

7. When validated, select the **Active** check box to activate the event forwarding to the target instance and select **Submit**.
   The configuration is created and is listed on the **Event Sync Configurations** page.
8. For multiple targets, repeat the steps for a separate configuration record for each instance.

Related topics

Periodically run an event forwarding job

Periodically run an event forwarding job

Schedule an event forwarding job to periodically send events to all target instances with active event forwarding configurations when the monitoring source can't send events to multiple target instances.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize the *event - forwarding* job behavior through related system properties. For more information, see Event forwarding properties.

Note:
To minimize the performance impact, the scheduled job sends events not older than the latest hour when it ran for the first time after setting up event forwarding.

Procedure

1. Navigate to **All** > **Scheduled jobs** > **Event Management - Event Forwarding Job**.
2. On the **Scheduled Script Execution** page, select the **Active** check box.
3. In the **Repeat Interval** field, set the appropriate time interval for the job to run periodically.

   The default value is for the job to run every minute.
4. Select **Update**.

Result
The event forwarding job runs periodically based on the repeat interval that you set. Events are sent to all target ServiceNow instances that have active event forwarding configuration records.

If the admin account is disabled, configure the user of the scheduled job. By default, it's admin, but in this case, it must be changed.

Note:

If the event forwarding to the instance failed due to any reason, the **Last Event Forwarding status** field displays `Failed` with a corresponding error message displayed in the **Last Event Forwarding error** field. The target instance generates a self-health monitoring event during the next successful event forwarding indicating the failure of event forwarding for the specified time range.

Create basic auth server credentials

Create credentials to access a ServiceNow instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential while it attempts to log in to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Select **Submit**.

Result
The Basic Auth credential for use with the server instance is created.

Processing Events

Event processing is the process of taking events or streams of events, analyzing them and taking automatic action. The process includes viewing events, event binding, event rules and event field mapping.

An event is a notification from one or more monitoring tools that indicate something of interest has occurred, such as a log message, warning, or error. Events are processed and alerts are generated based on the following factors:

Event collection configuration via a MID Server, script, SNMP trap collector, or email message.

An Event rule, alert binding, or event field mapping configuration for processing events from various sources. When a package of events that contains events with a custom (non-supported) state is processed, the events with the custom state are not processed.

For more information, see Exploring Event Management.

View events

Event Management tracks individual events to manage external systems. These events are notifications from monitoring tools indicating occurrences of interest, like log messages,

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

warnings, or errors. Event Management gathers events from external sources and stores them in the Event [em_event] table, offering a list of raw incoming events.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, evt_mgmt_user, or evt_mgmt_integration

Note:
Ensure that you do not change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

About this task

The event monitoring tool generates the values of the source and resource fields. Event Management implementers can define event types and register nodes to help uniquely identify incoming events and create alerts for the specific needs of the enterprise. Event Management uses this information to determine whether to create an alert or update an existing one.

An event source may generate duplicate events with the same identifying information. For events with the same identifying information, Event Management uses the time interval between events to determine whether the events represent an existing issue or new issue.

Additional fields should be included in the **Additional information** field of the event. Do not add additional fields to an event by adding a custom field to the event [em_event] table. For more information about how to include additional fields in events, see Custom alert fields.

Note:
Avoid writing business rules for event [em_event] tables, as they can result in performance degradation.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.

   The All Events list displays the following columns.

All Events list

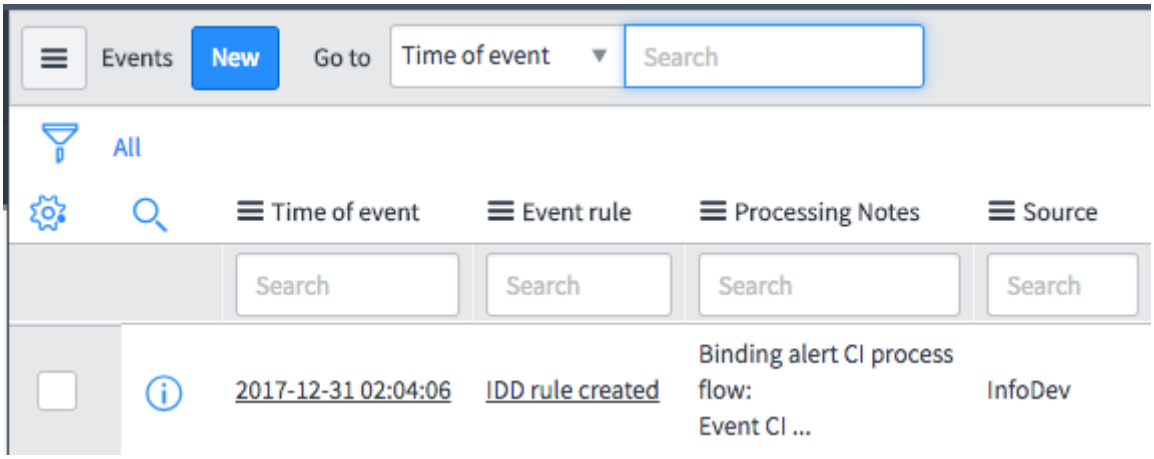
Column	Description	Populated by
Time of event	The time that the event occurred, in the network node time zone. The system supports time resolution in seconds.	External event monitoring tool
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.	External event monitoring tool
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.	External event monitoring tool
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.	External event monitoring tool
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.	External event monitoring tool
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.	External event monitoring tool

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description	Populated by
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.	External event monitoring tool
Message Key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.	External event monitoring tool
State	The status of the event: ○ **Ready**: Event has been received and is waiting to be processed. ○ **Queued**: Event is queued by the event processor job. ○ **Processed**: Event was successfully processed. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank. ○ **Ignored**: Value is not in use.	Event
Severity	Mandatory. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.	Event
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.	A matching event rule or event field mapping

2. To review a single event, click the required row in the **Time of event** column.
3. To review the event rules that processed the event, in the **Related Links** section click **Check process of event**.
   For further ways to see which event rules were applied to the event, you can display the `Event rule` and `Processing Notes` fields in the Events list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Optional event fields to display the applied event rule

Column	Description
Matching Event rule	The event rule that matches the current event rule definitions. This information is primarily used to create event rule recommendations for events that currently are not covered by rules. If event rules have been modified, this information can be retrieved from the Processing Notes field, described below. **Note:** This field does not show the history of event rules that were applied to the event.
Processing Notes	Information related to the binding to CI type and the event rules that were applied to the event.

4. To create an event rule for an event that is not associated with an event rule:

   a. Click the event.

   The event opens in the Event form.

   b. Click **Create Event Rule**.
   The fields of the new Event rule are populated with data from the event. You can use the event information, for example, when composing fields for alerts.

Team-based integrations in Event Management

Team-based integrations empower teams to optimize event processing within Event Management to enhance efficiency and operational effectiveness.

Team-based integrations provides the following capabilities:

- Assign teams to particular connectors, providing a structured approach to integration efforts.
- Enable each team to define and apply custom rules, enabling a more targeted and straightforward handling of event processing.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Route alerts automatically to the appropriate team members responsible for the integrated systems based on integration ownership and configuration item (CI) ownership.
- Enable seamless integration and automation through the automatic assignment of alerts to appropriate team members based on integration ownership and configuration item (CI) ownership.

Customize event rules, event mapping, and the precedence of team rules for team-based integrations. For more information, see Team-based integration properties.

Event rules

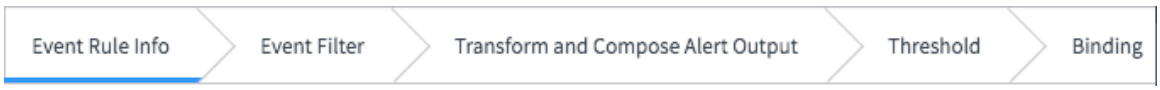
Event field mapping configuration

Alert assignment groups for teams

Event rules

Use event rules to generate alerts for tracking and remediation. Event rules are stored in the Event Rule [em_match_rule] table. Configure and customize event rules to manage events and alert generation.

Event rules do not change the event records in the Event table. Changes to event data are stored in the ServiceNow instance memory.



Use the Event rule designer to create and configure event rules. You can use the default event rules or event rules that you have created to:

- Apply an event rule filter to determine whether the rule applies to an event.
- Apply a transform with **Event Match Fields** and optional **Event Compose Fields** to format the alert text.
- Apply a threshold to create custom alerts for rapidly recurring events.
- Automatically create or close alerts.
- Bind alerts to CI information from the CMDB.
- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

Create or edit an event rule

You can create event rules to generate alerts for tracking and remediation. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to general rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

About this task

View the list of available event rules on the **Event Rules** page to determine whether you want to create or edit an event rule.

You can create rules that:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Transform information in events to populate specified alert field values and compose alert fields from various values.
- Configure threshold rules that create or close alerts only when the incoming matching events exceed the specified threshold.
- Bind alerts to CIs using CI identifiers.

Options to create the rule are:

- Create an event rule and assign event fields for alert generation.
- Create a rule from an existing event or group of events that don't have a rule. In this case, the event fields are copied to the Event Match Fields section of the rule.
- Edit an existing event rule.
- For Team-based integrations, select an assignment group.

- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

You can refresh an existing event rule with new event data. For more information see, Refresh event rules.

Note:

- Event rules that aren't configured to perform any action are skipped. Therefore, if the rule isn't configured as ignore, threshold, or binding, it's important to specify either the match or the composed fields.
- Make sure that you don't change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules** and take one of the following actions.

Option	Description
Create an event rule from an existing event	**a.** Select the link for unassociated events or grouped events that aren't mapped to the rules.  **b.** Select the event that you want to use for cre ating the rule. The event fields are copied to the Event Field Rules section of the rule.
Edit an existing event rule	In the event rule list, select the required event rule to be modified. The event rule opens in

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	the event rule designer where you can modify the values of the fields. Select **Save and Upgrade**  to modify the rule when the following banner message appears and you want to convert the event rule. `Rule cannot be viewed in the event rule designer. To modify the rule click 'Save and Upgrade'.`
Create an event rule	Select **New**.

2. Ensure that **Active** is selected.
When the rule is deactivated, Event Management finds and applies another event rule. An alert is still created for the event unless *Ignore* is selected in another applicable rule or when configuring the filter for this event rule.
3. Enter a unique and meaningful name and fill in the form.

Event Rule Info form

Field	Description
Source	Category to which this matching rule applies. The mapping rule only applies to events with the same event class value. If this value is empty, apply the rule to all events.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Description	Type additional information that describes the event rule.
Apply additional matching rules	Select to apply additional event matching rules according to the Order field. The last rule with binding settings sets the CI binding. When selected, the Thresholds tab is inactive.
Assignment group	For team-based integrations, select an assignment group. If no assignment group is defined in the event rule, then this event rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.

4. **Optional:** Define the event rule using these Event Rule Designer features.

Option	Description
Event Filter	Define a filter to restrict to which events the event rule must apply. See Filter the events that an event rule applies to.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Transform and compose alert output	Configure the customization of alert content. See Configure an event rule to customize alert content.
Threshold	Create or close alerts according to the specified threshold. See Set a threshold to suppress alert generation.
Binding	Configure event rules to automatically bind alerts to CI information from the CMDB. See Binding alerts to CIs.

5. Select **Save**, **Submit**, or **Update**.

Related topics

- Pattern matching

- Configure an event rule to customize alert content
- Refresh event rules
- Simulate event processing
- Filter the events that an event rule applies to

Use event input information

The **Event Input** pane that is included in the steps to create an event rule provides a reference to the information that you can use when configuring an event rule.

In the **Transform and compose alert output** pane, you can also drag the information into the required fields to customize alert content. The fields in the right-hand pane appear as a reference to which fields, expressions, and their values are available when working in the Event Rule designer. The fields that display in the Transform and compose alert output left-hand workarea become the fields in the generated alert form. In addition, you can define alert tags that are specific for customization.

General components and navigation

The Event Input pane consists of these sections:

- Event Additional Info
- Expressions
- Event Raw Info

The Event Input pane displays in all Event Rule designer sections, except for the Event Rule Info section. The fields in the right-pane can be modified only in the Transform and compose alert output section. In all the other sections, the Event Input pane is read-only and available for reference purposes.

Note:

If **Accessibility enabled** 
is selected in System Settings, standard edit mode is not available .

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit modes

Mode	Description
Standard edit mode	Text selected in the left-hand workarea cannot be edited. Undo is not available. In this mode, you can only mark the text or values and transform it by selecting a field name.
Regex edit mode	Edit text in the left-hand workarea by selecting it, as required. After you have edited the text, you cannot go back to the standard mode. **Undo** is not available. However, **Reset** is available, returning the field to its original value. You can compose text using regular expression (regex) format conventions, for example, type (.*) to create a field name. You cannot use field values like: type "$" to include the value of a field and specify the name of the field in parentheses {}. You can include special characters in a field by "escaping" them, that is, by prefixing the character with a "\". For example, to include a "\" in your text, enter "\\".

Event additional info

The Event additional info section displays default event form fields, plus fields that were created to display in alerts and that are added to the **Additional information** section of the alert.

When configuring text in the fields in the left-hand workarea, you can drag field names and/or their value from this section into the fields.

Expressions

The Expressions section is available only if an additional information field was created. You can create expressions from event raw data or from additional information data.

1. Click in a field in the **Event Input** pane to perform transformation actions.
2. Create an expression by transforming information and associating it with a field name. Either select a field name from the suggested list, or create a field name, as required.

3. Click in a field in the **Event Input** pane. In the left-hand workarea, select the required information.

Create expressions by transforming information and associating it with a field name. Select a field name from the suggested list, or you can create a field name, as required.

Event raw info

The Event raw info section is always available. Its contents are the fields from the Event form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To transform text, click a field in the right-panel to open it in the work area on the left-panel, in the Mark Expressions section. You can select text in the **Mark Expressions** section where the selected text becomes the value of a newly created field. Name the new field. This new field is added to the Expressions section.

Note:
When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained.

Controlling how fields appear:

- Use the exclusion list [em_event_rule_black_list] table to hide fields from the right-pane.
- Use the em_event_rule_order form to order the position of each field.
- Fields that are not in the exclusion list and also not part of the em_event_rule_order table, still appear in the event rule designer, in the right-panel and in the **Transform and Compose Alert Output** tab.

Related topics

Create or edit an event rule

Configure an event rule to customize alert content

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

Filter the events that an event rule applies to

Define a filter to restrict to which events the event rule must apply. Configure the filter by providing a set of conditions that each event must match to be either excluded or included from applying to the event rule.

Before you begin

Ensure that a name is specified for the event rule.
Role required: evt_mgmt_admin

About this task

To construct the required condition statement, you can use event fields as well as additional fields that are defined in the **Additional Information** field of the event. Use these fields to configure conditions that can exclude events. Alternatively, you can filter incoming events to ensure that only those events that meet the required conditions are included.

Note:
Event rules filter is case-sensitive.

While working in the Event Filter tab:

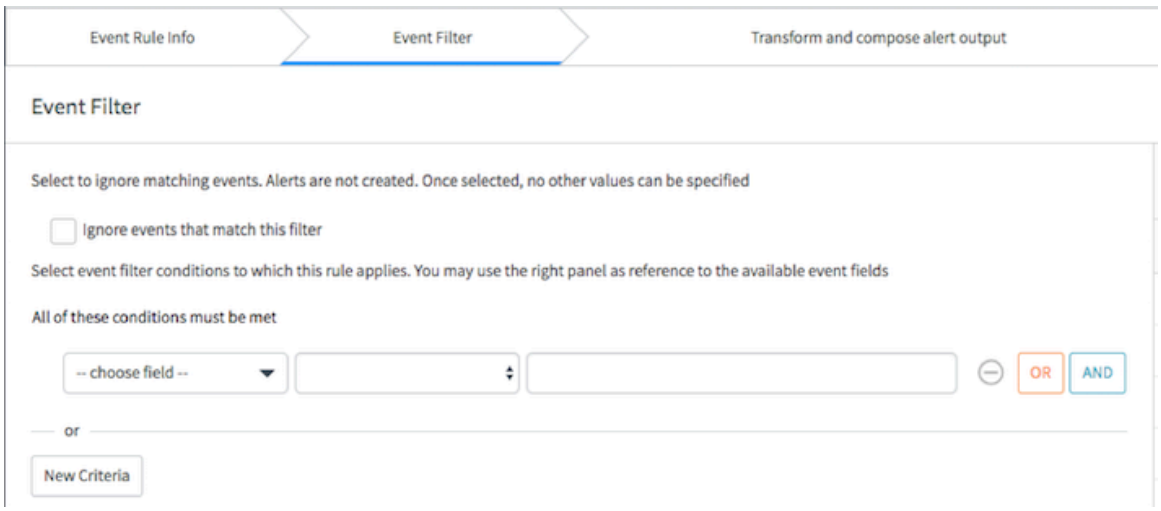
- In the Event rule list, if you selected a recommended rule or an existing rule, the filter fields are populated with values from these events. You can use these filter fields to compose filter conditions.
- You can click another tab (for example, **Threshold**), work in that area and then return to work in the Event Filter area without losing information.
- Use the right-panel as a source of reference for which fields are available to be used when composing filter conditions.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Event filters created on additional_info fields only perform a string comparison and not a numeric comparison, even if the information entered into the value field appears as if it is numeric, as depicted in the following graphic:

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Event Filter**.



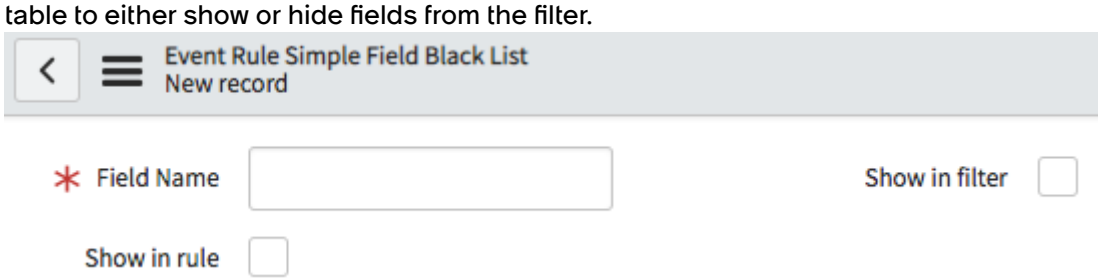
4. To ignore events, select **Ignore events that match this filter**.
   All events that match this event rule are ignored. You can add more conditions to the filter by clicking either **OR** or **AND**.

   Note:
   Even if an event is ignored by an event rule, the event is still recorded in the Event [em_event] table. Select this option to inhibit an alert from being created and be associated with the event.

5. To configure conditions to which the event rule must apply, click **New Criteria**.
   You can add further conditions by clicking either **OR** or **AND**.

   Note:
   The **%** character is not supported in filter conditions.

6. You can add field names to the Event Rule Simple Field Black Lists [em_event_rule_black_list] table to either show or hide fields from the filter.

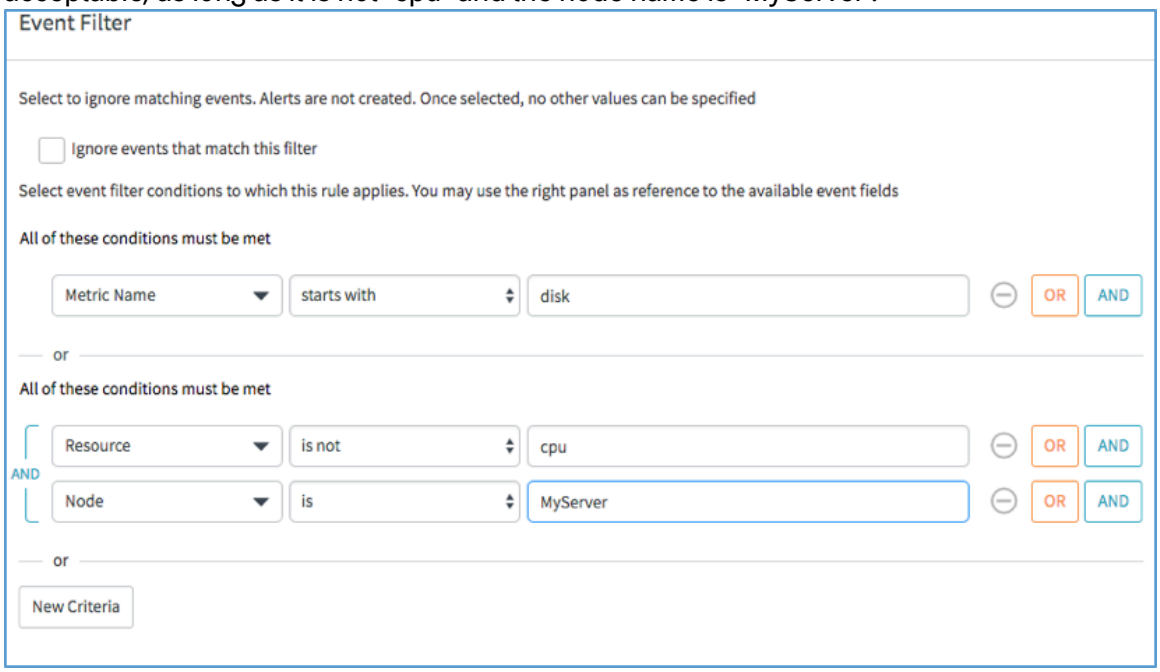


© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To remove fields from the filter and the right panel, add a new black list field with **Show in rule** not selected.
- To remove fields only from the filter and still enable it to appear in the right panel, add an exclusion list field with **Show in rule** selected.

7. Click either **Save** or **Submit**.

Example:
Example showing filter conditions that are specified to run a rule when the metric name starts with the word "disk". For this example, any resource is acceptable, as long as it is not "cpu" and the node name is "MyServer".



Example to filter events using time conditions. In the **Select Field or add New** field, select `Time of event`.

Specify the required time conditions, for example, anytime after yesterday.

Find events that are not matched to rules

Find events that are not matched to any rules, and determine if it is necessary to create event rules to manage them.

Before you begin

Role required: evt_mgmt_admin

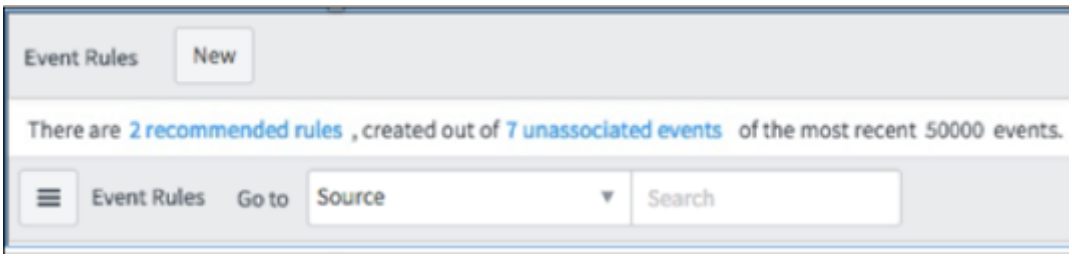
About this task

This task describes how to find events that are not matched to rules.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Near the top of the form, click the link for events or grouped events that are not mapped to rules.

Example



What to do next

Create an event rule. For example, event rules are useful for managing events that occur regularly.

View event rules

You can view all event rules on the Event Rules list.

Before you begin

Role required: evt_mgmt_admin

Procedure

Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.

Event Rules list

Field	Description
Name	The event rule name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Override default binding	Legacy binding criteria. If, in the **Bind** section criteria have not been specified or if the specified bind criteria are not matched, then the legacy binding criteria are considered.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Updated	Update date and time for the rule.

Note:
You can filter the Event Rule list to display the required subset of the information. However, if you create a favorite link after filtering, when the link is clicked the Event Rule list does not display the correct filter.

Configure an event rule to customize alert content

You can configure an event rule to customize alert content. You can customize the order of the fields and select which fields display. The fields in the left-hand work area of the **Transform and Compose Alert Output** section of an event rule are the fields that appear in the generated alert.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize alert content by adding the required event fields and modifying the text in the fields.

Note:
When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained.

Format alert text by using one or both of these methods:

Format alert text

Format method	Description
Transform	Create a field to display in an alert. The field and its value appear in the **Additional Information** section or in the **Alert Tags** section. In the **Event Input** pane, the new field is listed in the **Expressions** section.
Compose	Determine which text to display in the selected field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Configure which fields display in the **Event Input** pane by configuring the exclusion list [em_event_rule_black_list].

  A field entered into the exclusion list that already appears in an existing event rule is not removed from the rule; instead, it is moved to the **Manual Attributes** section in the rule.

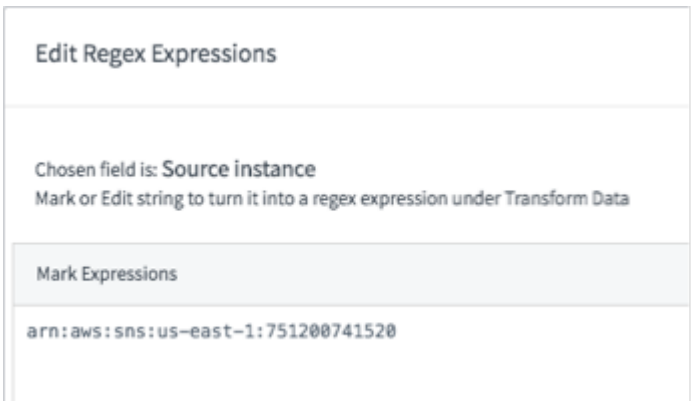
- Control the order of event form fields by configuring em_event_rule_order.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Transform and compose alert output**.
   In this section, you can use the **Transform** mode and the **Compose** mode.
4. To transform information in fields—standard mode:

Note:
In this step, the selection of text is made in standard edit mode. In this mode, undo is available.

a. Click the required field in the Event Input pane. The value and contents of the selected field appear in the workarea on the left.



b. Select standard edit mode .

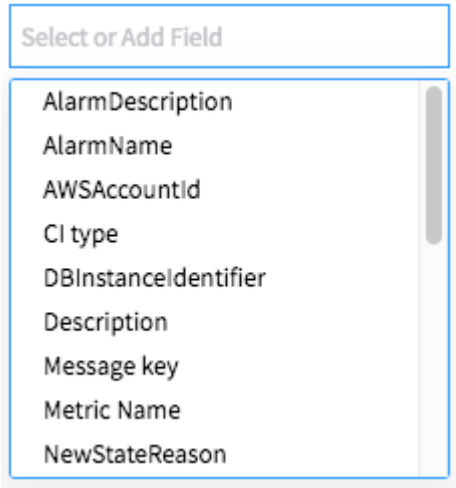
c. Using the pencil cursor, highlight the required text. You can double-click text in the field to select a word or select the required text and symbols.

Note:

If **Accessibility enabled** Accessibility enabled is selected in System Settings, standard edit mode is not available .

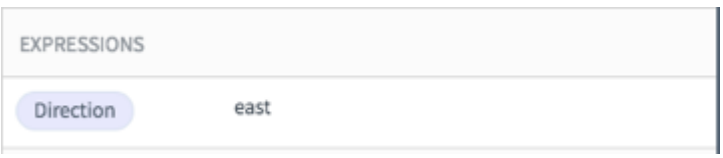
d. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane and the selected text is highlighted. Both the text and the expression name are highlighted in the same color. Each additional expression that you create, plus its value, is highlighted in a different color.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
Transform field names cannot contain a ‘ (single quote) character.

e. Click **Done**. The expression name appears in the **Expressions** section of the **Event Input** pane.



f. If you click an expression or its value in the **Event Input** pane, the details display in the workarea on the left.

5. To transform information in fields—regex mode:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- In regex mode, undo is not available.
- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text `vhxy2stlgwc_8888_hec03v012979`, the regex

  ```
  ^([^_]+)_
  ```

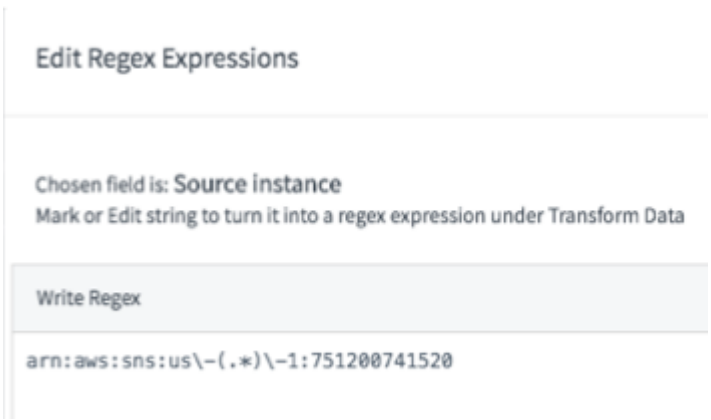
  looks as if it should catch the text `"vhxy2stlgwc"` that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows:

  ```
  ^([^_]+)_.*
  ```

- The Java Matcher parser is used for the regex engine. Ensure that you use a Java parser to test the regex.
- If the regex does not match the entire string when parsing data, the event rule will not capture the event, and no parsing takes place.
- The Java regex engine "matches" method is used. With this implementation, the regex engine attempts to match the entire input sequence against the specified pattern. Other matching methods, for example, the find method, are not supported.
- No regex flags are set by default, except the `Pattern.DOTALL` flag. With this implementation of Java regex, the DOT character "." matches any character, including a line terminator.
- Aside from `Pattern.DOTALL`, other regex flags cannot be changed.
- `Lookahead` is supported. However, `Lookbehind` is not supported.

a. Click the required field in the Event Input pane. The value and contents of the selected field appears in the workarea on the left.

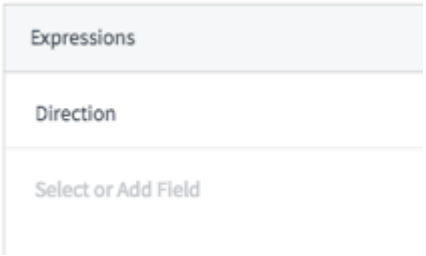
b. Select regex edit mode .



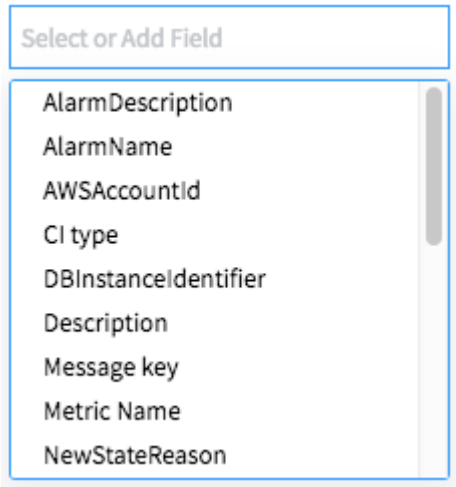
c. Select the required text and symbols 
. Replace the highlighted text with (.*) to create a regex expression.

d. In the **Expressions** pane, click the **Select or Add Field** field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane.



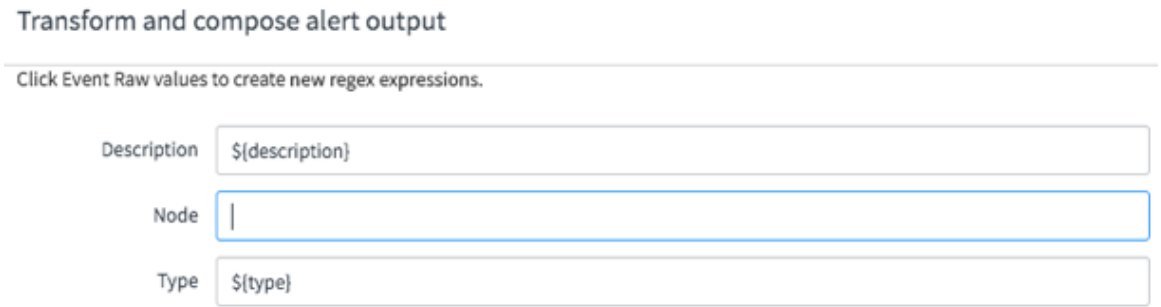
Note:
Transform field names cannot contain a ' (single quote) character.

f. Click **Done**.

Note:

- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text vhxy2stlgwc_8888_hec03v012979, the regex ^([^_]+)_ looks as if it should catch the text "vhxy2stlgwc" that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows: ^([^_]+)_.*

6. To compose text, in the Transform and compose alert output section, click in the required field.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compose text in the alert fields by performing any of these actions:

- Drag a field from the Event Info pane into the required field.
- Use the Event Info pane as a reference of which fields are available. Write the field name details, using the format ${<fieldname>}, where "$" means "use the value". Between the brackets, the name of the event field replaces the <fieldname> variable.
- Freely enter text, spaces, or characters. For example, use spaces or underscore symbols (_) to make the text in the alert field readable.

7. To specify fields that must display in the generated alert, select the **Manual attributes** check box.

> **Note:**
> These fields, and their values, display in the **Additional Information** section or in the **Alert Tags** section for attributes prefixed with "t_".

   a. In the left-hand column, enter a value.

   b. In the right-hand column, either drag a value from the Add or Expression fields or type in a value.
   When entering a value with attributes prefixed with "t_", a drop-down list appears with all the previously defined "t_" attributes.

8. Click **Save** or **Update**.

What to do next
You can filter event rules. See Filter the events that an event rule applies to.

Related topics
Create or edit an event rule

Use event input information

Alert tags

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

The event threshold is the rate upon which Event Management generates an alert. Receiving multiple events for a device over a short interval may warrant creating an alert, as the condition may be serious. However, receiving events over a longer interval may indicate a less serious situation which would not warrant creating an alert.

Before you begin
Role required: evt_mgmt_admin

About this task
You can configure the properties in an event rule to create alerts, suppress alert generation, or close existing alerts according to a specified threshold. The threshold is based on the value of event fields or number of occurrences over a specified period.

> **Note:**
> **Field Name** can be the name of any numeric field in the **Additional information** field of the event. Therefore, if CPU is an additional information field for a specific event, then CPU can be used as a **Field Name**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assume that you want to generate an alert when CPU utilization reaches or exceeds 80% three times with no more than 20 seconds between any two consecutive events. Create an event rule with these settings (an explanation for each value is given in parentheses):

- **Create Alert Operator**: *>=* (operator to determine whether utilization of **Field Name** reaches or exceeds the specified value)
- **Field Name**: *CPU* (events regarding high CPU usage)
- **Threshold Value**: *80* (percent)
- **Occurs**: *3* (three events occur where the CPU usage is at or above ">=" 80%)
- **Over(seconds)**: *20* (20 seconds or less between events)

To demonstrate how the preceding settings are evaluated, assume that the following events are received:

Scenario	Outcome
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=80 • Third event elapse time 60, CPU=70	In this scenario, no alert is generated since one event has a CPU utilization that is under 80%.
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=90 • Third event elapse time 70, CPU=95	In this scenario, an alert is not generated since the elapsed time in one event is over the specified 20 seconds.
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=95 • Third event elapse time 60, CPU=90	In this scenario, an alert is generated since in all events the elapsed time is within the specified time and the CPU usage is over 80%.

Note:

- When configuring an event rule to create or close alerts according to a threshold, events that arrive at the same second, as determined by the `time_of_event` field, are skipped. This occurs because these events are considered to be duplicates.
- When threshold conditions are configured, alerts close when the **Close Alert Operator** condition is met, and not when an event is received with **Severity = Clear** or **Resolution state = Closing**.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Create or open an event rule.
3. Click **Threshold**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Active**.
   If **Active** is not selected, the fields on this page do not appear.
5. In the **Create Alert Operator** field, select an operator.
   - If you select **Count**, specify the corresponding **Occurs** and **Over(seconds)** fields.
   - If you select any operator other than **Count**, the **Field name** and **Threshold value** fields appear. Specify the required values in these fields.

     Note:
     The value of the **Threshold value** property can be the name of any field in the **Additional information** of the event. For example, if `CPU` is a field in **Additional information** for a specific event, then `CPU` can be used as the **Threshold value**.

   - In the **Occurs** field, specify the required value.
   - In the **Over(seconds)** field, specify the required period.
6. To automatically close alerts, in the **Close Alert Operator** field, select an operator.
   Extra fields appear according to your selection.
   - If **Count** is specified as the operator for the **Create Alert Operator** field, then the selection in the **Close Alert Operator** field is either `None` or `Idle`. Specify the required value.
   - If you select **Idle**, configure the **Over(seconds)** field.
   - In the **Close Alert Operator** field, if you select an operator other than **Idle**, then configure the **Threshold value**, **Occurs**, and **Over(seconds)** fields.
7. Click **Save** or **Submit**.

Example:
To create an alert when a specific event occurs 5 times in 10 minutes, in **Threshold**:

1. In the **Field name** field, specify the name of any field that exists in the **Additional information** field in the event. The value of the field is irrelevant.
2. In the **Create Alert Operator** field, select `Count`.
3. In the **Occurs** field, specify `5`.
4. In the **Over** field, `600` (10 * 60 seconds).
5. Click **Save** or **Submit**.

To create an alert when a specific event occurs 5 times in 10 minutes with a metric value greater than 55. Assume that “metric_value” is a field in the **Additional information** of the event. Specify:

1. Select the *`Active`* check box.
2. In the **Create Alert Operator** field, select `>=`.
3. In the **Field name** field, specify **metric_value**.
4. In the **Threshold value** field, specify `55`.
5. In the **Occurs** field, specify `5`.
6. In the **Over** field, specify `600` (10 * 60 seconds).
7. Click **Save** or **Submit**.

Binding alerts to CIs

CI binding or linking is the process of finding and connecting a Configuration Item (CI) from the Configuration Management Database (CMDB) to an alert, using the logic defined in event rules. This helps ensure alerts are tied to the right IT components for better visibility and faster issue resolution.

Understanding CI binding

Binding alerts to CIs links incoming alerts to the correct Configuration Item (CI) representing a specific host, such as a computer, server, router, or virtual machine in your IT infrastructure. This ensures accurate alert tracking, simplifies troubleshooting by identifying the source of issues, and maintains a historical record of alerts tied to specific systems.

In IT Operations Management, the relationship between alerts and CIs plays a critical role in effectively managing services and infrastructure. A CI represents a component within your IT environment, such as a server, application, or database. Linking alerts to CIs ensures that alerts and incidents are directly associated with the affected component, enabling accurate impact analysis and faster resolution.

In dynamic and large-scale environments, it's often challenging to pinpoint which CI is responsible for triggering an alert. Alerts are generated from raw event data captured across multiple sources, but this data may not explicitly reference a CI. Without a reliable method to bind alerts to CIs, IT teams face the risk of:

- Poor visibility into service impact.
- Longer mean time to resolution (MTTR).
- Inefficient alert management processes.

Event rules provide a structured way to analyze incoming event data, enrich it with additional context, and map it to the correct CI. These rules act as a bridge, transforming raw event data into actionable alerts linked to CIs. For example, event rules can:

- Parse incoming event data: The process involves breaking down raw event data to extract important details, such as hostnames, IP addresses, or service tags. These details are then used to analyze the event—identifying its source, type, and impact—and to enrich the alert by adding relevant context, like affected services, priorities, or resolution steps, ensuring it's actionable for IT teams.
- Match patterns: Here, the extracted event details—such as hostnames, IP addresses, or service tags—are compared against entries in the CMDB to identify the corresponding Configuration Item (CI) based on predefined rules or logic. Once matched, the alert is linked to the CI, providing context about the affected IT component for better visibility and faster resolution.
- Bind the CI to the alert: At this point, the alert is automatically associated with the identified CI. It ensures that the alert is connected to the right IT component in the system, making it easier to track and manage, and helping teams quickly address the issue.

Types of CI binding

Binding type	Description
Implicit Node binding (Default binding)	Binds alerts to host CIs by matching the **Node** field in the event with attributes like Name, FQDN, IP, or MAC address.
CI field matching binding	Binds alerts using the **CI Identifier** field, a JSON structure containing column names and values (e.g., Name, FQDN, IP, or MAC Address).
CI identification binding	Binds alerts to specific applications on hosts using event rules.
Process-level binding	Binds alerts to application CIs by matching process-related attributes.
Device-level binding	Binds alerts to device CIs by matching event data with attributes like hostname, IP address, or MAC address.

Key benefits

- Improved service visibility: Alerts linked to CIs provide a clear picture of which IT components are affected.
- Enhanced automation: Automated CI binding reduces manual effort, ensuring consistency.
- Faster resolution: Teams can quickly diagnose and resolve issues by focusing on the impacted CI.

Example use case

Scenario: A company's email server named MailServer-01 goes down.

Process:

1. Alert generation: An alert is triggered when MailServer-01 becomes unresponsive.
2. CI binding: Event Management automatically looks for MailServer-01 in the CMDB (Configuration Management Database).
   - If found, the alert is linked to this specific server (CI).
   - If not found, the alert remains unlinked until more information is provided.

Result: The alert now shows that MailServer-01 is the affected system.

- Impact: IT teams immediately know which server to investigate.
- Efficiency: They don't need to check other infrastructure components or systems, saving time and effort.

This direct link helps streamline troubleshooting by pointing to the exact problem source.

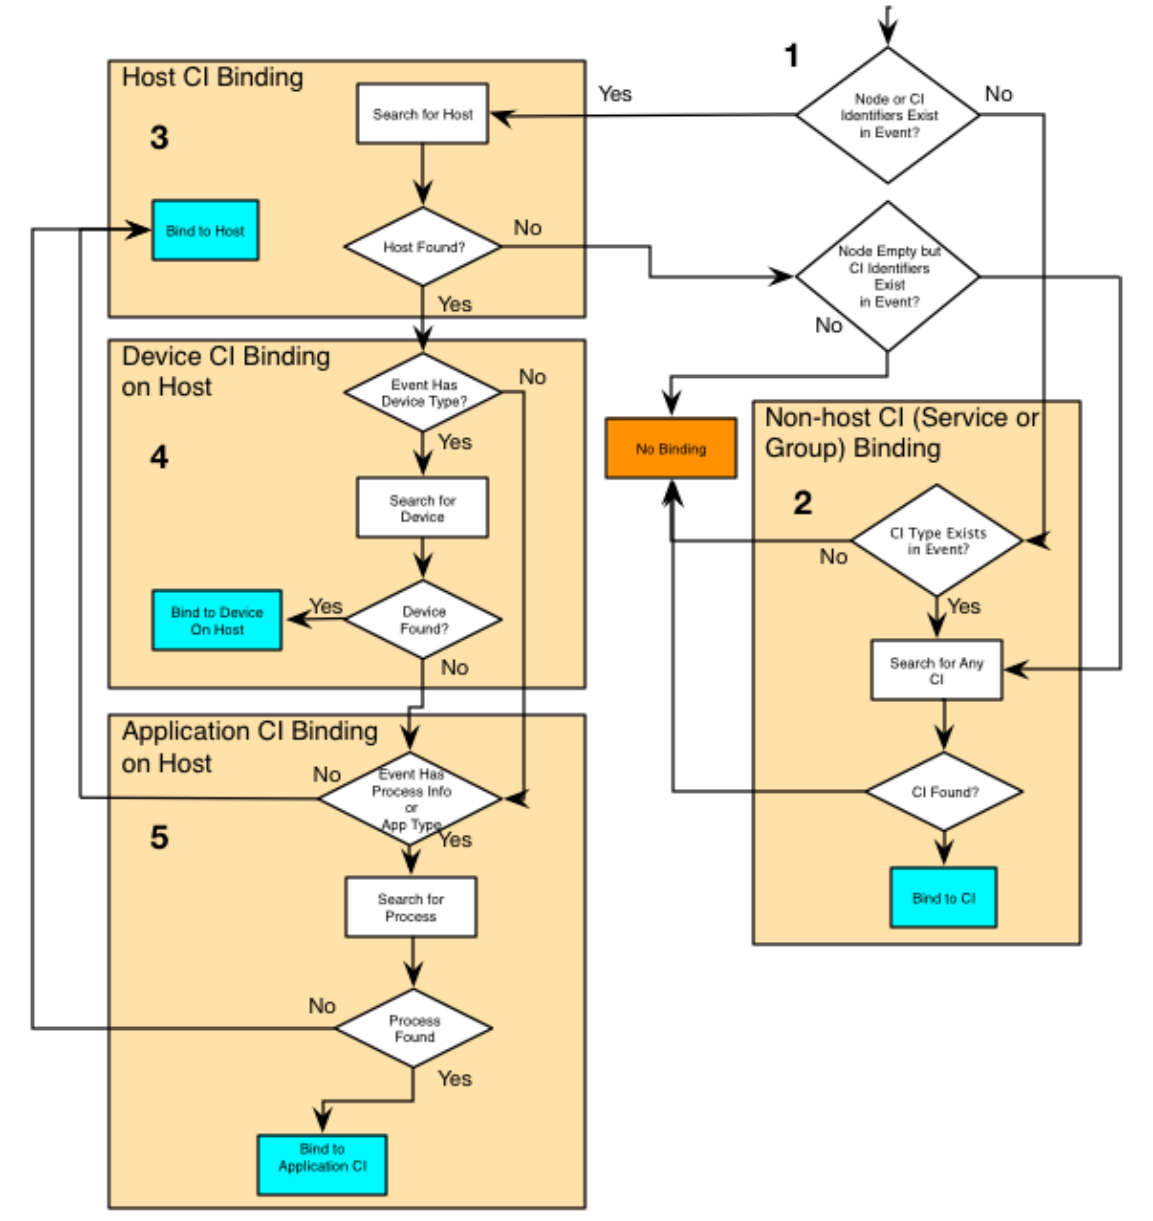
Simulate event processing

Binding process flow

Learn the process of binding Configuration Items (CIs) to alerts. This includes handling event arrival, binding alerts using available fields when no node is present, and searching the CMDB for matching hosts. It also explains linking alerts to CIs based on host and CI type detection.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI binding to alerts: Flow diagram



Process of linking CIs to alerts

1. Event Arrival: When an event is received, Event Management checks for node or CI identifiers.
2. Is Node Value Present?
   - Yes: If a node value is provided, Event Management searches the CMDB for a matching host.
   - No: If no node is found, the system attempts to bind the alert using other available details, such as:
     - Alert Type
     - Additional Information
     - CI Identifier
3. Host and CI Type Detection:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Both Found: If both a host and CI type are identified, the alert is linked to the corresponding device CI.
- Host Only Found: If only a host is identified, the system links the alert to an application CI.

Additional Considerations

- Event Processing Notes: The event can include the binding process flow in its **Processing Notes** field, providing insights into the binding actions.
- Binding to Retired CIs: By default, events do not bind to CIs with a Retired status. To enable binding to these CIs, set the *evt_mgmt.ignore_retired_cis_in_binding* property to false.
- Specifying CI Statuses for Binding: You can configure the *evt_mgmt.install_status_list_to_ignore_in_binding* property by specifying CI status numbers to control which CIs are considered for binding. For example:

CI Statuses

Status Number	Status
1	Installed
2	OnOrder
3	InMaintenance
4	PendingInstall
5	PendingRepair
6	InStock
7	Retired
8	Stolen
100	Absent

Note:
To specify multiple statuses, separate each status number with a comma.

Binding alerts to a specific host CI (default binding)

Binding alerts to Configuration Items (CIs) using the **Node** field or the **CI Identifier** field ensures accurate event association. By comparing an event record's **Node** or **CI Identifier** value, alerts are linked to the right system. This improves response, root cause analysis, and impact assessment by providing clear visibility into affected assets.

How default binding works

The system can perform default binding using the **Node** field or the **CI Identifier** field from the event record.

When an event enters the system, a key field like **Node** is available in the event record. However, there is no **Node** field in the CI. Instead, the node value from the event is compared with various attributes in the host CI, such as Name, Fully Qualified Domain Name (FQDN), IP, or MAC address. If a match is found, the alert is linked to the corresponding CI. This is the default method for binding alerts to CIs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The property *sa.active_operation_status* is used by the default binding mechanism, specifically when binding via IP/MAC using the node field in the event. When an event attempts to bind to a host through the node field (using IP/MAC), the system ignores hosts whose operational status is not included in this property and the operational status of the host must also not be null. By default, the property value is "1", which corresponds to Operational. You can extend the list to include additional statuses, and any status in the list is not ignored during binding.

Example: If *sa.active_operational_status* = "1,2", then both Operational and Non-operational hosts are considered valid for binding. The status attribute is defined by the following values:

- 1 – Operational
- 2 – Non-operational
- 3 – Repair in Progress
- 4 – DR Standby
- 6 – Retired

Note:
In this binding process, the CI must be a host. Host CIs include Computers, Operating Systems (OS), Switches, Routers, or any CI type/class that extends the [cmdb_ci_hardware] table, meaning the CI type or class must be a hardware component.

If no match is found using node, the system looks at the **CI Identifier** field on the event record. The **CI Identifier** is a JSON structure containing column names and values for comparison (e.g., Name, Fully qualified domain name, IP, or MAC Address). The JSON is: {"column_name":"<column_value>"}. For example, if we want to bind to a CI identified by **serial_number** whose value is **Dell Latitude 7420 Laptop**, the JSON is: `{"serial_number":"Dell Latitude 7420 Laptop"}`. If a match is found, the alert is linked to the corresponding CI.

Difference between binding with Node vs. CI Identifier

In default binding, the system considers all fields in the **Additional Information** field and attempts to match their values with the CI table. The **CI Identifier** field allows specifying particular fields for matching, even if they are not present in **Additional Information**. This process uses a predefined JSON structure and applies only when the CI is a host.

Note:
Even if the **Node** or the **CI Identifier** successfully binds the alert with the CI, event rules further determine how the binding occurs using the **Override default binding** check box available in Event rules. This ensures that alerts are bound correctly based on business logic, not just direct matches. This ensures that alerts are bound correctly based on business logic, not just direct matches.

Example: Resolving a CI Using Node and Event Rules

Imagine a server (Server-123) in your network generates an event. The event record contains a **Node** field with the value "Server-123.example.com".

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Matching with CI Attributes:
   a. The system checks the Node value against the CMDB.
   b. It compares "Server-123.example.com" with the FQDN, IP, MAC address, or Name of existing host CIs.
   c. If a match is found (e.g., FQDN in the CMDB is also "Server-123.example.com"), the alert is linked to that CI.
2. Applying Event Rules: Even if the Node resolves to Server-123, additional event rules might determine if the alert should be linked differently. For example, an event rule may specify that alerts from Server-123 should be linked to a parent CI (like a cluster) instead of the individual server.

Overriding default binding

Overriding default binding allows flexibility in linking alerts to CIs beyond the default Node-based matching. This helps customize alert binding based on business needs, ensuring accurate associations and preventing mislinked alerts, improving incident management and root cause analysis.

By default, alerts are bound to CIs by matching the node value in the alert with attributes like Name, FQDN, IP, or MAC Address in the CI. However, if you want to change this behavior—either by using additional criteria or ignoring the node altogether—you can use the **Override Default Binding** check box.

This allows for two scenarios:

1. When Binding Type = CI Field Matching
   - If the CI is a host, the Node is required for binding. For more information, see Bind host CIs using CI field matching.
   - If the CI is not a host, the Node must be empty. For more information, see Bind non-host CIs using CI field matching.
2. When Binding Type = CI Identification. For more information, see Bind alerts to CIs using CI identification.

This flexibility ensures alerts are linked correctly based on specific business needs.

Note:
You can also use the Service Operations Workspace to define binding rules. For more information, see Create Enrich automation.

Bind host CIs using CI field matching

When CI Field Matching is used and the CI is a host, the Node value from the alert is used for binding. The system compares the Node with attributes like Name, FQDN, IP, or MAC Address in the CMDB to find a match. This ensures that alerts are correctly linked to the corresponding host CI.

Before you begin

Role required: evt_mgmt_admin

About this task

When an event enters the system, key field like **Node** is available on the event record. The **Node** field generally represents the name of the server. In CI there is no field like **Node**. However, the value of **Node** from the event is compared with different values in the host CI such as Name, Fully qualified domain name (FQDN), IP, or MAC Address. If a match is found, the alert is linked to the corresponding CI. This is the default binding of alerts to CIs. In this binding, the CI must be a

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

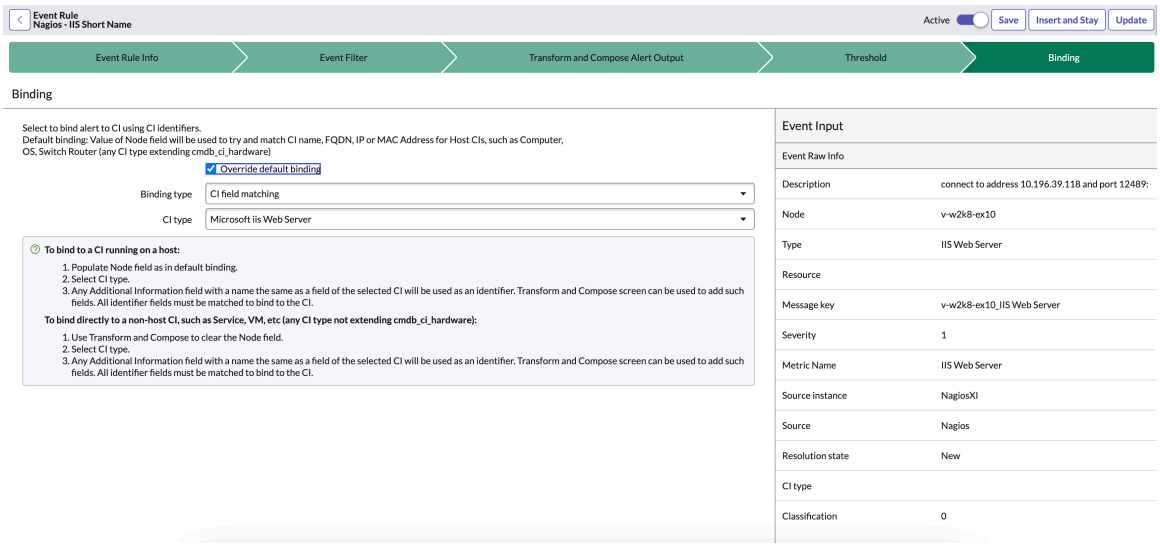
host. Host CIs include Computers, OS, Switches, Routers—essentially any CI type or class that extends the [cmdb_ci_hardware] table.

There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues successfully. For information on how to create a manual field, see Bind CIs using CI field matching and handling column name differences.

Note:
Even if the node successfully binds the alert with the CI, event rules further determine how the binding occurs.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.



6. In the **CI type** field, select the appropriate type of hardware component (such as a server, router, or storage device) that the CI type represents.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI. For example, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.
7. Select **Submit**.

Note:
You can also use the Service Operations Workspace to define binding rules. For more information, see Create Enrich automation.

Bind alerts to a specific device

Bind each alert directly to the originating device to establish a clear source of impact. This ensures accurate troubleshooting, reduces noise from unrelated alerts, and helps teams focus on resolving the right issue faster.

Before you begin

Role required: evt_mgmt_admin

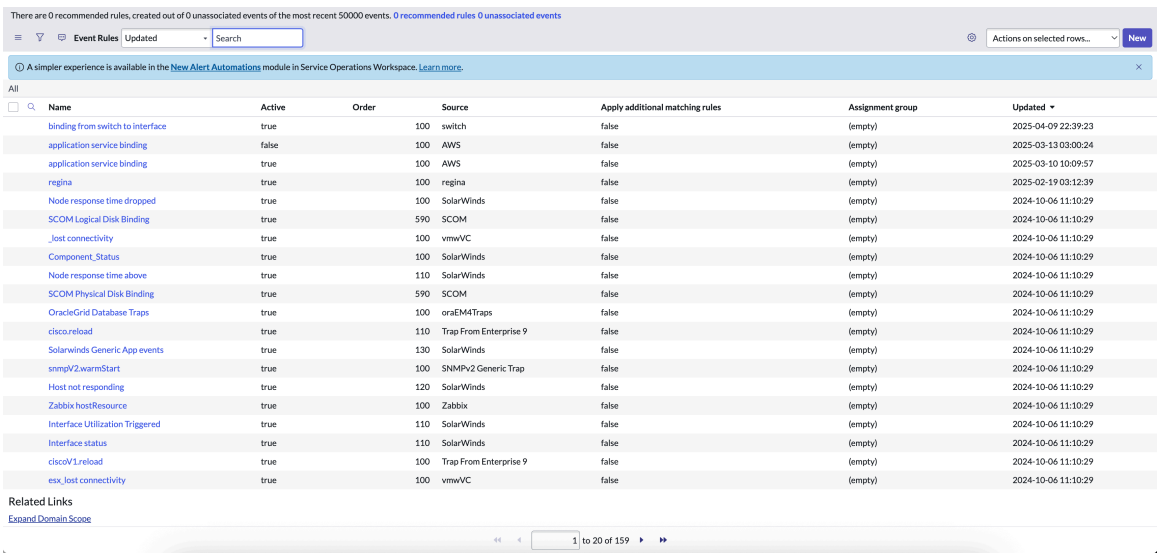
About this task

In IT environments, multiple devices like switches have many smaller components, such as ports. When something goes wrong, it's not enough to just say the switch has an issue—the system needs to pinpoint exactly which port is causing it. Binding alerts to the specific port that triggered the issue allows teams to act faster and fix the real issue without wasting time checking the entire switch or unrelated components.

The following example procedure shows the alert binding configuration for a switch named IP-Switch-1, ensuring alerts target the correct port. The event rule setup starts by enabling the **Override default binding** option and selecting **CI field matching** as the **Binding type**. Choosing **Switchport** as the **CI type** instructs the system to bind alerts to individual ports. The Binding Device Map defines how the system links the switch (cmdb_ci_ip_switch) to its ports (dscy_switchport) using the cmdb_ci reference field. This map guides the binding logic. Under **Configuration** > **Network** > **Switches**, selecting **IP-Switch-1** reveals its switchports and interface names. When an incoming event includes a matching interface name in the **Additional information** field, the system binds the alert directly to the correct port—ensuring precise and meaningful alert context.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.



3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.
6. In the **CI type** field, select **Switchport**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.

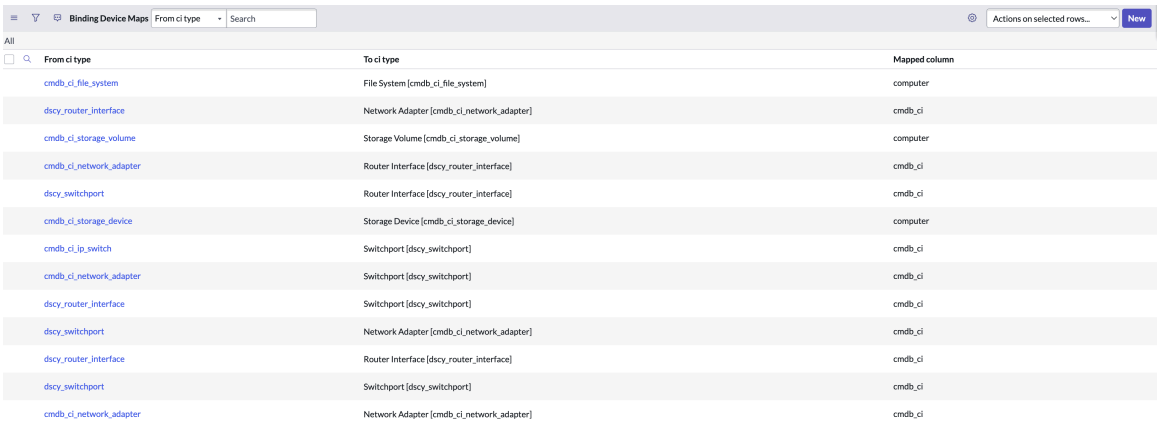
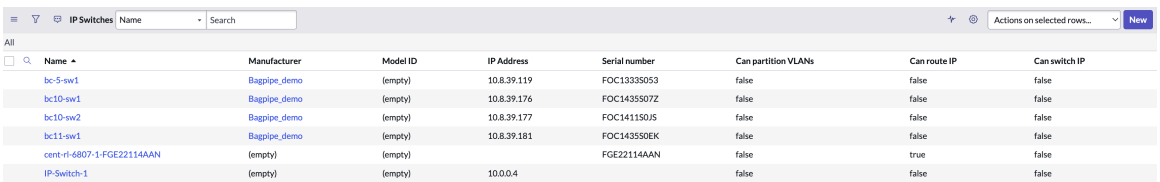
7. Navigate to **All** and search `em_binding_device_map.list`.
   The Binding Device Maps page opens. Here the column values **From ci type** is mapped to **To ci type** using the **Mapped column**. For example, **cmdb_ci_ip_switch** is mapped to the Switchport [dscy_switchport] table using the reference field **cmdb_ci**.



From ci type	To ci type	Mapped column
cmdb_ci_file_system	File System [cmdb_ci_file_system]	computer
dscy_router_interface	Network Adapter [cmdb_ci_network_adapter]	cmdb_ci
cmdb_ci_storage_volume	Storage Volume [cmdb_ci_storage_volume]	computer
cmdb_ci_network_adapter	Router Interface [dscy_router_interface]	cmdb_ci
dscy_switchport	Router Interface [dscy_router_interface]	cmdb_ci
cmdb_ci_storage_device	Storage Device [cmdb_ci_storage_device]	computer
cmdb_ci_ip_switch	Switchport [dscy_switchport]	cmdb_ci
cmdb_ci_network_adapter	Switchport [dscy_switchport]	cmdb_ci
dscy_router_interface	Switchport [dscy_switchport]	cmdb_ci
dscy_switchport	Network Adapter [cmdb_ci_network_adapter]	cmdb_ci
dscy_router_interface	Router Interface [dscy_router_interface]	cmdb_ci
dscy_switchport	Switchport [dscy_switchport]	cmdb_ci
cmdb_ci_network_adapter	Network Adapter [cmdb_ci_network_adapter]	cmdb_ci

8. Navigate to **All** and search `switches` and select **Configuration** > **Network** > **Switches**.
   The IP Switches page opens.



Name	Manufacturer	Model ID	IP Address	Serial number	Can partition VLANs	Can route IP	Can switch IP

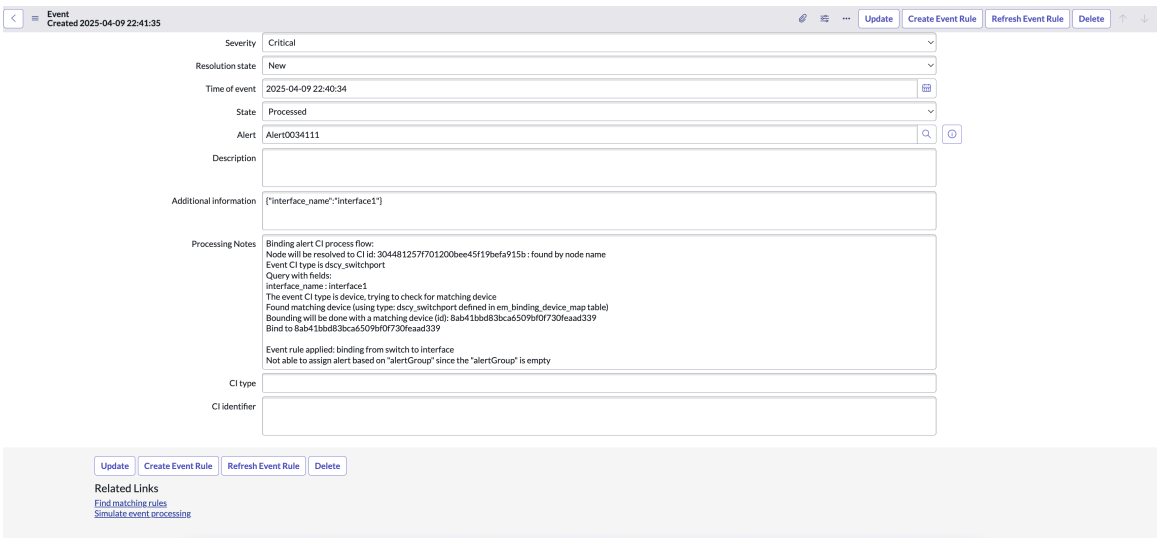
In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching device.



Bind alerts to a specific process

Bind specific server processes to their corresponding Configuration Items (CIs) in the CMDB to ensure accurate mapping and visibility. This binding is crucial for identifying service dependencies, reducing ambiguity from generic process names, and enabling effective monitoring. It supports faster alert resolution, impact analysis, and better alignment between infrastructure and application components in dynamic environments.

Before you begin

Role required: evt_mgmt_admin

About this task

Sometimes, when an alert (or event) comes into the system, it needs to be connected — or "bound" — to a Configuration Item (CI) in the CMDB. By default, the system binds alerts to host specified in the **Node** field of the event. Imagine a situation where you have a Windows server running multiple processes, like MSFT SQL Instances and SQL Server Analysis Services. The challenge is to bind an event to the specific process instance rather than just the host server, as multiple processes could have the same generic name, such as MSSQLSERVER, leading to ambiguity.

The following example procedure uses a Windows server as the host, MSFT SQL Instances as the CI class of the process, and MSSQLSERVER as the process name. The following steps are

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

based on the assumption that the event **Node** field of the event provides the host name, and the **Additional Information** field contains specific process details required for binding.

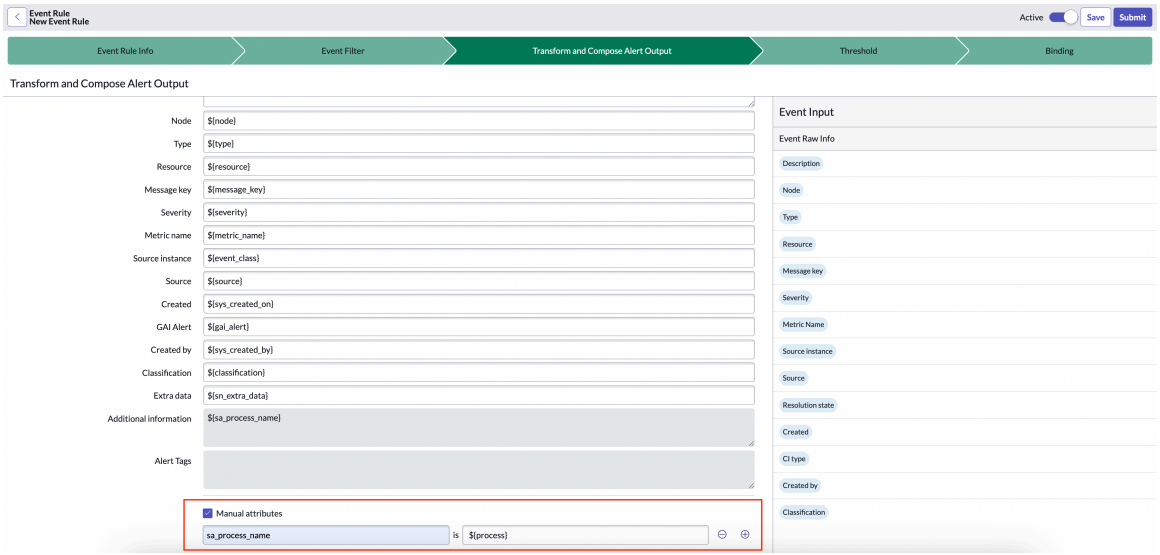
Alert-to-CI Binding via Process Mapping

Action	Steps
Set event rule: Add process name	Add the process name `sa_process_name` in the event rule.
Set event rule: Define CI type	Select the target CI type in the event rule. For example, MSFT SQL Instances.
Define process mapping	Navigate to the Process to CI Type Mapping table [em_binding_process_map] and add an entry mapping a CI type (e.g., MSFT SQL Instances) to a process name (e.g., MSSQLSERVER).
Bind CI to alert	When an event is triggered, the system: **1.** Applies default binding to identify the host. **2.** Checks the CI type specified in the event rule. **3.** Looks up the Process to CI Type Mappings table [em_binding_process_map] for a matching process name and CI type. **4.** Searches the CI Relationships table [cmdb_rel_ci.list] for a Runs on::Runs relationship between the process and the host CI. **5.** Binds to a process when values from the **CI Type** column match the corresponding entries in the **Process** column in the Process to CI Type Mappings table [em_binding_process_map].

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.
3. Select the **Transform and Compose Alert Output** tab and perform the following steps:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

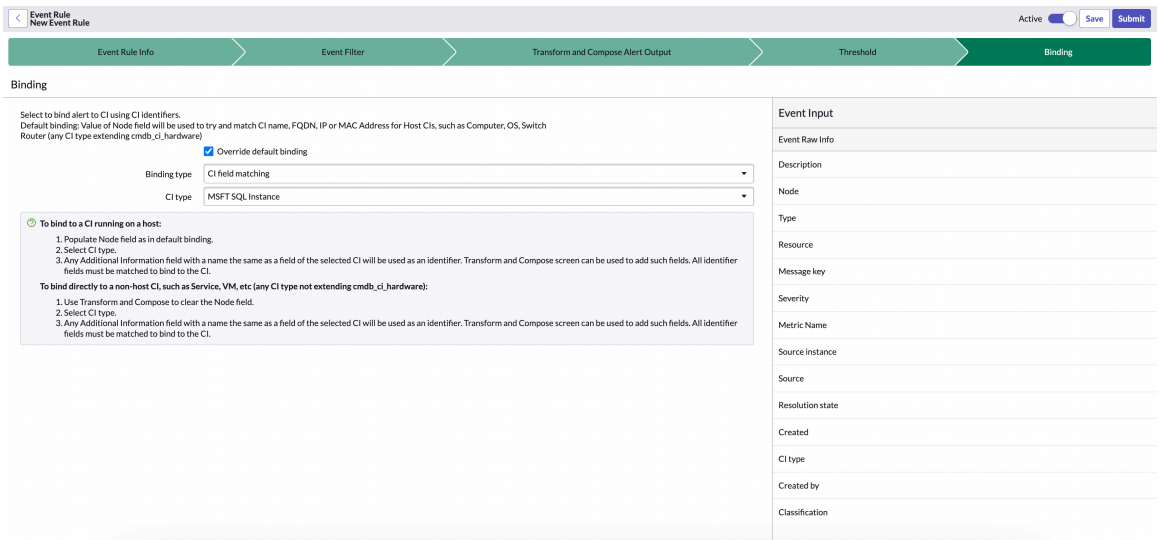


a. Select the **Manual attributes** check box.

b. Enter `sa_process_name` is `${process}`.

sa_process_name is a special variable name used to specify the name of the process to search for. ${sa_process_name} will appear in the **Additional information** field of the event. Instead of `${process}`, you can enter any other field name from which the variable `sa_process_name` derives its value.

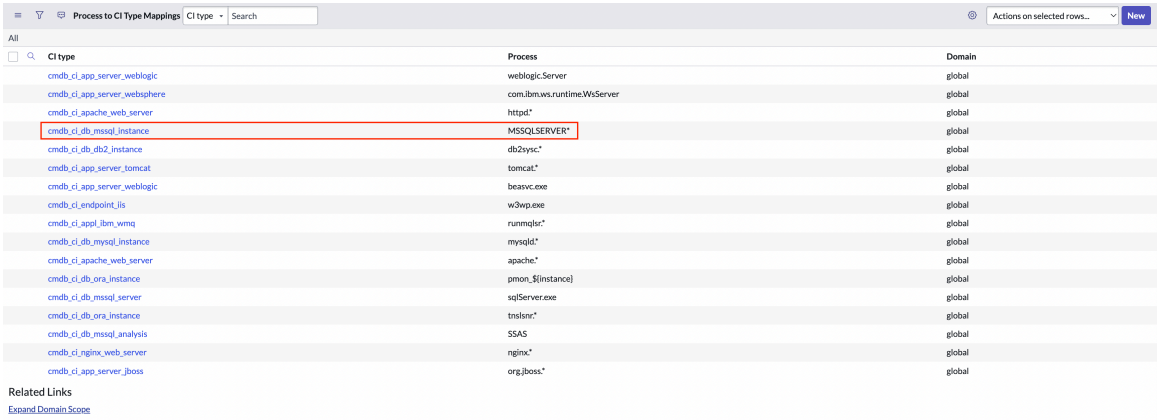
4. Select the **Binding** tab.
5. Select the **Override default binding** check box.
6. In the **Binding type** field, select **CI field matching**.
7. In the **CI type** field, select **MSFT SQL Instances**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.



8. Navigate to **All** and search `em_binding_process_map.list`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

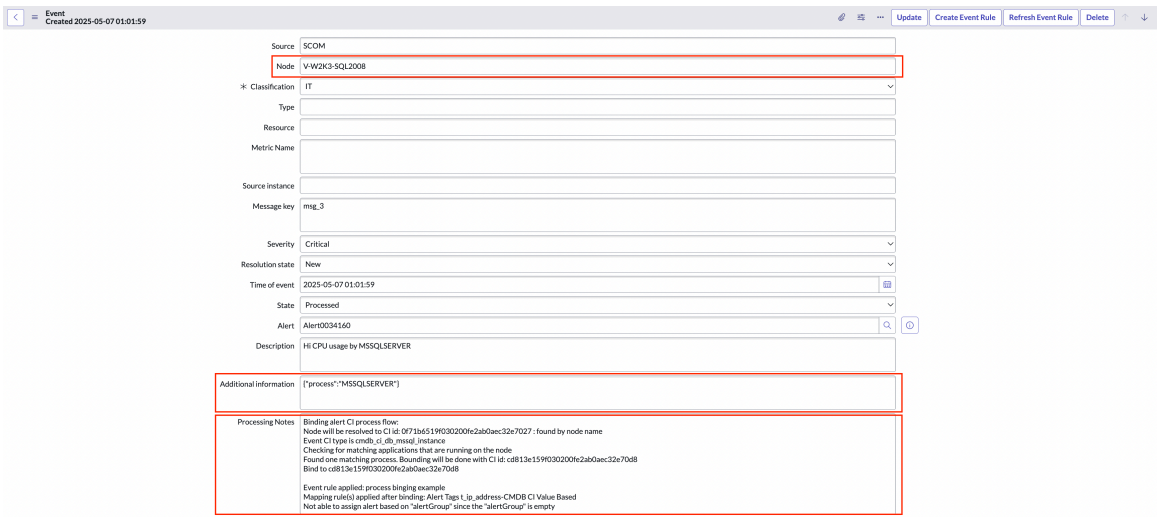
The Process to CI Type Mappings page opens. Here the values from the **CI type** column are mapped to entries in the **Process** column. For example, **cmdb_ci_db_mssql_instance** is mapped to the **MSSQLSERVER** process.



9. **Optional:** Navigate to **All** and search `cmdb_rel_ci.list`.
   The CI Relationships page opens.
10. **Optional:** Verify that the node is in a Runs on::Runs relationship with the appropriate process.

11. Navigate to **All** > **Event Management** > **All Events**.
12. Create an event with **Node** value as the name of the host such as Windows Server (V-W2K3-SQL2008).
    The **Additional information** field in the event has a key called **process** whose value is **MSSQLSERVER**.

    In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching process.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bind non-host CIs using CI field matching

If no match is found using the **Node** field, the system uses the **CI identifier** field to match alerts with non-host CIs based on attributes like Name, FQDN, IP, or MAC. This ensures accurate alert association, improving visibility, troubleshooting, and root cause analysis for diverse infrastructure components.

Before you begin

Role required: evt_mgmt_admin

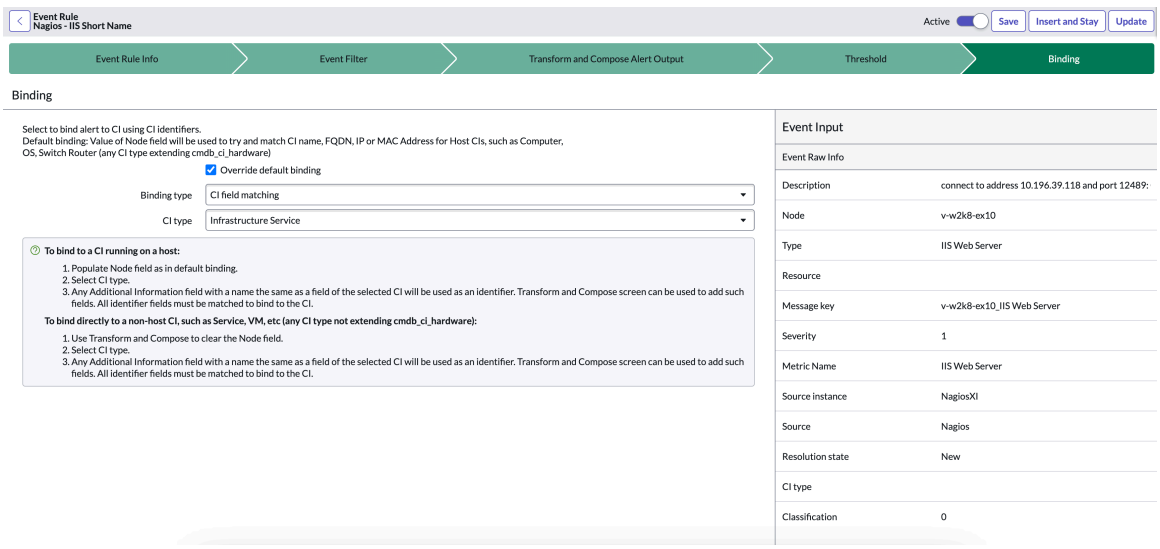
About this task

If no match is found using the **Node** field, the system looks at the **Additional information** field of the alert. When you select a CI type, such as File System, the system automatically searches for a matching record in the [cmdb_ci_file_system] table. It uses the details provided in event rule record, specifically in the **Additional information** field, to refine the search. For example, if the **Additional information** field contains values like `{"mount_point": "/snap/amazon-ssm-agent/9565", "name": "/dev/loop0"}`, the system looks for a record in the [cmdb_ci_file_system] table that matches these values. If a match is found, the system binds the CI to the alert, ensuring accurate identification and association. Similarly, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.

There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues successfully. For information on how to create a manual field, see Bind CIs using CI field matching and handling column name differences.

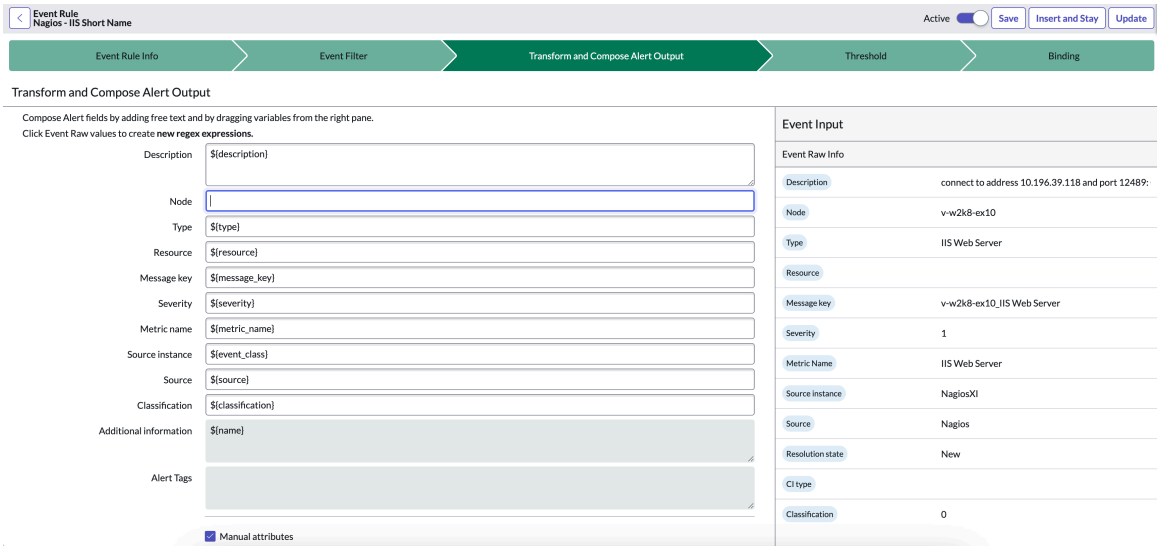
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.



6. Select the **Transform and Compose Alert Output** tab.
7. Clear the **Node** field value.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. In the **CI type** field, select the non-host CI.

   A non-host CI type is any CI type that does not extend the [cmdb_ci_hardware] table, such as a Service or VM. The **CI type** determines the specific CMDB table where the system searches for the matching CI.

9. Select **Save**.

Bind CIs using CI field matching and handling column name differences

Bind CIs by matching event **Additional information** fields with CI attributes. If column names differ, manually create an additional key-value pair to align with the CI table, ensuring accurate CI association.

Before you begin

Role required: evt_mgmt_admin

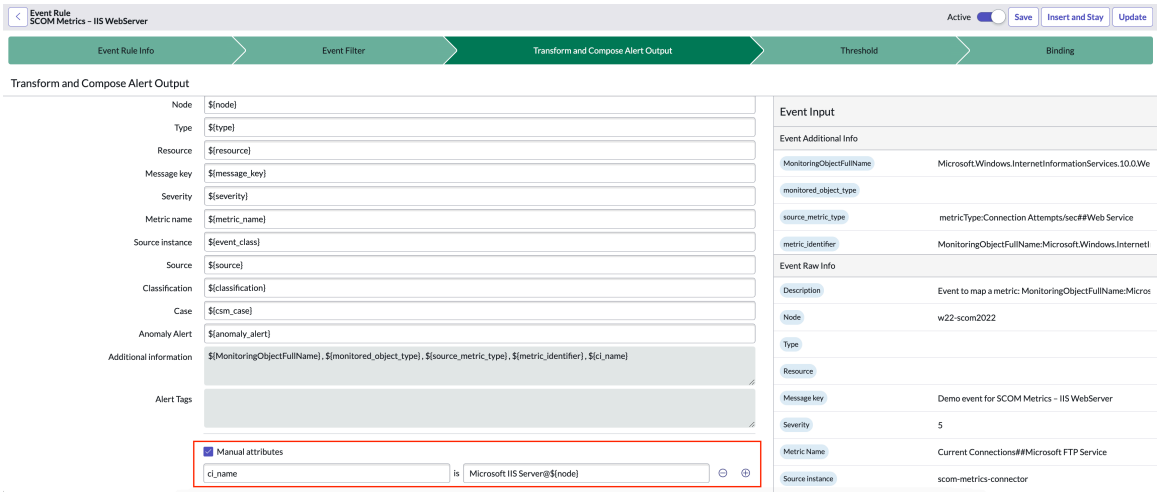
About this task

If no match is found using the **Node** field, the system looks at the **Additional information** field in the event record. There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column and add it to the **Additional information** field, ensuring the matching process continues successfully.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields, or open an existing event rule record to modify it.
3. Select the **Transform and Compose Alert Output** tab.
4. Select the **Manual attributes** check box.
5. In the **Field Name** and **Field Value** fields, enter the corresponding field name and specify the source field from which the value should be populated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use the add icon (⊕) icon to add multiple fields as needed.

6. Select **Save**.
   The fields are created in the event rules record. However, when any alert is generated from an event using the event rule, the manually added fields appear in the **Additional information** field of the alert.

Bind alerts to CIs using CI identification

Bind alerts to specific applications on hosts using event rules to ensure accurate tracking and to improve issue resolution speed—leading to efficient remediation and better alignment of alerts with the right resources.

Before you begin

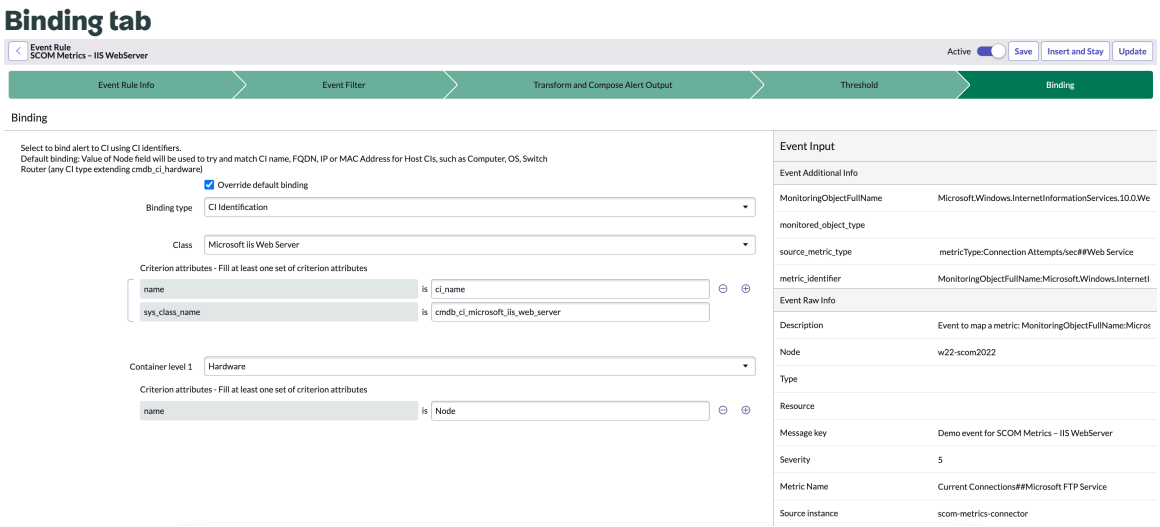
Role required: evt_mgmt_admin

About this task

Before going through the procedure, let's first understand how this binding works with an example. Suppose an out-of-the-box event rule, SCOM Metrics – IIS WebServer, generates an alert for a Microsoft IIS Web Server running on a host. Instead of binding the alert to just the host machine, you want it to be associated with the specific application (IIS Web Server) where the issue occurred. Here's how the system ensures accurate binding.

Let's say in the **Binding** tab, the **Class** and **Container Level 1** are defined along with their respective attributes, as shown in the image.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The binding procedure follows these steps:

1. Identifying the Host (Container Level 1)

   Since the Microsoft IIS Web Server runs on a host (in this case Hardware), the system first locates the host, which is defined as **Container Level 1**. The name field is used to identify the host, and its value is taken from the **Node** field of the event. Using this name, the system searches the CMDB to find a matching host CI.

2. Identifying the Microsoft IIS Web Server CI on the Host

   Once the host is identified, the system looks for a Microsoft IIS Web Server CI under that host with the following attributes:

   - name = ci_name
   - sys_class_name = cmdb_ci_microsoft_iis_web_server

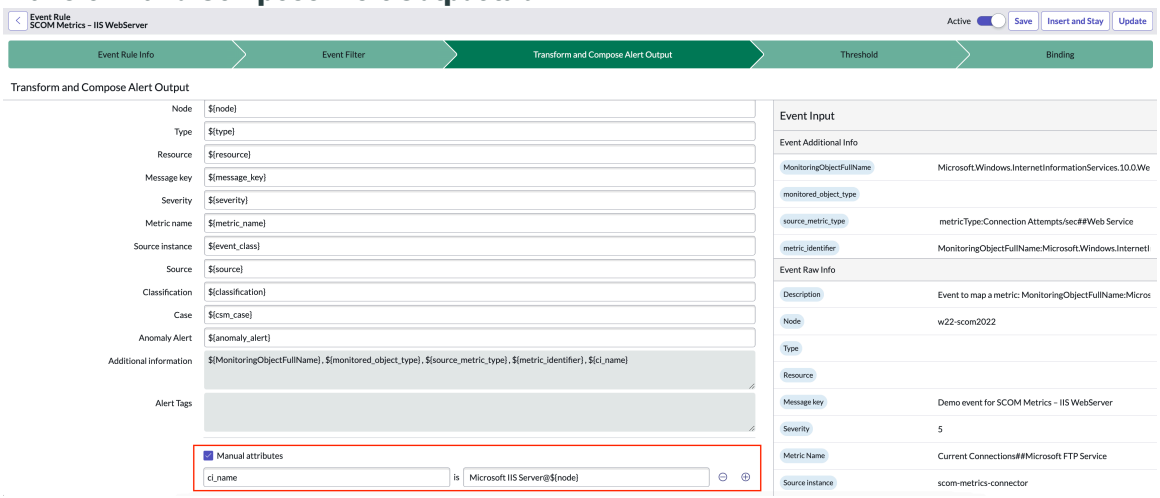
   Here, ci_name is derived from the key-value pair defined in the **Transform and Compose Alert Output** tab of the event rule. Assume that in the **Transform and Compose Alert Output** tab of the event rule, the **Manual attributes** check box is selected and the following key-value pair is already added:

   - **Field Name**: `ci_name`
   - **Field Value**: `Microsoft IIS Server@${node}`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This ensures that `ci_name` appears in the **Additional information** field of the alert and is used when configuring the attribute field of the CI class.

Transform and Compose Alert Output tab



If a matching Microsoft IIS Web Server CI is found on the identified host, the alert is bound to the correct application CI rather than just the host. This ensures more precise incident tracking and resolution, linking the alert to the actual service affected instead of only the machine it runs on.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI Identification**.
6. In the **Class** field, select a CI class.
7. In the **Select an identifier** field, select an identifier for the class.

   An identifier for a class is a set of rules that helps the system recognize and match CIs correctly. Think of it like a fingerprint for each type of CI (such as a server, router, or application). The identifier uses key attributes—like a serial number, hostname, or IP address—to make sure that when new data comes in, it gets linked to the right CI instead of creating duplicates. For more information on CI identification rule, see Create a CI identification rule.
8. In the **Add value** field, add the exact value or specify the source field from which the value for the field must be populated.

   Add or remove fields using the add (⊕) and the delete (⊖) icons.

   Note:
   While filling in the CI Class attributes, if you do not find the attribute you need, you can use the **Transform and Compose Alert Output** tab of the event rule to add the necessary key-value pair. For more information, see Configure an event rule to customize alert content.

   The event rule transformation and composition is useful when relevant information exists in a different field but needs to be extracted or reassigned for proper alert processing. This is especially important when the required attribute is not directly available and must be manually defined.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, suppose the **Additional information** field of an alert contains the alert name under the **Node** field. However, for correct processing, we need this value to appear under the **Name** field instead. Since there is no existing name attribute in the event, we can manually create one using the **Transform and Compose Alert Output** tab in the event rule. Here's how:

a. Select the **Transform and Compose Alert Output** tab.

b. Select the **Manual attributes** check box.

c. Add the following key-value pair:

- **Field**: Name
- **Field Value**: Node

This configuration ensures that the system extracts the **Node** value and maps it to the name field, making it available for CI binding and alert correlation.

9. In the *Container level 1* area, specify the host.
10. In the **Select an identifier** field, select an identifier for the container.
11. In the **Add value** field, add the exact value or the field that is the source for the **Select an identifier** field of the container.

    Add or remove fields using the add (⊕) and the delete (⊖) icons.
12. Select **Save**.

Example: Binding alerts to non-host CIs

Bind alerts to an application service (a non-host CI) using event rules and event field mapping. This example demonstrates how to achieve this by leveraging the IP address associated with the service.

Before you begin

Role required: evt_mgmt_admin

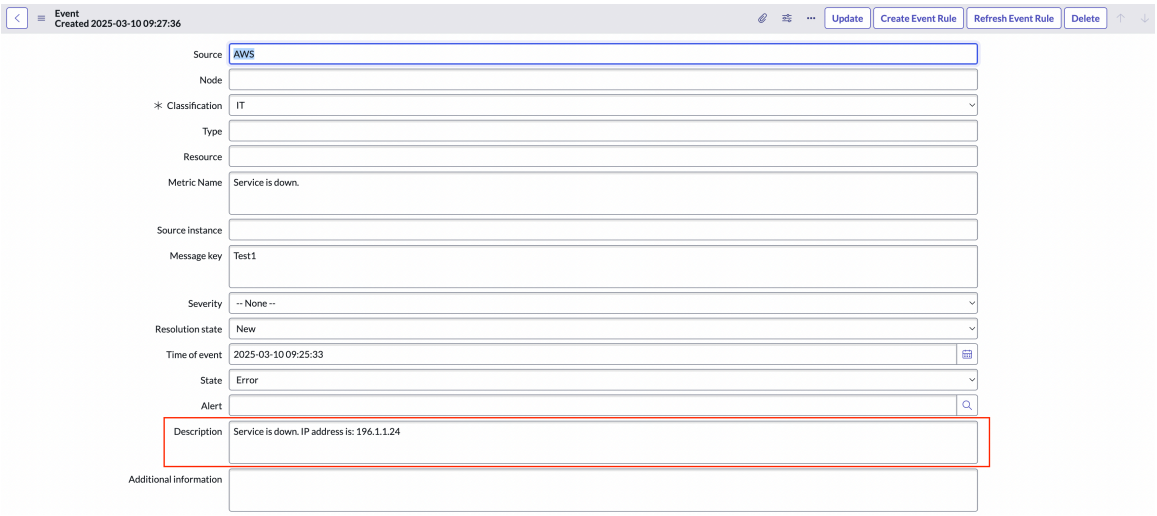
About this task

When an event is generated, it may not always include the exact name of the Application Service it affects. Instead, it might provide details such as an IP address. In this example, suppose application services are identified by IP addresses. Since the goal is to bind the alert to an Application Service, you need to determine which service name corresponds to the given IP address.

To achieve this, follow these steps:

1. Match the correct Application Service: Override the default binding and select **Binding Type** as **CI field matching**. The binding process needs to associate the alert with an Application Service, not a host. In the event rule, set the **CI Type** to **Application Service** so that the system searches for the service in the Application Service table (cmdb_ci_service_auto).
2. Extract the IP address from the event description: The event might contain a message like `Service is down. IP address is: 196.1.1.24`. You need to extract the IP address from this description for further processing.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

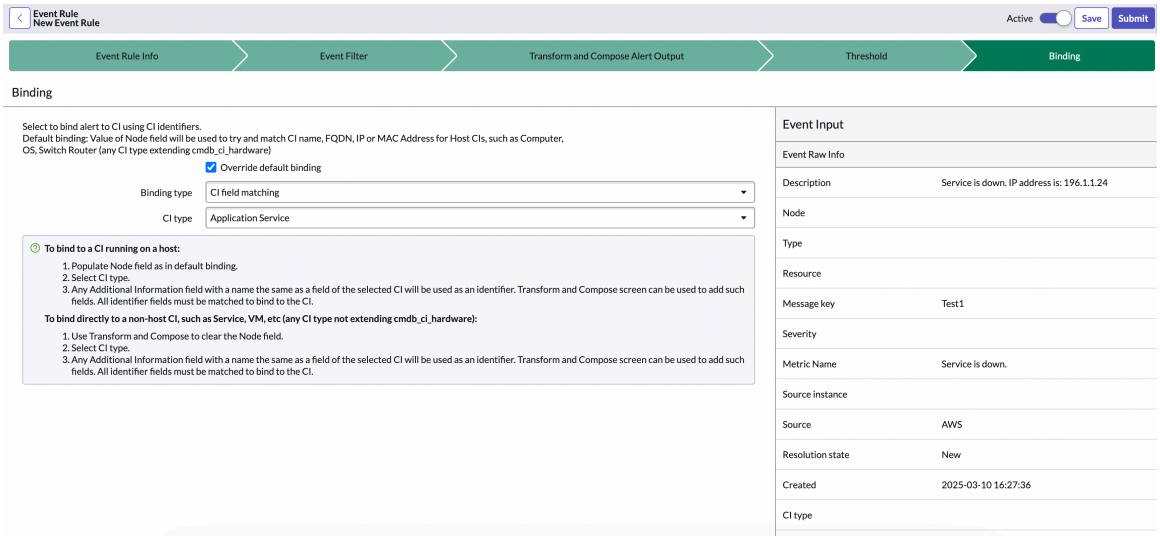


3. Translate the IP address into a service name using Event Field Mapping: Use Event Field Mapping to look up the extracted IP address in the CMDB and find the associated application service. Once a matching service is found, its name is stored in the **Name** field of the event.
4. Bind the alert to the correct Application Service: If the service name is identified, the alert's CI is populated with that service.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the specific event for which you want to create an event rule.
3. Select **Create Event Rule**.
   The new event rule page opens. Some fields in the event rule are populated based on the event record data, such as the Source field value.
4. In the **Event Rule Info** tab, in the **Name** field, enter `application service binding`.
5. Select the **Binding** tab.
   In this tab, you select the CI type as a service (non-host) instead of a host because the goal is to bind alerts to an Application Service, not to a physical or virtual machine.
6. Perform the following steps:
   a. Select the **Override default binding** check box.
   b. In the **Binding type** field, select **CI field matching**.
   c. From the **CI type** list, select **Application Service**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select the **Transform and Compose Alert Output** tab.

   In this tab, you extract the IP address of the application service into a manually created field. Extracting the IP allows the system to look up the corresponding service in the Application Service table (cmdb_ci_service_auto). Without extracting the IP, the system wouldn't be able to determine which Application Service the event belongs to, making it difficult to bind the alert correctly.

8. Perform the following steps:

   a. Clear the **Node** field.

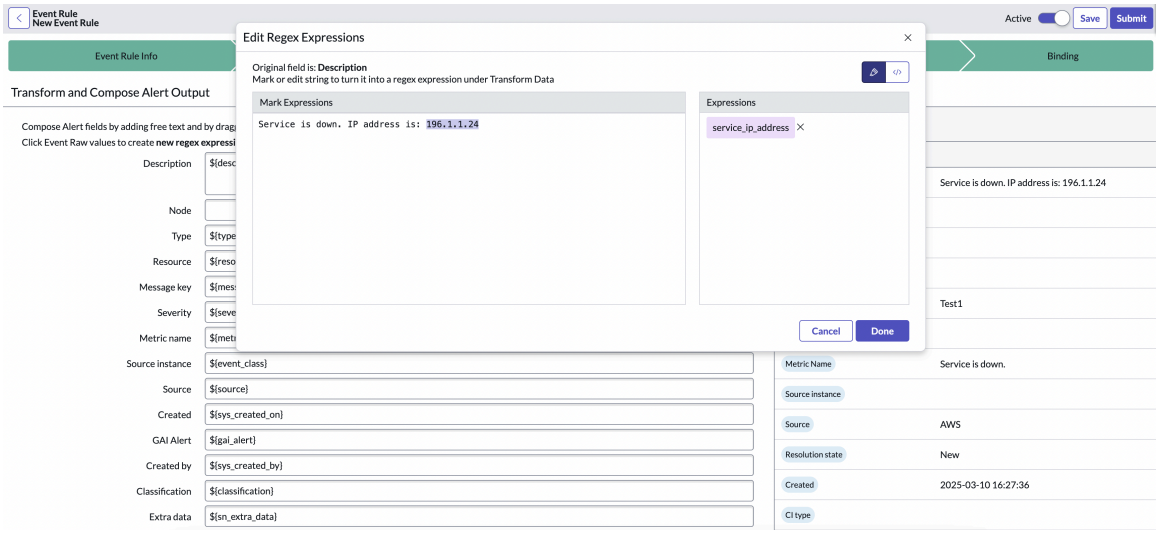
      When an event is processed, it often comes with multiple fields of information. The **Node** field typically contains the host or device name. However, since the goal is to bind the alert to an Application Service rather than a host, clearing the **Node** field ensures that the system focuses on identifying the correct service instead of mistakenly associating the alert with a host CI.

   b. Under **Event Input** > **Event Raw Info**, select **Description**.

      The Edit Regex Expressions window opens.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Mark Expressions section, select the IP address, manually enter a field name (e.g., service_ip_address), and press Enter to save it.



d. Select **Done**.

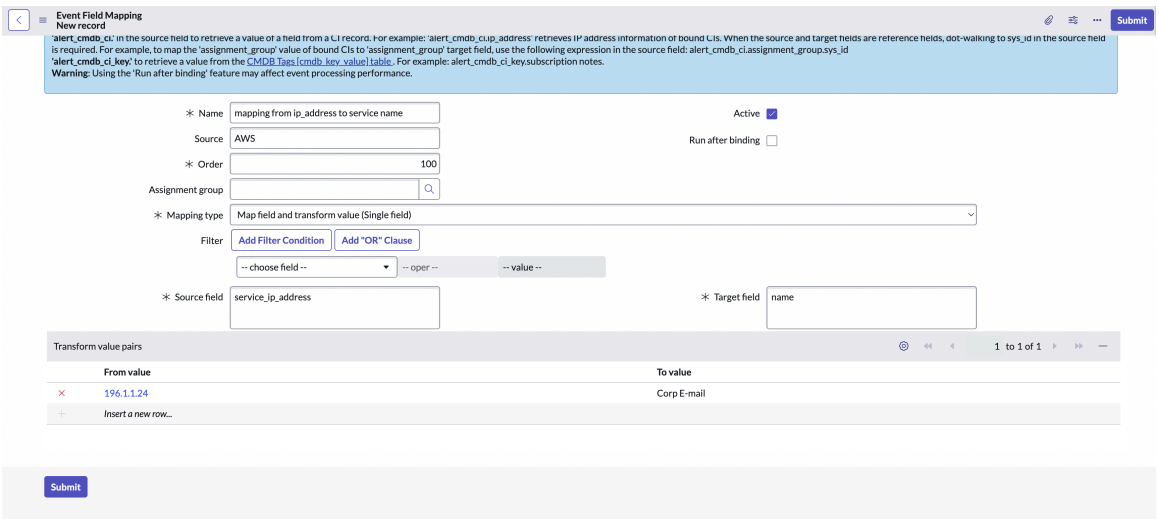
The IP address is extracted into the newly created **service_ip_address** field, which is added to the **Additional info** field of the alert. This allows it to be used later to identify the corresponding Application Service.

9. Select **Submit** in the event rule to save your changes.

10. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
In Event Field Mapping, configure the extracted IP address to map it to the corresponding service name. The event provides only an IP address, but alerts need to be associated with a service name (not just an IP). The system needs to map this IP to its corresponding Application Service so that teams can easily identify the impacted service.

11. Select **New**.
The Event Field Mapping window opens.

12. Perform the following:



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Action
Name	Enter the name of the mapping. Example: mapping from ip_address to service name.
Source	Enter `AWS`. **Note:** The source is the same as the one in the Events record.
Mapping type	Select **Map field and transform value (Single field)**
Source field	Enter `service_ip_address`.
Target field	Enter `name`. The target field value is the column name in the Application Service table (cmdb_ci_service_auto) where the source field value is searched.
Transform value pairs	
From value	196.1.1.24
To value	Corp E-mail

13. Select **Submit**.

    The system extracts the IP address of the service from the event and stores it in the **service_ip_address** field. Since the Application Service table (cmdb_ci_service_auto) does not have a column for searching by IP address, the Transform value pairs feature is used to map the IP address to a name—in this case, Corp E-mail and and saves it in the **name** field within the **Additional info** field of the alert. The **Target field** specifies where to search for the Corp E-mail in the Application Service table. The system looks for Corp E-mail in the **name** column of

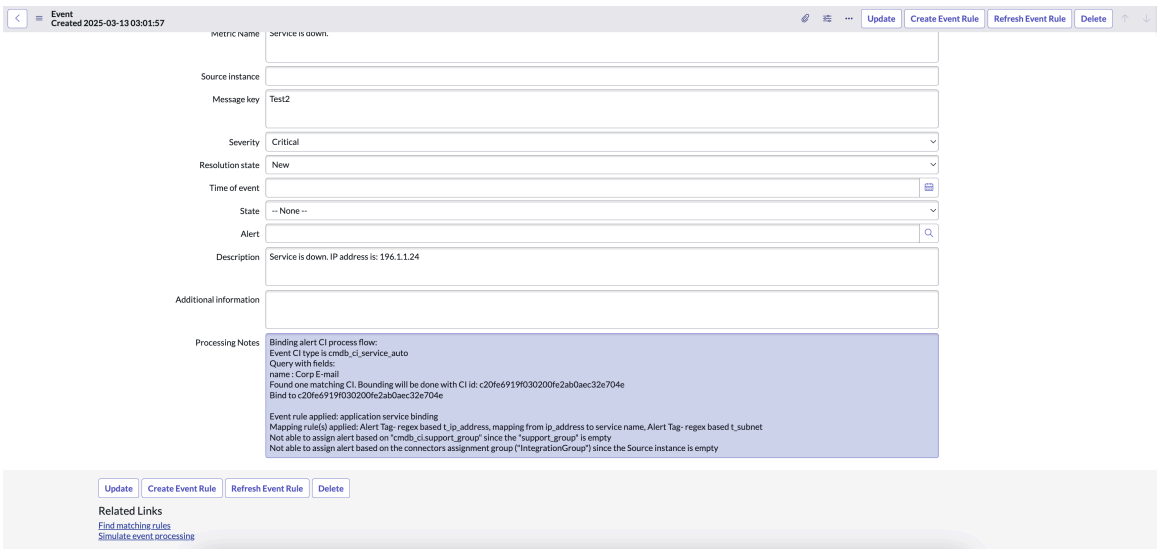
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the Application Service table (cmdb_ci_service_auto). If a match is found, the alert is bound to the corresponding Application Service.



Example: Bind alerts to CIs using dynamic CI types

Use event field mapping to dynamically bind alerts to the appropriate CIs based on event attributes, eliminating the need for separate event rules for each CI type (also known as CI class). This approach simplifies configuration, improves accuracy, and enhances alert to CI binding.

Before you begin

Role required: evt_mgmt_admin

About this task

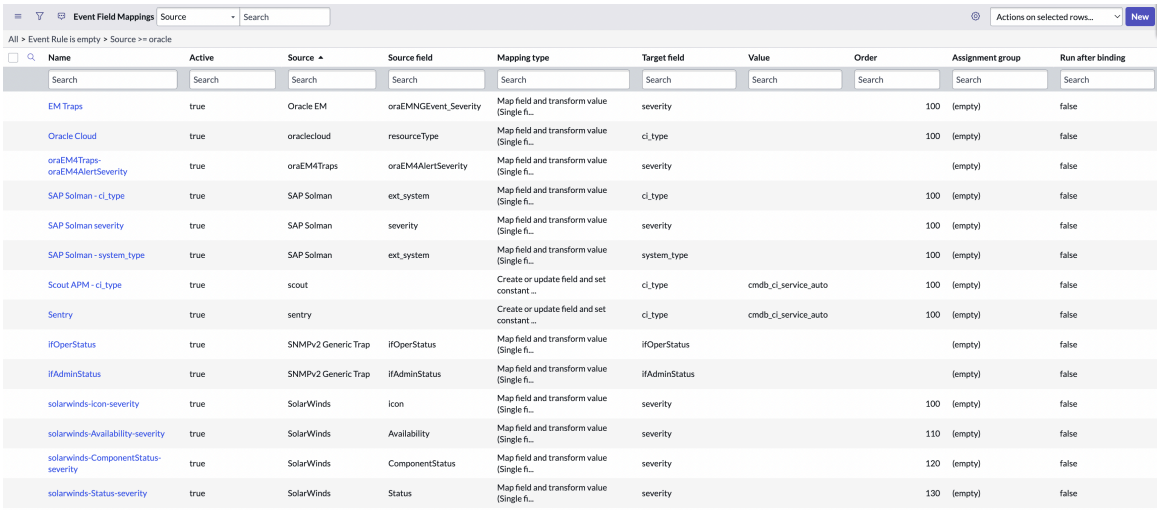
In general, for an event generated from a specific source mentioned in the **Source** field, the system applies the corresponding event rule. The override default binding option in an event rule specifies a specific CI class for binding. However, in a more dynamic use case, the CI class is not predefined and can change based on event attributes. For example, suppose a customer has multiple CIs with the same name, but each CI belongs to a different CI class. In the traditional event rule method, as the CI class (or the CMDB table) is defined for a CI, the mapping is incorrect because the system searches in the same CI class for all CIs with the same name and attributes, instead of looking in the specific CMDB table defined for each CI class.

To resolve this—in other words, to determine the correct CI class to search—the system uses the **CI type** field from the event to identify the CI class. By using an event field mapping that maps from event attributes to CI type, it becomes possible to know which CMDB table to search, ensuring that the CI is correctly mapped to the event.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

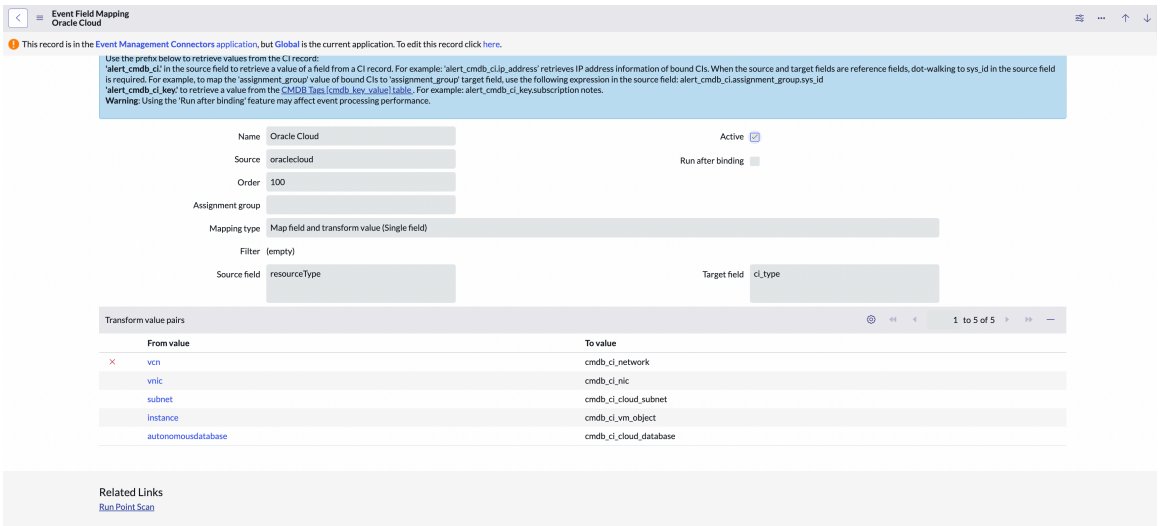
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.



2. Select **Oracle Cloud**.

   This is an existing event field map used as an example. The event field map details page opens.



3. Review the event field mapping details page and understand the relevant fields and their corresponding values.

Event Field Mapping fields

Field	Description
Name	Event field map name.
Source	Event monitoring software that generated the event. In this case, oraclecloud.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Mapping type	Select **Map field and transform value (Single field)**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source field	**resourceType** is a field that is defined in the **Additional Information** field of the event defined by the Oracle Cloud system. The possible values of **resourceType** are listed in the **From value** column, while the corresponding CMDB tables for those values are specified in the **To value** column in the Transform value pairs section. If **resourceType** is **instance**, the system searches in the [cmdb_ci_vm_object] table for CI binding.
Target field	The **CI type** field (**ci_type**) in an event is a special field that provides the CI class name, indicating which CMDB table to search. The **CI type** field values are listed in the **To value** column in the Transform value pairs section.
Transform value pairs	
From value	Lists the possible values of the event field (e.g., `resourceType`) that are derived from the event data.
To value	Specifies the corresponding CMDB table associated with each value listed in the **From value** column. Indicates the CI type to bind the alert to.

View patterns for event group creation

Event groups are sets of events that do not have a matching event rule. You can view the patterns in a group of events to learn the impact of creating a rule based on the event source and description patterns.

Before you begin

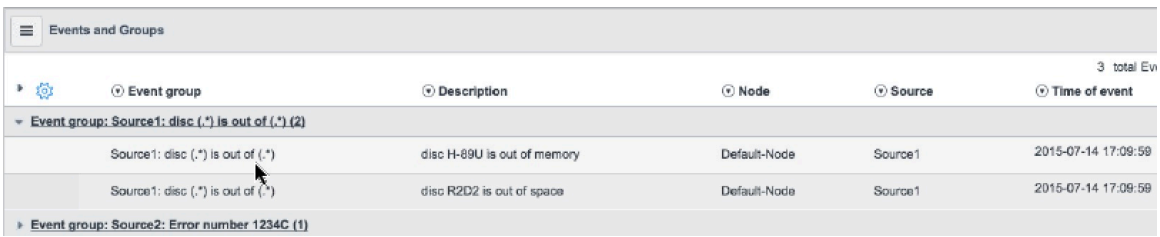
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Events are grouped according to their source and description.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Wait for the group calculation to complete and then click the created link.
   If there are not enough events, the calculation will not create groups.
3. In the list of events, select an event.
4. To change the pattern of an event, double-click the pattern, make your changes, and then click **Update**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refresh event rules

Manually update event rules to reflect current event information because once an event rule is created, the **Event Additional info** and **Event Raw info** fields are not automatically updated.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Select the event.
3. Select **Refresh Event Rule**.
4. Select the event rules to refresh.
5. Select **Refresh Selected**.

   If you selected multiple event rules, then the last selected item in the list opens in the Event Rule Designer.

> **Note:**
> If the current event rule regex expressions do not match the selected event after the refresh, the update fails and an error message appears specifying the problematic fields. This safeguard ensures that your previously defined event rule regex expressions are not broken due to the refresh.

Find rules that will be applied to an event

View the rules that will be applied on an event to determine how this event will be processed.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **Event Management** > **All Events**, and then click an event number.
2. Under **Related Links**, click **Find matching rules**.
3. Review the information that appears in the blue box at the top of the page, and review all **Processing Notes** to find rules that apply to an event.

Related topics

View events

Simulate event processing

You can simulate event processing logic on events and display the resulting alert to better understand which rules are executed on a given event and how the event fields change after the rule is executed.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the event you want to simulate.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Related Links** section, select **Simulate event processing.**
4. In the info message that appears at the top of the screen, select the link to the created simulated alert.
5. **Optional:** View which event rules and event field mapping rules were applied and the event field values by selecting the **Activities** tab.

Event field mapping configuration

Use Event field mappings rules to map values from specific fields to values in other fields.

Event Management stores event field mappings in the Event Field Mapping [em_mapping_rule] table. The mappings apply after event rule processing and prior to alert generation. The mapping values from the Event Mapping Pair [em_mapping_pair] table apply to the alert. The original event severity remains unchanged.

For example, if events come with the field "**org_severity**" with the values "*Low*, *Medium*, *High*" and you want the alert **Severity** to hold this value, create an event field mapping rule that maps the field **org_severity** to **Severity**, with these values:

Example showing org_severity mapped to Severity

Original org_severity value	Map to alert Severity value
Low	Warning
Medium	Major
High	Critical

Default event field mappings

Event Management provides default event field mappings for commonly used system monitoring tools. The Transform Value Pairs from event field mappings format the incoming event data for Event Management.

You can view the default event field mappings and mapping pairs by navigating to **Event Management** > **Rules** > **Event Field Mappings** and double-clicking **Name**.

Create event field mappings

Use event field mappings to map values from specific event fields to values in other fields to provide more comprehensive information in an alert. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to global rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

About this task

Create the rule to match the event by its class and original values. Also, specify the new values to replace the original values in the event.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
2. Select **New** or open an existing rule to edit and fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.

Event Field Mapping form

Field	Description
Name	Event field mapping name.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Assignment group	For Team-based integrations, select an assignment group. If no assignment group is defined in the event field-mapping rule, then this rule is considered global. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.
Mapping type	Mapping mechanism that is used to change an event field value. ○ **Map field and transform value (Single field)**: Maps the **Source field** value to the matching value in the Transform value pairs [em_mapping_pair] table and populates the **Target field**. Source and Target fields may be event fields, additional info fields, or alert tags. ○ **Create or update field and set constant value (Constant)**: Sets a constant value to a **Target field**. The **Target field** may be an event field, additional info field, or alert tag. ○ **Map field (Copy field)**: Copies the exact value of a Source field to the specified Target field. The Source and Target fields may be Event field, Additional info field, or alert tags. ○ **Map field and transform value using regex**: Generically maps the value from the Source field to the matching value in the Transform value pairs table and populate the **Target field**. Source and Target fields may be event, additional info, or alert tags fields. ○ **Map field using regex**: Copies the value from a generically defined **Source field** to the **Target field**. The Source field must be a field from the event additional info field. The Target field may be the field of event, additional info, or alert tag. With this type, you can generically find the name of the Source field by using a regular expression (regex).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Map field and copy value from regex group**: Copies part of the Source field value to the Target field. Source and Target fields may be event fields, additional info fields, or alert tags. Define a regex to specify what part of the **Source field** should be copied. ○ **Advanced mapping using script**: Implements your own logic for event values transformation by using a script. When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance. ○ **Map field from reference table** Use this rule type to extract a **Source field** value from the selected **Reference table** by matching the **Field to match**value to the **Matching alert field** value and then mapping the **Source field** value to the **Target field**. The **Matching alert field** and the **Target field** may be event fields, additional info fields, or alert tags.
Filter	A condition for event field mapping. Select **Add Filter Condition** or **Add "OR" Clause** to configure multiple conditions. **Note:** The filter is case-sensitive.
Active	Activates or deactivates the event field mapping. If possible, find and apply another event field mapping rule.
Run after binding	○ When selected, the rule is executed after the CI binding phase. ○ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example: Use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Field	Description
	Note: This check box is displayed only for the following Mapping types: **Map field and transform value (Single field)**, **Map field (Copy field)**, **Map field and transform value using regex**, **Map field and copy value from regex group**, and **Map field from reference table**.

- If you selected **Map field and transform value (Single field)**, fill in the fields as appropriate.

Map field and transform value (Single field) fields

Field	Description
Source field	Event field to map - includes all event and additional info fields. Note: For Additional info fields use: "additional_info.<field name>". When the 'Run after binding' check box is selected, you can use the **alert_cmdb_ci** and the **alert_cmdb_ci_key** prefixes to receive CI related data.
Target field	Event field where the mapping rule inserts or updates the value. When this field is identical to the **Source field**, the mapping rule updates the value in memory of the event field. Alert tags can also be defined by using the *<t_>* prefix.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the following prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**. Select **+** to add more **Key** fields, as required.

Typical use case: To map the 'event_severity' field in the additional info field with possible values [such as WARNING, MINOR, CRITICAL, CLEAR, MAJOR] to the severity field, configure the following:

- Source field: 'event_severity'
- Target field: 'severity'
- Transform value pairs:
  - From value: 'WARNING', to value: '4'
  - From value: 'MINOR', to value: '3'
  - and so forth...

- If you selected **Create or update field and set constant value (Constant)**, fill in the fields as appropriate.

Create or update field and set constant value (Constant) fields

Field	Description
Target field	The **Target field** may be an an event field, additional info field, or alert tag. Typical use case: Set alert severity to 1 for all events that match the filter.
Value	Value you want to use for the **To field**. This field is displayed when the **Mapping type** is **Constant**.

Typical use case: Set alert severity to 1 for all events that match the filter.

- If you selected **Map field (Copy field)**, fill in the fields as appropriate.

Map field (Copy field) fields

Field	Description
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To copy the IP field from the event additional info field to the alert field node, use the following:

- 'Source field': ip
- 'Target field': node

- If you selected **Map field and transform value using regex**, fill in the fields as appropriate.

Map field and transform value using regex

Field	Description
Source field	Source field value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

© 2025 ServiceNow, Inc. All rights reserved.

Field	Description
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To map severity from the field color in the Additional info field to the Severity field, use:

- Source field: 'color'
- Target field: 'severity'
- Transform value pairs:
  - From value: '.*red', To value: '1'. This covers both 'dark red', 'light red', and other values containing 'red' and maps them all to '1'.
  - and so forth...

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**. Select **+** to add more **Key** fields, as required.

- If you selected **Map field using regex**, fill in the fields as appropriate.

Map field using regex fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The **Source field** must be a field from the event additional info field. With this type, you can generically find the name of the Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

Typical use case: To map the 'region' field from the additional_info field that appears as 'tags.region' or 'tags|region' or 'cloud.region' to an alert tag *t_region*, use:

- 'Source field': *region
- 'Target field': t_region

- If you selected **Map field and copy value from regex group**, fill in the fields, as appropriate.

Map field and copy value from regex group fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The Source field must be a field from the event additional info field. With this type, you can generically find the name of the Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with

Field	Description
	the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.
Regex group expression	.*_.*_(.*)_.*

Typical use case: To extract the third octet from the IP and save it in the additional info *third_octet* field, use:

- 'Source field': ip
- 'Target field': third_octet
- 'Regex group expression': .*_.*_(.*)_.*

○ If you selected **Advanced mapping using script**, fill in the fields as appropriate.

Advanced mapping using script fields

Field	Description
Script	The code editor gives text editor support for inline scripts. The code editor has these features for the supported language services and Inline scripts: Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes, Auto-suggestions, and auto-completions. Editing tips: ▪ To insert a fixed space anywhere in your code, press the Tab key. ▪ To indent a single line of code, select in the leading white space of the line and then press Tab. ▪ To indent one or more lines of code, select the code and then press Tab. ▪ To decrease the indentation, press Shift +Tab. ▪ To remove one tab from the start of a line of code, select in the line and press Shift +Tab. ▪ To declare variables, use the var keyword so that they remain within the proper JavaScript scope.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Run after binding	When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance.

- If you selected **Map field from reference table**, fill in the fields as appropriate.

Map field from reference table fields

Field	Description
Reference table	The reference table. Select the table from where the field is to be mapped to the Target field in the event.
Field to match	The field from the Reference table to be matched with the Matching alert field from the event. It's used to filter out the Reference table records.
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** is the field of the table that was selected as the Reference table.
Matching alert field	Event field to find matching Reference table records. The **Matching alert field** is matched with the **Field to match** field. The Matching alert field may be the Event field, Additional info field, or the Alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** In the **Matching alert field**, to retrieve a value of a field from a CI record. For example: 'alert_cmdb_ci.ip_address' retrieves IP address information of bound CIs. When the **Matching alert field** and

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	the **Field to match** fields are reference fields, dot-walking to sys_id in the **Matching alert field** is required. For example, to use the 'assignment_group' value of bound CIs to match with the **Field to match** field, use the following expression in the **Matching alert field**: alert_cmdb_ci.assignment_group.sys_id ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: Extract 'short_description' from the 'pc_vendor_cat_item' records matching its 'name' field with the 'cat_item_name' field in the Additional info field of the event and map it to the 'description' field on the event in the following fields:

- 'Reference table': pc_vendor_cat_item
- 'Field to match': name
- 'Source field': short_description
- 'Matching alert field': cat_item_name
- 'Target field': description

3. Right-click the form header and select **Save**.
4. Select **Submit**.

Example:
The following values comprise a predefined rule that is applied to events in the *Trap From Enterprise 9* class. If the events contain the `snmpTrapOID` element with a value of `iso.org.dod.internet.private.enterprises.cisco.0.0`, the mapping rule changes the value to `reload` in the alerts. If the events contain the `snmpTrapOID` element, a value of `iso.org.dod.internet.private.enterprises.cisco.0.1`, the mapping rule changes the value to `tcpConnectionClose` in the alerts.

Field	Values
Name	cisco.snmpTrapOID
Source	Trap From Enterprise 9
Mapping type	Map field and transform value (Single field).
Source field	snmpTrapOID
Target field	snmpTrapOID
Transform Value Pairs	• Pair 1 ○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: reload

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Values
	• Pair 2 ○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: tcpConnectionClose

What to do next
Test an event field mapping by sending an event that includes a field that is present in the event field mapping.

Create event field mappings with advanced mapping script

Create event field mappings with advanced mapping scripts to transform raw event data into structured, meaningful information. This method goes beyond basic configurations, aligns fields with business context, and improves event correlation. By reducing alert noise and enhancing visibility, it helps teams respond faster and manage incidents more effectively.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
2. Select New to fill in the form fields or open an existing one to edit the required fields.
3. In the **Mapping type** field, select **Advanced mapping using script**.
   If you selected **Advanced mapping using script**, fill in the fields as appropriate.

eventFieldMappingScript

Name	Type	Description
eventGr	glide record	GlideRecord representing the event.
origEventSysId	string	Id of the event. **Note:** The GlideRecord event parameter is a temporary object, and therefore does not contain the id of the original event.
fieldMappingRuleName	string	The name of this field mapping rule.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
boolean	Value is `true` if the binding can proceed successfully, or `false` if the binding operation is aborted.

4. Select **Submit**.

Example:
The use case for this script is to automatically enrich incoming events with classification details before they are processed further. For example, by adding u_alert_classification = "Network" into the event's metadata, the system can tag and group network-related alerts more effectively. This helps streamline event correlation, reduce noise, and improve routing so incidents are categorized and resolved faster.

This script checks the event's additional_info field, ensures it contains valid JSON, and then updates it by adding a new property called u_alert_classification with the value "Network." If the JSON is invalid, it logs an error and stops the binding. Otherwise, it saves the updated data back to the event record and allows the binding to proceed.

```
try {
        var addInfo = eventGr.getValue('additional_info');
        if (!addInfo) {
            addInfo = "{}";
        }
        var addInfoJson = {};
        // Parse JSON
        try {
            addInfoJson = JSON.parse(addInfo);
        } catch (parseError) {
            gs.error("Error parsing additional_info: " +
 parseError);
            return false;
        }
        addInfoJson.u_alert_classification = "Network";
        var updatedAddInfo = JSON.stringify(addInfoJson);
        eventGr.setValue('additional_info', updatedAddInfo);
        return true;
    } catch (e) {
        gs.error("The script type mapping rule '" +
 fieldMappingRuleName + "' ran with the error: \n" + e);
    }
```

Event identifiers

Event fields uniquely identify each event. Event Management uses this information to determine whether to create a new alert or update an existing one.

- By default, each event is uniquely identified by the **Message Key**.
- If the **Message Key** is not populated, the system concatenates the **Source**, **Type**, **Node**, **Resource**, and **Metric Name** fields to populate the **Message Key**.
- If identifiers are not supplied in the event, you can add them with event rules.

Alert tags

Alert tags allow consolidation for all normalized fields and improve the admin experience to transform and normalize alert fields (key/value) enabling reuse of normalized fields across different sources. This improves alert quality for correlation and provides more out-of-the-box TBAC (Tag Based Automatic Correlation) definitions.

Example: Field normalization in alert management

In some cases, the same information may exist under different field names across data sources. For instance, an incoming event from one source has the location stored under the field **region**, but in other source, the same information is captured under **impacted_region**. To avoid confusion and enable consistent grouping, filtering, or automation, we normalize these fields by creating a unified field — for example,**t_region**. This field pulls the value from **region** or from **impacted_region** depending what field is present in the event. This way, the normalized field **t_region** always holds the location value in a consistent manner, regardless of the original source field.

Alert tags field appears in the Alerts form. These tags are created by Event Rules and in Event mapping and are saved in the alert tags' table [em_alert_tags]. The naming convention used to create key/value pairs is t_<tag name>. This enables reusing tags in the event rules by allowing users to select tags that were previously defined. When new alert tags are defined, TBAC (Tag Based Alert Clustering) tags are automatically created. Using these TBAC tags, you can create new TBAC alert clustering definitions from the new source of tags.

Event field format for event collection

Event Management requires all events to use a standard form, regardless of how they arrive at the instance.

In the application navigation filter, enter `em_event.list`.

Event form

Name	Description
em_event.source [Source]	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
em_event.node [Node]	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
em_event.type [Type]	Optional. The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
em_event.resource [Resource]	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
metric_name [Metric Name]	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
em_event.event_class [Source instance]	If the em_event.node field is not specified, it is mandatory for alerts to be created automatically. Values for the em_event.event_class field originate from either the source generating the events or by event rule. Name of the machine or software that generated the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
	event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
em_event.message_key [Message key]	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
em_event.ci_type [CI type]	String containing information about CI type. Maximum length: 100 characters.
em_event.severity [Severity]	Event severity options are: • **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning**: Attention is required, even though the resource is still functional. • **OK**: An alert is created. The resource is still functional. • **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
em_event.resolution_state [Resolution state]	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. • **New**, the resolution on corresponding alerts is open. • **Closing** event state closes corresponding alerts.
em_event.time_of_event [Time of event]	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
em_event.state [State]	Current processing state of the event: • **Ready**: Event has been received and is waiting to be processed. • **Processed**: Event was successfully processed. • **Ignored**: Value is not in use. • **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
em_event.alert [Alert]	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
em_event.description [Description]	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
em_event.additional_info [Additional information]	Optional. A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.
processing_notes [Processing Notes]	Display of the events processing log.

Custom alert fields

You can populate custom alert fields with data contained in **Additional information** field of the event.

Valuable data contained in **Additional information** fields of events can be useful, for example, for reporting. Alert fields are automatically populated from fields that have the same name in the event. This behavior holds true for **Additional information** event fields and for **Additional information** fields that Event Rule adds. Therefore, to populate a custom alert field with the value in **Additional information** fields, use the custom field name in the **Additional information** field. You can also use Event Rules for this purpose. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON format when the event is processed. For more information, see Configure an event rule to customize alert content.

The short description field of an alert is automatically written using the type, node, and description of the alert. To prevent the short description field from being over-written, open the *sys_properties* table, locate the *evt_mgmt.override_alert_short_description* property, change the value to `false`, and then click **Update**.

Depending on permissions, you may only be able to create fields with the **user_** prefix. If so, use Event Rules to create an **Additional information** field with the same name. To prevent some fields to be copied to the alert field, use the *evt_mgmt.alert_black_list_fields* property and add the field names that must be excluded. By default, the fields that are not copied are:

Testing and sending events

You can manually test and send events to confirm that Event Management properly manages events and generates alerts.

Before you begin

Role required: evt_mgmt_admin

About this task

For example, you can manually send events to:

- Confirm that the MID Server is using an event connector definition and instance to send events.
- Confirm that event rules, event field mapping, and other configurations do generate alerts.
- Track an operation or action that did not generate an event.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Click **New** and then fill in the fields.

Event form

Name	Description
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Metric Name	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Source instance	Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed. ○ **OK**: An alert is created. The resource is still functional.
Resolution state	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. ○ **New**, the resolution on corresponding alerts is open. ○ **Closing** event state closes corresponding alerts.
Time of event	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
State	The current processing state of the event: ○ **Ready**: Event has been received and is waiting to be processed. ○ **Processed**: Event was successfully processed. ○ **Ignored**: Value is not in use. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field “Connection instance is successful”.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {“additional_content”: “Connection instance is successful"}.

3. Click **Submit**.

View event processing statistics

Extract statistics from your instance to ensure that performance is not affected and extract metrics related to event processes to monitor event processing status.

Before you begin

Ensure that the *Event Management - Collect xmlstats* job is active. Configure this scheduled job by navigating to **System Definition** > **Scheduled Jobs**.

You can control the processing of event statistics using the *evt_mgmt.event_processing_stats_period* property. For information about configuring this property, see Configure statistics processing period.

Role required: evt_mgmt_operator

About this task

You can view key metrics from the instance to ensure that performance is not affected and monitor the status of the processing of events. For more information about viewing self-health monitoring statistics, see View self-health monitoring statistics for Metric Intelligence.

Procedure

1. In a browser where the instance is running, run the XML Stats script by appending the following text to the instance URL: `xmlstats.do?include=XMLStatsEm`
2. Press **Enter**.
3. Monitor the event processing metrics that are reported to ensure that events are processed according to accepted benchmark values.

Result

Example: Sample output after running the XML Stats script

```
<xmlstats created="Tue Oct 23 04:01:25 PDT 2018"
 includes="XMLStatsEm" version="2">
<itom_event_management>
<event_processing>
<processed count="47" max_process_time="10"
 mean_process_time="5" record_time="2018-10-23 11:00:41"/>
<ready count="7" oldest_ready_event="37" record_time="2018-10-23
 11:00:41"/>
<error count="5" record_time="2018-10-23 11:00:41"/>
<total_created count="5" record_time="2018-10-23 11:00:41"/>
</event_processing>
</itom_event_management>
</xmlstats>
```

The event processing metrics in the report are described in the following table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The default processing cycle is events created in the last hour and updated in the last minute.

Event processing statistics

Metric	Description
Event processing statistics	
processed count=n	Number of events processed by the instance.
max_process_time=n	Longest time taken by the instance to process an event.
mean_process_time=n	Average time taken by the instance to process the events in this cycle.
Event ready statistics	
ready count=n	Number of events that are in Ready state and are available to be processed. Default processing cycle: events created in the last hour and updated in the last minute.
oldest_ready_event=n	Longest time taken by an event to remain in Ready state. If this metric has a value that is bigger than your benchmark figure, investigate the event further to determine what is impeding the processing. Default processing cycle: events created in the last hour.
Other processing statistics	
error count=n	Number of events for which errors were reported. Default processing cycle: events created in the last hour and updated in the last minute.
total_created count=n	Overall number of events that were processed during this event processing cycle. Default processing cycle: events created in the last hour.

Enable processing of event process statistics

Enable the system property that switches on statistics processing for events to let the platform collect and analyze metrics such as event volume, processing flow, and handling time. This helps you monitor system performance, identify bottlenecks, and optimize event handling for faster and more efficient operations.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New** and fill in the form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System property fields

Field	Description
Name	Name of the property you are creating.
Description	Narrative that describes the property and its function.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000,Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.
Type	Data type, that is selected from a list (for example, integer, string, or true|false).
Value	Desired value for the property. When retrieving properties using the *gs.getProperty()* method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Read roles	Roles that have read access to this property.
Write roles	Roles that have write access to this property.

3. Select **Submit**.

Add a system property

Configure statistics processing period

Set the time period, in seconds, for collecting event processing statistics. For example, you can set a time period twice as long as the default 60 seconds to collect more statistics.

Before you begin

Role required: evt_mgmt_admin

About this task

Use the *evt_mgmt.event_processing_stats_period* property to configure the XMLStatsEm script time to collect event processing statistics. The default value of this property is 60 and the unit is second. Set the property values to run the script over a longer or shorter period. For example, set a shorter period of statistics collection so fewer CPU resources are used.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *evt_mgmt.event_processing_stats_period* property.
   Either configure the value of an existing *evt_mgmt.event_processing_stats_period* property to run the XMLStatsEm script over a shorter or longer time period or create a new property if it does not exist already.
   - If the property exists, set the property to the required time period to enable the XMLStatsEm script time to collect event processing statistics and click **Update**.
   - If the property does not exist, click **New**, fill in the form, and click **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a system property

Manage and monitor alerts

An alert is a notification for selected events that are considered to be important and require attention. Event Management generates alerts based on event rules.

You can monitor and resolve alerts in ways that are based on alert impact calculations and alert configuration and property settings.

Alert management rules for resolving alerts

You can configure Event Management to respond to alerts automatically. An alert management rule determines the required alert response, such as to open an incident, knowledge base article, open a task, launch remediation action.

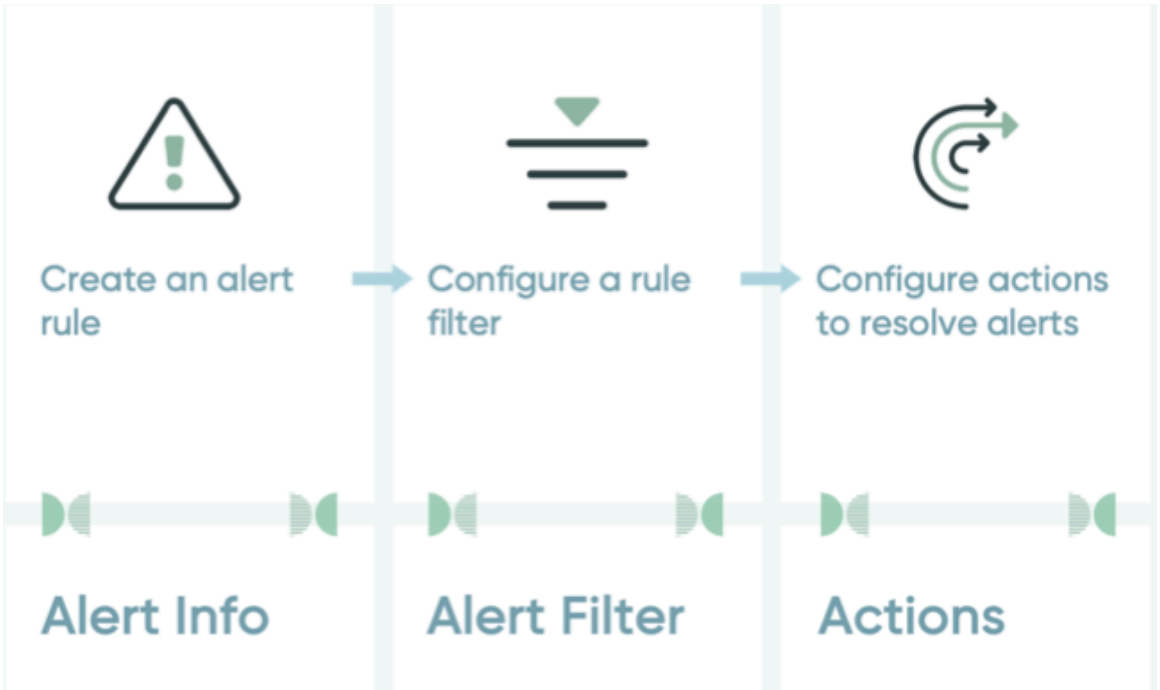
Alert management rules provided with the base system as a store application (Alert Rules Management [sn_em_arm]) to help you respond to alerts. You can create filters to specify conditions for the rule so that the remedial action specified in the rule takes effect only when the conditions are met. For example, launch the required subflow or open an incident based on an alert. The alert's execution history is automatically updated to indicate the actions that were invoked.

Users with the evt_mgmt_admin role can use the alert management rule designer to create and customize alert management rules to act on specified alerts. Define rules with filters to determine which alerts the rule applies to. You can create rules to launch applications, URLs, subflows, remediation actions, or take other actions, such as to open an incident. For more information, see Create an alert management rule.

Users with the evt_mgmt_operator role can manually run alert management rules.

Alert management rule flow

The flow to create and run an alert management rule is:



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rule components

Component	Description
Alert Info	Configure a name and general information for the rule.
Alert Filter	Specify a filter to determine to which alerts the rule applies. You can specify the related list conditions. **Note:** The fields that are not supported for alert filtering are: Overall Event Count, Priority, Priority Group, Priority Breakdown, Tags, and Impacted Services.
Actions	Specify the response to the alert, such as to run a subflow, perform remediation action, launch an application, or launch a URL in a browser.

How rules are applied to updated alerts

Alert management rules run on all updated open alerts. Rules don't run on closed alerts, even if they've been updated. The filters determine whether the rule's actions apply to the alert. For example, if a rule's condition indicates that an email message is sent when the alert severity changes to Major, the rule applies to an alert updated by a severity change from Warning to Major.

Use of filters and other actions

Filters ensure that the rule is invoked only when the configured condition occurs, and not for every update of the alert. For example, you can configure a rule so that updates that aren't relevant (such as a **Work notes** field update) don't cause the rule to run. As another example, a filter condition can specify that the alert management rule runs only when the alert severity is critical.

You can perform the following actions:

- Specify a filter that determines which alerts the rule applies to.
- In the Related List Conditions section of the form, configure additional conditions, for example, with an *`Alert > Parent`* relationship, to filter for any alerts that were received today.
- Respond to alerts. For example, by using subflows and workflows, create incidents for primary alerts with critical severity, or open a search engine in a browser to search for data according to the description field of the alert.
- Apply remediation. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Note:
For enhanced performance of *`Event Management - Evaluate Scoped Alert Rules Management`* scheduled jobs, use subflows instead of workflows.

Scheduled jobs that check alert management rules

Alert management rules are checked every 11 seconds by the default *`Event Management - Evaluate Scoped Alert Rules Management0`* scheduled job. The job then executes the required actions. For large-scale environments, you can add more than one job. Please contact Customer Service and Support.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Only new users from Vancouver and up get two scheduled jobs: *Event Management - Evaluate Scoped Alert Rules Management0* and *Event Management - Evaluate Scoped Alert Rules Management1*. Users upgrading from previous family releases remain with a single scheduled job *Event Management - Evaluate Scoped Alert Rules Management0*.

Don't modify the *sn_em_arm.alert_management.num_of_jobs* property.

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management (**Event Management - Evaluate Scoped Alert Rules Management0**) jobs run independently of each other. For more information about coordinating the alert response and the automated alert grouping, see Synchronizing alert response with automated alert grouping.

Migrate existing alert action rules

Existing alert action rules from an earlier release can be migrated to become alert management rules. You can modify an alert action rule only after migrating it to an alert management rule. For more information, see Migrate an alert action rule to an alert management rule.

Create an alert management rule

Create an alert management rule to track alerts and resolve them by determining the required response, for example, to open an incident or launch remediation action.

Before you begin

To enable remediation with a subflow, you can use a subflow that is available with the base system, or you can create your own subflow. For details, see Create a custom subflow for alerts.

Role required: evt_mgmt_admin, flow_designer

About this task

Use alert management rules to track and resolve alerts.
While working in the alert management rule designer, you can work in multiple sections without losing information in any section.

Note:

- Alert management rules that are not configured to perform any action are skipped and the rule is automatically set to inactive.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Create alert management rules that:

- Locate other alert management rules that have relevance to the selected alert.
- Determine when the execution of the rule takes place.

Alert management rules do not necessarily complete in the order in which they are invoked.

You can configure alert management rules to:

- Automatically generate and link incidents, tasks, or knowledge articles to alerts.
- Automatically apply a remediation workflow or enable users to manually run remediation.
- Automatically construct a URL according to the value of specified fields in the alert.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To assist you, several alert management rules are provided with the base system. You can use them as presented or you can use them as examples to build custom alert management rules.

Alert management rules provided with the base system

Rule	Description	Active
Open sensor dashboard in PRTG	The sensor dashboard in the Paessler PRTG Network Monitor (PRTG) application opens.	Yes
Oracle EM Launch Target Status and View Events	Launch Oracle Enterprise Manager to view: • Target Status • Event for alerts from source Oracle EM	Yes
Drilldown to OMI	Drill down to the HP Operations Manager i (OMi) application.	Yes
Create Incident on Primary Critical Alert	Create an incident for primary critical alerts. The incident can be created automatically or manually.	No
Search Google for "description"	Open Google Search in a browser to search for data according to the description that appears in the alert.	Yes
Create Incident	Create an incident for all alerts that are not in maintenance state. The rule runs automatically on selective update.	No
Create Incident Manually	Manually create an incident for alerts that are not in maintenance state.	Yes
Create Major Incident Candidate	Create a major incident candidate for all alerts that are not in maintenance state and are not secondary alerts. A major incident candidate can be promoted to become a major incident.	No
Create Major Incident	Create a major incident for all alerts that are not in maintenance state and are not secondary alerts.	No

If your instance was upgraded from Kingston, the alert action rules that were provided with the Kingston base system are available to you. However, if you modified any of the rules, the changes made are not carried over.

Alert management rules run 5 seconds after an alert is updated, resetting the timer if updates occur within that window. This delay ensures remediation actions, such as incident creation, are triggered only when the issue is clear and stable, reducing duplicates and unnecessary noise. To change the default 5-second delay, create the `evt_mgmt.alert_rule_delay` property on the **All** > **System Properties** > **All Properties** and change the value. To know how to create a property, see Add a system property.

Procedure

1. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
2. Click **New** and then fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Management Rule form

Field	Description
Name	Unique name for the rule.
Active	Check box for enabling the rule. If this check box is selected, you must specify: ○ in the **Alert Filter** section, an alert filter ○ in the **Actions** section, at least one of any of these actions: ▪ active subflow ▪ workflow ▪ quick response
Order	Order in which rules are evaluated when multiple rules are defined for the same alert. Alert management rules are evaluated in ascending order. The default value is `100`.
Multiple alert rules	Instruction about whether to search for additional rules: ○ **Search for additional rules**: Execute the current rule then continue and execute other matching rules in the order of rule priority, where the lower number has the higher priority. ○ **Stop search for additional rules**: Execute only the current rule for the alert that matches the filter. When selecting this option, a rule configured second in a rule hierarchy may run before the results of the first rule take effect.
Description	Descriptive text for the rule.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.

3. Click **Alert Filter** and specify conditions for alerts that this rule is applied to.

Alert Filter stage

Field	Description
Rule is activated when	Rule execution takes place when: ○ **Alert changes to filter**–content changes to the alert cause the alert to match the filter. If the filter is matched on following update of the alert, the rule is not applied. If the alert was closed and then reopens, at the next update of the alert and the filter is matched, the rule is applied. Thereafter, when there is an update of the alert, the rule is no longer applied.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Alert matches filter**–the content of the alert matches the filter. On following update of the alert and if the filter is matched, the rule runs and is applied to the alert. The rule remains applied for every matching update.
Alert filter	
Preview	Function to preview alerts that match the specified condition. A hyperlink shows how many alerts match the filter.  If you click the hyperlink, the browser opens another tab that lists alerts in the Alerts [em_alert_list] table. The list shows which alerts match the rule, including closed alerts. Alerts that have already been run by the rule are not marked in any way. You can click any alert to view further details.
Conditions	Conditions that, if fulfilled, cause the filter to be applied. For more information about building conditions, see Using the condition builder. To add another condition, click **New Criteria**. **Note:** The **Created on** condition is not invoked when running the **Event Management - Evaluate Alert Management Rules** job. Instead, use the **Updated on** condition, as the job detects alerts based on the time they were updated and not on the time they were created.
Related List Conditions	Conditions to include a relationship with another table in the filter. **a.** Click **Table** and select the required table. **b.** Specify the conditions for this filter. For more information about creating related lists, see Add related list conditions.

4. Click **Actions**.
   In this section, you can configure the following action types as a response to alerts or to remediate alerts:
   - Remediation Subflows: Execute a subflow provided with the base system.
   - Launch Applications: Open applications and browsers that you configure.

   Note:
   The Remediation Workflows option is deprecated. To enable flows to be triggered by alerts, use the Flow Designer.

5. **Optional:** In the Remediation Subflows section, follow these instructions to add subflows:

   a. Under **Subflow**, double-click the cell.

   b. Click the search icon.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The list of subflows provided with the base system appears. For more information, see Event Management subflows in the base system.

c. From the subflow list, select a subflow.

d. Repeat, adding as many subflows as required.

(Optional)

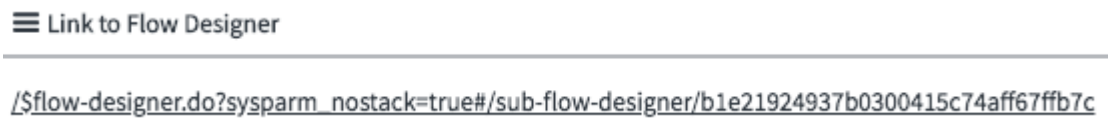
e. To specify when the subflow must be executed, double-click the cell under **Execution**.

Subflow execution options

Name	Description
Automatic	The subflow is executed automatically when the rule is matched.
Manual	Execute the subflow if required when the rule is matched.
Both	When the rule is matched, the subflow is executed automatically and you can optionally execute the subflow again manually.

f. Under **Automatic executions limit**, double-click the cell and enter the integer number of times to execute the subflow.
After the subflow has been executed the indicated number of times, it does not run anymore.

g. To enable the subflow to be executed, double-click the cell under **Active** and select `true`.
A link in the cell under **Link to Flow Designer** appears only after a subflow has been selected and the rule has been saved.



6. To add instructions to launch applications or to open browser windows, in the Launch Applications area:

a. Under **Display Name**, double-click the cell.
Specify a name for the link.

b. In the **URL** field, compose the URL using data from the alert in the format:`http://${source}.com:${port}/${cmdb_ci.name}`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Active** field is automatically updated.

Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

7. Click **Submit**.

Result

The alert management rule is added to the list of available rules that can be used to resolve alerts.

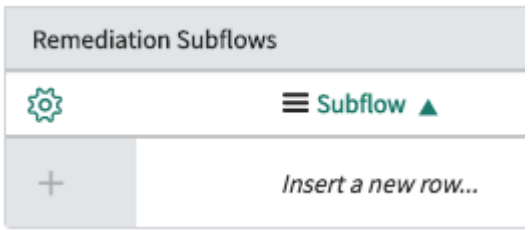
Event Management subflows in the base system

The subflows provided with the base system appear in the Remediation Subflows area of alert management rules.

Accessing the subflows

Navigate to **Event Management** > **Rules** > **Alert Management Rules** and click **New**. Click the **Actions** tab. In the Remediation Subflows area, double-click the **Insert a new row** field.



Click the search icon to add subflows. The list of subflows that are provided with the base system appears.

Subflows in the base system

Name	Description
Acknowledge Alert	Subflow to mark the alert as being Acknowledged. Acknowledge an alert to show that further attention is required.
Attach Knowledge Article (legacy)	Subflow to attach a knowledge article to the alert. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Knowledge article** column to the Alert Management Rules [em_alert_management_rule] table, and select an article to attach to an alert when the rule executes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows in the base system (continued)

Name	Description
Change Alert to Maintenance Mode	Subflow to mark the alert as being in Maintenance.
Close Alert	Subflow to mark the alert as being Closed.
Create Incident	Subflow to create an incident. Fields from the alert are used to populate the matching fields in the incident that is created. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • The alert management job runs even if the alert grouping job is not complete, if a specified time frame has passed. When this occurs, you can enable the *Avoid INTs on secondary alerts* rule to prevent incidents from being created for secondary alerts (when the *evt_mgmt.avoid_int_enabled* property is enabled), since an incident already exists for the primary alert.
Create Major Incident Candidate	Subflow to create a major incident candidate. Fields from the alert populate the matching fields in the major incident candidate that is created. A major incident candidate can be upgraded to become a major incident. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, a major incident candidate is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident from Alert	Subflow to create a major incident from alert. Fields from the alert are used to populate the matching fields in the major incident that is created.

Subflows in the base system (continued)

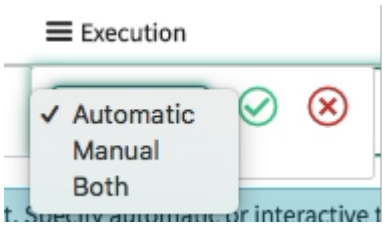
Name	Description
	Note: • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident with Impact	Subflow to create a major incident from an alert in which the **Impact** field is also taken as input. Fields from the alert are used to populate the matching fields in the major incident that is created. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident Candidate with Impact	Subflow to create a major incident candidate in which the **Impact** field is also taken as input. Fields from the alert populate the matching fields in the major incident candidate that is created. A major incident candidate can be upgraded to become a major incident. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, a major incident candidate is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Task (legacy)	This subflow uses a task template, if provided, or the *EventMgmtCustomIncidentPopulator*

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows in the base system (continued)

Name	Description
	script for instances migrated from legacy releases (prior to the London release). If configured, apply the task template. **Note:** Add the **Task template** column to the Alert Management Rules [em_alert_management_rule] table, and select a task template and task to apply when the rule executes.
Overwrite Alert Template (legacy)	This subflow applies the alert template. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Task type** column to the Alert Management Rules [em_alert_management_rule] table, and select an alert template to apply when the rule executes.

1. Select the subflow that you need.
2. To customize a subflow, see Create a custom subflow for alerts. This topic also describes the input parameters in a subflow.
3. To specify when the workflow must be executed, double-click the cell under **Execution**.



.

Create a custom subflow for alerts

You can create a subflow according to your requirements. For example, you can resolve alerts, notify teams, or run remediation actions.

Before you begin

Role required: evt_mgmt_admin, flow_designer

About this task

Copy an existing subflow, and then customize it. Publish the custom subflow so that it is available to be used to resolve any alert. For more information, see Create a subflow.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If your ServiceNow instance uses domain separation, you must ensure that the new custom subflow that you created operates only on the data of the designated domain.

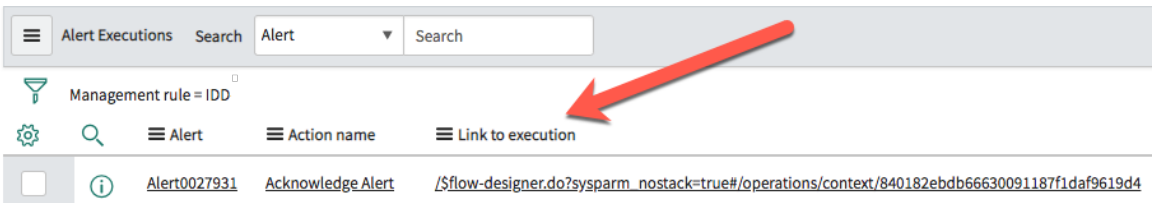
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. In the Flow Designer window, click **Subflows**.
3. Click **Create Incident**.
   The Create Incident subflow opens in Flow Designer in read-only format. The inputs in the Create Incident subflow are described in the following table.

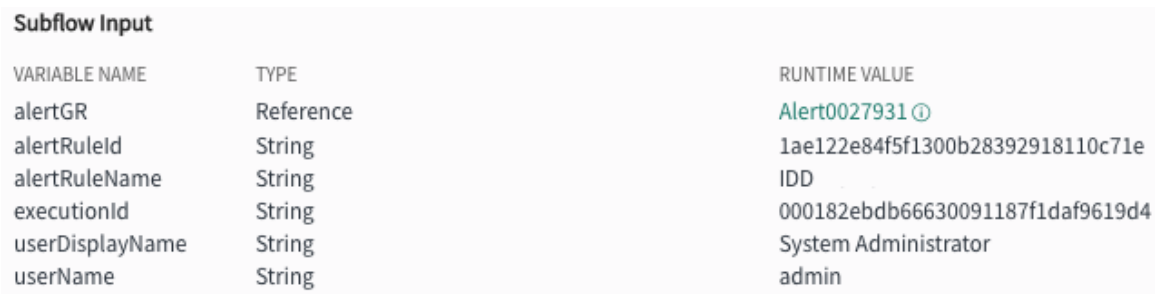
Create Incident input parameters

Value	Description
alertRuleName	The name of the alert management rule that specifies this subflow, for example `IDD`.
alertRuleId	The sys_id of the alert management rule, for example, `1ae122e84f5f1300b28392918110c71e`.
alertGR	The alert record that matches the filter that is defined in the alert management rule, for example, `Alert0027931`
executionId	The ID of the execution to be retrieved, for example, `000182ebdb66630091187f1daf9619d4`
userName	The current user's name, for example, `admin`.
userDisplayName	The name that the current user specified to be displayed, for example, `System Administrator`.

For example, in an alert management rule that has processed alerts, in the Alert Executions area, click the **Link to execution** of the required alert.



The Flow Designer opens. Click **Subflow Inputs and Outputs**. The input variable names of the subflow are displayed with their respective values.



4. In the subflow header, click more actions and select **Copy subflow**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **New Subflow Name** field, enter the name of the new subflow.
6. To limit the application scope of the subflow, in the **Application** field, select the required application, otherwise select `Global`.
7. Click **Copy**.
   The new subflow is created and is opened as a tab in the subflow designer editor. The inputs provided by the template appear.

   Inputs are fixed and cannot be added to.

   In the editor, you can delete subflow inputs or outputs, as required.
8. To delete an input, click .
   Inputs are fixed and cannot be added to.
9. Create subflow outputs by defining the names and data types.
   a. Click to add output.
   b. Define the name and the data type.
10. To save the subflow in draft status, click **Save**.
11. To save and publish the subflow so that it can be used in the alert management rule designer, click **Publish**.

Result

Include the modified subflow in an alert management rule to resolve alerts according to your customized requirements.

Subflows

Alert executions information

Alert executions information provides a reference to the alert management rule actions that are performed. This information appears in the Alert Management Rule record only if an alert matches the filter in the rule and an action was performed. You can click any link in the Alert Executions list to open the referenced item.

Alert Executions

In the Alert Management Rule record, the Alert Executions list shows key related records for the rule.

Note:
The Alert Executions list in the Alert Management Rules record shows alert execution information and lists the alert management rules that the selected alert matched.

Alert Executions list

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Information in the Alert Executions list

The columns in the Alert Executions list are populated with details of the alerts that matched the alert management rule and the actions that ran. The listed alerts match the filter in the rule.

View alert execution information

You can click any link in the Alert Executions list to view the alert execution information of the referenced item. This information appears in the Alert Management Rule record only after an alert matched the filter in the rule and an action was performed.

Before you begin

Role required: evt_mgmt_admin

About this task

Among the information shown in the Alert Executions list is:

- The list of alerts that matched the filter of the rule.
- The tasks, including incidents, that were opened.
- Which remediation workflows ran and which subflows ran.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
2. In the Alert Management Rules list, click the rule.
   If an alert matched the filter in the rule and an action was performed, the Alert Executions list appears in the Alert Management Rules record. The list appears irrespective of the stage of the selected alert management rule.

Alert Executions list

Column	Description
Alert	Alert number of the alerts that matched the alert management rule.
Action name	Name of the action that was taken to resolve the alert (subflow or workflow).
Link to execution	Link to the action execution log that was created when the action was performed.
Related task	Link to the task that was created when the alert was resolved. For example, if the action for a rule is to create an incident, this field provides the incident number with a link to open the incident. A link is provided to the workflow remediation task that is created to monitor the remediation.
Log	Notice or information showing the result of the execution action, for example, how executions took place, "`1 out of 2 executions`". When the alert closes, the execution count number (the first number) resets to 0. This information does not indicate that the subflow was executed successfully, rather that the call to that subflow was successful and that the subflow is correctly configured.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Automatic run	Indication of how the action ran: automatically (true) or manually (false).
Created	Date and time that the entry was created.

Migrate an alert action rule to an alert management rule

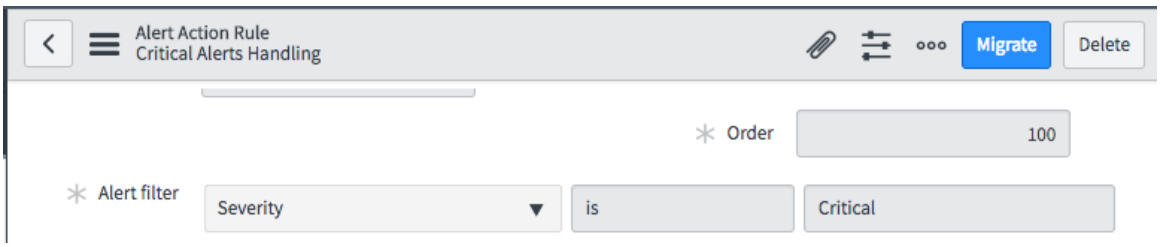
Existing alert action rules from an earlier release can be executed, but cannot be modified. Alert action rules that have been migrated become alert management rules and all the definitions of the alert action rules are migrated to the alert management rule format. Migrated rules can be modified.

Before you begin
Role required: evt_mgmt_admin

About this task
Existing alert action rules are active, read-only rules. An alert action rule can be modified only after it is migrated to an alert management rule.

Procedure
1. Navigate to **All** > **Event Management** > **Rules** > **Alert Action Rules**.
2. Select an alert action rule to migrate or delete.

Alert Action Rule record



3. Click **Migrate**.
   If you clicked **Migrate**, the list of migrated rules can be found, together with new alert management rules, by navigating to **Event Management** > **Rules** > **Alert Management**.

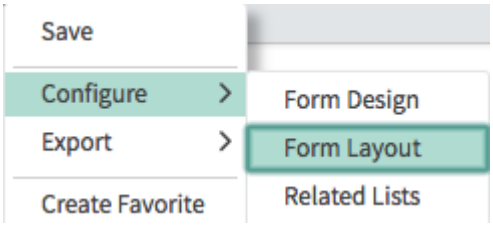
   After a successful migration, all the definitions of the alert action rules are migrated to the alert management rule format.

Result
When an alert action rule has been migrated successfully, the alert action rule can no longer be modified. However, the new alert management rule can be modified.

What to do next
If the alert action rule that was migrated had a task template, you can customize the alert management rule designer to display the task template name.

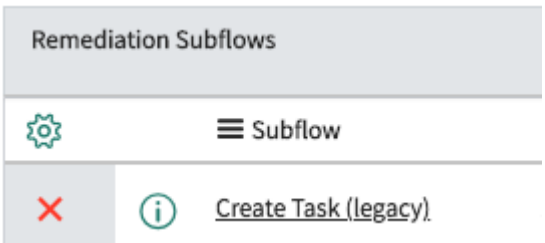
1. In the header of the alert management rule, click **Additional actions** .
2. Select **Configure** > **Form Layout**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the **Available** pane, select **Task template** and move it to the **Selected** pane. Position it as required.

4. In the **Task template** field, select the required template.
5. In the Actions tab, in the Remediation Subflows area, select the Create Task (legacy) subflow to run the task template.



Related topics

Apply a quick response in an alert

Synchronizing alert response with automated alert grouping

Synchronize alert response with grouping by ensuring alert management jobs runs after alert grouping jobs—this prevents duplicate actions like incident creation on secondary alerts.

Before you begin

Role required: admin

About this task

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management job (**Event Management - Evaluate Scoped Alert Rules Management0**) run independently of each other. To synchronize the alert response with automated alert grouping (for example, to avoid creating an incident on a secondary alert), you must enable the property *evt_mgmt.avoid_int_enabled* to ensure that the Alert Management job is executed after the Alert Grouping job is completed. This property is accessible from the Event Management Properties page (**All** > **Event Management** > **Administration** > **Event Management Properties**). In addition, you must configure the relevant alert management rule (for example, for incident creation), to filter out all secondary alerts.

Note:
If only one alert exists when the Alert Management job runs, an incident is created. When a second alert arrives later, the next Alert Grouping job forms a group, makes the new alert as secondary, and creates a new incident.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. If you want to avoid incidents on secondary alerts, select the **Enable Avoid Incidents on Secondary alerts and wait for Grouping job to be executed** check box.
3. Select **Save**.
4. To filter out secondary alerts, navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
5. Select the relevant rule.
6. In the Alert Management Rule form, select the **Alert Filter** tab.
7. In the Condition area, select **And**.
8. Add a condition:
   - **Role in Group**
   - **is not**
   - **Secondary**
9. Select **Update**.

Configure alert remediation actions

Run commands to perform alert remediation on remote Linux and Windows CIs.

Before you begin

Install the following plugins:

- IntegrationHub Enterprise spokes plugin
- ServiceNow IntegrationHub Action Step - PowerShell
- ServiceNow IntegrationHub Action Step - SSH

For Linux: Ensure that the remote Linux host is reachable using the MID Server IP address that runs action scripts.

For Windows:

- Ensure that Powershell v3.0 - 5.0 are supported and installed on the Windows target server.
- Enable Powershell remoting on the remote Windows target server.
- Ensure that the remote Windows target server is reachable using the FQDN from the MID Server that runs action scripts.

Add credentials to the credential aliases that come with the base system:

- linuxAdmin
- windowsAdmin

Role required: evt_mgmt_admin or flow_designer

Procedure

1. Access remediation actions in one of the following ways:
   - Quick actions in an alert, as described in Apply a quick response in an alert.
   - The Playbook tab in Service Operations Workspace, as described in Run actions to resolve alert issues .

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Configure additional input in the alert's **Additional Information** field, using this format:

```
{"remediation_action_resource":"<mandatory input>"}
```

The mandatory input per action is described in the following table.

Action name	Mandatory input in Additional information field
Stop Windows Process	Process ID
Restart Linux Service	Service Name
Kill Linux Process	Process ID
Get Windows Processes	N/A
Stop Windows Service	Service Display Name
Restart Windows Service	Service Display Name
Get Windows Services	N/A
Stop Linux Service	Service Name
Start Windows Service	Service Display Name
Suspend Windows Service	Service Display Name
Get Linux Services	N/A
Run Linux Top for Memory	N/A
Show Disk Space Used	N/A
Run Linux Top	N/A
Start Linux Service	Service Name
Show Disk Space Used	N/A

Result

After executing an alert action, the results are noted in the *Work Notes* field of the alert.

CI Remediation

Alert and configuration item (CI) remediations help troubleshoot and resolve underlying problems that generate alerts. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Event Management provides a framework for configuring and implementing a system-wide remediation plan to resolve, minimize, or prevent problems that generate events and alerts. Configure alert management rules to remediate alerts and CI remediation rules to remediate a set of CIs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert remediation

Use alert management rules to associate specific alerts with a remediation workflow. You can apply a workflow to alerts manually. Alternatively, you can configure the alert management rule that executes a workflow automatically for alerts that match the rule criteria. The workflow can also be scripted to request user approval before executing subsequent workflow tasks. The workflow is paused for user approval, even if it was automatically triggered.

CI remediation

Configure remediation more comprehensively by creating CI remediation rules to manually apply remediation to specific CIs.

Remediation tasks

When a remediation workflow is executed, a remediation task is created to capture details such as the time that the workflow started to run, the alert that triggered the remediation workflow (if relevant), and the CI that was remediated. View these tasks to track remediation activities in the organization.

Related topics

Migrate an alert action rule to an alert management rule

Create or edit CI remediation

Create a CI remediation rule that lets users manually apply an Orchestration workflow for resolving issues with specific CIs associated with alerts. Define these CIs in the CI filter conditions of the rule.

Before you begin

Create the workflow to remediate CIs. In the workflow settings, select **Remediation Task [em_remediation_task]** in the **Table** field.

Then submit the workflow definition, and add the following conditions to the workflow properties:

- **[Run Remediation][is][true]**
- **[Workflow][is][<name of the new workflow that you just created>]**

  For example, if the name of the workflow is `CI remediation`, add this condition:

  [Workflow][is][CI remediation]

After you finish configuring the workflow, make sure that you publish it. For more details, see Create a workflow.

Role required: evt_mgmt_admin

About this task

A CI remediation rule associates a set of CIs that might experience problems with a remediation workflow. The remediation workflow can either resolve the underlying problem or help troubleshoot the problem that generated the alert. For example, you can proactively configure a workflow with the appropriate response actions for predictable alerts. For more details, see the Event Management Remediation short video.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **CI Remediations**.
2. Click **New**, or select a CI remediation to edit.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill in the fields, and click **Submit** or **Update**.

CI remediation form

Control	Description
CI filter	Conditions to match the CIs that you want to apply this remediation to.
Orchestration workflow	The remediation workflow to apply to CIs that match the filter conditions.

Result
In service maps that are opened from the Event Management dashboard, this remediation can be applied to any CIs that match the filter conditions.

View remediation tasks

Event Management automatically creates a remediation task to capture every remediation that was applied to a CI or to an alert. It gives you an overall view of remediation activities in the organization.

Before you begin
Role required: evt_mgmt_user

Procedure

Navigate to **All** > **Event Management** > **Remediation Tasks**.

Column	Description
Number	Number assigned to this task.
Configuration item	Item or service affected by this task.
Priority	Priority that was assigned to this task, based on impact and urgency.
State	State of the task, which can be open or closed.
Assigned to	Person that this task was assigned to.
Short description	Description for the task.
Task type	This task type is a remediation task.

How alerts work with CIs in maintenance

When a CI is in maintenance, the impact tree, the service map, and Alerts tab are updated based on various factors.

Event Management Part 2 | Impact Tree Watch this brief video to learn about how alerts work with CIs.

A CI is in maintenance when:

- A change request is scheduled for the CI.
- The **Install Status** field on the CI record is set to **In Maintenance**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To customize how alerts work with CIs in maintenance, see Create maintenance rules.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with an active change request  If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation. The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green. For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active.	An active change request has the following values: • The **State** is **Scheduled** or **Implement**. • The current time is between the Planned start date and Planned end date on the change request. OR • The current time is between the Actual start date and Actual end date on the change request. You can monitor the progress of the change request. Wait until the change request moves to the **Review** or **Closed** state. Then you can address all alerts for the affected CI and any alerts that generated between start and end dates. Use the impact tree, topology, and Alerts tab to show the calculated impact severity. **Note:** The **Maintenance** check box for an alert is selected when the **Install Status** field on the CI record is **In Maintenance**. This **Maintenance** check box indicates that the alert must be hidden from the **Alerts** tab.
CI with no active change request and not in maintenance When there is no active change request for a CI and when the CI is not in maintenance, impact calculation resumes. The impact tree, the service map, and Alerts tab show the calculated impact severity for alerts.	An inactive change request has the following values: • The **State** is **New**, **Assess**, **Authorize**, **Review**, **Close**, or has no changes at all. • The **State** is **Scheduled** or **Implement**. However, the current time is before or after the planned or actual date ranges on the change request. You can monitor the progress of the change request. When a CI has an inactive change request, you can address the corresponding alerts as appropriate.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with no active change request and in maintenance If no active change request is scheduled for the CI and if the **Install Status** of the CI is **In Maintenance**, all alerts on this CI are excluded from impact calculation. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.	All alerts on a CI with an inactive change request and **In Maintenance** has no impact calculation.

SLAs for application services and CIs

Event Management supports the creation of SLAs for application services and for CIs.

You can monitor and manage the quality of the application services offered by your organization. For example, you might want to set up an SLA that is triggered when the max alert severity of an application service or CI is **Critical**, and measure the time it takes to bring the application service or CI back to the **OK** state, when the conditions that caused the alert have been resolved.

SLAs and the Task table

You can create SLA definitions only for tables that extend the Task table. The Event Management application provides a table named Event Management SLA [em_ci_severity_task], which extends the Task table. Use this table in your SLA definitions to specify the severity level that should trigger and stop the SLA. During alert impact calculation, changes in the severity level of application services and CIs are automatically updated in the Event Management SLA table. Scheduled jobs keep the information in this table up to date.

How the Event Management SLA table is populated

The Event Management SLA table is populated differently for application services and CIs:

- For application services, the system automatically populates the Event Management SLA table when an application service is created or when its max severity is changed.
- For CIs, you must first identify which CIs can be made available for SLAs by creating an SLA configuration record. The system then automatically populates the Event Management SLA table with the CI max severity is changed.

Note:
Duplicate CIs are not added to the Event Management SLA table even if the same CI matches more than one SLA configuration filter.

Create an SLA configuration for CIs

Create an SLA configuration from the Event Management application to determine which CIs are available for SLAs.

Before you begin
Role required: evt_mgmt_admin

About this task
The SLA configuration record is a filter on a table in the system. Select a table that has the CIs for which you want to create an SLA.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **SLA Configuration**.
2. Click **New**.
3. Fill in the form fields (see table).

SLA Configuration form fields

Field	Description
Name	Provide a descriptive name.
Table	Select a table with the CIs for which you want to create the SLA. You can also use the Configuration Item to Host View [query_based_service_basic_view] table, which is used by Dynamic CI Groups.
Filter	Configure the filter for the records.

4. Right-click the header and select **Save**.

Example:
The following is an example.

If you want to run an SLA on all Linux servers for major and critical alerts, first create an SLA configuration on the Linux Server [cmdb_ci_linux_server] table. Then create the SLA definition with this filter:

- `CI.class` is `Linux Server`
- `Severity` is `Major` or `Critical`

What to do next
Create an SLA definition on the CIs that match this SLA configuration.

Limit the records for the SLA configuration filter

If too many records are returned by the SLA configuration filter, you can add a property to set the maximum number of records.

Before you begin
Role required: evt_mgmt_admin

About this task
By default, the size of dynamic CI group records is limited to 10,000 elements. Exceeding this limit can affect system stability. If the filter configuration for a specified dynamic CI group returns too many records, you can limit the number of records that are returned by setting the value of the sa.qbs.max_num_of_cis property. For more information, see Create a Dynamic CI Group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter `sys_properties.list` in the application navigator.
2. Add the following property:
   sa.qbs.max_num_of_cis
3. Set the value to an integer that represents the maximum number of records to return.

Create an SLA definition for a CI or application service

You can create SLA definitions for CIs and application services just as you can for other task records in the instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Click **New**.
3. Fill out the fields on the SLA Definition form.
   For a description of each field, see Create an SLA definition for a CI or application service.
4. For the **Table** field, select **Event Management SLA [em_ci_severity_task]**.
5. Configure the **Start condition** filter by adding conditions, such as:

SLA filter conditions

For all CIs where the **Severity** is **Critical**		
Type	**is**	**CI** **Note:** Event Management SLAs work only on CI classes from Service Instance [cmdb_ci_service_auto].
Severity	**is**	**Critical**
For a specific service, such as Email, when the **Severity** is **Critical**		
Application Service	**is**	**Email**
Severity	**is**	**Critical**

6. Configure pause, stop and reset conditions.
7. Click **Submit**.

Alert lifecycle configuration

Event Management provides various modules, templates, and properties for configuring alerts and the actions that execute for these alerts.

Configure the alert active interval

The active interval property (**evt_mgmt.active_interval**) determines how Event Management handles a new event that is similar to events that appear on an existing closed alert. Based on the active interval, event, and existing closed alert information, the alert is reopened and the event information is added to the existing alert or a new alert is created.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
When the new event is received and the alert is already closed, Event Management compares the time since the last alert update (**sys_updated_on**) and the active interval property value. Then, the system either updates the existing alert or creates a new alert (if the original alert is closed), as explained in the following table. If the alert is open, Event Management automatically updates it without checking the active interval property value.

Scenario	Result
The new event occurs before the active interval elapses for the existing closed alert.	The event is identified as a recurrence of an existing issue. The alert is updated with the event information and the alert is reopened.
The new event occurs after the active interval elapses for the existing closed alert.	A new alert is created because the event is identified as a new issue. The event information is added to the new alert.

Change the active interval by editing the **Active interval (in seconds), within which a new event reopens a closed alert** property value.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Change the number of seconds for the **Active interval (in seconds), within which a new event reopens a closed alert** property.
3. Click **Save**.

Configure alert flapping

Set flapping properties to determine when an alert enters and exits the flapping state. Flapping can indicate configuration problems (that is, thresholds set too low), troublesome services, or real network problems.

Before you begin
Role required: evt_mgmt_admin

About this task
Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Edit the following properties, as appropriate.

3. Click **Save**.

What to do next
You can monitor the **Event Management** > **All Alerts** list for alerts that are in the flapping state. For details, see View alerts in the flapping state.

Alert priority

Determine the order in which to handle alerts according to the alert priority score. Multiple factors determine the alert priority score and this value changes with changes to the underlying factors.

Multi-factor decisions

The value of the alert priority score is a composite of the value of the category and its relative weight. You can configure the factors that make up the score, as described in the following sections, according to *`Category order`*, *`Category value mapping`*, and *`CI type weight factor mapping`*. The categories are:

- *`Accumulated categories`* - These categories accumulate items with different sub-types that may have a different status or weighing factor. For example, services that are factored according to different criticality or services that are factored according to cost.
- *`Choice-list categories`* - A list of items. You can map any of the items to a different value, thereby changing the priority for that item. For example, critical severity, which has the value of 1 by default, can be mapped to 4 to give it a higher weight in the calculated alert priority score.

List of categories

Category	Description
Accumulated categories	
Number of impacted business-services	This category is factored by the business-criticality of the service. An alert that has an impact on one service has a lower priority score than an alert that has an impact on many services. For example, if a router is down, then it might affect many services and a higher priority ensures that this alert is handled before handling another alert that has an impact on fewer services. An alert that has an impact on many non-critical services must be handled with priority. However, if an alert has an impact on only a few services, but they are critical services, then this alert has a higher priority.
CI type	This category distinguishes between various CI types. For example, an alert on a CI type that is a router or switch may have a higher priority than an alert on another CI type, like a server or application.
Number of Secondary alerts	Alerts that have characteristics similar to other alerts are usually grouped together, such as alerts with the same message key. A parent alert which has many secondary alerts has a higher priority than a parent alert that has only a few secondary alerts. All secondary alerts of a parent alert are counted. If a secondary alert is closed, it is no longer correlated to the parent alert. If a parent alert is closed, all secondary alerts are no longer correlated and their priority value is calculated accordingly.
Choice-list categories

List of categories (continued)

Category	Description
Alert state	Priority score is not calculated for an alert that is in *Closed* state. The available states with their default values are: • Open = mapping value 1 • Reopen = mapping value 2 • Flapping = mapping value 3
Alert severity	The priority score reflects the level of seriousness of the underlying alert, for example, an alert that has severity of *Critical* has a higher weighted value than an alert with a severity of *Minor*. Priority is not calculated for an alert that has a severity of *OK*. The available levels are: • Critical • Major • Minor • Warning
Role	The priority score reflects the role of the alert. The priority score is higher for an alert that has a role of *Parent*, next is the role of *None*, and the least weight is given to an alert with a role of *Secondary*. A parent alert that has many secondary alerts has a higher value than a parent alert that has less secondary alerts. The available roles are: • Parent • None • Secondary

Structure of the alert priority score

Weighted value for each category

Each category has its own placement in the alert priority score, according to its order and limit. You can configure the order and limit, as described in Modify the alert priority score, below. There are only positive numbers.

All category values are mapped from the *em_alert_priority_category_mapping* table, except for the following:

- CI Type: Mapped from the *em_alert_priority_ci_type* table.
- Secondary: Value is the number of secondary alerts and is not mapped from any table.

Note:
To ensure optimal memory protection, alert groups with more than 1000 alerts may not have an accurate priority score.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example constituents of alert priority score of 7302020.003

Category	Score
Services	(7.0, 1000000.0) For example, if there are 2 impacted services whose business criticality priority score is as follows: • Service1: Business criticality priority score = **3** • Service2: Business criticality priority score = **4** The sum of the business criticality priority scores is **7**, so the computed priority value is 7,000,000 (7 * 1,000,000) **Note:** The business criticality priority score is the mapped value (**Value after mapping**) in the application services entries of the Alert Priority Category Mappings table (em_alert_priority_category_mapping).
Severity	(3.0, 100000.0)
CI type	(20.0, 100.0)
Role	(2.0, 10.0)
Secondary	(0, 0.01)
State	(3.0, 0.001)

Using the scores from the preceding table, the alert priority score is computed as follows:

```
(Services value * 1,000,000) + (Severity value * 100,000) +
(CI type value * 100) + (Role value * 10) + (Secondary value) +
(State value * 0.001)
```

Replacing the values of the categories from the preceding table into the formula:

```
(7 * 1,000,000) + (3 * 100,000) + (20 * 100) + (2 * 10) + (0 *
0.001) + (3 * 0.001) = 7,302,020.003
```

In the **Priority Breakdown** area of the **More Information** tab, the alert priority value is displayed as 7302020.003. In the Alerts list, this value is displayed as 7302 (number of thousands).

Note: If you have customized business criticality values that differ from the out-of-box values, add an entry to the Alert Priority Category Mappings table [em_alert_priority_category_mapping].

Effect of category limits

Limits placed on categories enable overflow values to affect the next category that is ranked higher in priority order. Each accumulated category has a predefined limit. If the count goes above that limit, 1 is added to the next higher-order category. For example, if the number of CI types goes over the limit, then 1 is added to the next category (Severity) which is higher in priority: `yyy-zzz becomes yy(y+1) -000`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Display in All Alerts list

In the **All Alerts** list, the alert priority score value is displayed in the **Priority** column. For display purposes only, the actual calculated alert priority score is divided by 1000, while in the database, for calculation and sorting purposes, the full computed value is used.

The detailed computation of the alert priority of the selected alert is displayed in the **Priority Breakdown** area **More Information** tab.

Calculating the alert priority score

Calculating alert priority is based on all of a group's alerts, and not only the group's primary alert. Priority is calculated for alerts that match these conditions:

- State not-equal to **Closed**
- Severity not-equal to **OK**

Alerts that are queued for priority calculation are listed in the `em_alert_trigger_queue` table. In the Scheduled Jobs table, there are two `Event Management - Alert Priority Queue` jobs. These two jobs can run in parallel. You can use *`Insert and Stay`* to create another job. The `Event Management - Alert Priority Queue` job runs once every minute and calculates priorities in batches of 1000 open alerts. There are multiple factors that determine the value of the priority of an alert. A change in severity triggers an immediate update of the alert priority score. In this case, only the severity-part of the priority is changed, together with severity information in the **Priority Breakdown** area of the **More Information** tab.

Triggers that cause recalculation

Triggers that can cause the alert priority score to be recalculated are:

List of recalculation triggers

Trigger	Effect on the alert priority score
New alert	The generation of a new alert is a trigger to calculate the alert priority score.
Existing alert that changes from closed to any other state	Priority is not calculated for a closed alert, so if the alert state is changed from its current state of closed to open, reopen, or flapping, that change is a trigger to recalculate the alert priority score.
Role change, between primary, secondary, or none	Changes in role are a trigger for the alert priority score to be recalculated. For example: • An alert whose type has changed to `Primary`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `None`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `Secondary`, triggers the alert priority score to be recalculated.
CI type	When a CI becomes bound to alert, that change is a trigger to recalculate the alert priority score. This trigger to recalculate the priority occurs once only, when the CI is bound to the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of recalculation triggers (continued)

Trigger	Effect on the alert priority score
Change of number of secondary alerts	A change in the number of secondary alerts triggers the alert priority score to be recalculated.
Severity	A change in severity is a trigger to recalculate the alert priority score. For example, changing from OK to `Major` triggers the score to be recalculated. Unlike the other triggers listed above, a change in severity triggers an immediate update of the severity part of the alert priority score calculation.

Modify the alert priority score

You can change the importance of some categories of the alert priority, by modifying their order and/or their weight, as described below. For example, if the CI type is higher in importance than the number of impacted services, you can change their respective order. As a result, the number of services is now multiplied by 100, while CI type is now multiplied by 1000000.

Note:
The changes that you make, using this advanced procedure, change the default method of calculating the alert priority score. Alerts that might otherwise not have a high score, by changing these configurable values, change the way you determine the order in which to handle alerts.

Changing category order

Navigate to the *em_alert_priority_category_order* table. In the **Order** column, you can change the order of the required category.

Category value mapping

The *em_alert_priority_category_mapping* table shows the configuration value for each category choice. Each value in a drop-down list of categories can be remapped to a different value by configuring this table.

CI type weight factor mapping

Navigate to the *em_alert_priority_ci_type* table. You can add a new CI, for example, `DualCore`CPU and in the **Priority** column, you can change the priority of the required category. In addition, you can edit existing Type and also change its priority value. This table is used to map the value of each CI type, for example, a mainframe that is CI_type: cmdb_ci_mainframe might have a priority of 80, while a server with CI type: cmdb_ci_server might have a priority of 60. The mapping enables you to customize the priority of the various Ci types.

Alert assignment groups for teams

Alert assignment groups assign alerts to the right teams promptly and automatically, improving overall incident management capabilities.

Admins determine the alert assignment group priority, making sure that alerts are routed to the appropriate team members.

The Alert assignment group is determined by the *evt_mgmt.alert_auto_assignment_field* property value. As an admin, you can choose to set the assignment group based on the alert fields using the property value and the order of the comma-separated fields by editing the property value.

Assigning alert assignment group precedence

Assign alert assignment group precedence to make sure that alerts are routed to the appropriate team members.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** and search for `sys_properties.list`.
2. In the **Search** field, enter `evt_mgmt.alert_auto_assignment_field` and select the property record.
   For more information on the property, see Team-based integration properties.
3. In the **Value** field, enter the assignment group precedence.
   Set the assignment group precedence according to the order of the comma-separated fields such as cmdb_ci.support_group, IntegrationGroup.
4. Select **Update**.

Related topics

- Team-based integration properties

Configuring Express List views for users and user groups

Centrally control what users monitor by predefining views in Express List and assigning them to users and user groups.

As an Event Management admin, you can create Express List views to ensure that users focus on specific services, priorities, or alerts. Event Management enables you to define the filters, column order, and filter attributes for an Express List view and then assign the view to individual users and user groups.

Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If a user belongs to multiple groups, they can see the views you assigned to all of these groups. Users can switch between views and modify and save all views except their assigned default view. However, they can't override settings in any of their assigned views and modify or share their default view.

The filter conditions builder enables you to configure AND and OR conditions between attributes.

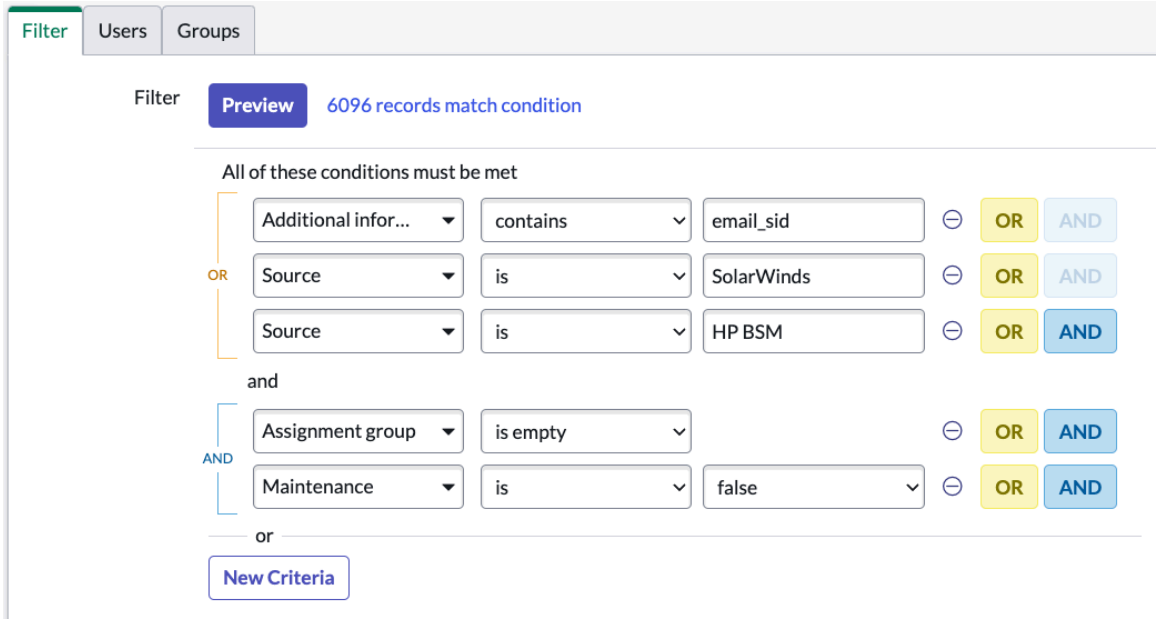
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Express List view filter conditions



For example, the admin can configure conditions that allow the user to see only alerts that are not assigned to an assignment group or in maintenance. In the example, the alerts must also contain a value of email_sid and must be from one of the specified sources.

Related topics

Create a predefined Express List view for users

Use an assigned Express List view

Create a predefined Express List view for users

Configure an Express List view for users to make sure that they focus on specific services, priorities, or alerts. You can set the filters, column order, and filter attributes for this view and assign it to individual users or user groups.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select **New**.
3. On the **Express List View** form, fill in the fields.

Express List View table

Field	Description
Name	Unique name of the Express List view.
Primary Sort By Field	The field by which to sort the Express List. Default: Initial event generation time.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secondary Sort By Field	The field by which to sort the results of the primary sort-by field. This field is optional.
Order	The order of this Express List view, if multiple views exist.
Order of Primary Sort By Field	The sorting order of the Primary Sort By Field: Ascending or Descending.
Order of Secondary Sort By Field	The sorting order of the Secondary Sort By Field, if set: Ascending or Descending.
Default	Option to set this Express List view as the default view for the assigned user or group. If multiple default views exist, the value set in the Order field determines their order.

4. Set filter conditions for the Express List view.

Note:
When you include even a single unsupported filter in your Express List view, it prevents the Event Management operator from modifying the settings of any filters in this view, including those that are supported. If you want to allow operators to adjust their personal view, make sure to only include supported filters.

a. In the **Filter** tab, select a field, an operator, and one or more values for a condition.

Note:
The default field is State.

b. **Optional:** Perform the following tasks:

Task	Procedure
Add a filter condition	i. Select either the AND or the OR operator. ii. Select a field, an operator, and one or more values for the condition.
Add an alert tag filter condition	i. In the Alert Tags Filter section, select **Insert a new row...**. ii. Select the required tag, operator, and value for each tag filter.
Add an additional set of alert tag filter conditions	i. In the Alert Tags Filter section, select **New Criteria**. ii. Add the required tag filter conditions.
View the number of results a query with the configured conditions would return	Select **Preview**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Assign users and groups to the Express List view.

6. From the form menu, select **Save**.
   The following tabs display:
   - The **Express List Table Fields** tab shows the fields to be displayed as table columns in Express List.
   - The **Express List View Field Attributes** tab shows the filter attributes for the open alerts in Express List.
7. **Optional:** Add table fields and field attributes to the Express List view.

8. **Optional:** Exclude fields or field attributes from the Express List view by deactivating them.

   Note:
   You can view the updated state of a field or a field attribute in the table by selecting the list controls icon ( ) and then selecting **Refresh List**.

9. When you're satisfied with the Express List view, select **Update**.

Assign users and groups to predefined Express List views

Assign individual users and user groups to preconfigured Express List views to make sure that they focus on specific services, priorities, or alerts.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select the predefined Express List view that you want to assign to a user or group.
3. Assign users or groups to the selected Express List view.

4. Select **Update**.

Alert impact calculation

Impact calculation shows the magnitude of an outage on CIs, services, alerts, and alert groups. The system uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. The severity appears on the impact tree, application services maps, and dashboards.

Impact calculations are available for application services alert groups. The following factors are used to calculate the overall impact of an outage.

- Impact rules.
- Number of related active alerts.
- Past history of the affected CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Relationships between CIs for a particular application service or application services.
- If the CI element includes a network or storage devices.
- Alerts on CIs in the maintenance state are excluded from impact calculation.

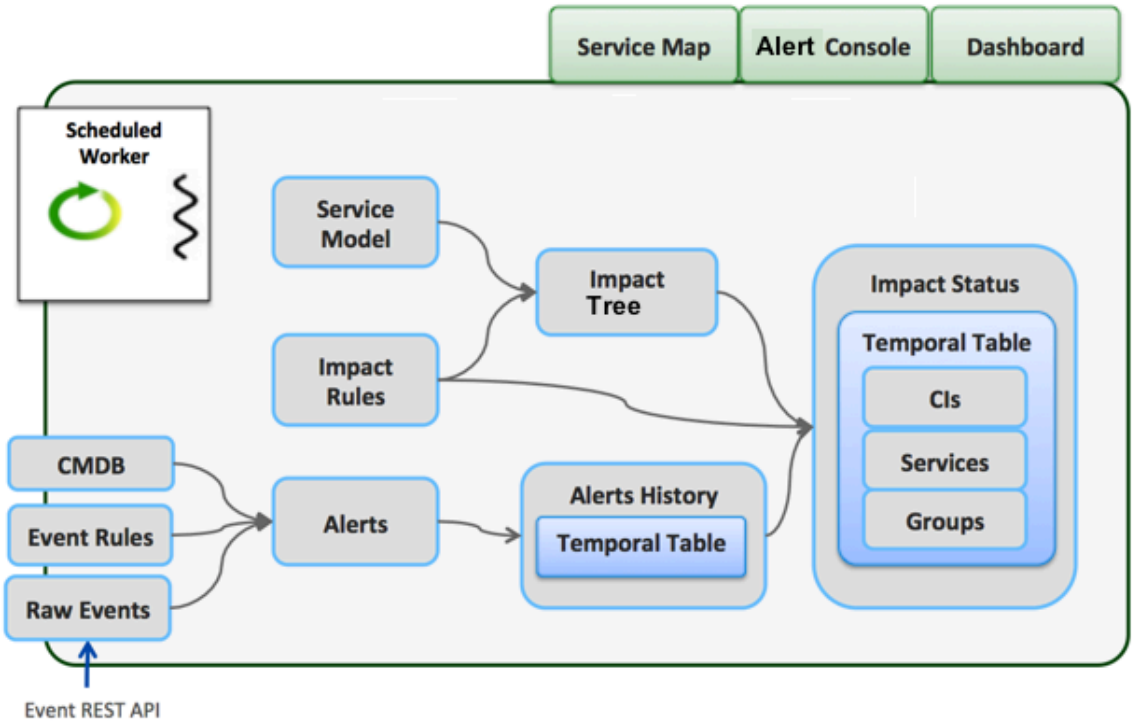
Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

- By default, impact is calculated for all operational application services. However, the system allows you to filter impact calculation by service class or by individual application service. For more information, see Add CMDB tables or classes for impact calculation and Add application services for impact calculation.

If there is a connection between services, the impact of one service on the other is also calculated.

Impact calculations use information from various sources to set the alert severity



How impact is calculated

Impact calculation varies depending on the CI relationships for a application service or application services. Additional factors, such as change requests, network paths, storage paths, and related CIs all affect impact calculation.

Services

The following impact calculation flow operates for alerts where the outage does not affect a network or network storage. Event Management performs the following steps:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create a service map. Use the Service Configuration Item Associations [svc_ci_assoc] and CI Relationships [cmdb_rel_ci] tables to create child-parent relationships in the application service or application services.
2. If there is no CMDB path from the service to the CI but an association appears in the svc_ci_assoc table, show a Depends-on relationship between the application service and the CI. Otherwise, show no connection.
3. For an application services, if the CIs assigned to the service are also connected to the service in the CMDB, the map keeps the hierarchy between CIs as they appear in CMDB. The CI service assignments appear in the Service Configuration Item Associations section of the Application service form. If there is no connection to the service in the CMDB, the CIs appear directly under the application services in the map.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Change requests and the In Maintenance status

If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation. The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.

Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active. For additional information, see How alerts work with CIs in maintenance.

Network paths

To account for network redundancy, Event Management uses a separate impact calculation. You can see network topology or path changes in the application service. The following impact calculation flow operates for alerts where a network path is affected. Event Management performs the following steps:

1. Create a application service map for the affected network.
   - Use the host ID and target IP information from the alert and the network path from the Network Paths [sa_network_paths] table.
   - Use the elements in the network path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path, from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the network path is the child.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the application CI where the path originated from.
3. Calculate all redundant elements in the path with the redundancy rule by reducing the severity on the impacted CIs by one level. For example, if the severity is *Critical*, the redundancy rule decreases severity by one level to *Major*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Storage paths

To account for storage device redundancy, Event Management uses a separate impact calculation. You can see impact tree updates when the network storage topology changes from the application service. Event Management performs the following steps for alerts that contain storage CIs:

1. Create a application service map for the affected storage device:
   - Use the storage device in the sa_fs_to_storage_path table. The storage device definition uses the file system information in the path.
   - Use the elements in the storage path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the storage path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the original application CI the path.
3. Use the redundancy rule to calculate redundant elements in the path by reducing the severity on the impacted CIs by one level. For example, if the severity is *Critical*, the redundancy rule decreases by one level to *Major*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Related CIs

As alerts generate for a CI, additional impact calculations run for related CIs. For example additional impact calculations run for a application service dependency to a CI that is not actually part of the application service. These related CIs are not discovered as part of the service. Instead, the related CIs are specified by an infrastructure relationship definition.

The following impact calculation flow operates for alerts with CIs that have a dependency to related CIs which are considered outside the application service. Event Management performs the following steps:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Derive relationships between the application service CIs and related CIs. Use the relationships, impact rules, and other data from the Infrastructure Relations [em_impact_infra_rel_def] table.
2. Add related CIs to the impact tree and alert list on the Event Management dashboard.
   - Use data from the Infrastructure Relationship [em_impact_infra_rel_def] table to show containment links to the host.
   - Use the Impact Status [em_impact_status] and Alert History [em_alert_history] tables to determine the status.

Impact rules

Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs.

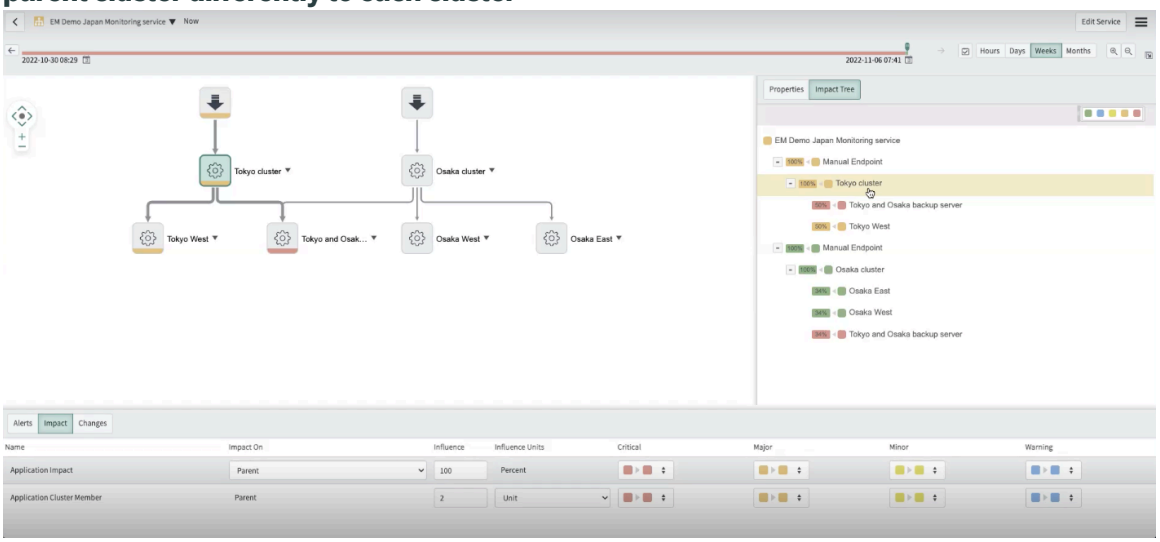
The Impact Rule [em_impact_rule] table contains impact rules that show the applicable CIs, application services, and settings for impact. The following default impact rules are available.

Application Cluster Member

Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**.

You can configure different impact rules per cluster and thus the child CI impact propagation to the parent (for the same child CI) will be different. Therefore, you can manually create groups of Cis (aka manual clusters) and configure the impact rule at the cluster level for downstream towards the cluster children.

Example where the same child CI will propagate its impact to its parent cluster differently to each cluster



In the above example, there are two entry points. The Osaka cluster on the right-hand side has three CIs. The Tokyo cluster on the left-hand side has two CIs. The Tokyo and Osaka backup server has shared parents - Tokyo cluster and Osaka cluster. On the right-hand panel you can see the Impact Tree where the Tokyo cluster has two Application Cluster Members with 50% influence each and the Osaka cluster has three with 34% influence each.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For manual cluster configuration there are two rows: Application Impact and Application Cluster Member. The children are displayed since the Impact On field was selected as Parent and not Application Service. In the Application Cluster Member row the Influence field is configured to two. This implies that the minimum amount of children who fail (and that they propagate the failure upwards to their parents) are two. The Osaka cluster is configured to three. The percentage is different for the Tokyo and Osaka backup server for each cluster (50% and 34%). As you can see, even though the Tokyo and Osaka backup server failure is Red Critical, it influences the parents differently. The Osaka cluster remains green even though the Tokyo cluster failure is Orange Major.

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View when you select **Alerts**. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

The following impact fields are displayed when you select **Impact**.

Inclusion

Determines the impact on entities with a Contains relationship. This rule is read-only.

Infrastructure Dependencies

Determines the definition of impact propagation for CIs in infrastructure relationships.

CI application service

Determines how impact applies to parent or child entities that are part of an application service.

CI Impact

Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

CI Parent in Application

Sets impact only on the parent entity.

Network Path

Determines how impact applies to parent or child entities that are part of a traditional network.

OS Cluster Member

Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down.

Storage Path

Determines how impact applies to parent or child entities that are part of a storage network.

Properties

In addition to configuring impact rules, you can configure properties for impact calculation.

Configure these properties, as appropriate:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact Calculation Properties

Property Name	Description
`evt_mgmt.impact_calculation.alert_grouping_support`	Enable alert grouping support.
`evt_mgmt.impact_maintenance.sleep_time_msec`	Minimum time in seconds for checking CI maintenance: checks both the Status field on the CI and any change request schedule for the CI.
`evt_mgmt.impact_calculation.alert_delay_msec`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate for the late arrivals or slow business rules defined on the em_alert table. Default = 2000 msec. Used when alerts and events are processed one at a time (when the `evt_mgmt.max_objs_in_alert_query` property is not defined or is set to **1**).
`evt_mgmt.impact_calculation.alert_delay_msec_when_processed_in_ba`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate the late arrivals or slow business rules defined on em_alert table. Default = 30000 msec. Used in large customer environments with high traffic, when alerts and events are processed in batches (when the `evt_mgmt.max_objs_in_alert_query` property is set to a value greater than **1**).

For more information, see Event Management - Impact calculation [KB1157218].

Understand Service Maps

Service maps show active alerts for CIs and the relationships between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

About Service Maps

A service map shows alerts with impacted CIs and CI interdependencies. For example, changes to a connection between a host and hypervisor appear on the service map. As service map definitions change, the service map, alert, and impact information updates accordingly. From the Quebec release, there is enhanced visibility. When the alert is bound to the entry point, the service map identifies an entry point problem.

Note:
Alerts will not be displayed for the entry points on the service map.

You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following icons are used in service maps. The icon shapes are slightly different for application services.

Service map icons

Icon	Description
	Represents applications such as Microsoft IIS or SQL servers.
	Represents physical and VM computers and servers.
	Represents the network starting point. For example, Layer 3 devices appear toward the top of the map, and connected software and services appear near the end of the map.
	Shows the number of redundant CIs.
	Shows the workload between machines.
	The gray connector shows a relationship between CIs.
	Each CI with no active alerts box represents a network CI. A gray box represents a CI with no active alerts. Information about the CI is hidden.
	Hides multiple CIs that are designated as redundant.
	An impacted CI displays the color that represents the severity of the alert associated with the CI. • **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major (orange)**: Major functionality is severely impaired or performance has degraded. • **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning (blue)**: Attention is required, even though the resource is still functional. • **OK (green)**: An alert is created. The resource is still functional. • **No color**: No active alerts.
	Represents a fiber channel, hard drives, or other data storage devices.
	Represents related web services for the network such as NGINX or JBoss web server.

Note:
Session timeout settings don't apply to this screen. The session remains connected, even when there is no human interaction. If this setting is a concern, either log out or close the active tab in the browser.

View the impact tree

The impact tree shows the relationships between CIs and the relative percentage impact for each child CI. This information is available for both discovered services and application services.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

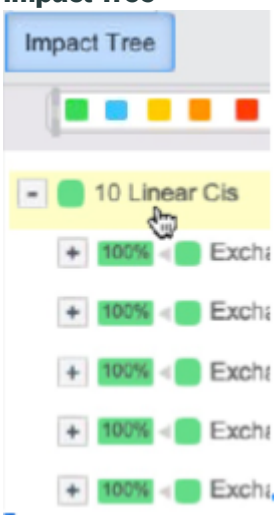
The impact tree shows the result of impact rules on CI parent and child relationships. The tree represents a service map with CIs from the Service Configuration Item Associations [svc_ci_assoc] table. When related CIs are connected but not part of the service map, the impact for the related CIs can also appear in the impact tree.

The numbers or percentages on a parent CI summarize overall severity based on alerts from child CIs. The parent severity is based on impact rule computations.

You can also learn about the impact tree from the following video tutorial.

Event Management Part 2 | Impact Tree

Impact Tree



Procedure

1. Open the service map for the service from the Application service list.
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Click **View service** next to the service.
2. On the service map, click a CI that has a severity color.
3. Click the **Impact** tab.
4. From the **Impact Tree** tab in the side pane, expand the parent CI and click the CI that generated alerts.
5. Use the severity color to locate CIs that contain alerts:
   - **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent.
   - **Major (orange)**: Major functionality is severely impaired or performance has degraded.
   - **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Warning (blue)**: Attention is required, even though the resource is still functional.
- **OK (green)**: An alert is created. The resource is still functional.

6. Do one or more of the following.

Option	Description
Adjust impact rules	**a.** Click the **Impact** tab. **b.** Review and adjust the impact rules as necessary.
Remediate an alert	**a.** Click the **Alerts**. **b.** Right-click the alert and select **Run remediation**.

Network paths appearing in the impact tree can use a large amount of resources, which degrades system performance. To disable network paths from appearing in the impact tree, navigate to **System Properties** > **All Properties** and set the *evt_mgmt.network_path_excluded* property to **true**.

To view impact tree using Service Operations Workspace, see View impact tree using Service Operations Workspace.

Adjust impact rules for a CI

Configure impact rules to customize the impact calculation for discovery services and manual services. The impact rules update the overall alert and show the impact on related CIs. When you change impact rules, the updates apply to alert severity in places such as the Event Management dashboard and Operator Workspace.

Before you begin

Role required: evt_mgmt_admin

About this task

You can view and adjust the impact rules of CIs from the application service map of a service.

Note:
Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

Procedure

1. Open the application service map from either the Event Management dashboard or the Application service list.

Option	Description
From the Event Management dashboard	**a.** Navigate to **Event Management** > **Dashboard**. **b.** Double-click the tile of the application services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
From the Application Service list	**a.** Navigate to **Event Management** > **Services** > **Application Services**. **b.** Click **View Map** next to the application ser vices.

2. On the application service map, click a CI.
3. Below the map, click the **Impact** tab and then adjust the impact rules accordingly.

Impact Rules

Field	Description
Name	The name of the impact rule. ○ **Application Cluster Member**: Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. **Note:** To configure a manual cluster, see Configure a manual cluster ○ **Application Impact**: Determines how impact is applied to a specific CI, the overall application service, or parent/child entities within an application service. For the Application Impact rule, you can choose from the following Impact options: **Application Service** or **Parent**. ▪ If no CI is selected, the alert rule applies to the entire application service. ▪ If you select a specific CI, you can define whether the rule applies to the service or its parent. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Infrastructure Dependencies**: Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **OS Cluster Member**: Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network.
Impact On	The valid type of service for this impact rule.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Application Service**: The impact rule applies to a application service. ○ **Parent**: The impact rule applies to the parent CI.
Influence	The value to allow the impact rule to set on the parent. Set a value on the parent. This field works with the **Influence Units** field.
Influence Units	The unit of measurement to show impact on the parent. Set the highest value on the parent CI. Set lower values on each child CI. When alerts occur for several child CIs, Event Management calculates the sum of the **Influence Units** of each affected child. If the sum exceeds the parent **Influence Units** value, the parent receives the highest severity in the set. This field works with the **Influence** field. ○ **Percent**: When the percentage exceeds the **Influence** value, apply the impact on the parent. ○ **Number**: When the number exceeds the **Influence** value, apply the impact on the parent. For example, you can set the parent **Influence Units** to **100%** and the child CIs to these values: ▪ Child 1: 34% ▪ Child 2: 34% ▪ Child 3: 34% ▪ Child 4: 70% When alerts for Child 3 and Child 5 have the Critical severity, the severity of the parent is set to Critical because the sum is greater than 100% (34% + 70% = 104%).
Impact when Critical	The alternative impact to use when the calculated severity is Critical. If the column to the right of **Impact when Critical** has a higher severity, update all right-most columns with the same or a lower severity as **Impact when Critical**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Major	The alternative impact to use when the calculated severity is **Major**. If the column to the right of **Impact when Major** has a higher severity, update all right-most columns the same or a lower severity as **Impact when Major**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Minor	The alternative impact to use when the calculated severity is **Minor**. Controls the field values to the right of this field. If the **Impact when Warning** column has a higher severity, use the **Impact when Minor** value for both fields. To make sure

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Warning	The alternative impact to use when the calculated severity is **Warning**. To make sure the topology and impact tree accurately show impact, make sure that the columns to the left have higher severities. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).

What to do next
Review the changes on the impact tree. For example, if you changed a number or percentage influence for child CIs, review the impact tree updates accordingly.

View an alert impact on CIs in a service map

You can view service maps to see active alerts for CIs and the relationship between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

Procedure
1. Open an application service map:
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Next to the service, click **View Map**.
2. Do one or more of the following.

Alert impact calculation

Understand Service Maps

Create an infrastructure relationship for related CIs

Infrastructure relationships show CIs that are connected to a application service but are not necessary parts of the service. Infrastructure relationships are only available for application services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
When you create a CI infrastructure relationship, the information is stored in the Infrastructure Relations [em_impact_infra_rel_def] table. When alerts generate, the related CI accompanies the application service information on the Event Management dashboard and in the impact tree. Additional information for the related CIs only appears on a related dependency view map for the application service. The following default infrastructure relationships are available.

Default infrastructure relationships

Infrastructure relationship	Impact rule	Description
cmdb_ci_appl	OS Cluster Member	Shows alert impact between hardware and software applications.
cmdb_ci_esx_server	Infrastructure Dependencies	Shows alert impact between VCenter and ESX clusters.
cmdb_ci_kvm	Infrastructure Dependencies	Shows that alert impact on Linux Kernel-based Virtual Machine (KVM) connectivity.
cmdb_ci_vm_zones	Infrastructure Dependencies	Shows alert impact on the Solaris VM zones.

For example, based on of the cmdb_ci_vm_zones Infrastructure relationship definition, Event Management adds ZoneServer@mmp1 to the application service. The Containment rule manages impact severity on alerts.

Related CIs appear on the BSM

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Infrastructure Relations**.
2. Click **New**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill in the fields, as appropriate.

Infrastructure Relations form

Field	Description
Child Type	The table that contains data about the child entity.
Parent Type	The table that contains data about the parent entity.
Relation Type	The relationship between the child and parent entities.
Impact Direction	The impacts direction to show on the application service map. ○ **From Child to Parent**: When an alert is regarding a child, show the impact on the parent. ○ **From Parent to Child**: When an alert is regarding a parent, show the impact on the child entity.
Impact Rule	The impact rule to calculate infrastructure relationships: ○ **OS Cluster Member** : Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Application Cluster Member** : Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. ○ **Infrastructure Dependencies** : Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **CI Application Service**: Determines how impact applies to parent or child entities that are part of an application service. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network. ○ **CI Impact** : Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

4. Click **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.

View impact of child service on parent service

In the map view of an application service, the severity of a child service is propagated to its parent service.

Before you begin

Role required:

- for application services, evt_mgmt_admin
- for discovered services, service_mapping_admin

About this task

In the map view of a discovered application service, you can see that the severity of a child service is propagated to the parent service.
An application service is affected by the severity of alerts that are directly associated with it and alerts on the CIs that are in the service. If the severity of a child service is higher than that of its parent service, on the map view the parent service shows the severity of the child service. In the map view, the **Impact Tree** list shows the CIs. The color of the CIs indicates the alert severity. The child service is also affected by application services that are under it.

Example where the parent service shows the severity of the child service

If a loop is created, for example, by connecting a parent service to a sub-service, this relationship can be viewed in the map view. The impact of this loop is not calculated and the Impact Tree does not display this relationship. For example, assume that there are three CIs, A, B, and C, where C is a sub-service to B and B is a sub-service to A. The relationship of the A connected service to C is displayed in the map view. However, this relationship is not shown in the Impact Tree.

Note:
A message appears in the system error log in the following format, where the sys_id of the service and the node changes accordingly: `Found loop in ServiceId:[sysId], and node:[sysId]. Removing this relation to avoid impact loops`

For example, `Found loop in ServiceId:409d4fd59f030200fe2ab0aec32e705c, and node:df5cf6159f030200fe2ab0aec32e70a2. Removing this relation to avoid impact loops`

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

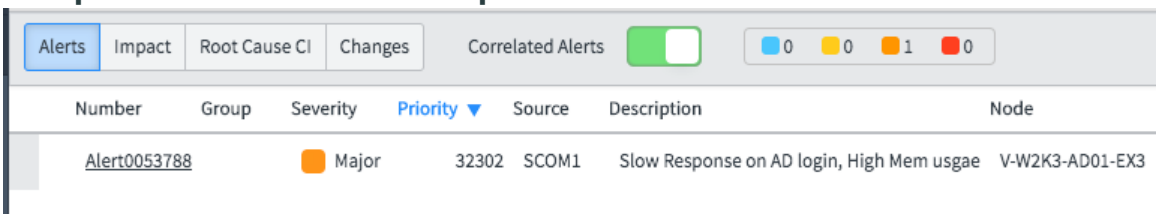
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of alerts listed under the Map View



Procedure

Open an application service map:

a. Navigate to **Event Management** > **Services** > **Application Services**.

b. Select **View Service** next to the service.

c. On the right-hand panel, select **Impact tree**.

d. On the lower panel, select **Impact**.

Result

In the service map, you can visually verify that the service health of the sub-service is rolled-up to the parent service. At the bottom of each icon of an impacted CI is a colored bar that represents the severity of the alert. This color bar also displays in the bottom bar of its parent service. For manual cluster configuration, you can modify the Application Impact and Application Cluster Member.

Add CMDB tables or classes for impact calculation

Add the CMDB tables that contain application services to be considered during impact calculation, helping ensure accurate and relevant impact results.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Organizations may have a vast number of CMDB tables—or classes—such as cmdb_ci_service_by_tags, cmdb_ci_service_auto and many others. However, not all of these are required for impact calculation. To streamline analysis and avoid processing irrelevant data, you can selectively add or remove only those CMDB classes that represent critical infrastructure or components. The procedure below shows how to add a CMDB class. If you want to remove any CMDB table from the list, see Remove CMDB tables or classes from impact calculation.

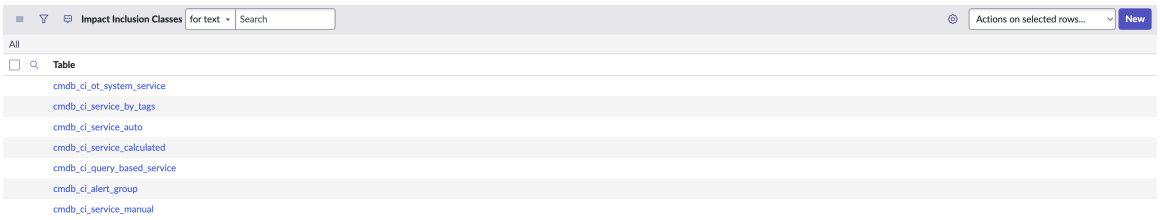
When you add a CMDB class, all application services related to that class are considered for impact calculation. However, if you do not want to include all services of a specific class and only want to select specific ones, you can do so on the Impact Filter Services page. For more information on how to include or exclude a service, see Add application services for impact calculation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

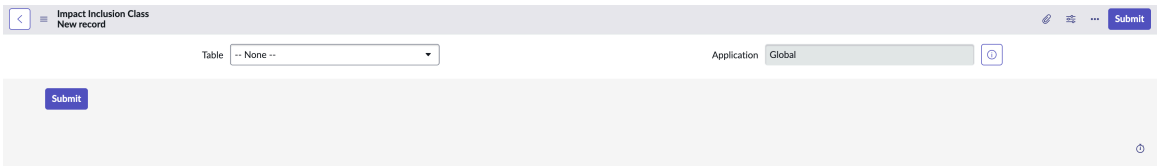
Procedure

1. Navigate to **All** and search for `em_impact_inclusion_class.list`.

   The Impact Inclusion Classes page opens, displaying a list of CMDB classes that are included in impact calculation.

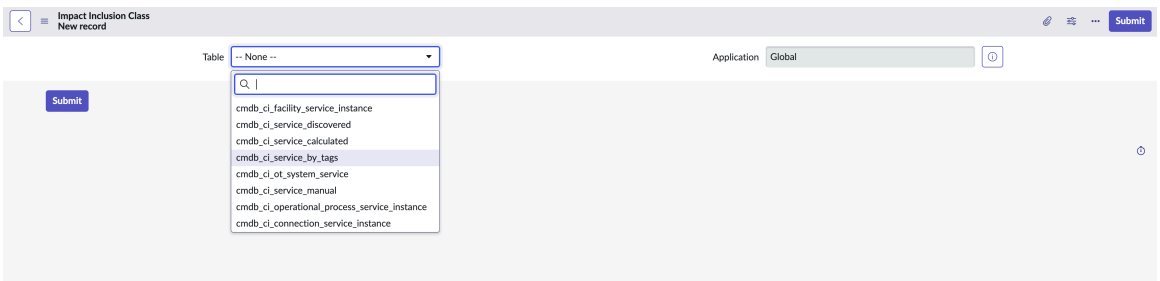


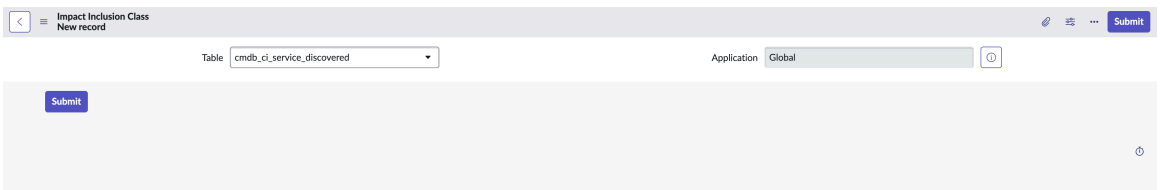
2. Select **New**.



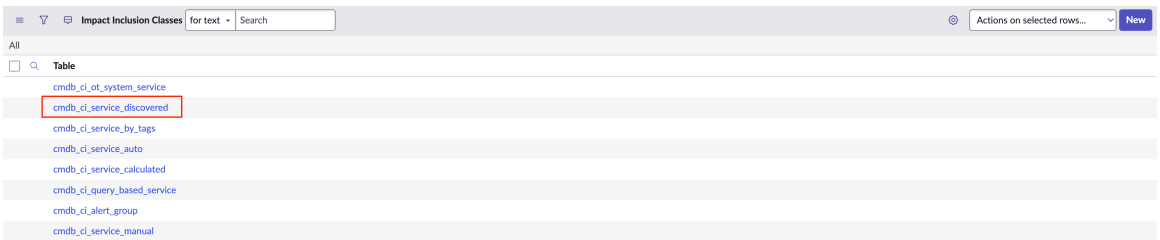
3. From the **Table** field, select a CMDB table.

   Note:
   The list contains only the CMDB tables supported for impact calculation, not all CMDB tables.





4. Select **Submit**.
   The CMDB table adds to the list of impact inclusion classes.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remove CMDB tables or classes from impact calculation

Exclude unnecessary CMDB tables or classes from impact calculation to improve performance and focus on relevant data.

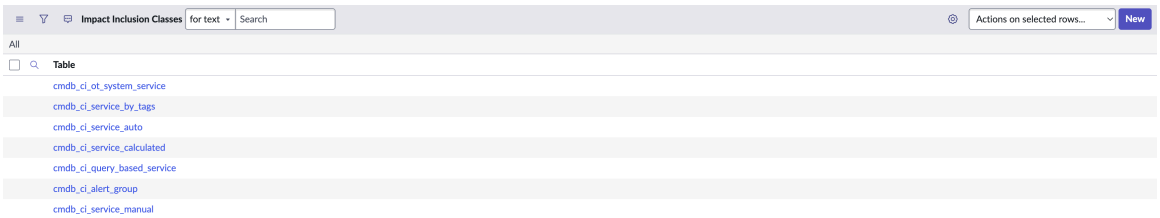
Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **All** and search for `em_impact_inclusion_class.list`.

   The Impact Inclusion Classes page opens, displaying a list of CMDB classes that are included in impact calculation.



2. Select the CMDB table that you want to remove.
3. Select the Actions on selected rows menu and then select **Delete**.
4. In the confirmation window, select **Delete**.
   The CMDB table is removed from the list.

Add application services for impact calculation

Specify the application services that must be considered during impact calculation to ensure accurate service impact assessment.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Organizations may have thousands—or even hundreds of thousands—of application services. If a CMDB class is added to the em_impact_inclusion_class.list table, then all application services related to that class are included in impact calculation. However, there are two possible scenarios:

- Scenario 1: CMDB class is added to em_impact_inclusion_class.list but you want only specific services to be considered for impact calculation. You can either:
  - Remove the unwanted services from the em_impact_filter_service.list, or
  - Set their status to false in the em_impact_filter_service.list.

  For information on how to remove the application service from the list, see Remove application services from impact calculation.
- Scenario 2: CMDB class is not added to em_impact_inclusion_class.list. So, none of the application services related to this class are considered for impact calculation. However, you want only specific application services from this class to be included, you can directly add those services to the em_impact_filter_service.list table and set their status to true without adding the CMDB class to the em_impact_inclusion_class.list table.

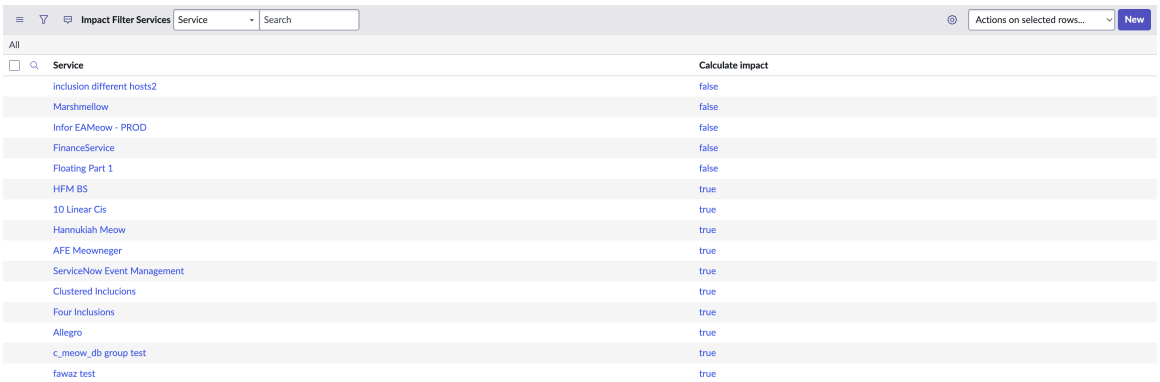
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following procedure shows how to add an application service directly to the em_impact_filter_service.list table so that it is considered for impact calculation.

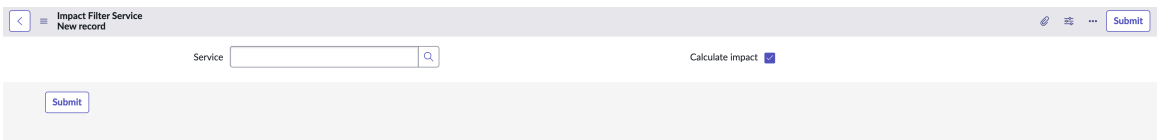
Procedure

1. Navigate to **All** and search for `em_impact_filter_service.list`.

   The Impact Filter Services page opens.



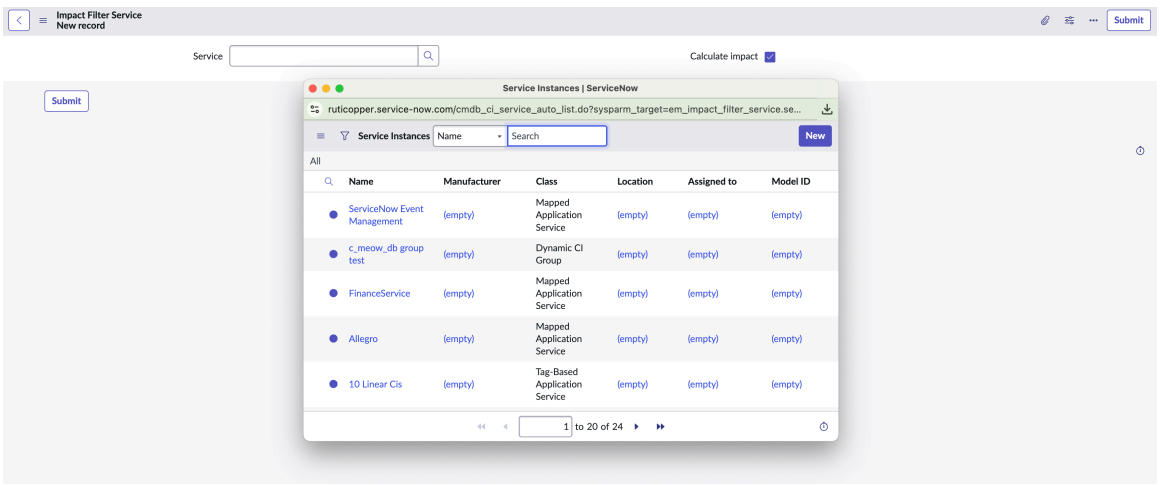
2. Select **New**.



3. In the **Service** field, select the search icon ( ).

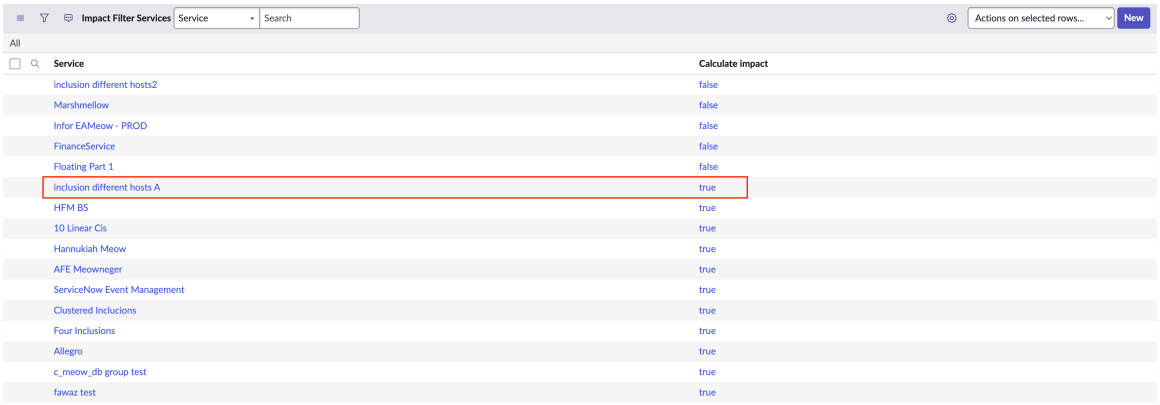
   Note:
   By default, the **Calculate impact** check box is selected.

4. In the Service Instances page, select the service that you want to add for the impact calculation.



5. Select **Submit**.
   The application service adds to the list of impact filter services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
Only the application services added to the Impact Filter Services list appear in the Service Dashboard.

Remove application services from impact calculation

Exclude specific application services from impact calculation to reduce noise and focus on critical components.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

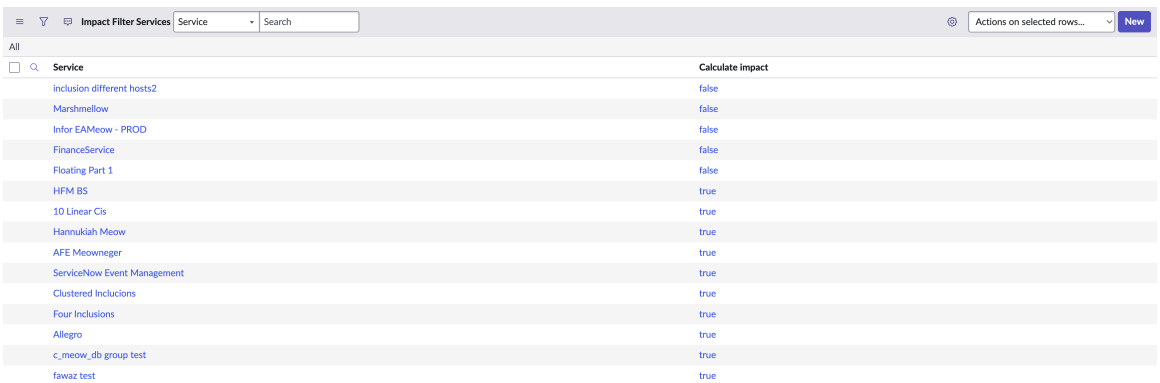
Removing or deleting a record from the list won't necessarily exclude the application service from impact calculation if the CMDB class still exists in em_impact_inclusion_class.list. However, even if the class exists in em_impact_inclusion_class.list, the application service will not be considered for impact calculation if its status is set to **Calculate Impact** = **false** in em_impact_filter_service.list.

For the application service that you want to exclude from the impact calculation, add the application service with **Calculate Impact** = **false**, or change the **Calculate Impact** = **false**, if this record already exist. The procedure shows how to configure this setting.

Procedure

1. Navigate to **All** and search for `em_impact_filter_service.list`.

   The Impact Filter Services page opens.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. For the application service that you want to exclude from the impact calculation, change the **Calculate impact** status of the application service to **false**.
   This keeps the application service record in the list but excludes it from impact calculation.

Probable Root Cause Analysis (RCA)

Shorten the mean time to repair (MTTR) by discovering the root cause of an alert.

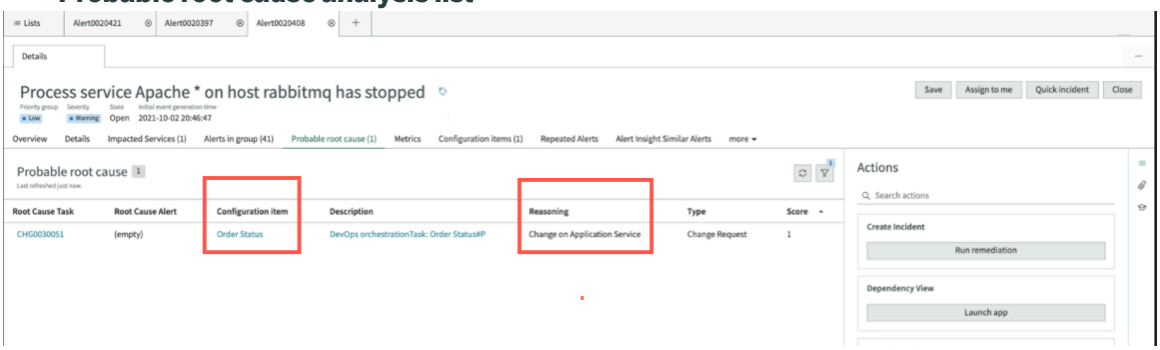
Probable root cause analysis (RCA) provides a list of probable root causes for alerts. This capability uses existing data in IT Service Management to help you determine the root cause of an issue.

RCA takes three factors into consideration: Alerts, configuration item (CI) topology, and change requests on the CIs. It extracts CIs from alerts or alert groups and analyzes the CI relationships in the CMDB. It then uses a set of configurable filters to consider relevant change requests on the CIs as possible root causes.

Change requests can be related to a time frame or to a CI, the application service it belongs to, or the software installed on it. For example, a CI must be upgraded or a security patch installed on it. A change request on one CI can affect other CIs.

RCA maps the alerts and change requests to the CIs. It proceeds to calculate the root cause score, a logical score used for sorting probable root causes. The calculation of this score is based on change requests on CIs, and on alerts on a crucial CI called the Topology Origin CI. The root cause score determines how RCA populates the probable root causes list.

Probable root cause analysis list



By default, the list shows the five probable root causes with the highest score. It lists the CIs related to each alert, and the reason RCA identified them as probable root causes.

Scoring for probable root causes is determined by the following criteria, in the indicated order (lower number = higher priority):

1. Change on a CI that originates from topology.
2. Change on a related CI originates from topology.
3. Change on a CI.
4. Change on a related CI/change on an application service/change on software.
5. Alert on the CI that originates from topology.

To disable the Probable Root Cause Analysis feature, you must create the property *sa_analytics.disable_prc* and set the value to `true`. For more information on how to create a property, see Add a system property.

Customize RCA settings

Modify default settings that determine RCA behavior.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
Default filter settings control which change requests RCA considers as possible root causes. You may want to change certain default settings, for example to make RCA ignore standard change requests.

You can also change the number of probable root causes shown in the list. By default, the list shows the five probable root causes with the highest root cause score.

By default the RCA calculation is enabled. You can disable it by changing the default *sa_analytics.disable_prc* value to True.

Procedure
1. Navigate to **All** > **System Properties** > **All Properties**.
2. Do one or both of the following, as needed.
   - Change default filter settings:
     a. Select **New**.
     b. In the **Name** field, specify the name of the property for which you want to change the default setting.

        The new property must have the same name as the related property in the table.

Property	Description	Type	Default value
sa_analytics.rca.filter_category	The categories of change requests that RCA considers as possible root cause.	string	" "
sa_analytics.rca.filter_type	The types of change requests that RCA considers as possible root cause.	string	"standard,normal,emergency"
sa_analytics.rca.filter_state	The state of change requests that RCA considers as possible root cause.	string	"-1,0,3,7,8,157"
sa_analytics.rca.filter_timeframe_interval_in_hours	The timeframe, in hours, during which change requests occurred that RCA considers as possible root cause.	int	168
sa_analytics.rca_use_legacy_query	Use legacy less efficient queries for RCA calculation.	Boolean	False
sa_analytics.rca.get_tasks_for_impacted_cis	Include change requests for	Boolean	True

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Type	Default value
	impacted services in the RCA list.		
sa_analytics.rca_scoring_by_selected_proximity	Enables selecting proximity of RCAs by time proximity to the alert.	Boolean	True
sa_analytics.rca_cmdb_relation_levels	Number of levels to search related configuration items.	int	3
sa_analytics.rca_time_filtering_by_planned_time	Enables filtering of change requests by planned time.	Boolean	True
sa_analytics.rca_time_filtering_by_actual_start_time	Enables filtering of change requests by implementation time.	Boolean	True
sa_analytics.rca.upper_filter_time_unit	Determines the time unit for upper bound for change requests filtering.	int	1
sa_analytics.rca.order_by_scoring_for_virtual_alerts	When scoring for virtual alerts RCAs for virtual alert – order the records by scoring of PRCs of the corresponding secondaries.	Boolean	True
sa_analytics.rca_same_reasoning_prioritize_newer	When 2 PRCs have the same reasoning, prioritize the one with the most recent change request during scoring calculations.	Boolean	True
sa_analytics.rca.prefer_rca_on_app_service	In case the service is the same change request on application service and on CI, prefer the one from application service.	Boolean	False

c. Enter a valid value for the property.

Note:
The value you set for the new property overrides the default value for the related property.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Change the maximum number of probable root causes shown in the list:

  a. Find the property *sa_analytics.rca_task_table_max_records*.

Property name	Description	Type	Default value
sa_analytics.rca_task_table_max_records	The maximum number of probable root causes shown in the Probable root causes list.	integer	5

  b. Replace the default value with a new valid value.

- Disable RCA by creating the *sa_analytics.disable_prc* property.

  a. Select **New**.

  b. Fill in the form with the following values.

Property name	Description	Type	Value
sa_analytics.disable_prc	Disabling the Probable root cause.	Boolean	True

3. Click **Submit**.

Alert similarity

Finding alerts that are similar to the alert that you are currently investigating can help save troubleshooting time by seeing how similar alerts were resolved.

Finding similar alerts

Alert similarity applies natural language processing (NLP) based on ServiceNow AI Platform machine learning (ML) as implemented in Predictive Intelligence.

ML logic filters out irrelevant information and provides further information to help you understand the cause of alerts. You can view solutions used to resolve similar alerts and the probable root cause.

ML helps find similar alerts based on text found in these alert record fields:

- Configuration item.Class
- Metric name
- Description

Additional alert information

In the Alert Workspace, select the required alert and click **Insight** to view additional information about the alert.

In the Alerts list, select the required alert and use the Alert Insight tabs on the right side of the alert record to view additional information about the alert. For example, you can view the top recent alerts for the current CI and similar CIs to find the most suitable solution towards resolving the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert insight tabs are:

- Impacted Services
- Flapping
- History
- Activities
- More Information
- Repeated Alerts
- Similar Alerts
- CI Incidents
- CI Change Requests
- CI Problems
- Related Incidents
- Related Change Requests
- Related Problems

For more information about the alert insight tabs, see Alert insight information.

Find similar alerts

You can find alerts similar to the alert currently being investigated. Save troubleshooting time by reviewing similar alerts to see how they were resolved.

Before you begin

Ensure that the Predictive Intelligence plugin is activated. To activate this plugin, see Activate a plugin.

Ensure that the `evt_mgmt.similarity_use_ml` property is set to `true`.

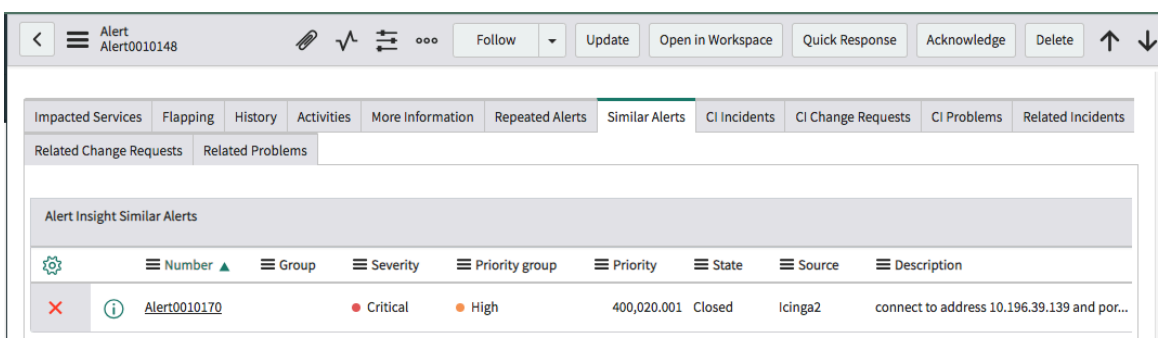
Role required: evt_mgmt_admin

About this task

Save time in resolving the current alert by reviewing how similar alerts were resolved. Provide resolution consistency by resolving similar alerts in the same way.

Procedure

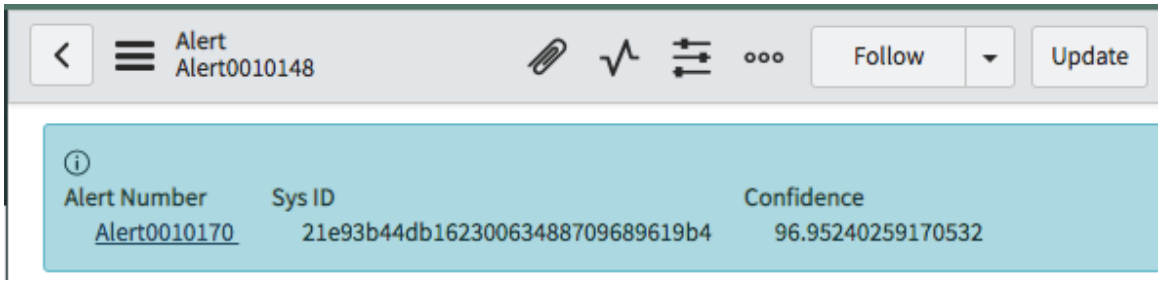
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the list of alerts, click the alert record that you want to investigate.
3. In the alert record, click the **Similar Alerts** tab.
   Alerts that are similar to the alert that is being investigated are listed.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, up to 10 similar alerts are listed. You can modify this value by setting the `evt_mgmt.similarity_max_similar_alerts_shown` property.

4. If you configured a threshold, in the Related links area, click **Show Similarities Details**. The Sys ID and confidence level of each similar alert is displayed. The Confidence level is an indication of how the similar alert matches the parameters that you set. As an example, a high confidence percentage value indicates a higher likelihood of similarity of the alerts to the values that you set.



You can modify the value of the threshold by setting the `evt_mgmt.similarity_use_threshold` property.

Similarity solutions

Similarity solutions enable you to use Machine Learning (ML) to compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Training a similarity solution

To train a similarity solution, you collect words to compile a collection that Machine Learning (ML) can use to compare text in the **Short Description**, **Description**, **Source**, **Type**, **Resource**, and **Metric Name** fields in a resolved alert to see whether the words in the set match words in an open alert. The resolved alert, which is similar to an open alert, provides an example to show how the open alert can be resolved.

To train a solution, the filter must return at least one record. If your filter returns no records, update it.

Note:
The preferred number of records for training a solution is between 30,000 records and 300,000. If you submit more than 300,000 records, the most recent 300,000 records are used to train the solution. Use only authentic records from the database.

- Ensure that the records you train are not too old and that they are relevant to your business needs. Keep the words in the collection current.
- Do not use hard-coded dates as filters because these filters are not updated when you retrain solutions unless you update them manually before every retraining. Instead, use relative date filters, for example, the last 3 months, last 6 months, or last 12 months.
- Perform training as needed until it provides an acceptable similarity solution. This practice provides you time to review and update your solution definition.

Fields to include in the solution

Record the fields that are likely to contain words and phrases that help the system identify similar records for your solution.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The similarity fields that you select should be a subset of your input field selections. For example, if you select fields from incident records that are in Open state, do not select **Close note** as a similarity field. Because open records do not include **Close note** fields, the text cannot be similar.

The similarity fields are available to users when they create records.

About the similarity score

The similarity score is a measure from 0-100 of the degree of similarity between two alert records. Alert records that have a similarity score higher than the threshold that you specify is returned by the solution.

Review similarity examples and their scores using the **Show training progress** feature to determine whether to either increase or decrease the solution threshold. You can change the threshold value in the **Threshold for Similarity Score** field.

View training solution progress

Training times vary based on the number of records and classes within the training set. The more records and classes you use, the longer the training can take. For example, a data set containing 100,000 records and several hundred classes can take around five hours to complete.

To show the training solution progress, the ML solution automatically performs the following activities when you select **Show training progress** on the Solutions page. For more information, see View solution training progress.

Solution training activities

Activity	Description
Fetching files for training.	The system downloads the training records and sends them to the nearest training service.
Preparing the data.	The system removes duplicate records from the training set.
Training the solution.	The training service trains the solution.
Uploading the trained solution.	The training service uploads the solution as attachment records.

Create an Event Management similarity solution

Create and train a solution that applies machine learning to a collection of words to target and suggest similar alerts in your instance dataset. For example, you can compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Before you begin

Role required: evt_mgmt_admin

About this task

The encryption scheme that you use can affect whether you can train solutions.

- If your data is encrypted by Full Disc Encryption (FDE), you can train solutions.
- If the field you are using for training is encrypted using Field Encryption, ensure that the shared service worker user has the correct encryption module role that has been used for encryption.
- If you are using Edge Encryption, training is not supported.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This feature supports only English language processing.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Click **New**.
3. On the form, fill in the fields.

ML Solution Definition form

Field	Description
Solution Template	Use to define a word collection.
Label	Unique name for the similarity solution.
Name	Field that is auto-populated with a system-assigned name that is similar to the label name when the solution is created.
Table	Table that contains the records to use for the word collection, for example, the Incident table or the Asset table. When you assign a table value, a link appears that shows the number of records that match your current conditions.
Filter	Conditions that you want to apply to the training records. To train a solution, the filter must return at least one record. If your filter returns no records, update it.
Input Fields	Record the fields that contain the text and context that you want to include in your word collection. The field data type can be a string, reference, choice, or HTML, such as **Short description** and **Description**. **Note:** **Journal type** is not a supported data type. Good candidates for your input fields have text that is relevant to the solution. For example, if you are configuring a solution to find similar incident records, you can select the **Short Description**, **Description**, **Resolution notes**, and **Close notes** fields.
Training Frequency	Training is performed once by the system, by default. Because your data can age over time and degrade the accuracy of recommendations, consider invoking scheduled trainings once your solution definition is fairly stable.
Domain	On instances where domain separation is active, select the domain whose target records you want to use for your word collection. Create a separate similarity solution definition record for each domain whose field values you want to use for your word collection.
Similarity Fields	Record fields that are likely to contain words and phrases that help the system identify similar records for your solution. To change your **Similarity Field** choices, click the Lock icon ( ) to open the field and make your updates. Click the icon again to close the field and save your updates.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Similarity Window	The period in which you want to look for similar records. If you have a smaller number of total incoming records, a larger window might be best. However, if the window is too large, you may retrieve records that are not as useful. If the window is too small, you might not retrieve enough similar records. For example, if you are looking for similar incident records that are open, you can select **Last 1 day**. This selection targets the most recent records, many of which could still be open.
Similarity Window Filters	Filter conditions for your similarity window. These filters define the dataset conditions under which your similarity results are determined. For example, if you are looking for similar incident records that are open, you can filter your search by creating conditions such as: **[Incident state] [is] [In progress]** These filters are applied in addition to the **Input Field** filters.
Window Refresh Frequency	Frequency to refresh the similarity window. For example, if your window contains incident records that are open, you can select a refresh frequency value of **Every 15 minutes**. New incidents typically occur frequently throughout the day so this frequency increases the likelihood that newly opened records are included in the refresh. **Note:** If your similarity window is composed of records such as Knowledge article records, which are typically not created often, you can choose a larger refresh frequency such as **Every 1 day**.

4. Click **Save** to save the solution definition record so you can return to it later, or click **Submit & Train** to create the solution definition record and train it.
5. If you submitted the solution for training, click **OK** on the **Training Activation** window to confirm.

Result

The system schedules the solution for training with the nearest training service. You and other users subscribed to the Predictive Intelligence Notifications category receive a notification when the training completes, including any errors that might have occurred in the training. When training is complete, the system uploads the solution as an Attachment record.

What to do next

Review the trained similarity solution examples in the **Similarity Examples** related link on your ML Solution Definition form.

View Event Management solution training progress

View solution training progress or statistics to determine whether a solution is available or how long the next training cycle might take to complete.

Before you begin

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, select the solution whose progress or statistics you want to view.
3. Click the **Show training progress** related link.
   The ML solution automatically performs activities that appear in the Training Progress pop-up window.

   The system shows a Training Progress pop-up window. In the following example, the progress failed.

   If the training is a success, all bars would be fully blue and the progress for each step would show 100%.

What to do next

See Review Event Management similarity examples.

Review Event Management similarity examples

Review the similarity examples and scores that the system provides during solution training to see how the selected alert record compares to existing alert records. For example, you can modify the similarity score threshold to increase the accuracy of your similarity recommendations.

Before you begin

Train a similarity solution in a ServiceNow datacenter. For more information, see Create an Event Management similarity solution.

Role required: evt_mgmt_admin

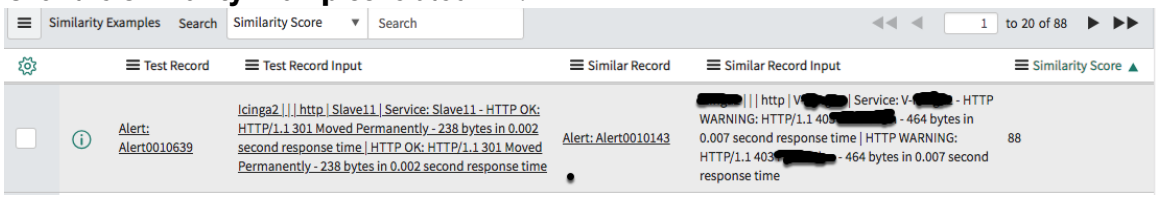
About this task

Adjust the current threshold to provide useful results. For example, a low similarity score has more coverage but less precision.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, locate your solution and click the Information icon (ⓘ).
3. Click **Open Record**.
4. Click the **Similarity Examples** related link.



5. Review the similarity examples and their threshold scores to determine the accuracy and coverage levels you want applied to your solution similarity results.
   The higher the similarity score, the more precise it is and the less coverage it offers. The lower the similarity score, the more coverage it has and the less precision it offers.
6. Based on your review, determine whether to increase or decrease the similarity score threshold value for your similarity solution

   The solution returns only similarity results that have a score that is higher than the threshold. If the current threshold is not providing useful results, adjust the threshold value.
7. Navigate to **Predictive Intelligence** > **Similarity** > **Solutions**.
8. In the ML Solutions list, locate your solution and click the Reference icon (ⓘ).
9. Click **Open Record**.
10. In the Solution Statistics tab, enter a new value in the **Similarity Score Threshold** field.
    For example, suppose that the current score is 80. Based on your similarity example review, you might want to update the field by entering a higher score of 90, which will return fewer results but ones that are more similar to the alert record under review. A lower similarity score has more coverage but less precision.
11. Right-click in the form header and click **Save**.
    Your solution uses the new similarity threshold value. In the example, the solution returns similar results that have a score higher than 90.

Activate Event Management solution version

The system activates the most recent version of the solution, but you can activate any previously trained Event Management solution version if it is more appropriate.

Before you begin

Because you might have created more than one solution, you can choose to activate the solution that is most appropriate.
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, click the Reference icon (ⓘ) for the trained solution that you want to activate.
3. Click **Open Record**.
   You can assign a title to the solution using the `evt_mgmt_similarity_solution_title` property. The default value is

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`ml_x_global_alert_similarity`. This property changes the value in the **Solution Name** field.

4. In the solution record, click **Activate**.
   The system activates this solution version and deactivates any other solution version.

Self-health monitors for Event Management

Use the Event Management self-health monitors to track Event Management features and resolve issues.

Monitor Event Management to detect and resolve issues

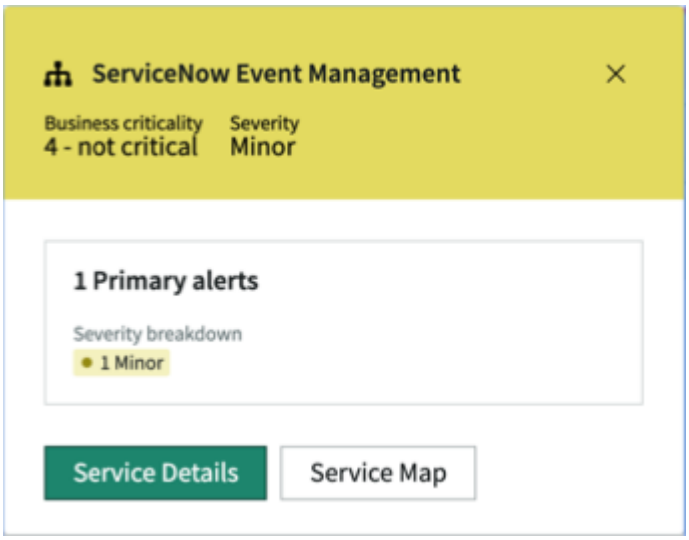
Enable the self-health feature to help detect and troubleshoot Event Management health issues. Some configuration is required before the self-health feature can display meaningful data. Once configured and the related scheduled jobs are enabled, the Service Operations Workspace displays data that is automatically collected and calculated on a recurring schedule.

Note:
Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

The self-health feature creates CIs in the CMDB to represent the components of the self-health service. Use the provided monitors to monitor and track the health of services and Event Management features.

Event Management self-health can:

- Trigger alerts when there is an issue with Event Management.
- Display the **ServiceNow Event Management** application services in Service Operations Workspace. Use Service Operations Workspace to view alerts by application service, technical service, and alert groups. You can double-click a tile to view general information about the service.



- Click **Service Details** to view details of the service.
- Click **Service Map** to view a map representation of the **ServiceNow Event Management** application services to see the relationships between CIs in the **ServiceNow Event Management** application services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Self-health monitoring process workflow

After the *Event Management – self-health monitoring* property is enabled:

1. The **ServiceNow Event Management** application services is automatically created.
2. Jobs are automatically scheduled to run scripts that configure what must be monitored.
3. The Monitoring States [em_monitor_state] table is updated after each event run that the configuration scripts trigger.
4. The alerts that are generated are monitored.

   The service displays the status of the monitored entity. For example, alerts are displayed in the Event Management dashboard, Service Operations Workspace or All Alerts list.

You can resolve the alerts according to the underlying issue by using **Quick Response** on the standard platform interface. For details, see Apply a quick response in an alert.

Jobs scheduled to process scripts

The jobs scheduled to run by default after the *Event Management – self-health monitoring* property is enabled are:

- The `Event Management - Insert Health Monitor` scheduled job which runs the scripts.
- The `Event Management - Update Health Monitor` scheduled job which runs the update scripts. This job runs once every minute.

Start or stop self-health monitoring

You can control the starting or stopping of the self-health monitor feature by configuring the self-health monitoring property. The first time that the self-health monitoring property is enabled, it automatically creates the ServiceNow Event Management application services.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the self-health monitoring property to monitor and track application services and Event Management.

Procedure

1. Navigate to **All** > **Event Management** > **Event Management Properties**.
2. Locate the *Enable Event Management self-health monitoring* (*evt_mgmt.self_health_active*) property.
   Select one of these values:

Enable Event Management self-health monitoring property

Field	Description
Enabled	The ServiceNow Event Management application services is created and set to monitor self-health. Events are received and alerts are generated.
Alerts Only	The ServiceNow Event Management application services and the CIs related to it are not created. Alerts are created but are not bound to a CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disabled	The ServiceNow Event Management application services is not operational. Events are not received, and alerts are not generated.

3. Click **Save**.

Result

The ServiceNow Event Management application services is set according to the value selected for the *evt_mgmt.self_health_active* property.

Configure the Event Management - Insert Health Monitor scheduled job

Determine what the Event Management - Insert Health Monitor scheduled job is to monitor. After the job runs, you can view the **ServiceNow Event Management** application services.

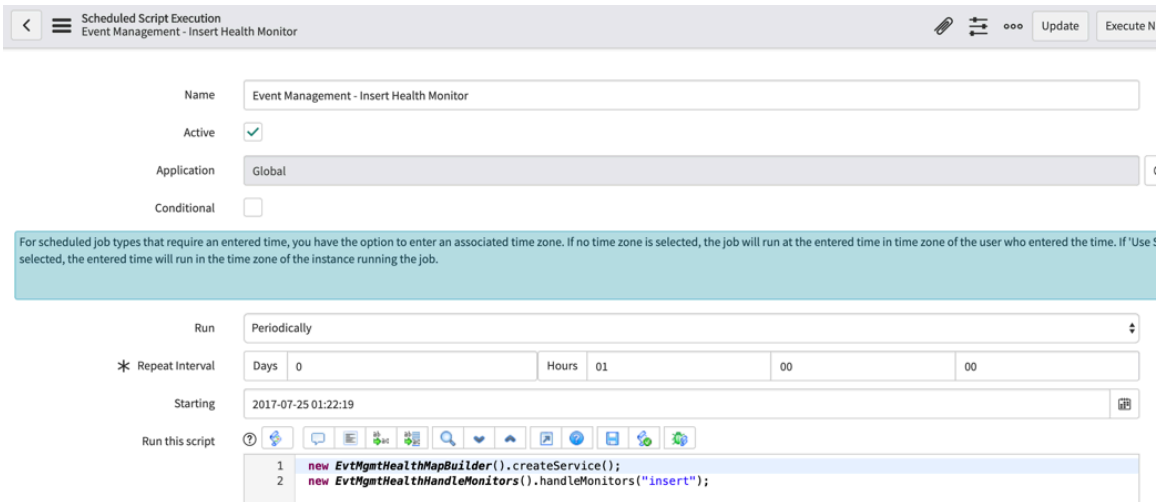
Before you begin

Ensure that the *Enable Event Management — self-health monitoring* property is enabled on the Event Management Properties page (**Event Management** > **Event Management Properties**).

Role required: evt_mgmt_admin

Procedure

1. Navigate to **System Definition** > **Scheduled Jobs**.
2. Locate and select the **Event Management - Insert Health Monitor** job.



3. Modify the scripts indicated in the **Run this script** field to determine what the scripts are to monitor.

Monitor self-health with domain separation

Use domain separation to enable self-health to display Event Management health issues that are based on data, rules, and settings from the logged in user domain. The selected domain must not contain any child domains.

Before you begin

Ensure that the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated and that the MID Server you're connecting to is configured for Event Management.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

About this task

Self-health monitoring is domain aware. If the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin has been activated, then self-health displays health issues based on data, rules, and settings from the logged in user domain. If rules and settings aren't defined for a child domain, then the settings of the parent are applied, recursively.

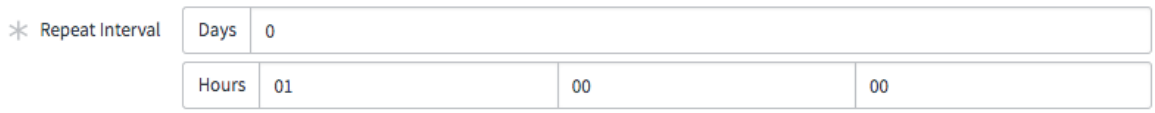
Note:
To generate self-health monitoring events in the domain-separated instance, you must specify the domain of these generated events. This is done by specifying the `sys_id` of the required domain in the *`evt_mgmt.domain_self_monitoring`* property.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin isn't activated, adding, or removing a connector or MID Server is immediately reflected in the map.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated, updates are done periodically according to the interval specifications of the Event Management — Insert Health Monitor scheduled job.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. In the **Schedule** list, locate and select the Event Management — Insert Health Monitor job.
3. In the Event Management — Insert Health Monitor job, under Related Links, select **Configure Job Definition**.
4. Set the required periodic update time in the **Repeat Interval** field by specifying the required values.
   The default interval is one hour.



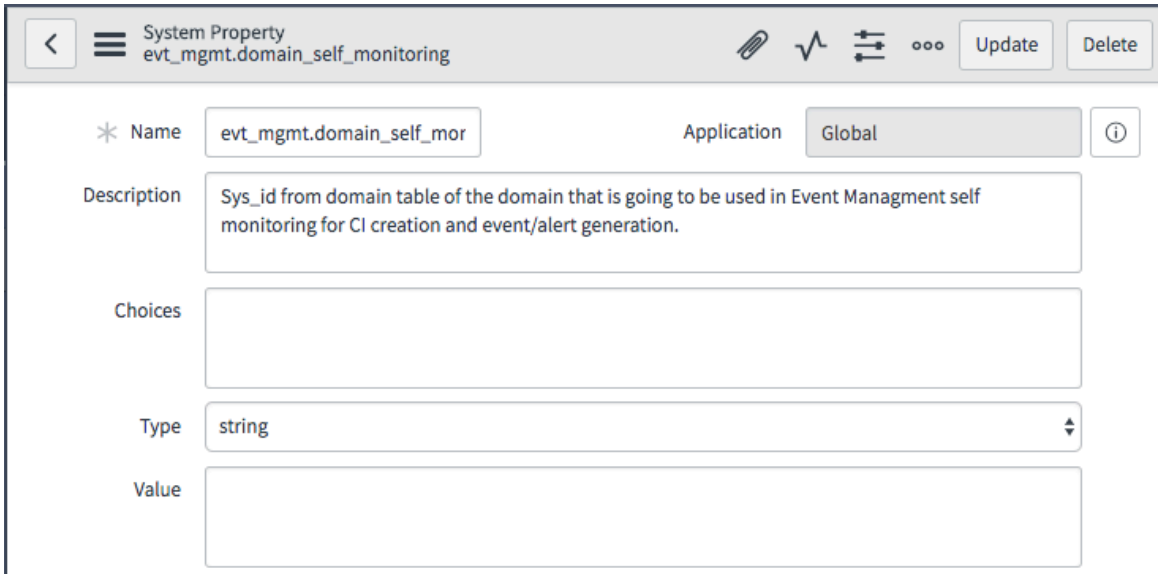
5. Select **Update**.

Result

Further configuration is required for CI creation, receipt of events, and alert generation. The `sys_id` of the domain must be specified in the **Value** field of the *`evt_mgmt.domain_self_monitoring`* property.

1. Navigate to **System Properties All Properties**.
2. Locate and select the *`evt_mgmt.domain_self_monitoring`* property.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the **Value** field, specify the `sys_id` of the domain.
4. Select **Update**.

Domain separation setup and basic administration

Configure a self-health monitor

You can configure a self-health monitor to track Event Management components and see that they do not exceed the specified threshold.

Before you begin

Role required: evt_mgmt_admin

About this task

The Monitoring Configurations [em_monitor_conf] table lists the records that determine which Event Management components are being monitored. Each record contains the health monitor script that is relevant to what you are monitoring. If you intend to create a new health monitor script, you must configure a monitor to match the purpose of the custom script. You can configure the monitoring configuration records to track the items that are important to you. For example, you can modify the threshold aspect in the *`Connector's Idle state monitoring`* record, by specifying that the monitoring job frequency is 90 seconds instead of 120 seconds.

Note:
Each of the monitoring configuration records can be disabled.

If a monitoring configuration specifies a threshold, the configuration value determines what alert severity to display. Threshold values specify the delay time values in units of minutes.

After the *`Event Management - self-health monitoring`* property is enabled, these jobs are automatically scheduled to run scripts that configure what must be monitored:

- The `Event Management - Insert Health Monitor` scheduled job runs the scripts. Determine what must be monitored by adding or modifying the script in this job, which runs once every hour.
- The `Event Management - Update Health Monitor` scheduled job runs the update scripts. This job runs once every minute.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the following procedure to configure whether a monitoring configuration can run and set the frequency of the monitoring job. You can specify the threshold values that, if exceeded, trigger an alert.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Self-Health Monitoring**.
2. From the Monitoring Configurations list, select a monitoring configuration record and modify the required field.
   On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Active	Check box for enabling the monitoring configuration to be active.
Monitoring job frequency [seconds]	Frequency that the monitoring job is run.
Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the **Critical Threshold**, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.

3. Click **Update**.

Result

The values in the modified monitoring configuration record are compared to the actual values as they occur in events that are received. Alerts are created according to the configuration settings.

Example:

Example 1: Use the following procedure to modify the **Critical Threshold** field of the **Connector's Idle state monitoring** monitor from 30 seconds to 35 seconds. This field determines the number of seconds that pass before an alert is generated when the **Critical Threshold** idle state value of a connector is exceeded. In this example, the **Critical Threshold** field is modified from 30 seconds to 35 seconds.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connector's Idle state monitoring**.
3. In the **Critical Threshold** field, modify the value to `35`.
4. Click **Update**.

Result The threshold value of the **Critical Threshold** field is increased from `30` to `35`, thereby increasing the number of seconds that pass before an alert is generated for this threshold.

Example 2: This example describes the configuration of the severity threshold when using the **Connectors Status** monitor. The **Connector Status** monitor has a true (= value 1) or false (= value 0) configuration for the severity threshold. For this monitor, where a threshold has the value `1`, then that severity is displayed. Only one severity threshold can have the value`1`. This example assumes that the required severity displayed is `Minor`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connectors Status**.
3. In the **Minor Threshold** field, specify the value `1`.
4. Click **Update**.

Result The monitor issues an alert if the threshold value of the **Minor Threshold** field is exceeded.

What to do next

Create a customized monitor. A template is provided to assist you to create script that can monitor the specified components. For more information, see Create a self-health monitor to use custom health monitor script.

Create a self-health monitor to use custom health monitor script

You can create a self-health monitor to use custom health monitor script to monitor specified Event Management components.

Before you begin

Role required: evt_mgmt_admin

About this task

To augment the self-health monitors that are provided with the base system, you can create a self-health monitor to monitor the components that you specify. The health monitor scripts that are provided with the base system are listed in the following table.

Health monitor scripts provided with the base system

Health monitor script	Used by a monitor to:
Check delay in event processing	Monitor the duration of events [in minutes] that remain in Ready state and are not processed.
Connectors Monitor	Monitor: • Whether the time that a connector in idle state surpassed the threshold [in minutes] configured. • The active status of connectors.
Get Event Processing state	Monitor the time that events are in Ready state. Alerts are sent when this time exceeds the threshold.
MID Server Threshold Alerts	Monitor MID Server health. Events are sent when changes in MID Server state are detected.

You can create alert management rules to respond to and remediate the issues detected by self-health. Alerts are generated based on the specified severity and threshold. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring** for the monitors that are provided with the base instance to monitor the issues detected by self-health, which are:

Monitor	Description
Connector's idle state monitoring	Monitor to verify whether any of the connectors were in idle state that surpassed the threshold [in minutes] that was configured.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor	Description
	Health Monitor script selected: `Connectors Monitor`.
Connectors Status	Monitor to track the active status of the connectors. Select only one threshold to configure which severity to invoke using 1 to select the threshold field or 0 to ignore the threshold field. For more information, see Connector status example. Health Monitor script selected: `Connectors Monitor`.
Delay in event processing	Monitor to track the duration of events [in minutes] that remain in Ready state and were not processed. This duration period initiates an alert for the event processing CI with severity according to the configured thresholds [minutes]. Health Monitor script selected: `Check delay in event processing`.
Event Processing job	Monitor the state of the event processing jobs. An alert is generated when the idle time of a job exceeds the configured threshold. Health Monitor script selected: `Get Event Processing state`.
MID Server MID Server Threshold Alerts	Monitor MID Server MID Server health. Events are sent when issues with MID Server availability and resource thresholds are detected. Health Monitor script selected: `MID Server Threshold Alerts`.

Note:
To prevent a self-health monitor from detecting the connector status, at any time you can clear the **Active** check box of the monitor and then click **Update**.

Procedure

1. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring**, and click **New**.
2. On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Name	Descriptive and meaningful name for the monitor.
Description	Text narrative that describes the monitor.
Active	Check box to enable the monitor.
Monitoring job frequency [seconds]	Frequency that the monitoring job should run. Default: `120` seconds.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Last Run	Last run date and time. These values are automatically updated.
Script	Monitoring script. Click the search icon. The existing scripts are listed in the Health Monitor Scripts screen, or click **New** to create a custom health monitor script. For more information about creating a custom health monitor script, see step 3.

Note:
Regarding all the following threshold configuration fields: All monitored values are compared against the thresholds. If a monitored value exceeds a threshold, an alert with the appropriate severity is issued.

Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the Critical Threshold, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.
Additional information	Further information about the monitor.

3. To create a custom health monitor script, on the Monitoring Configuration form, next to the **Script** field, click the search icon to open the Health Monitor Scripts form, and click **New**.
4. On the form, fill in the fields.

Health Monitor Script form

Field	Description
Active	Check box to enable the monitor.
Description	Text narrative that describes the custom script.
Name	Descriptive and meaningful name for the custom script.
Script	Custom script to run when called from a monitor. A script template is provided as a guide. You can use the Health monitor scripts provided with the base system as examples of how to author the script, and use the script editor tools. Ensure that the custom script includes: Run the monitor function, which is called according to the "monitoring job frequency" setting *runUpdateHealthMonitorScripts(scriptId)*. Add this function to run the monitoring logic. Specify the configuration function that is called every hour *runInsertHealthMonitorScripts(scriptId)*. Add the configuration logic and add a CI if needed. In the navigation pane search field, enter `em_monitor_state.list`. In the Monitoring States [em_monitor_state] table, specify the initialization of the monitor record in the required record.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Use the helper functions defined in *EvtMgmtHealthMonitorCommon* and *EvtMgmtEventAlertGenerator* script includes: ○ EvtMgmtHealthMonitorCommon ○ healthMonitorCommon.shouldRun ○ healthMonitorCommon.calculateSeverity ○ EvtMgmtEventAlertGenerato ○ openAlert ○ closeAlert

You can use the Monitoring Configurations [em_monitor_conf] table for self-health monitoring configuration, the Health Monitor Scripts [em_monitor_scripts] table for scripts, and Monitoring States [em_monitor_state] table for displaying the results of the monitor, as initialized inside *runInsertHealthMonitorScripts*.

For more information about script includes and APIs, see:Script includes that are installed with Event Management

5. Click **Submit**.

Result
To monitor the Event Management components that you specify, you can configure a self-health monitor that uses the custom health monitor script that you created.

View the Event Management self-health application services map

You can view Event Management application services maps to have a visualization of the data on configuration items (CIs) that comprise this service, and the relations and connections between these CIs.

Before you begin
Role required: evt_mgmt_admin

The Event Management application services topology map only displays MID Servers that have passed validation and connectors that are active.

About this task
The Event Management components that are monitored by the self-health application services are listed in the following table:

Components monitored by the self-health application service

Component	What is monitored
Event connectors	For each connector: • Status: Success or Error • Delay: Elapsed time from 'last run time' (above threshold)
Event processing jobs	For each event processing job:

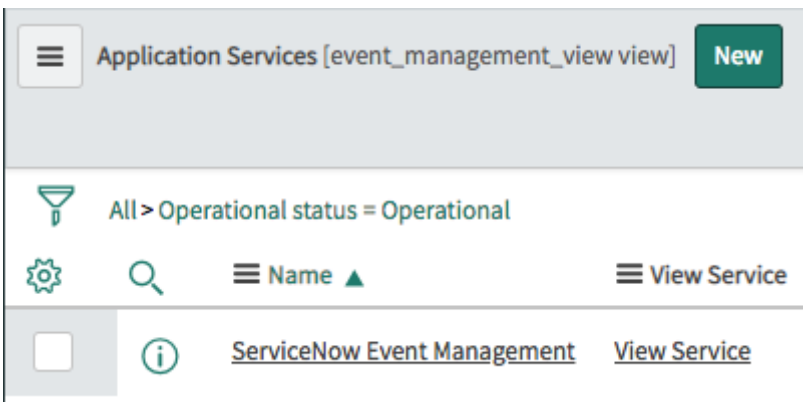
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Components monitored by the self-health application service (continued)

Component	What is monitored
	• Number of actual jobs executed compared to the number of jobs configured to run. • Delay of any of the event processing jobs above the time set as threshold. • Duration of events in Ready state compared to the specified threshold. • Delay of event rule processing above the set threshold. If there is a delay, an alert is generated and the event rule is disabled.
MID Servers	MID Servers that have been validated are displayed. The MID Server status and the `Ecc_agent_issue` table are monitored. An event is triggered whenever this table is updated. The MID Server status is displayed, either **Up** or **Down**. For information about MID Server health, see MID Server heartbeat

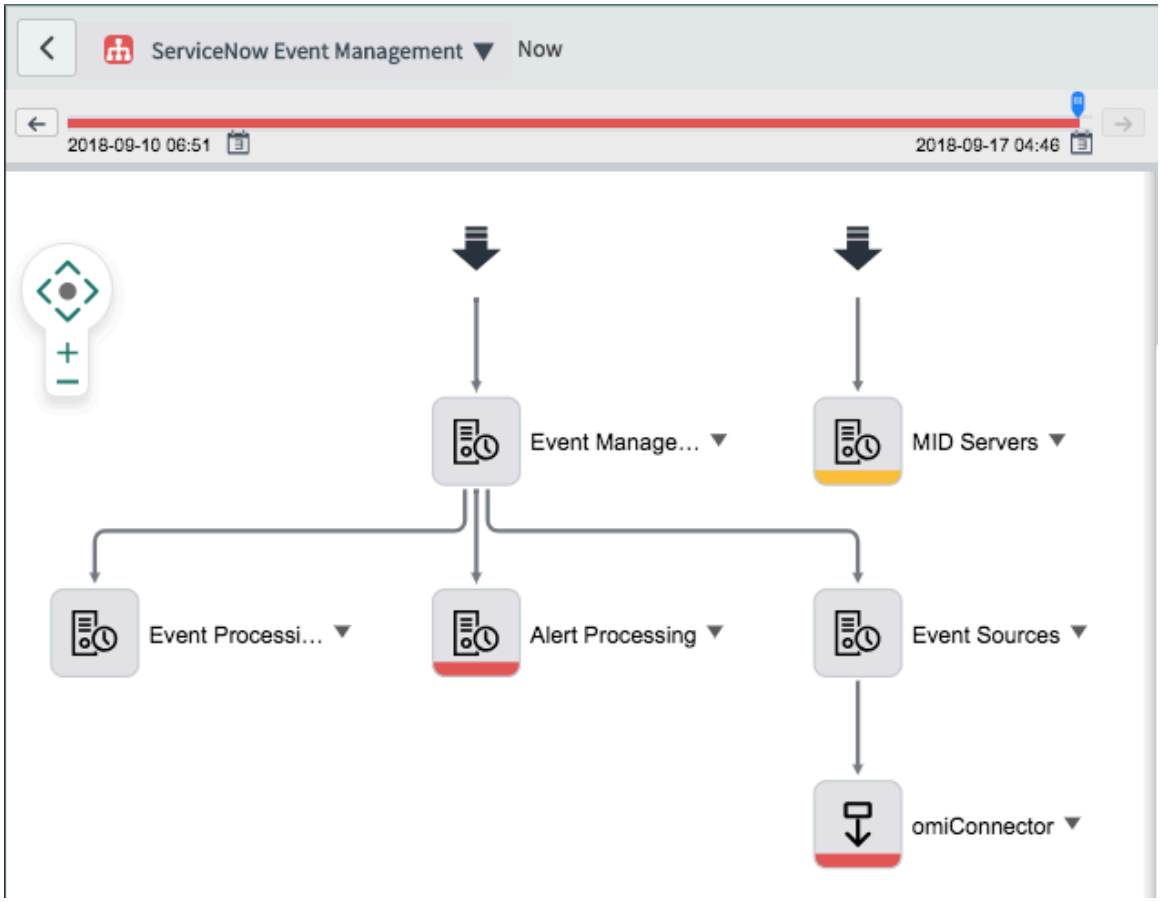
Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click the **ServiceNow Event Management** application services.
3. On the **Application Services** page, locate **ServiceNow Event Management** and click **View Service**.



Displayed on the map are the related MID Servers and the Event Management object, as depicted in the following image; these MID Servers have an **UP** status. MID Servers are updated when they are created or deactivated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Under the Event Management object is Event Processing, Alert Processing, and Event Sources (for example, connectors). Only **Active** connectors are shown; when a connector is created, the connector is displayed only after it has been activated. The status of active connectors is updated and the status of non-active connectors is not displayed.

In the preceding image, the health of Event Management components is displayed. The omniConnector component has a red bar, indicating that a critical alert has occurred that affects this connector. In addition, this critical alert impacts the parent Alert Processing object, which as a result, has a red bar.

Result

You can select the configuration item that has a critical alert and change the impact from parent to application service.

Create maintenance rules

Use maintenance rules to mark CIs in maintenance status. When in maintenance status, these CIs are excluded from impact calculation.

Before you begin

Role required: evt_mgmt_admin

About this task

You can define rules to mark CIs that match the specified criteria as being in maintenance status. The marked CIs populate the Impact Maintenance CIs [em_impact_maint_ci] table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When running maintenance rules, the cmdb_ci status of matching CIs is not changed. However, matching CIs are flagged in the em_impact_maint_ci table by these rules and this status is considered for impact and alert calculations.

The field flagged by this rule as being in maintenance status is the CMDB status field.

Note:
To activate a maintenance rule, select the **Active** field in the maintenance rule. To deactivate a maintenance rule, clear the **Active** field.

The maintenance rules provided with the base instance are:

Default maintenance rule	Description
CI in Change Window	Where the CI has an active change window, the matching CIs are marked as being in maintenance status. The rule runs a query against the change request [change_request] table to determine whether the rule is applied. All these conditions in the change_request table must be met: • **State** is one of these options: Scheduled, Implement, Work in Progress, or Open/New (state in (-2, -1, 1, 2)). • **Approval** is Approved (approval = 'approved'). • The change request window is active, that is, the current time is between **Planned start date** and **Planned end date**, or the current time is between **Actual start date** and **Actual end date**. • The change request record is not an on-hold record (on_hold='false'). **Note:** All these conditions must be present for the CI to be placed in maintenance status by this rule. For example, if the **State** of the change request approval status is `Change is waiting for approval`, then the change is not added to the em_impact_maint_ci table.
Maintenance status of CI	CIs whose CMDB status field is **In Maintenance** are flagged by this rule as being in maintenance status. By default, retired CIs are not included in CIs that are **In Maintenance**. To include retired CIs:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default maintenance rule	Description
	1. Navigate to **All Properties**. 2. Select **New**. 3. Configure the *evt_mgmt.maintenance_rule_include_retired* property with **Value = true**. **Note:** Including thousands of retired CIs may decrease system performance.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Maintenance Rules**.
2. Click **New**.
3. Fill in the fields, as appropriate.

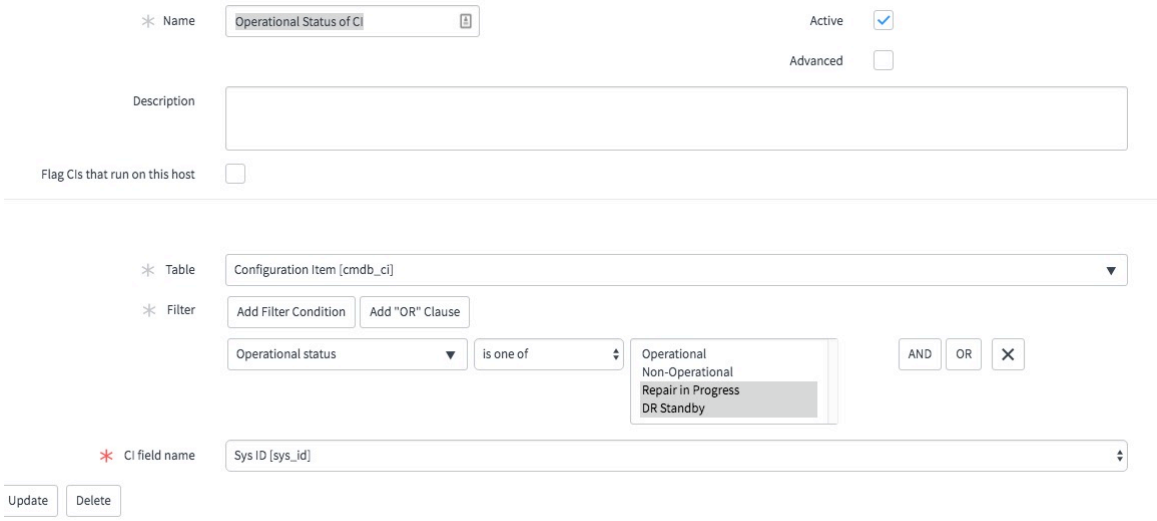
Column heading	Description
Name	The maintenance rule name.
Active	Select to activate the maintenance rule.
Advanced	Select to enable the optional script section to display.
Description	Information that describes this maintenance rule.
Flag CIs that run on this host	Select to flag all applications running on the recognized host as being in maintenance.
Table	Select the table that contains the CI that you require.
Filter	Specify how to select the data.
CI field name	Select the CI from the list. The list is populated according to your selection in the **Table** field. If a CMDB table, or a table derived from CMDB, was selected, specify `sys_id` for the **CI field name**. Otherwise, specify the required CI field that you want to use. See the examples.

4. Click **Submit**.

Example:

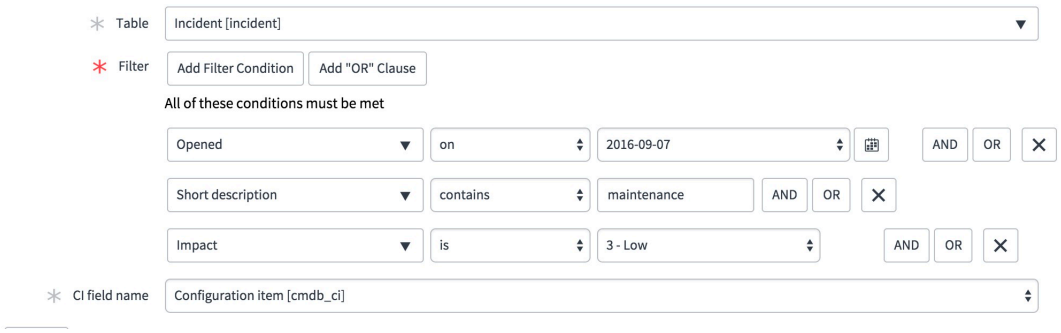
Example of a maintenance rule using a CMDB table.
Assume that a company defines a CI as being in maintenance when the Operational Status of the CI is either **Repair in Progress** or **DR Standby**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Example of a maintenance rule using a table other than CMDB.

Assume that a company uses Incident records to track maintenance. Any maintenance request is translated to an incident when it has a description that starts with “Performing maintenance on CI”. As long as the status of such an incident is open, this status indicates that the maintenance is in progress. For the **CI field name** field, specify a CI name from the table that was chosen, in this case **Incident**.



Example of a maintenance rule that uses the advanced script feature.

In the Maintenance Rule page, select the **Advanced** option. Customize the provided example script:

```
var now_GR = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +'');}
```

The return value for this example script is a text string that represents an array of CI IDs, for example, ['sys_id1','sys_id2','sys_id3'].

You can use this script as an example to prepare your own customized script.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function findCisInMaint(){
var result = [];

//Your code goes here, this is an example of setting CIs in maintenance
var gr = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +''); //The array should be a string array, make sure to add strings
}

//Make sure to create a string representation of the array
return JSON.stringify(result);

})();
```

- How alerts work with CIs in maintenance
- Place an alert into maintenance

Resolve an incident related to an alert

When you resolve an incident that is associated with an alert, the alert can also close according to the *evt_mgmt.incident_closes_alert* property.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Open an incident.
2. Click **Resolve Incident**.

   The corresponding alert is closed, resolved, or left alone as specified by the *evt_mgmt.incident_closes_alert* system property.

   The alert may not close immediately when the incident is closed. Depending on the value of the *evt_mgmt.alert_rule_close_delay* parameter, the alert may close 5 seconds after the last alert update. This value (in seconds) is defined in the parameter. To use the property, you need to create the property with the same name and assign the required value to it. For more information on how to create a property, see Add a system property.

Close an alert

Close an alert by an event or a user action. Closing an alert also closes any related incident that is not already resolved or closed.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

An alert can be closed manually, automatically by a close or clear event, or when a related incident is resolved. Whether the alert is closed when the incident is closed is determined by the *evt_mgmt.incident_closes_alert* property.

When a Clear event is triggered for an open alert, the corresponding alert is set to the "Closed" state. Closing an alert also closes any related incident that is not already resolved or closed. This default behavior can be configured using the *evt_mgmt.alert_closes_incident* property.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **All Alerts**.
2. Select the alert you want to close.
3. In the Alert Form, select **Close**.
   The alert closes without confirmation. If the alert has any resolved or closed incidents, a work note is added to the incident indicating that the related alert was closed.

   If an alert has an open incident that is not related to any other open alerts, the incident is either closed, resolved, or left unchanged based on the *evt_mgmt.alert_closes_incident* property.

Reopen an alert

Additional events can cause reopening of alerts, or you can reopen an alert by changing its state. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the *evt_mgmt.alert_reopens_incident* property.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
When an alert is reopened, the related incident is processed as follows:

- If the incident is not *Resolved* or *Closed*, a work note is added to indicate that the related alert was reopened.
- If the incident is *Resolved* or *Closed*, the incident is reopened, a new incident is created, or nothing is done, depending on the *evt_mgmt.alert_reopens_incident* property value.
  - If the incident is reopened, work notes are added to the incident.
  - If a new incident is created, any matching alert management rule, alert action rule, and task template applies to the incident. If there is no matching alert action rule or template, fields from the existing incident are copied to a new incident.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search by alert number.
3. In the **State** field, click **Reopen**.
4. Click **Update**.

Alert insight properties

Use these properties to configure alert insight.

The role required: evt_mgmt_admin

The following alert_insight properties are under sys_properties.

Property	Usage
Time Frame	

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Usage
evt_mgmt.alert_insight_alert_history_min	Set the time frame (in minutes) to retrieve repeated and similar alert data. Default `43200` (30 days) **Note:** Alerts are retrieved regardless of their state (open / reopen / flapping / closed).
evt_mgmt.alert_insight_closed_alert_window	Set the time frame (in minutes) to retrieve alerts that were already closed. It is the time after the alert last updated date. Default: `4320` (3 days)
Similarity	
evt_mgmt.alert_insight_alert_same_as_filter	This property is a comma-separated string that defines which of the alert fields is used to consider alerts to be similar. Default: `source,type,resource,metric_name`
Related CIs	
evt_mgmt.alert_insight_related_cis_topology_levels The relationship types are: • CMDB based (metadata rules and suggested relations) • Within application services • Within Alert groups	For 'Within application service' relationship type, this property sets the depth or the maximum level of relationship of retrieved CIs. Default: 3
Score	
evt_mgmt.alert_insight_group_mapping	This property sets the score for within alert group relations. Default: 2
evt_mgmt.alert_insight_level_1_mapping	This property sets the score for level 1 relationship. Default: 3
evt_mgmt.alert_insight_level_2_mapping	This property sets the score for level 2 relationship. Default: 2
evt_mgmt.alert_insight_level_3_mapping	This property sets the score for level 3 relationship. Default: 1
Maximum related tasks	
evt_mgmt.alert_insight_max_tasks	Maximum related tasks to retrieve for alert insight. Default: 10

Metadata rules consideration

The parent-child relationship of CIs is considered. Dependent relationship rules consist of hosting and containment rules, each type modeling the data from a different perspective of the CI.

To manage dependent relationship rules:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To access rules at the class level, use the CI Class Manager. Navigate to **All** > **Configuration** > **CI Class Manager**.
- To access grouped rules, use the Metadata Editor. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Metadata Editor**.

Containment rules represent configuration hierarchy of CIs, describing which CI contains which other CIs.

Hosting rules represent placement of CIs in a business definition, describing what CIs run on.

Modify the alert insight properties to configure the way alert information and analysis appears in the Alert Insight pane.

Related CIs configuration

The following properties control which CMDB relationships to consider for related CIs. The CMDB relationships include regular CMDB relation rules, metadata rules (containment rules and hosting rules), and suggested relations.

Property	Usage
evt_mgmt.related_cis_get_all_relation_types	Get all relation types, not including metadata rules. Default: `false`
evt_mgmt.related_cis_use_containment_rules	Use metadata containment rules. Default: `true`
evt_mgmt.related_cis_use_hosting_rules	Use metadata hosting rules. Default: `true`
evt_mgmt.related_cis_use_suggested_relations_rules	Use suggested relations rules. Default: `false`
evt_mgmt.related_cis_validate_relation_rules	This property controls whether to validate relation of CI according to metadata rules. Default: `true`

Score

Scores are configured per relation type or depth. Scores are accumulated. The higher the score, the more relevant is the related CI to the current CI.

Example: For a CI that was found at level `2` in the same application service of the current CI, the score is 2. The same CI is in the same alert group, so there is an extra score of `3`. The accumulated score is therefore `2+3 = 5`.

Affiliation type

The Affiliation Type column in the **Related Incidents**, **Related Change Requests**, and **Related Problems** tabs shows the type of relationship that the CI of the selected alert and the related CI have.

To see affiliation type relationships, navigate to **All** > **Configuration** > **Identification/ Reconciliation** > **Metadata Editor**.

The parent-child relationship between configuration items is considered.

© 2025 ServiceNow, Inc. All rights reserved.

Rotate event and alert table for cleanup

The growth of data tables impedes performance. Preserve instance performance by event table rotation and alert table cleanup for status and alert history retention.

Containing the growth of event tables

By default, the Event Management event [em_event] table uses table rotation. The table rotation schedule ensures that new data is written to one of the tables in the rotation group. According to the value of **Clean base rotation** setting, the base table is deleted and then a new round of writing the tables in a daily rotation commences. By default, this table deletion occurs after seven rotations.

To back up events to a custom table, see Event Management configuration preferences.

Containing the growth of alert tables

By default, a scheduled job cleans out the alert [em_alert] table. Table cleanup is done also for impact status and alert history table.

Related topics

- Purge impact status and alert history
- Alert table clean up
- Table rotation

Modify event table rotation

Table rotation is used by Event Management, by default, to contain the growth of event [em_event] tables within the rotation table group.

Before you begin
Role required: evt_mgmt_admin

About this task
Table rotation ensures that event tables grow to a reasonable size.
Each table rotation has a schedule, according to which new data is written to one of the tables in the rotation group. A table rotation group includes the original table plus several additional tables. After the rotation procedure has written the last table in a rotation, the rotation overwrites the first table in the rotation. By default, the table rotation for Event Management is to rotate the em_table to an offload table and the base table cleanup takes place after seven table rotations. For information about backing up events to a custom table, see Event Management configuration preferences.

Procedure

1. Navigate to **All** > **System Definition** > **Table Rotations**.
2. Select the [em_event] table rotation group to modify.
3. Edit the required fields.
4. Select **Update**.

Related topics

- Table rotation
- Apply table rotation

Purge impact status and alert history

Automatically cleans up outdated impact statuses and alert history from the database to free up space, improve system performance, and ensure only relevant data is retained.

Before you begin

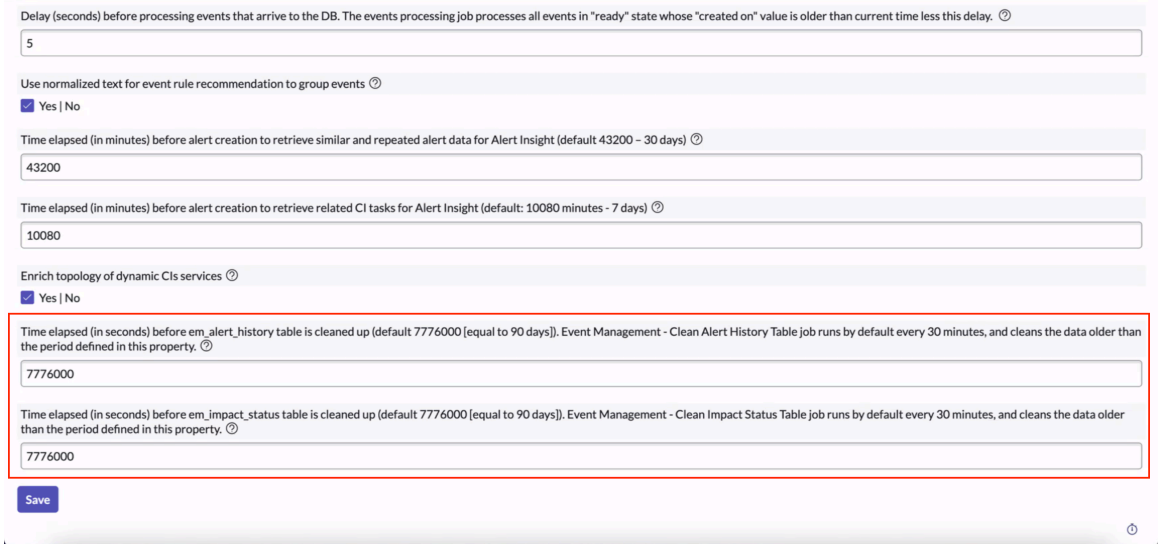
Role required: evt_mgmt_admin

About this task

If records are older than 90 days, by default they are purged. If records are retained for a longer period, larger volumes of data are stored, and performance may be impacted. The data cleanup is done by two jobs: Event Management - Clean Alert History Table and Event Management - Clean Impact Status Table.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. To shorten the retention period, use the highlighted properties.



Related topics

- Rotate event and alert table for cleanup
- Modify event table rotation

- Alert table clean up

Clean alert history and impact status tables

Schedule jobs to mark and remove old alert records in the Alert History [em_alert_history] and Impact Status [em_impact_status] tables, to prevent the tables from becoming overloaded with data.

Before you begin

Role required: evt_mgmt_admin

About this task

Schedule the following jobs to remove old alert records:

- **Backfill**: Determines when alerts are to be marked for deletion.
- **Clean**: Deletes the alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The records in the [em_alert_history] and [em_impact_status] tables are deleted by default after three months. This is controlled by the properties *evt_mgmt.impact_calculation.cleanup_age_seconds.em_alert_history* and *evt_mgmt.impact_calculation.cleanup_age_seconds.em_impact_status*. The default value is 7,776,000 seconds (equivalent to 90 days).

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
   The **Scheduled Jobs** page appears.
2. To determine how often to mark alerts for deletion on the **Impact Status** table:

   a. Locate and select the **Event Management - Backfill Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

Scheduled Script Execution page

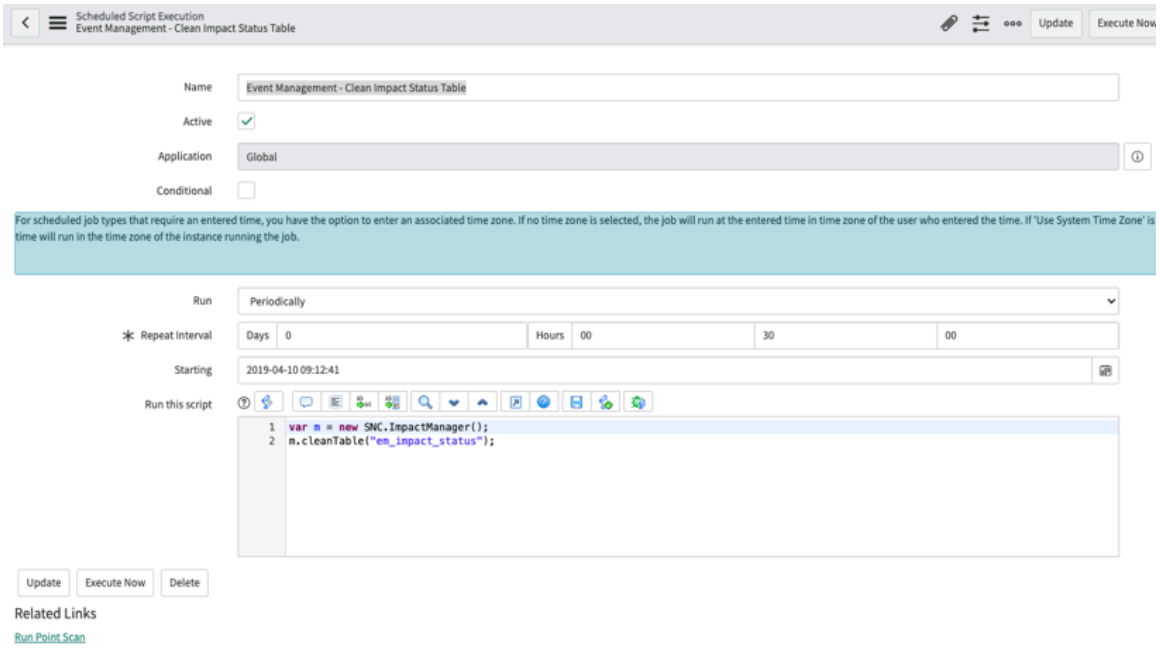
   b. In the **Repeat Interval** field, configure how often you want the job to run.
   To run the job immediately, select **Execute Now**.

   c. Select **Update**.

3. To remove old alerts from the **Impact Status** table:

   a. Locate and select the **Event Management - Clean Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



b. In the **Repeat Interval** field, configure how often you want the job to run.
To run the job immediately, select **Execute Now**.

c. Select **Update**.

4. Repeat steps 2 and 3 to perform the Backfill and Clean jobs on the **Alert History Table**.

Alert table clean up

The Scheduled Jobs feature runs a script to automatically close alerts in the Alerts [em_alert] table that meet specific conditions, helping reduce alert noise and keep the system clean and efficient.

Before you begin

Role required: evt_mgmt_admin

About this task

When the Event Management plugin is activated, by default a job is scheduled to run the `Event Management - auto close alerts` script to automatically close alerts in the alerts table that meet the specified conditions. The default retention policy for closed alerts is that the system deletes closed alerts if it is not updated for 90 days. For more information on the scheduled job, see Table cleaner.

Due to the high level of traffic to the table, you cannot audit the Alert table [em_alert] as a whole. Instead, audit selected fields of interest on the table.

Procedure

1. Set the table to `audit = true`.

2. Set `audit = true` on the relevant fields.
To avoid an excess of audit records, audit only the fields that are necessary for auditing.

Result

The `Event Management - auto close alerts` script runs automatically and repeatedly at the scheduled time and closes alerts that meet the specified conditions.

Alert grouping

Alert grouping is the process of organizing and consolidating related alerts into sets based on common characteristics or criteria. This helps in simplifying alert management by reducing noise, making it easier to prioritize, track, and address issues efficiently. Grouped alerts provide a clearer overview of related incidents, facilitating quicker root cause analysis and remediation.

Understanding alert grouping

Watch this brief video to learn how alert grouping organizes alerts into clusters based on specific criteria.

Video explaining how alert grouping organizes alerts into clusters based on specific criteria.

How alert grouping works

Alert grouping enhances operational efficiency and optimizes alert management by categorizing alerts. Here's how it works:

1. Event consolidation: Event Management collects alerts from multiple sources, providing a centralized view of notifications and alerts. This consolidation enables teams to manage alerts more efficiently and recognize critical issues more easily.
2. Contextual Enrichment: Alerts are enriched with data from the Configuration Management Database (CMDB), which contains detailed information about applications and infrastructure components. This context allows teams to better understand the significance of alerts and prioritize responses based on their impact.
3. Intelligent Correlation: Event Management utilizes different types of machine learning algorithms to automatically group related alerts. This intelligent grouping reduces alert noise by combining similar alerts, allowing teams to concentrate on significant issues rather than being inundated with multiple notifications.

Benefits of alert grouping

- Creating automated alert groups by aggregating alerts based on predefined patterns.
- Correlating alerts using timestamps and CI identification to form automated alert groups.
- Forming CMDB based alert grouping by correlating alerts based on CI relationships in the CMDB.
- Correlating alerts based on text similarity of alerts using NLP (Natural Language Processing).

Related topics

- Synchronizing alert response with automated alert grouping

Alert grouping and use cases

Alert grouping methods range from user-defined approaches, like Manual and Rule-based to advanced, fine-tunable algorithms, including Automatic, Mixed, Text-based, Log Analytics, and Network Traffic-based grouping.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases

Type	Description	Use case
Log Analytics Grouping	Alerts are grouped based on the analysis of log data. This involves correlating log entries to identify related alerts and issues. By leveraging log patterns and sequences, this method can detect complex, multi-step problems across the IT environment.	An online gaming company enhances server stability by implementing proactive log analytics. They monitor logs from game servers in real-time and use analysis tools to detect patterns of errors that occur before crashes. For instance, the analysis reveals that certain error patterns appear about 30 minutes prior to server crashes. By setting up automated alerts for these patterns, the company can initiate remediation actions, such as restarting services or reallocating resources, before a crash occurs. This proactive approach prevents disruptions, minimizes downtime, and improves the gaming experience by addressing issues before they impact players.
Rule-based Grouping	Alerts are grouped according to predefined rules and criteria set by users. These rules might include specific conditions, such as thresholds or event types. This method is effective for consistent and repeatable patterns but requires maintenance of the rules.	In a data center managing an e-commerce website, rule-based alert grouping helps handle high traffic during events like flash sales. Alerts about server issues, such as high CPU usage, are designated as parent alerts. These parent alerts are linked to child alerts that report related problems, like slow database queries. The rules ensure that server-related alerts are grouped with their symptoms, allowing the IT team to quickly identify and address server overload issues. This approach improves issue resolution efficiency and minimizes downtime.

Alert grouping types and use cases (continued)

Type	Description	Use case
Automated Grouping	Advanced algorithms automatically identify and group related alerts based on patterns and similarities in the alert data. This method leverages machine learning and AI to adapt to new and unknown issues, providing proactive alert management. Event Management groups alerts that are similar, but not necessarily identical, based on the proximity in time of the last event generation. Alerts with the same CI and the same pattern identifier are grouped together. Automatic alert grouping consists of the following components. • Alert Aggregation Learner (**Service Analytics Alert Aggregation Learner - Daily**): This offline job runs daily to process past alerts and perform statistical analysis to build alert patterns. For details, see Configure pattern based alert grouping. • Real-time Alert Aggregation job (**Service Analytics group alerts using RCA/ Alert Aggregation**): This job runs every minute to generate alert aggregation groups based on alert patterns, CMDB relationships, text similarity, user-defined alert clustering tags, and network traffic connection between processes.	A large financial institution uses machine learning to manage alerts from numerous servers and applications. The system analyzes historical alert data to recognize patterns, such as database server failures frequently being accompanied by client connection errors. It then automatically groups related alerts together. For instance, when a new database server failure alert is detected, it is grouped with previous connection error alerts. This automated grouping helps the IT and security teams quickly identify and address issues, improving response times and reducing downtime.
Mixed Grouping	Mixed Grouping method combines alerts using multiple grouping strategies, such as CMDB-based grouping and tag-based grouping, into a single, cohesive group.	Use case for CMDB-based grouping: A telecommunications company uses CMDB data to

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
	It leverages the strengths of each strategy to reduce alert noise, improve alert correlation, and highlight the true root cause of incidents. • CMDB-based Grouping: Alerts are grouped based on Configuration Item (CI) relationships and dependencies from the Configuration Management Database (CMDB). This approach ensures that alerts related to specific infrastructure components or services are grouped together, providing context-aware alert management. • Tag Cluster Grouping: Alerts are categorized and grouped using tags or labels that represent common attributes, such as application, server type, or geographic location. This method allows for flexible and dynamic grouping based on evolving tagging strategies.	manage alerts related to their network infrastructure. Alerts related to a specific network router and its connected devices are grouped together based on their CMDB relationships, enabling the network team to see all related issues and address the root cause efficiently. Use case for tag cluster grouping: An organization without a CMDB manages a Linux server running various services. The IT team uses a **Node** field in each alert to identify the server, and they group all events related to services on the same server based on this node value. For example, they cluster alerts like Service A down and Service B high CPU usage together if they share the same node value. This approach helps the IT team address server-related issues more efficiently. By clustering alerts for the same node, application, or IP address, the team streamlines their response efforts and resolves issues more effectively, even without a CMDB.
Network-traffic based Grouping	Network-traffic-based alert grouping analyzes network connections between processes across hosts to identify related alerts. This method leverages service candidates detected through ML Service Mapping, ensuring that alerts related to network traffic issues are grouped together for better context and faster alert resolution.	A cloud-based e-commerce platform experiences transaction slowdowns, causing delays in payment processing. Traditional alerting generates separate alerts for API timeouts, database lags, and network issues, making it difficult to pinpoint the root cause. With Network-Traffic Based Grouping, alerts

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
		are automatically grouped based on process-to-process connections identified through ML Service Mapping. The system detects that payment gateway services, fraud detection, and order processing are part of the same service candidate. This reveals that an overloaded fraud detection process is causing transaction bottlenecks. By scaling up the service, the team quickly resolves the issue, minimizing downtime and improving customer experience.
Text-based Grouping	Alerts are grouped by analyzing the text content of alerts to identify similarities and related issues. Natural language processing (NLP) techniques are used to find commonalities in alert description, metric name, and ci class, making this method effective for unstructured data.	In an organization that uses Zoom rooms for virtual meetings, the IT team receives numerous alerts when the Zoom room server experiences an outage. Each alert might indicate a different Zoom room being down, such as Zoom room no 10 is down, Zoom room no 11 is down, and so on, with the only difference being the room number. For organizations with a CMDB, these alerts can be grouped using CMDB relations, as the system can correlate the alerts based on the server's impact on all associated Zoom rooms. However, for organizations without a CMDB, text-based grouping can be used. The system applies natural language processing to group alerts with similar descriptions, helping the IT team quickly identify that multiple Zoom rooms are affected by the same underlying server issue. This approach allows the IT team to efficiently address the root cause of the problem,

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
		reducing downtime and improving response times.
Manual Grouping	Users manually select and group related alerts based on their expertise and understanding of the system. This approach allows for precise control but can be time-consuming and may miss automated correlations.	A system administrator receives multiple alerts about different services failing on a single server. The admin manually groups these alerts, recognizing that they are all related to a single hardware failure on that server, and prioritizes fixing the hardware issue to restore all services.

Manual and rule-based alert grouping differs from algorithm-based grouping mainly in how the parent alert is chosen. In manual, rule-based, or log analytics grouping, one of the real alerts is designated as the parent alert. In Automatic, CMDB, Text-based, Tag Cluster modes, and Network Traffic, a virtual alert, representing the oldest and most severe alert in the group, is created as the parent alert.

Note:
In domain-separated environments, alert groups are created only for alerts within the same domain.

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on different grouping types, see Alert grouping types and creation methods.

Scheduled jobs and parameters for alert grouping

Automate alert organization by configuring jobs to group alerts based on predefined criteria and parameters.

To group alerts in Automated, CMDB, Text-based, Tag Cluster, and Network Traffic Correlation groups, the scheduled job named **Service Analytics group alerts using RCA/Alert Aggregation** is typically run once per minute. This job handles the grouping of alerts based on the specified method. Additionally, you can run multiple scheduled jobs in parallel to manage alert grouping more efficiently. For further details, see Run multiple scheduled jobs for alert grouping.

To define which alerts are grouped, the following parameters are used:

- *sa_analytics.aggregation_enabled*: This parameter enables alert grouping created by the schedule job. Set the property *Enable alert aggregation for Automated, CMDB, and Text-Based groups* to `true` to activate this feature.

  Note:
  This property also applies to Tag Cluster and Network Traffic Correlation grouping.

- *sa_analytics.agg.query_dynamic_window*: By default, this is set to 10 minutes (600 seconds). It defines the maximum time difference allowed between the last event generation times of two alerts that can be grouped together.
- *sa_analytics.agg.query_max_group_lifetime*: This parameter specifies the maximum time period from the generation of the first alert to the last alert in a group, with a

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

default of 30 minutes (1800 seconds). If events arrive with a delay exceeding this period, the *sa_analytics.agg.group_expiration_time* parameter can be used to extend the grouping time beyond 30 minutes.

Note:
Some parameters, such as **sa_analytics.agg.query_dynamic_window**, **sa_analytics.agg.query_max_group_lifetime**, and **sa_analytics.agg.group_expiration_time**, are not provided out of the box. To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

Example: How alerts are grouped

For tag-cluster grouping, alerts are added to a group based on the timeframe parameter defined in the alert tag clustering settings. For automated, CMDB, and text-based, network traffic grouping, alerts are aggregated as follows.

Consider the following alerts with the same CI. (All of them may be added to the same CMDB group).

- Alert1: Initial event generation at 01:00:00 AM
- Alert2: Initial event generation at 01:11:00 AM
- Alert3: Initial event generation at 01:13:00 AM
- Alert4: Initial event generation at 01:16:00 AM
- Alert5: Initial event generation at 01:25:00 AM
- Alert6: Initial event generation at 01:34:00 AM
- Alert7: Initial event generation at 01:43:00 AM

Alert1 and Alert2 are not grouped due to the time gap exceeding 10 minutes. Alert2 and Alert3 create a group at 01:13:00 AM. The 10-minute dynamic window starts at 01:13:00 AM, with the following:

- Alert4 is added to the group at 01:16:00 AM, restarting the 10-minute window.
- Alert5 and Alert6 are added to the group as their event times are within the 10-minute window.
- Alert7 is not added to the group because it arrives 9 minutes after Alert6, exceeding the *sa_analytics.agg.query_max_group_lifetime* limit of 30-minute maximum group lifetime from the initial group creation (01:13:00 AM + 30 minutes = 01:43:00 AM).

Note:
After an alert is created, correlation logic is applied only once. Changes to the alert after its creation are not re-evaluated for correlation. If correlation is not established initially, the alert may still be added to a group later—but only if a new incoming alert matches and triggers grouping logic.

Configure scheduled job-based alert grouping

Set up rules and parameters to group related alerts automatically, streamlining alert management and reducing alert noise.

Before you begin
Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The scheduled job Service Analytics: Group Alerts Using RCA/Alert Aggregation helps in grouping alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. On the Alert Correlation Properties page, enable the relevant properties.
   - Enable CMDB correlation (*sa_analytics.agg.query_cmdb_correlation_enabled*).
   - Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
   - Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).
   - Enable Text based correlation (*sa_analytics.text_based_group_enabled*).
   - "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together (*sa_analytics.agg.group_alert_with_same_group_by_fields*).
   - Max number of relations between CIs in a topology which form a CMDB group (*sa_analytics.agg.query_cmdb_graph_walk_nodes*).
   - Use all CMDB relations for CMDB group correlation (*evt_mgmt.related_cis_get_all_relation_types*).
3. Select **Save**.

   To group alerts without a CI as Text-based or ML based groups, set *sa_analytics.enable_no_ci_grouping* to `true`. Ensure the Feature Identifier includes both the node and metric name. For details on configuring the feature identifier, see Specify and manage pattern identifier attributes for alert grouping.

4. **Optional:** Set *evt_mgmt.alert_groups_reasoning.enable_worknotes* to `none` to prevent group reasoning work note display.

   (Optional) By default, a work note appears in the **Activities** tab when a group is created or updated, showing the grouping reason.

Automated alert grouping

CMDB based alert grouping

Text-based alert grouping

Tag cluster alert grouping

Run multiple scheduled jobs for alert grouping

Run multiple scheduled jobs in parallel to group alerts. This helps prevent overwhelming the system during surges (alert storms).

Before you begin

Role required: admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The current scheduled job operates with a single thread. During alert surges (alert storms), processing takes significantly longer. To address this impact, now multiple jobs can process alerts within the scheduled job. This enhances scalability and improves overall performance during high-volume periods.

The number of jobs to be running in the alerts processing is defined in a new property *sa_analytics.agg.alert_grouping.num_of_jobs*. The job number is sent as a parameter to the relevant method.

Note:
In this scenario, the procedure for increasing the scale-out from no scale-out (single job) to 2 jobs is shown.

You can efficiently manage and run multiple scheduled jobs in parallel to group alerts using specific properties. These properties allow you to tailor the grouping criteria to meet your needs, ensuring that alerts are processed based on assignment groups, domain separation, or group-by fields. The available properties are:

- *sa_analytics.agg.group_alert_with_same_assignment_group_only*: Groups alerts that share the same assignment group. By default, the value is set to false. If you want to set this property to true, create a property with the same name and set the value to true.
- *sa_analytics.agg.group_alert_with_same_domain_only*: Groups alerts that belong to the same domain. By default, the value is set to true.
- *sa_analytics.agg.group_alert_with_same_group_by_fields*: "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together.

Note:
To ensure efficient scale-out, at least one of these properties must be defined to establish some form of separation or grouping logic. This is necessary to ensure that all alerts belonging to the same group are processed correctly by specific jobs, creating a logical division of alerts.

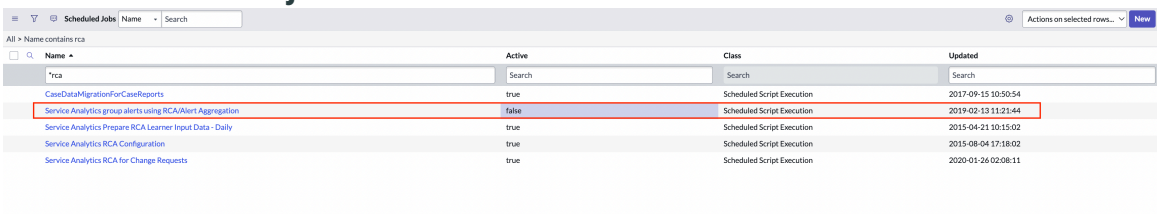
Without setting at least one of these properties to true, the alerts will not be properly segregated. For instance, if you do not define any grouping logic (set any property to true) and both the assignment group and domain separation are set to false, the scale-out will not work, and all alerts will be processed by a single scheduled job.

Procedure

1. Navigate to **All** > **System definition** > **Scheduled jobs**.
2. Locate the scheduled job: Service Analytics group alerts using RCA/Alert Aggregation.
3. For all existing scheduled jobs Service Analytics group alerts using RCA/Alert Aggregation, set the value in the **Active** column to **false**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deactivate scheduled job



4. Create a new property *sa_analytics.agg.alert_grouping.num_of_jobs*, or if it already exists, update the property to the desired number of multiple scheduled jobs for alert grouping such as 2 or 4.
5. Clone the scheduled job definition from the Scheduled jobs [sys_auto] table to the desired number of multiple scheduled jobs for alert grouping.
6. In the new jobs, in the Run this script section, call the new JS function queryS0 (instead of old query() function) and transfer to it the job number as input parameter.

   Note:
   Job numbers must start at 0 and follow consecutively: 0, 1, 2, 3, 4...

7. Fix hashes in the [sa_analytics_status] and [sa_hash] table by selecting the earliest hash with the same prefix, cloning it, and adding the hash name suffix, for example, "_groupingX", where X is the job number.

   In the case of scaling out from no scale-out (single job) to 2 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`

   In the case of scaling out from no scale-out (single job) to 4 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`
   - `last_alert_process_time_grouping2`
   - `last_alert_process_time_grouping3`

Hashes to be cloned

Hash name	Table
query_job_last_run	sa_hash
last_alert_process_time	sa_analytics_status
last_staging_table_update_time	sa_analytics_status
last_staging_table_truncate_time	sa_analytics_status
analytics_trigger_g1	sa_hash

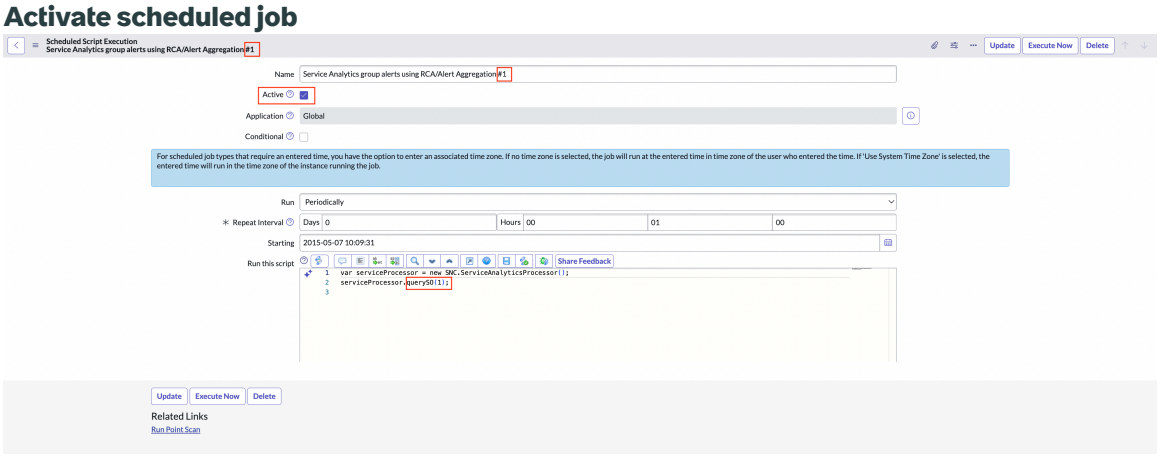
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Activate the new jobs by selecting the **Active** check box for each job.



Result

The scheduled job Service Analytics group alerts using RCA/Alert Aggregation is set up to run multiple jobs simultaneously for alert grouping.

Configure alert correlation logic order

Improve alert management by enabling users to customize correlation logic order. This feature empowers you to fine-tune correlation methods to their specific needs, enhancing alert prioritization and response efficiency.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *sa_analytics.agg.query.group_logic_order*.

   Default value is “CMDB,NETWORK_TRAFFIC,TAG_BASED,PATTERN,TEXTBASE". This is a comma separated list of the grouping types in the order of their execution.

   Note:
   If one of the grouping types is not specified in the property, it needs to be added manually. Alert correlation rules are trigger-based and applied immediately when an alert is created or updated, before other grouping algorithms.

   - CMDB: CMDB grouping
   - NETWORK_TRAFFIC: Network traffic grouping
   - TAG_BASED: Tag cluster grouping
   - PATTERN: Automated CI-based patterns grouping
   - TEXTBASE: Text-based grouping
3. Use the property *sa_analytics.agg.query.group_logic_order* to define or modify the order of correlation methods based on your preferences.

Configure filters for automatic alert groups

Filter alerts and alert groups to reduce alert noise. Only alerts that match the filter are included in the group of the selected group type (Automated, CMDB, or Text).

Before you begin

Role required: evt_mgmt_admin

About this task

If your filter specifies alerts whose configuration item class is not Linux, then only alerts with non-Linux configuration items are included in the group of the selected group type.

Note:
After the filter is created, it will only apply to new alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filter**.
2. On the Automatic Group Filters page, either select an existing group filter or create a new filter.
3. If you are creating a new filter:
   a. Select **New**.
   b. Enter a name for the filter in the **Name** field.
   c. Select the alert group type:
      - Automated
      - Test
      - CMDB

      You can assign more than one group type with a single filter condition.

      Each group type can have only one active filter.
4. In the **Alert Filter** section, create conditions for the alert to meet to be included in the group.
5. Save the alert group filter.
   - For an existing alert group filter, select **Submit**.
   - For a new alert group filter, select **Update**.

Result

The filter condition appears on the SA Grouped Alert Filters page in the **Alert filter** column.

Apply alert group filters to aggregated groups

Reduce noise by locating only aggregated alert groups that match a configured filter. Aggregated groups are groups created for alerts with identical CIs and pattern identifiers.

Before you begin

Note:
This procedure is relevant for advanced configuration only.

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filters**.
2. On the Automatic Group Filters page, add the **Aggregated** column.
   a. Select the Personalize List icon ( ) in the upper right corner.
   b. Move the **Aggregated** entry from the **Available** list to the **Selected** list.
   c. Select the up/down arrows to determine where the **Aggregated** entry is to appear on the form.
   d. Select **OK**.
3. On the Automatic Group Filters page, double-click the value in the **Aggregated** column.

   Aggregated groups apply only to automated alert groups. When the Aggregated option appears, it is automatically activated for an automated alert group.

   Note:
   If the value of the **Automated** field changes, the value of the **Aggregated** field also changes. You can change the value of the **Aggregated** field only if the value of the **Automated** field is true.

4. Select **true** for the specified filter to apply to groups with identical CIs and pattern identifiers or select **false** to ignore the filter and create aggregated groups for all alerts in the system.

Related topics

Specify and manage pattern identifier attributes for alert grouping

Alert grouping types and creation methods

Explore different alert grouping types, understand their descriptions, and learn about their creation methods to enhance problem identification and streamline alert management.

Viewing and managing alert groups

Navigate to **Event Management** > **All Alerts** to view all alert groups. The icon in the **Group** column denotes the alert group type, while alerts not associated with any group have no entry in the **Group** column. Double-click the **Group** column to open the Grouped Alerts dialog, where you can view all alerts in the group and manually add or remove alerts.

Note:
An alert can belong to only one alert group at a time.

Types of alert grouping

Alert grouping types

Type	Icon	Description	Creation method	Additional information
Log Analytics	L	Log Analytics groups are formed when the system identifies multiple related Log Analytics alerts, grouping them based on their significant connections.	Created as part of log analytics event processing.	Kinds of Health Log Analytics alerts

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on configuring alert correlation logic order, see Configure alert correlation logic order.

Log analytics alert grouping

ServiceNow Health Log Analytics identifies patterns in log data and learns pattern behavior. When its artificial intelligence engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application.

Log analytics alert groups are created by the Health Log Analytics application. For more information, see Types of Health Log Analytics alerts.

Rule-based alert grouping

Rule-based alert grouping is created by alert correlation rules. These rules allow you to manually classify alerts as primary or secondary and establish a relationship between them. Use alert correlation rules to group related alerts. The rule runs only for new alerts or alerts whose status changed from close/flapping to open/reopen.

Example: If rule-based alert grouping is applied, secondary alerts indicating that virtual machines or applications on the offline server are also down and are grouped under the primary alert, which is the root alert for the server that is offline. You can view rule-based alert grouping in Express List of Service Operations Workspace (ITOM). For more information, see Viewing links between alerts in rules-based alert groups.

Primary and secondary alerts

- Primary alert: Identifies the root cause of an alert group and represents its secondary alerts.
- Secondary alert: Related to the same issue, they are grouped under the primary alert. The purpose of secondary alerts is to determine which alerts to suppress, reducing alert noise and allowing you to focus on the primary alert.

How primary and secondary alerts interact

In rule-based alert grouping, one of the real alerts is designated as the primary alert. Primary and secondary alert filter conditions specify which alerts are classified as primary and which as secondary. The filter criteria are applied to the Alert [em_alert] table.

In this alert grouping, both primary and secondary alerts are visible but secondary alerts are grouped under the primary alert. The property **Keep the secondary alert open even when primary closed. for manual or rule based** (*evt_mgmt.rule_based_manual_closure*) controls whether secondary alerts remain open or are closed when the primary alert is closed.

If the property is not selected (i.e., set to No), after the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), and the secondary alerts are closed and become stand-alone. If you select the checkbox for the property (i.e., set it to Yes) and the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), causing them to become stand-alone open alerts.

Alert hierarchy

Only one level of secondary alerts is permitted. In situations where a secondary alert has its own secondary alert, the Event Management application flattens the hierarchy to preserve only two levels.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, assume alert A is the primary alert and alert B is the secondary alert. If alert C becomes a secondary alert for alert B, the application flattens the hierarchy so that A remains the primary and B and C become sibling secondary alerts, one level below A.

As another example, assume that there are three correlation rules that produce the following results:

- Rule 1 (with an Order value of 1): B becomes a primary alert for A.
- Rule 2 (with an Order value of 2): A becomes a primary alert for C and D.
- Rule 3 (with an Order value of 3): E becomes a primary alert for A.

When alerts B, C, D, and E are triggered, they all appear in the alert list separately because there are no correlations between them.

When alert A is triggered:

1. Rule 1 makes A a secondary alert under alert B.
2. Rule 2 makes both C and D secondary alerts under alert A, and the hierarchy is flattened so that A, C, and D become secondary alerts to the primary alert B.
3. Rule 3 is not applied because multiple parents are not allowed—A already has B as its primary.

Therefore, if all alerts are triggered, only B appears as the primary alert for A, D, and C, while E remains a standalone alert.

Create an alert correlation rule

Create an alert correlation rule to designate primary and secondary alerts. The primary alert is identified as the root cause of the alert group and the secondary alerts are grouped under the primary alert.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Correlation Rules**.
2. Click **New**.
3. On the form, fill in the fields.
   For information on the fields, see Alert correlation rule form.
4. Select **Submit**.

Result

A rule-based alert group is created when a new alert is generated or when the status of an existing alert changes from Closed or Flapping to Open or Reopened, provided the filter criteria are matched.

Automated alert grouping

Automated alert grouping is a process that uses historical data to automatically organize similar alerts into groups. These alerts could be system issues, like server errors or network outages. By grouping related alerts together, it helps teams quickly identify patterns, manage recurring problems, and reduce the noise from too many individual alerts.

Imagine you're monitoring a city's traffic system. You get a lot of alerts—like reports of accidents, traffic jams, and road closures. Automated alert grouping works like a smart assistant that organizes these alerts based on patterns, so you can see related issues together and respond

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

more efficiently. These automated alert groups are displayed in the Express List within the Service Operations Workspace.

How do you enable this grouping

To enable machine learning-based automation for alert correlation, set the property **Enable ML based Automation correlation** (sa_analytics.specific_patterns_enabled) to true.

If the Domain Support - Domain Extensions Installer is activated, alert aggregation patterns are created based on the domain level defined in the sa_analytics.agg.learner_domain_level property. By default, this domain level is set to two, which corresponds to the second level in the domain hierarchy. For example, in a company, Level 1 might represent the company itself, while Level 2 could represent departments or teams within the company. Alerts are grouped based on this second level, like sorting them by department or team. For more details, Domain separation and Event Management.

How does it work

Automated alert grouping uses machine learning (ML) and historical data to identify patterns among alerts. It looks at specific characteristics, called pattern identifiers—such as the type of issue, the affected system, CI or metric that happened multiple times within a similar time period—to determine if alerts are related. The Alert Aggregation Learner uses algorithms to group alerts based on patterns. Specifically, it uses pattern-based algorithms and probabilistic methods to analyze incoming alerts and identify related ones.

Think of it like noticing that accidents often happen at a particular intersection at rush hour. The system groups similar alerts (like recurring traffic jams at the same spot) together based on certain identifiers (like location or type of problem). The system follows these key steps to group alerts effectively:

- Analyze Historical Data: The system studies past alerts to learn patterns and relationships.
- Apply Machine Learning: ML algorithms analyze historical alert data to identify patterns and relationships among alerts. It enables the system to learn from past incidents and improve its ability to group similar alerts together over time.
- Group Similar Alerts: Alerts with matching patterns are automatically grouped together.

Imagine you're managing a city's traffic system, and you receive multiple alerts:

- 8:00 AM: Accident on Main Street
- 8:05 AM: Traffic jam near Main Street
- 8:10 AM: Road closure on Main Street

Automated alert grouping works like a smart assistant by analyzing these alerts and recognizing a pattern. It groups them together because they all relate to Main Street, likely stemming from the same accident. This helps you see the bigger picture quickly and focus on resolving the root cause (the accident), rather than addressing each alert separately.

Benefits

- Find Recurring Issues: Quickly spot patterns (like a server consistently overheating).
- Save Time: Handle groups of related alerts instead of individual ones.
- Improve Response: Focus on fixing the root cause rather than dealing with scattered issues.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understanding pattern identifiers

A pattern identifier is a set of criteria or attributes (such as alert type, affected system, etc.) used to group similar alerts. It helps to identify recurring issues, making it easier for teams to respond and address ongoing problems.

How pattern identifiers group alerts

Consider a network monitoring system that generates alerts for various issues, such as high CPU usage, memory leaks, or connection timeouts.

Pattern Identifier: Metric Name and CI

- Alert 1: High CPU usage on Server A at 10:00 AM
- Alert 2: High CPU usage on Server A at 10:05 AM
- Alert 3: Memory leak on Server B at 10:10 AM
- Alert 4: High CPU usage on Server A at 10:15 AM

In this case, the pattern identifier could be set to the Metric Name (e.g., high CPU usage) combined with the Configuration Item (CI) (e.g., Server A). Alerts 1, 2, and 4 would be grouped together because they share the same metric (high CPU usage) and the same CI (Server A), indicating a recurring issue that may need further investigation. Alert 3, however, would not be included in this group because it has a different metric (memory leak) and CI (Server B).

Note:
The set of alert fields used for the pattern identifier is also referred to as Feature Identifier Attributes or simply attributes.

How to configure effective pattern identifiers

To configure effective pattern identifiers for alert grouping, follow these three key steps to ensure accurate and meaningful analysis of alerts.

Step	Action	Description
Create an event rule	Define an event rule. To know how to create an event rule, see Create or edit an event rule.	Set up an event rule to populate the relevant alert fields for the pattern identifier.
Manage pattern identifier	Add relevant alert field to the pattern identifier. To know how to add fields to the pattern identifier, see Specify and manage pattern identifier attributes for alert grouping.	After adding the relevant alert fields, select **Deploy** to activate the pattern identifier.
Choose relevant identifiers	Select alert fields that clearly identify the problem. For example, if the issue is that a service is offline or there's no connection to the database, look for specific	• Avoid overly unique fields (e.g., date) that make pattern identification difficult. • Avoid overly common fields that result in too

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Action	Description
	values in the alert that indicate this. Add these types of fields to the pattern identifier. By default, we provide the **Metric Name** field as a pattern identifier.	many alerts being grouped together, making patterns indistinguishable.

Alert grouping and Learned Patterns

Learn how alert patterns are discovered, grouped, and displayed in the system.

Concept	Description
Pattern discovery	When a set of alert fields matches, the alerts are grouped into a "Learned Pattern." For example, alerts with the same Priority Group and Resource are grouped into a pattern.
Pattern reporting	These patterns are displayed on the Learned Patterns report found under **Event Management** > **Administration** > **Learned Patterns**.

Managing Pattern Attributes and Time Frame

Learn the process of managing pattern identifier attributes, deployment of new sets, and how the system identifies issues.

Concept	Description
Active pattern identifier attributes	Only one set of attributes can be active at a time. **Note:** The new set replaces the current one after deployment.
Purpose and time frame	Pattern grouping identifies issues within the last 30 days, controlled by the **sa_analytics.agg.learner_period_days** property.
Issue identification	To identify an issue, the system utilizes a combination of Configuration Items (CIs) and Pattern Identifiers (sometimes referred to as Feature Identifiers). By default, a Pattern Identifier is defined as the Metric Name, but this can be modified. Two alerts are considered similar if they share the same CI and Pattern Identifier, although fields such as Source, Severity, Description, and others may differ.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
	For more information, see Specify and manage pattern identifier attributes for alert grouping. **Note:** The Alert Aggregation Learner also identifies patterns of alerts within manual alert groups. In some cases, you can create patterns from alerts where the CIs share the same value in a specified field. For example, to build patterns from alerts with the same CI **Location** field, enter `location` in the *`sa_analytics.agg.learner_group_by_property`* property. For more information, Configure scheduled job-based alert grouping. When working with CI-based groups, ensure that the pattern identifier includes both the node and the metric name. For details on configuring the Feature Identifier, see Learned patterns report. **Note:** Alerts that lack a CI can still be grouped together as Text-based or CI-based alert groups, treating a node as a CI. To enable this functionality, set the sa_analytics.enable_no_ci_grouping property to true.

Configure pattern based alert grouping

Configure the Alert Aggregation Learner (Service Analytics Alert Aggregation Learner - Daily), an offline job that runs daily to process past alerts. It identifies patterns of related alerts using a combination of pattern-based and probabilistic techniques, enabling quicker detection and resolution of recurring issues.

Before you begin

Role required: evt_mgmt_admin

About this task

The Alert Aggregation Learner tracks manual additions and removals of alerts from automated alert groups. If you undo any previous alert additions or removals, the automatic process adjusts accordingly.

You can review user additions and removals from automated alert groups and undo any action to prevent it from being automatically repeated. The Alert Aggregation Learner also identifies patterns in manual alert groups, enabling automatic formation of new alert groups based on these patterns when new streams of alerts arrive.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Corrlelation Properties**.
2. Enable the following properties.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable alert aggregation for Automated, CMDB, and Text-based groups (*sa_analytics.aggregation_enabled*).

  Note:
  When disabled, disables all other groups.

- Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).

3. **Optional:** To configure the time period for the Alert Aggregation Learner to process alerts, perform the following steps:

   a. Navigate to **All** > **System Properties** > **All Properties**.

   b. On the System Properties page, select the *sa_analytics.agg.learner_period_days* property.

      If the property doesn't exist, you need to define it.

   c. Set the property's **Value** to the number of days by which you want alert aggregation learner job to process.

      Note:
      Values larger than 30 days increase job processing time. For optimal performance, use values of 30 days or less.

Specify and manage pattern identifier attributes for alert grouping

The Alert Aggregation Learner analyzes alerts and identifies patterns using a defined set of alert and configuration item (CI) attributes. By configuring these attributes as pattern identifiers, you can control which characteristics are used to group alerts. This customization creates meaningful alert groups, improving alert management and response times by reducing noise and enabling focus on critical issues.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Administration** > **Manage Pattern Identifier**.
2. On the SA Alert Aggregation Pattern Attributes page, select **New** to create a new pattern identifier, or open an existing pattern identifier.
   The SA Alert Aggregation Pattern Attribute page opens.
3. Select the Unlock Feature Identifier Attributes icon ( ) and move attributes from the **Available** list to the **Selected** list.

   Note:
   Properties from CMDB CI via dot-walking are not populated.

   The **Configuration Item** attribute is automatically considered as an identifier and should not be added explicitly to the Feature Identifier Attributes section. The pattern is defined as a combination of the configuration item and your selected feature identifier attributes.

4. Selecting the Lock Feature Identifier Attributes icon ( ).
5. Select **Submit** for a new pattern identifier or **Update** for an existing pattern identifier.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Navigate back to the SA Alert Aggregation Pattern Attribute page by opening the pattern identifier.
7. Activate the pattern identifier attributes by selecting **Deploy**.

What to do next

- Ensure a corresponding event rule exists: Verify that there is an event rule set up to assign or populate the newly defined pattern identifier attributes to the incoming alerts. Event rules define how attributes are assigned to alerts based on certain conditions.
- Run the Service Analytics Attribute Populator for Historical Alerts job: After the new event rule is in place, this job is used to retroactively populate the pattern identifier attributes for existing alerts that were created before the new attributes were defined. It ensures that even past alerts (historical alerts) have the necessary attributes filled in for grouping them properly.

Learned patterns report

The Learned Patterns report helps assess the efficiency of alert aggregation and identify recurring alert patterns. It enables proactive issue resolution, enhancing overall system performance by providing insights into frequent alerts.

Navigating and sorting the report

To access the Learned Patterns report, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Sorting Options: You can sort patterns by Pattern Score, Frequency, and Size to prioritize which alerts to address first.

Metrics and data in the report

The report displays key metrics associated with learned patterns, including:

- Frequency: The occurrence count of pattern identifier attributes (CI/MetricName).
- Pattern Identifier Attributes: Describes how alert grouping combines relevant pattern attributes to create a learned pattern. These patterns can reappear across multiple alerts, often indicating the same underlying issue.
- Presentation Format: Metrics are shown in a table format, organized by learned patterns.

This report allows you to:

- Focus on Higher Frequency Alerts: Allocate resources to higher-frequency alerts to expedite the resolution of numerous alerts.
- Target Larger Patterns with Lower Frequency: Allocate resources to larger learned patterns with lower frequency for targeted analysis.

Pattern group details and identifier attributes

- Expand a pattern group to display details about all the identifier attributes that are associated with the pattern.
- Sort the entries within each pattern by Configuration Item and Feature Identifier.

Column	Description
Configuration Item	CI associated with the combined pattern identifier attributes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Feature Identifier	Feature identifier used for the combined pattern identifier attributes.
Frequency	Number of times the combined pattern identifier attributes appear in the data set.
Size	Number of occurrences of the combined pattern identifier attributes (like Configuration Item and Feature Identifier) within a learned pattern.
Score	Calculated score that combines the frequency and size of the learned pattern. The formula for this score is: `Score = Frequency × (Size + 1)`. This score helps prioritize patterns based on their recurrence and size, making it easier to focus on high-priority patterns.
CI Link	Link in the **Configuration Item** column to view details of the CI information.

Exclude patterns from learned patterns

Exclude CI-based or CI class-based alerts and patterns when you encounter alerts incorrectly added to a learned pattern by the Learned Patterns job. For example, a pattern might include an alert that occurred at the same time as other alerts but is not actually related to them. This maintains accuracy, ensuring better alert groupings and improved management efficiency.

Before you begin

Role required: evt_mgmt_admin

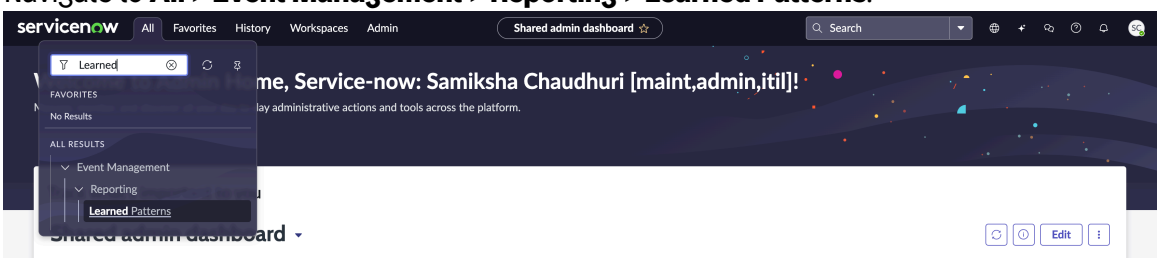
About this task

You select the incorrect alert in a pattern to exclude the entire pattern to which it belongs.

> **Note:**
> When you exclude an incorrect alert, any other patterns containing that alert are also excluded.

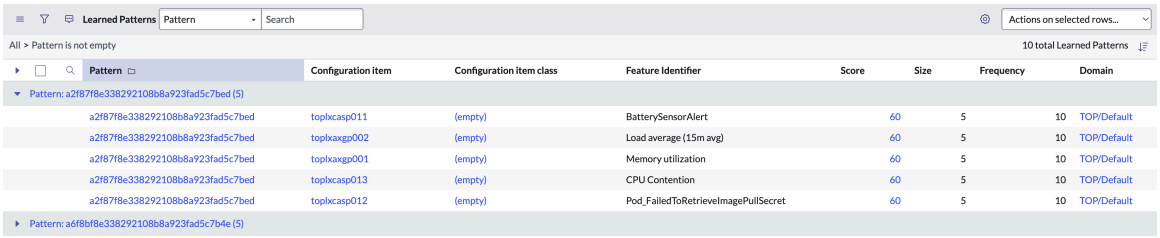
Procedure

1. Navigate to **All** > **Event Management** > **Reporting** > **Learned Patterns**.

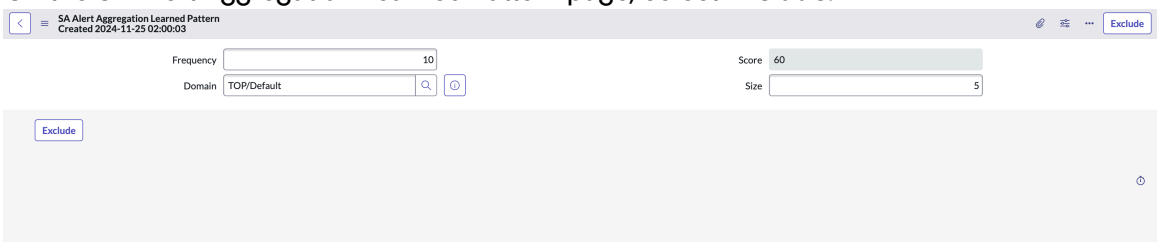


2. On the Learned Patterns page, expand the anomalous pattern.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the pattern name to open it for exclusion.
4. On the SA Alert Aggregation Learned Pattern page, select **Exclude**.



Result

The entire pattern is removed from the Learned Patterns report and listed on the Excluded Patterns page, located at **Event Management** > **Administration** > **Excluded patterns**.

If the pattern includes other alerts, you can restore it by reclaiming those alerts as a learned pattern. For further details, see Restore excluded patterns.

Restore excluded patterns

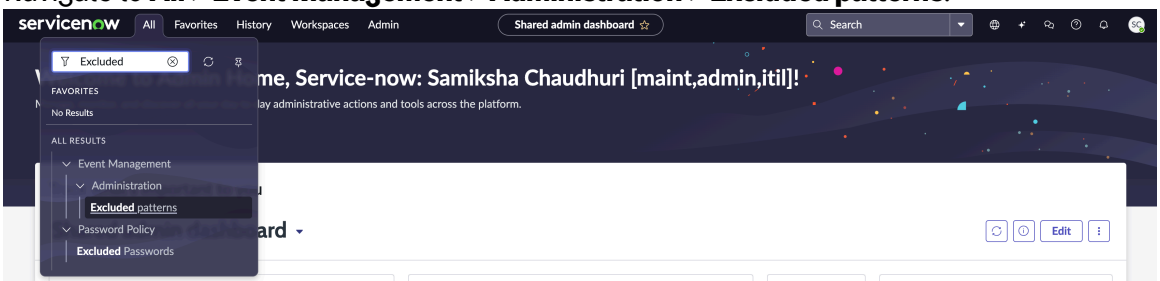
Restoring excluded patterns to the learned patterns report lets you reintegrate valuable insights lost due to incorrect alerts. This flexibility maintains accurate alert aggregation and enhances monitoring. For example, if you excluded a pattern due to an incorrect alert, you can restore it without that alert, ensuring relevant data remains accessible for analysis and decision-making.

Before you begin

Role required: evt_mgmt_admin

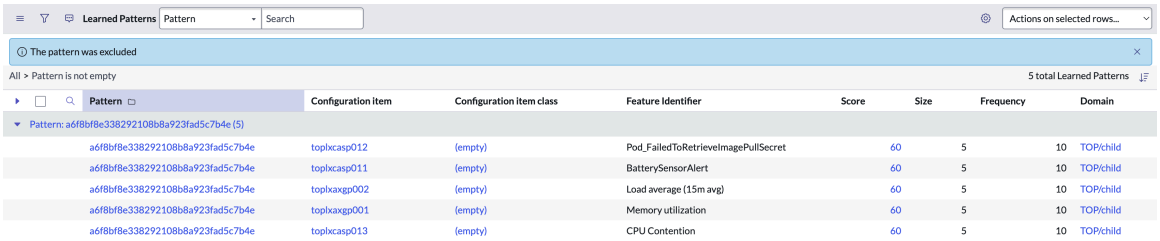
Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Excluded patterns**.

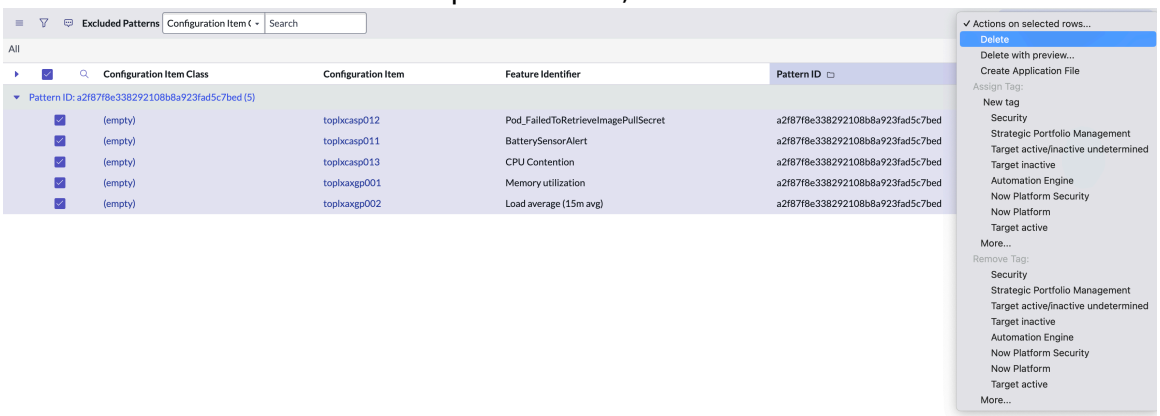


2. On the Excluded Patterns page, expand or select a pattern to view its alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the patterns you want to restore.
4. In the **Actions on selected rows** drop-down menu, select **Delete**.



5. In the confirmation window, select **Delete**.
6. Run the Learned Patterns scheduled job.
   a. Select **System Definition** > **Scheduled Job**.
   b. On the Scheduled Jobs page, search for the Service Analytics Alert Aggregation Learner - Daily job.
   c. Open the Service Analytics Alert Aggregation Learner - Daily job.

   d. Select **Execute Now**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The pattern appears with its restored alerts on the Learned Patterns report page. To access this page, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Network traffic based alert grouping

The Network traffic based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group alerts related to network traffic issues. This ensures alerts from directly connected processes within the same service candidate are grouped together, offering a more contextual view of network incidents.

Service candidates are potential collections of processes within your IT environment that are identified based on their network connections and interactions. They represent different services or functions that your IT systems provide, even if they are not fully detailed in your system's configuration database. For example, service candidates might group together all the processes involved in email delivery, even if the configuration details are incomplete.

ML Service Mapping uses machine learning to automatically discover and map out these service candidates. It identifies how different processes and components are connected and grouped together based on their network traffic and interactions. This helps in understanding and organizing the IT services and their components, making it easier to manage and troubleshoot issues. For example, ML Service Mapping might automatically identify and map the connections between email servers and mail clients based on their network interactions.

Note:
Network traffic based alert grouping is enabled for new customers starting with the Zurich release. Existing customers need to enable the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) manually.

How it works

- Host identification: Alerts related to network issues are generated from various sources.
- Network context identification: The correlation process uses horizontal discovery results and ML Service Mapping to identify the most relevant service candidates and network connections.

  This process uses the results of the scheduled job **Event Management - Populate Service candidate process to process mapping - Daily**, which runs once a day and is used to store process-to-process connections for Host CIs in the format required by the alert grouping algorithm.

- Alert grouping: Alerts are grouped based on direct process-to-process connections within the context of the same service candidate. Grouping is updated in real-time as new alerts are received.

Benefits

- Improved accuracy: By leveraging network traffic connections and service candidates, this method provides high accuracy in grouping alerts, minimizing false positives.
- Enhanced coverage: It effectively groups alerts even in environments with low CMDB maturity, covering a broader range of alerts and issues.
- Streamlined resolution: IT teams can quickly identify and resolve related issues in bulk, reducing the volume of alerts to manage and improving operational efficiency.

Enable network traffic-based alert grouping

Activate network traffic-based alert grouping to automatically correlate and reduce alert noise by grouping related events based on network traffic patterns. This helps improve efficiency in alert response and streamlines alert management.

Before you begin

Ensure the Service Mapping Plus application (sn_sm_scoped_app) is installed.

Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Ensure that the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) is selected.

Disable network traffic-based alert grouping

Disable network traffic-based alert grouping to prevent alerts from being grouped solely by network activity, reducing noise during traffic spikes and ensuring critical issues stand out for quicker resolution.

Before you begin

Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Clear that check box for the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
3. Set the property *sa_analytics.enable_process_mapping_calculation* to false.

Follow up on work notes and review service candidate

Track and follow up on work notes while reviewing the service candidate to ensure all actions and updates are captured. This helps maintain clarity and continuity in the review process, reducing the chances of missed details.

Before you begin

Role required: evt_mgmt_admin and sm_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

   Note:
   Scroll down to an alert with **Network Traffic** as the group, and in the **Group** column, right-click and select **Show Matching**. This displays all alerts related to **Network Traffic**.

2. For the alert whose work notes you want to see, select the alert number.
3. On the Alert page, scroll down and select the **Activities** tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the work notes for the selected alert.

4. In the work notes, select the service candidate to view details.
   The Application Service Candidate page opens.
5. Select **Preview Map Graph** to view the service candidates mapping in the form of a graph.
   Service candidates mapping provides a visual representation of how different service candidates are connected, making it easier to understand relationships, identify potential issues, and analyze dependencies more effectively.

Mixed alert grouping

Mixed alert grouping combines multiple strategies—currently CMDB-based and tag-based grouping—to form a single, cohesive alert group. It reduces noise, bridges gaps when one method isn't enough, and delivers a clearer, end-to-end view of incidents. This approach helps operators identify root causes faster and take informed action, even in complex or incomplete data environments.

To understand how Mixed grouping works in practice, it's important to look at the individual strategies it currently supports. At this stage, Mixed Grouping comprises two core methods: CMDB based alert grouping, which leverages service relationships defined in the CMDB, and Tag cluster alert grouping, which uses shared metadata across alerts. Each plays a distinct role in correlating related alerts effectively.

If you're looking to group alerts, see Create Group automation.

CMDB based alert grouping

CMDB based alert grouping helps organizations manage alerts by organizing them according to their related configuration items (CIs) within the Configuration Management Database (CMDB). This method group alerts based on CI relations in applications or infrastructure components, allowing teams to better understand the impact of issues, respond more effectively to alerts, and maintain service availability.

CMDB alert groups are created based on the current relationships between CIs in an organization. This means that when several alerts are triggered on different CIs—for example, if a server is experiencing issues — alerts are grouped based on CI relationships.

By default, all the existing connections between CIs are used to group alerts. However, given the complexity of IT systems, there are many types of relationships, and organizations can filter which ones to consider when aggregating alerts. For instance, you can filter relationship types by suggested relationships that appears in the CMDB Group CI Relations [em_suggested_relation_type] table. You can also filter using the hosting and containment rules (dependent relationship rules).

For example, if a server is hosting multiple applications, and there's a problem with that server, all the alerts related to both the server and the applications it hosts can be grouped together. This helps the IT team quickly identify and address the root cause of the issue rather than dealing with each alert in isolation. Similarly, if different processes are running on a server, grouping alerts based on those processes allows teams to see how problems in one area might affect others, leading to a more comprehensive understanding of the situation.

The CMDB alert groups are effectively displayed in the Express List within the Service Operations Workspace, which allows teams to easily monitor and manage related alerts. This feature enhances operational efficiency by providing a clear view of alerts that are interconnected based on the current relationships among configuration items (CIs).

Use cases for CMDB based alert grouping

Use cases for CMDB grouping enhance alert management by correlating alerts based on Configuration Item relationships, improving visibility, and facilitating more efficient troubleshooting.

Common CMDB grouping use cases

In the context of CMDB grouping, organizations face several challenges when managing alerts related to Configuration Items (CIs).

Common use cases

Use Case	Challenges	Solutions
Shared Configuration Item (CI) Scenario: An organization monitors a database server experiencing multiple issues, resulting in numerous alerts related to different applications using that database.	• Delayed response: Teams may respond to alerts in isolation, potentially overlooking related alerts, leading to delayed resolutions. • Inefficient resource allocation: Time and resources may be wasted on investigating separate alerts that are actually related. • Lack of context: Alerts related to the same CI can be scattered across different alert groups, making it difficult to see the full picture.	• Aggregate alerts related to the same CI into a single group for a unified view. • Facilitate faster alert resolution by addressing all related alerts together.
Hosting/Containment Relations Scenario: A physical server hosts several virtual machines (VMs), and an alert is generated for a hardware failure on the server. Multiple alerts also arise for the VMs due to their reliance on the server.	• Visibility into dependencies: Teams may lack visibility into how CIs are interconnected, leading to inefficient troubleshooting processes. • Complex alert resolution: Understanding which CIs are affected and how they relate can be complicated, resulting in longer resolution times. • Resource drain: Mismanagement of alerts can lead to duplicated efforts across teams, wasting time and resources.	• Group alerts using CMDB hosting/containment rules to aggregate alerts related to the physical server and its hosted VMs into a single alert group. • Provide a comprehensive view of all alerts tied to the physical server's failure. • Focus remediation efforts on the physical server while monitoring the VMs to ensure all aspects are addressed efficiently.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common use cases (continued)

Use Case	Challenges	Solutions
Applicative Relations Scenario: An enterprise application relies on multiple micro-services, and an issue arises with one of these services, generating alerts across several components, complicating diagnosis.	• Understanding application dependencies: Teams may find it challenging to trace how application components interact, making it difficult to pinpoint issues in complex systems. • Slow incident resolution: Without a clear understanding of applicative flow, alert resolution can be slow and labor-intensive. • Inconsistent monitoring: Alerts related to applications may not be consistently monitored or prioritized, leading to potential oversights.	• Implement grouping based on applicative flow relations to aggregate alerts related to the affected microservice and its dependent components. • Utilize dependency maps to visualize how different services interact. • Streamline the resolution process by addressing grouped alerts related to the application, improving response times.

CMDB alert grouping — properties and functionality

Learn about the key properties and functionality of CMDB alert grouping, which facilitate efficient alert organization based on relationships and enhance the overall effectiveness of alert management.

Properties for managing CMDB alert group creation

Use the properties listed in the following tables to control CMDB alert group creation. For more information, see Configure scheduled job-based alert grouping.

Property	Setting
Enable CMDB correlation *sa_analytics.agg.query_cmdb_correlation_enabled*	Enable this property to automatically use CI relationships for alert aggregation, correlating alerts and creating CMDB alert groups.
Max number of relations between CIs in a topology that form a CMDB group *sa_analytics.agg.query_cmdb_graph_walk_nodes*	Set the maximum number of enabled relations between CIs in a topology that form a CMDB group. For example, if you set this property to 3, a CI associated with an alert will automatically be grouped with similar CIs within three hops or less.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Setting
	Note: This property setting impacts all types of relations used for alert aggregation. Using a value greater than 4 may negatively affect the performance of the alert aggregation job.
Use all CMDB relations for CMDB group correlation *evt_mgmt.related_cis_get_all_relation_types*	Set to true if you want to use all relationship types for CMDB grouping. The default setting for new users is that the option is set to true, meaning all relationship types are used for grouping. Set the property to false to filter the relations.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

In some use cases, you may need to ignore or exclude certain CI relationships from automatic alert group creation. In this case, the *evt_mgmt.related_cis_get_all_relation_types* property must be set to false, and the properties in the below table must also be configured.

Note:
If the *evt_mgmt.related_cis_get_all_relation_types* property is set to false, and the relationship isn't specified in the [em_suggested_relation_type] table, the relationship is not considered for alert aggregation.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

Property	Setting
Enable Suggested Relations for CMDB Correlation *sa_analytics.agg.query_cmdb_suggested_relationship_enabled*	Keep this property enabled to use any suggested relationships defined in the CMDB Group CI Relations [em_suggested_relation_type] table when forming CMDB alert groups. To include a new relationship, add it to this table. This property is enabled by default.
Use CMDB relationship based on host-containment Metadata rules *evt_mgmt.related_cis_use_containment_rules*	Containment rules specify which configuration item classes can be contained within another item through a specific relationship when creating a service template. Keep this property enabled when forming CMDB alert groups to use any host-containment rules defined in the Metadata Editor. For more details, see CMDB dependent relationship rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for managing automatic creation of CMDB alert groups for advanced use cases (continued)

Property	Setting
	This property is enabled by default.
Enable filtering by dependent relationship rules *evt_mgmt.related_cis_use_hosting_rules*	Hosting rules define what classes of configuration items are hosted on other classes of configuration items. Keep this property enabled when forming CMDB alert groups to apply any hosting rules, which define which classes of configuration items are hosted on other classes. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
Ignore CMDB alert groups from forming due to CI applicative flow relations *sa_analytics.agg.ignore_cmdb_applicative_flow*	Set this property to true to prevent CMDB groups from forming based on applicative flow relations for CI relations in application services. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
sa_analytics.applicative_flow_rel_enabled	This property is hidden and enabled by default.

Event Management stores a map of related CIs in the Event Management CI Graph Reuse [em_ci_graph_reuse] table for each processed CI. You can adjust the storage period by modifying the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, with the default set to one day (86,400 seconds). This process enhances the search performance of relations in the CMDB. To disable the storage process during advanced use-case configurations, set the property value to zero.

Note:
If you need to change the default value, add the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.

© 2025 ServiceNow, Inc. All rights reserved.

View the Dependency map for CMDB alerts

The Dependency map illustrates how and why alerts are grouped, simplifying troubleshooting and issue management. It reveals connections between CIs within a CMDB alert group, enhancing visibility into their relationships. Additionally, if a CI is not part of the group but connects to other alert CIs, it remains visible on the map, aiding alert resolution and proactive management.

Before you begin

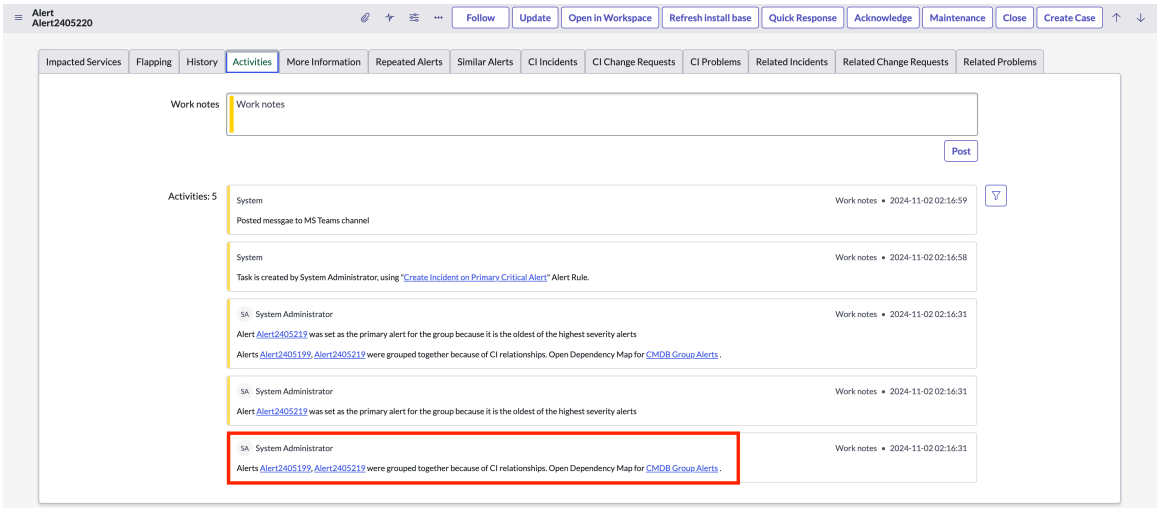
Role required: evt_mgmt_user, evt_mgmt_operator

Procedure

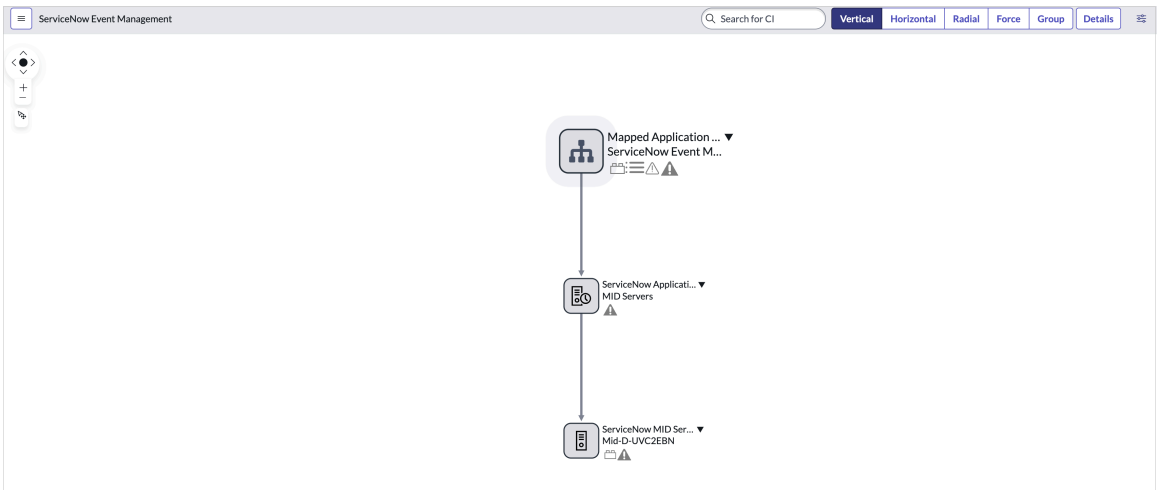
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search for the CMDB group.
3. Open a CMDB group alert.
4. Scroll down and select the **Activities** tab.

   You may see a message similar to the following:

   ```
   Alert2405199 and Alert2405219 were grouped together because of
   CI relationships. Open Dependency Map for CMDB Group Alerts.
   Open Dependency Map for CMDB Group Alerts.
   ```



5. Select the link to see the dependency view of the CMDB alerts.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a CI relationship to CMDB Group CI Relations

Add a CMDB group CI relationship for a CI class to enable accurate alert group generation.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the *sa_analytics.agg.query_cmdb_suggested_relationship_enabled* property to further enhance alert grouping by using suggested relationships. For more information on properties, see CMDB alert grouping — properties and functionality.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.

   a. Click **New**.

   b. Complete the form.

Suggested Relationship fields

Field	Description
Base class	The base class in the relationship serves as either the parent or the child, depending on the type of relationship established.
Relationship	The type of relationship that defines how two or more entities are connected.
Dependent class	The class that relies on another class in the relationship, serving as either the parent or the child depending on the relationship type.

2. Click **Submit**.

Example: CMDB Group CI relation

Base Class	Relationship	Dependent/Target Class
Oracle	Is Hosted On	Linux Server
Oracle	Is Hosted On	Solaris Server

Note:
The same parent class and relationship can appear more than once.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete a CI relationship from CMDB Group CI Relations

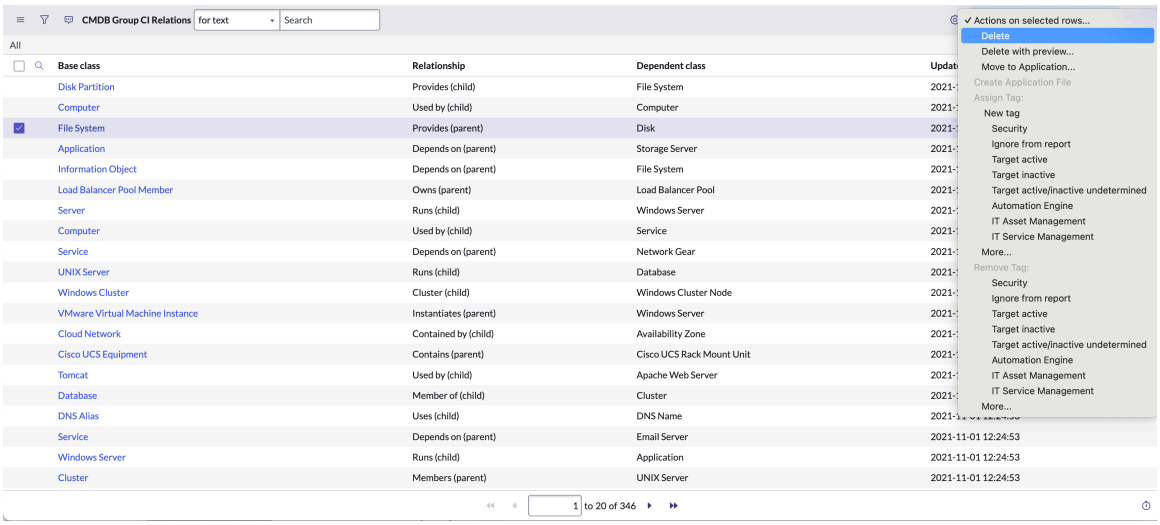
Delete a CMDB group CI relationship to limit available relationships for CMDB alert grouping, helping to reduce noise and improve alert relevance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.
2. Select the checkbox next to the CI relationship you want to delete.
3. Select the Actions menu and then select **Delete**.



4. On the confirmation window, select **Delete**.
   The CI relationship is deleted.

Tag cluster alert grouping

Tag cluster alert grouping enables you to easily create groups of alerts. It is a non-code method of alert grouping that correlates alerts without having to use CMDB or model training. This simpler way of grouping similar alerts reduces the overall noise of a large quantity of alerts.

Tag cluster alert grouping is enabled immediately after the activation of the Tag-Based Alert Clustering Engine application, available in the ServiceNow Store. This grouping is applied according to the correlation logic order specified in the Configure alert correlation logic order. Alert grouping tags are attached to definitions on a many-to-many (M2M) basis. Multiple tags can be linked to a single definition, and a tag can be part of multiple definitions. Groups formed from tag cluster alert grouping definitions are classified as the Tag Cluster group type.

Tag cluster alert grouping supports domain separation, allowing different domains to have their own distinct alert grouping configurations and logic.

First, create alert grouping tags to define the criteria for grouping alerts. You can set the tags to require an exact match, an approximate ('fuzzy') match, or a character pattern match.

You can also use preconfigured tags to speed up alert clustering. These predefined tags are mapped from alerts and are based on information from sources such as the Alert field, Alert tags, or Alert additional info. If the required data is missing and the selected tag source is Alert CI or Alert CI key, the tag is populated using the Configuration Item (CI) value from the Configuration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Management Database (CMDB). Predefined tags are easily identified by their description, which includes out of the box.

You can attach one or more tags to an alert clustering definition, which specifies the conditions for alert correlation. You can either create your own alert clustering definition or use a predefined one provided by the application. Predefined definitions come with associated tags.

Important:
Make sure to activate predefined definitions before use. In new systems, several definitions are active by default. The remaining ones must be activated. For more information, see Activate a predefined alert clustering definition.

Once one or more alert clustering tags are attached to a definition, the system collects alerts and checks if their tags match all the tag values specified in the definition. Alerts with matching or similar tag values are grouped together. New incoming alerts join an existing group if their tags match the tags in the definition used to create the group.

For tag-cluster grouping, alerts are added to a group based on the timeframe defined in the alert clustering settings. The time between the initial alert (virtual alert) and subsequent alerts is evaluated. If two new alerts are received, and their time difference falls within the defined timeframe, they are added to the group. The initial event's generation time is used to determine the relevance of the timeframe.

Create alert clustering tags

Create streamlined alert correlations with alert clustering tags by grouping alerts that share identical or similar tags based on your configured match method. This reduces noise, enhances incident prioritization, and improves operational efficiency, enabling faster issue resolution and response times.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Tags**.
2. Click **New**.
3. Fill in the values on the Event Management tag based alert clustering tag form.
4. Select **Submit**.

Result
The tag appears in the Tag Based Alert Clustering Tags table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an alert clustering definition

Define alert clustering conditions to trigger one or more alert clustering tags, which help create alert groups from fewer alerts. Creating alert groups from fewer alerts reduces noise, making it easier to identify critical incidents, prioritize responses, and manage issues effectively.

Before you begin
Role required: evt_mgmt_admin

About this task
To create a tag def users need to use filter to define on which alerts the definition will apply and define a grouping criteria by specifying which field values should be compared to create a group.

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select **New**.
3. Configure the fields on the Event Management tag based alert grouping definition form.
4. Select **Save**.

Result
The definition appears in the Tag Based Alert Clustering Definitions table and Service Operations Workspace (ITOM) > Grouping automation. Alert groups created by this definition are categorized as Tag Cluster groups.

Activate a predefined alert clustering definition

Activate the predefined alert clustering definitions provided with the Tag-Based Alert Clustering Engine application before use. Utilizing these preconfigured definitions minimizes setup time and ensures a more efficient configuration process, allowing for quicker implementation and streamlined alert management.

Before you begin

Important:
If you are already using the Tag-Based Alert Clustering Engine application, all the predefined definitions are inactive and must be activated. In contrast, new customers will find several definitions active by default, allowing for immediate utilization of the alert clustering capabilities without additional setup.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Clustering Definitions**.
2. Select a predefined definition.

   Note:
   For a complete list of the available predefined definitions, see List of predefined tag-based alert grouping definitions.

3. On the Tag Based Alert Clustering Definition form, select the **Active** check box.
4. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
In the Tag Based Alert Clustering Definitions table, the **Active** field for the activated definition displays the value **true**. You can now associate an alert clustering tag with this definition, enabling effective grouping of alerts based on the defined criteria.

Attach a predefined tag to a tag-based alert grouping definition

Get started faster with alert clustering by attaching a predefined alert clustering tag to a tag-based alert clustering definition in Event Management. By associating a predefined tag, you ensure that alerts meeting the specified criteria are grouped effectively, facilitating quicker identification and response to related incidents.

Before you begin
Role required: evt_mgmt_admin

About this task
The Tag Based Alert Clustering Engine application comes with a set of predefined alert clustering tags. Attach a tag to a tag-based alert clustering definition to specify the conditions that must be met for alert correlation. This enables effective grouping of alerts based on shared characteristics, improving the accuracy and efficiency of incident response and management.

Procedure
1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select a definition.
3. Under the Tag Based Alert Clustering Definitions Tags M2M section, select **Insert a new row**.
4. Use the search field to locate a predefined alert clustering tag, and then select the green check mark to confirm your selection.

   Note:
   Predefined tags are recognizable by their description, which includes “out of the box.” For a complete list of the available predefined tags, see List of predefined alert grouping tags.

5. Select **Save**.

Result
The predefined alert clustering tag is now attached to the tag-based alert clustering definition. This association enables the effective grouping of alerts based on the specified criteria, facilitating improved alert management and response efficiency.

Text-based alert grouping

In text-based alert grouping, alerts are organized and correlated based on specific text patterns or keywords within the alert content. This approach dynamically groups alerts that share similar textual characteristics, such as error messages or event descriptions, allowing for more flexible and adaptive management of alerts.

The EM Alert Clustering Solution is a method used to correlate alerts based on similarities in specific fields and form clusters or groups. In ServiceNow Event Management, it creates clusters based on the Description, Metric name, and Configuration item.Class fields. This solution organizes alerts into text-based groups, and when a new alert arrives, the ML Predictor identifies the appropriate cluster, grouping alerts within the same cluster.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The ML Predictor job is asynchronous and assigns real-time alerts to clusters, which may result in slight delays. This delay can cause text-based groups to be created several minutes later, as the alert grouping job runs once per minute. If prediction results are not available during a run, they are rechecked in the next grouping job.

For text-based logic to execute, you must have the Predictive Intelligence plugin (com.glide.platform_ml) installed and the EM Alert Clustering Solution definition activated.

There are specific settings or limits used to control the behavior of text-based alert grouping. These thresholds define the criteria for how alerts are grouped based on text patterns or attributes. The text-based thresholds are:

- Cluster quality threshold: The Cluster quality threshold (*sa_analytics.alert_grouping_tb_cluster_quality_threshold*) determines the minimum quality required for an alert cluster to be considered valid. This threshold ensures that only clusters with a minimum level of similarity and reliability are used. Clusters that meet this threshold are considered valid, improving the precision of the groupings and reducing noise from irrelevant or low-quality clusters. The range of the threshold is from 1 to 100 and the default value is 70.
- Alert rank threshold: The Alert rank threshold (*sa_analytics.alert_grouping_tb_alert_rank_threshold*) defines the minimum rank required for an alert to be included in a group. This threshold ensures that only alerts with a certain level of similarity are grouped together, filtering out lower-ranked alerts to maintain the quality of the alert group. The default value is 0.3, where smaller values indicate better similarity.

Note:
To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

The EM Alert Clustering Solution definition is located in the [ml_capability_definition_clustering] table. To access it, navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.

To verify if the solution definition is active, see Verify text-based clustering solution. To disable the EM Alert Clustering Solution definition, disable text-based alert grouping by setting the property *sa_analytics.text_based_group_enabled* to `false` and clearing the **Active** check box in the EM Alert Clustering Solution definition.

Example of text-based alert grouping

Scenario	Example
Network Connectivity Problems: There are widespread network connectivity issues affecting multiple departments.	Alerts from various network monitoring tools might report issues like Network segment down, High packet loss, or Connectivity issues in subnet. Text-based alert grouping uses the EM Alert Clustering Solution and ML Predictor to streamline alert management. The EM Alert Clustering Solution employs Natural Language Processing (NLP) algorithms to analyze and identify common text patterns in alerts such as Network segment down or High packet loss. It then clusters these alerts based on their text similarity, grouping related issues

Scenario	Example
	together. The ML Predictor further enhances this process by evaluating new alerts in real time and assigning them to the appropriate existing clusters based on their text patterns. This dynamic grouping provides a consolidated view of the connectivity problems, allowing network engineers to quickly diagnose and address the root cause of the issues more efficiently.

Verify text-based clustering solution

Event Management uses Natural Language Processing (NLP) algorithms to identify common text patterns in alerts and create alert groups through clustering. This approach not only organizes similar alerts efficiently but also reduces noise and helps focus on significant issues, enhancing overall alert management.

Before you begin

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml) is installed.

Ensure the parameter *sa_analytics.text_based_group_enabled* is set to `true`.

> **Note:**
> If the Predictive Intelligence plugin is not installed, the text-based logic will not execute, even if *sa_analytics.text_based_group_enabled* is set to true. This is because text-based grouping relies on clustering alerts based on the description, metric name, and CI class. Without the plugin, clustering cannot be performed, and as a result, text-based groups will not be created, regardless of the active status.

Ensure that there are at least 100 alerts in the Alerts table [em_alerts].

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
   The Clustering Definitions page opens.
2. Select EM ALert Clustering Solution.
3. Verify that the **Active** check box is selected.
4. Select **Update & Retrain**.
   For more information on ML solutions, see Reviewing your ML solution training jobs.

Manual alert grouping

Manual alert grouping involves organizing and categorizing alerts based on user-defined criteria and direct intervention.

You can manually select and group alerts to better manage and resolve incidents by tailoring the grouping based on specific needs, relevance, or context. This approach ensures that alerts are categorized effectively, enhancing overall incident management and response efficiency.

Create alert group manually

Manually create an alert group to organize and manage related alerts when not using scheduled jobs. This provides flexibility to group alerts on-demand for effective resolution.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin

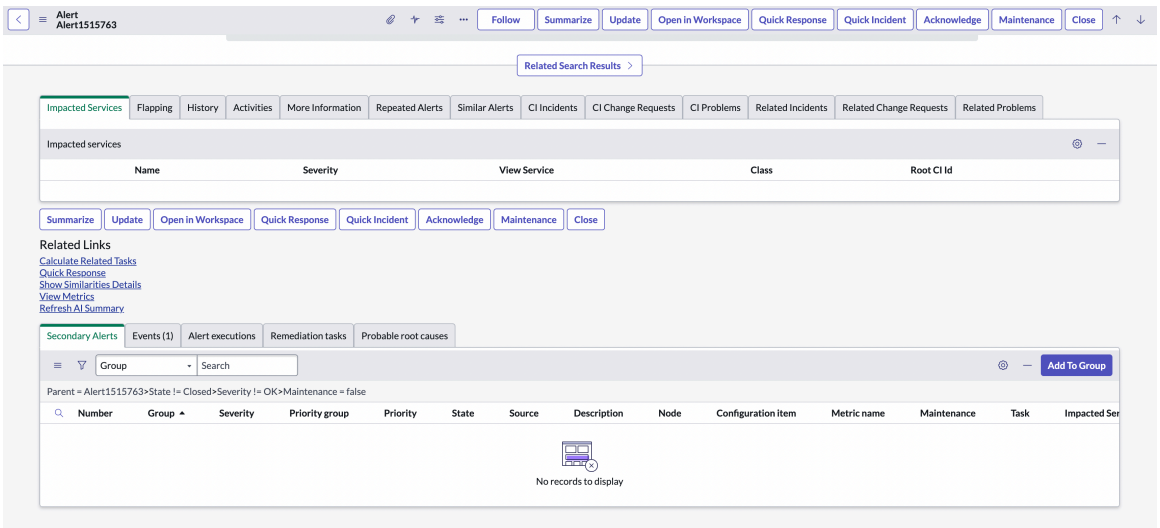
Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.

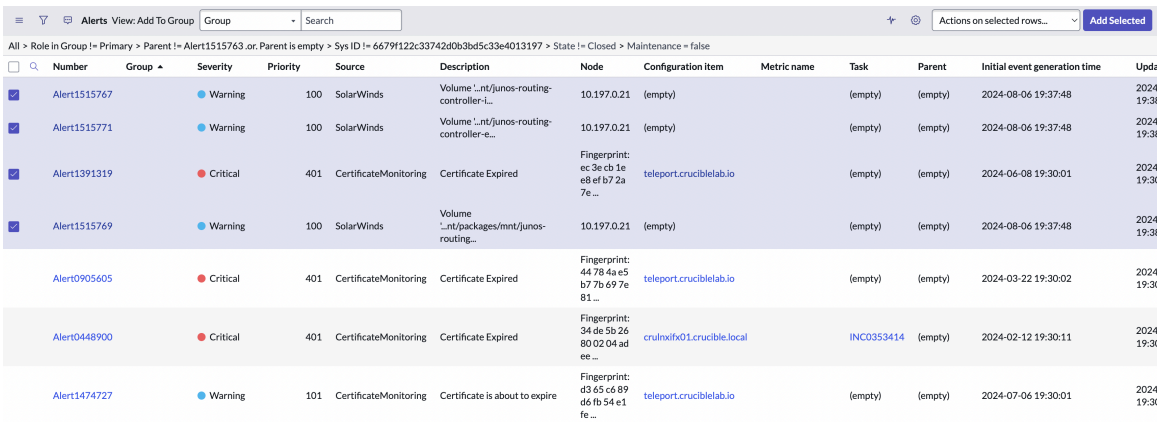
   The alert will be used to create an alert group, designated as the primary alert, to which you can add secondary alerts.

   Note:
   A closed alert cannot be assigned as a parent alert.

3. Scroll down and in the **Secondary Alerts** tab, select **Add To Group**.

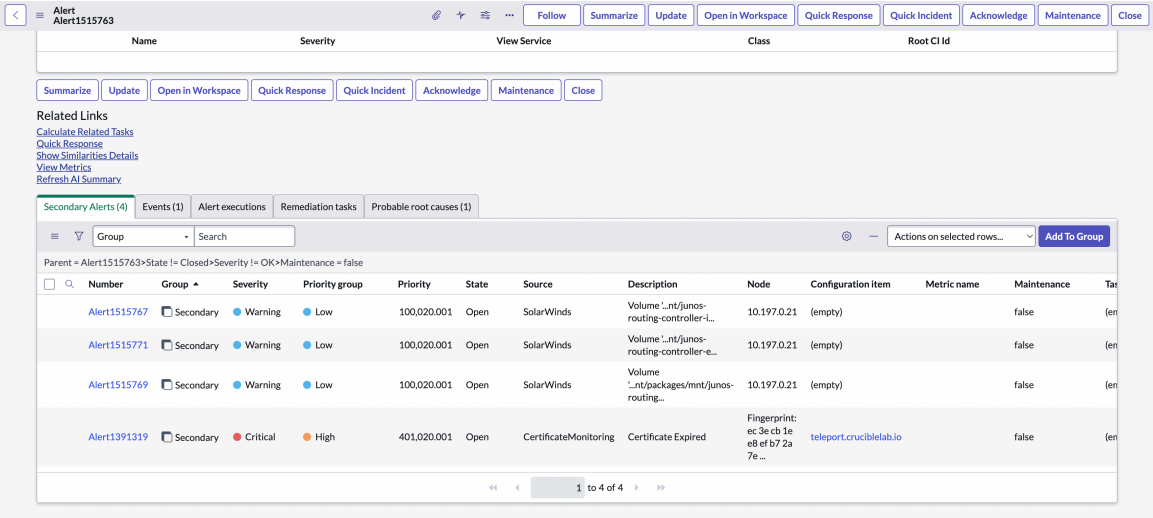


4. Select the check boxes for all alerts you want to add to the group as secondary alerts and select **Add Selected**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Secondary Alerts** tab, view the alerts that have been added as secondary.



Add secondary alert manually to an existing alert group

Add any relevant alert discovered during the review of an automated alert group as a secondary alert to improve the group's completeness and utility for incident troubleshooting.

Before you begin

Role required: evt_mgmt_admin

About this task

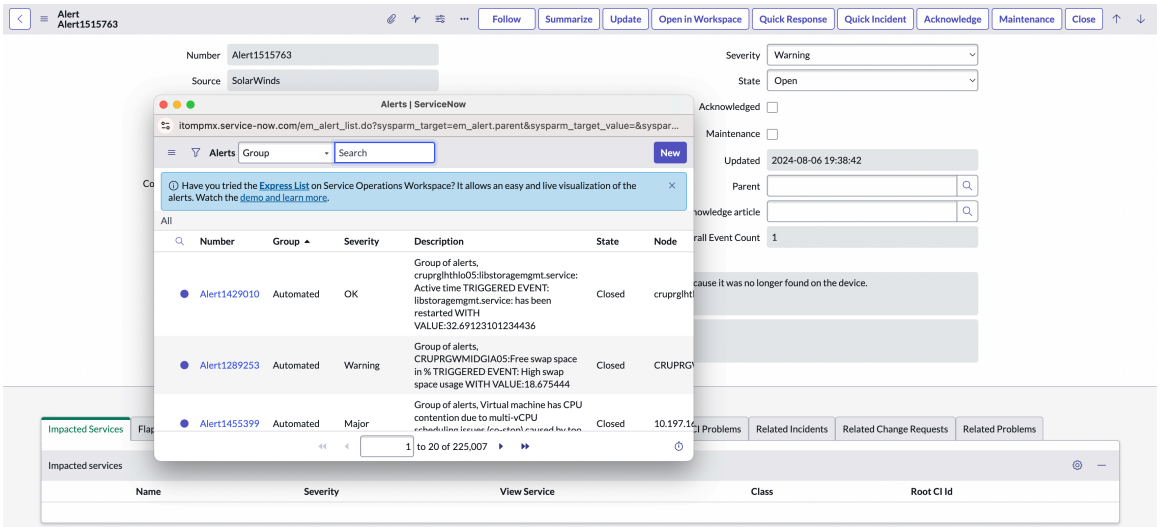
The alert you select to add to a new group may already be part of another group. Adding it to the new group will automatically remove it from its current group, changing its group association. Alternatively, you can update the alert's parent to move it to a different group. By specifying a new parent, the alert is transferred to the new parent's group and removed from the previous one. This can be accomplished by updating the **Parent** field on the alert form or by modifying the **Parent** column in the Alerts list.

Note:
When you add an alert to a group, this action is logged as feedback for alert grouping as part of the process. Currently, the feedback option is available but does not trigger further actions after being logged. Future enhancements to this feature are being considered.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.
3. In the **Parent** field, search for the alert you want to assign as the parent for the selected alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the parent alert number.
5. Select **Update**.

Result

The alert is added as a secondary alert to the selected parent alert.

Remove an alert from an alert group

Remove an alert if you want to improve the group's accuracy and usefulness in troubleshooting an incident. If this action leaves the group with one or no alerts, the group is deleted and no longer displays as an alert group.

Before you begin

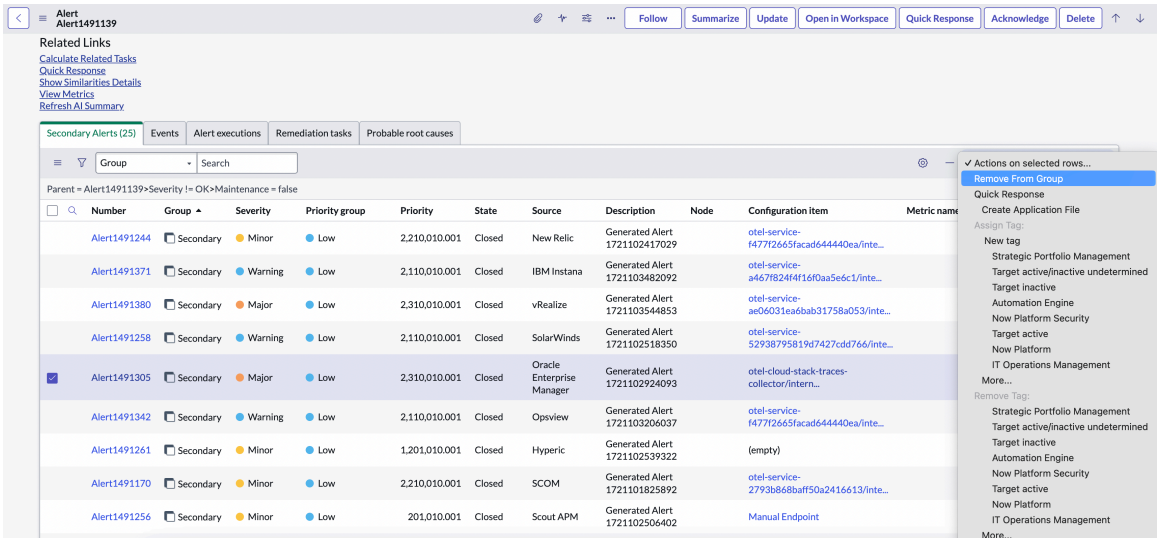
Role required: evt_mgmt_operator

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert group.
3. Scroll down to view the **Secondary Alerts** tab.
4. Select the check box next to the alert you want to remove from the group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. From the Actions on selected row menu, select **Remove From Group**.



Result

The alert is removed from the group.

Configure work notes to capture alert grouping justifications

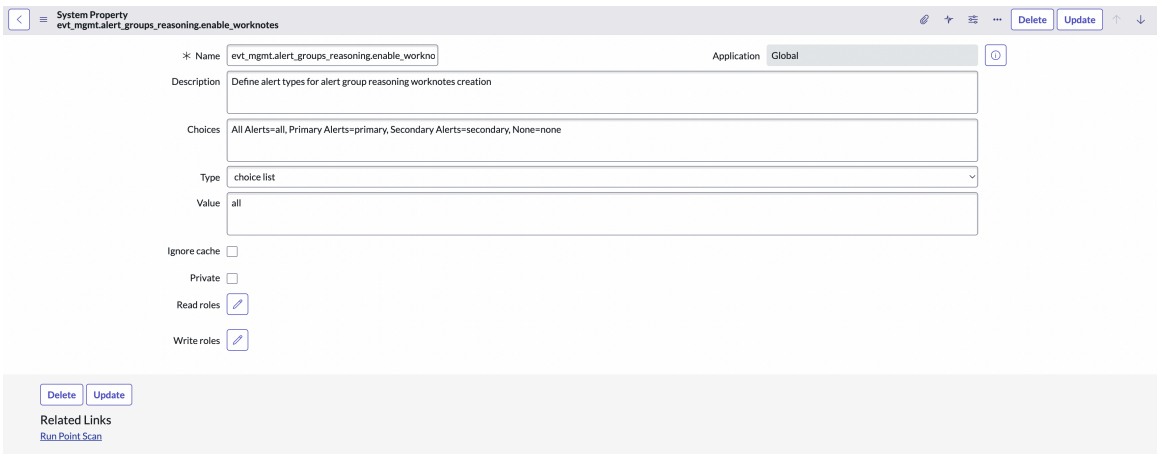
As alerts are added to a group, a message is recorded in the alert's Work notes field to explain why the alert was included in the group. Define alert types for creating these worknotes related to alert group reasoning.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *`evt_mgmt.alert_groups_reasoning.enable_worknotes`*.
3. Open the property.



4. In the **Choices** field, define alert types for creating worknotes related to alert group reasoning.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property values

Value	Description
All Alerts	Work note information is generated for every alert.
Primary Alerts	Work note information is generated only for primary alerts.
Secondary Alerts	Work note information is generated only for secondary alerts.
None	No work note information is generated.

5. Select **Update**.

Alert grouping types and creation methods

Application services in Event Management

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization.

For general information on application services, see Application services.

Manually create an application service in Event Management

You can manually create an application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

An application services is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. Use application services to organize, maintain, and monitor services in your organization.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click **New**.
3. On the form, fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a Service form

Field	Description
Name	Enter a unique application service name.
Owned by	Specify an owner who is responsible for this application service in the organization
Add entry points:	
CI Type	Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.
CI Name	Select the CI from the list of CIs of the selected CI type.

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

4. Click **Submit**.

What to do next

For details on grouping application services, see Group application services.

For details on controlling user access to application services, see Control user access to application services.

Convert manual services to application services

You can convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services.
During the conversion process:

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.
- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

Application service does not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

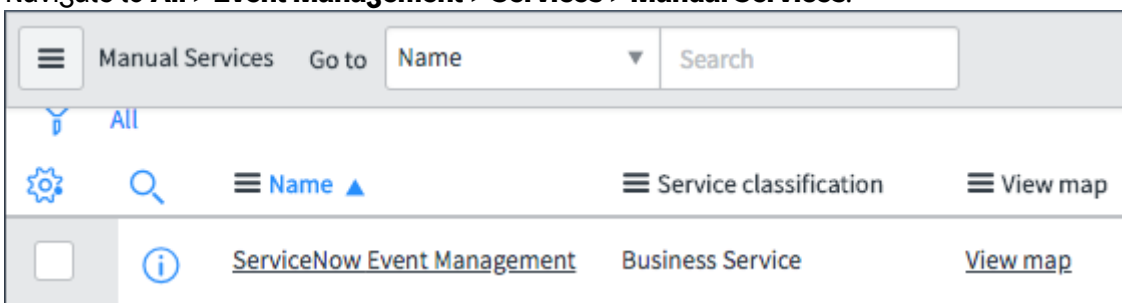
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

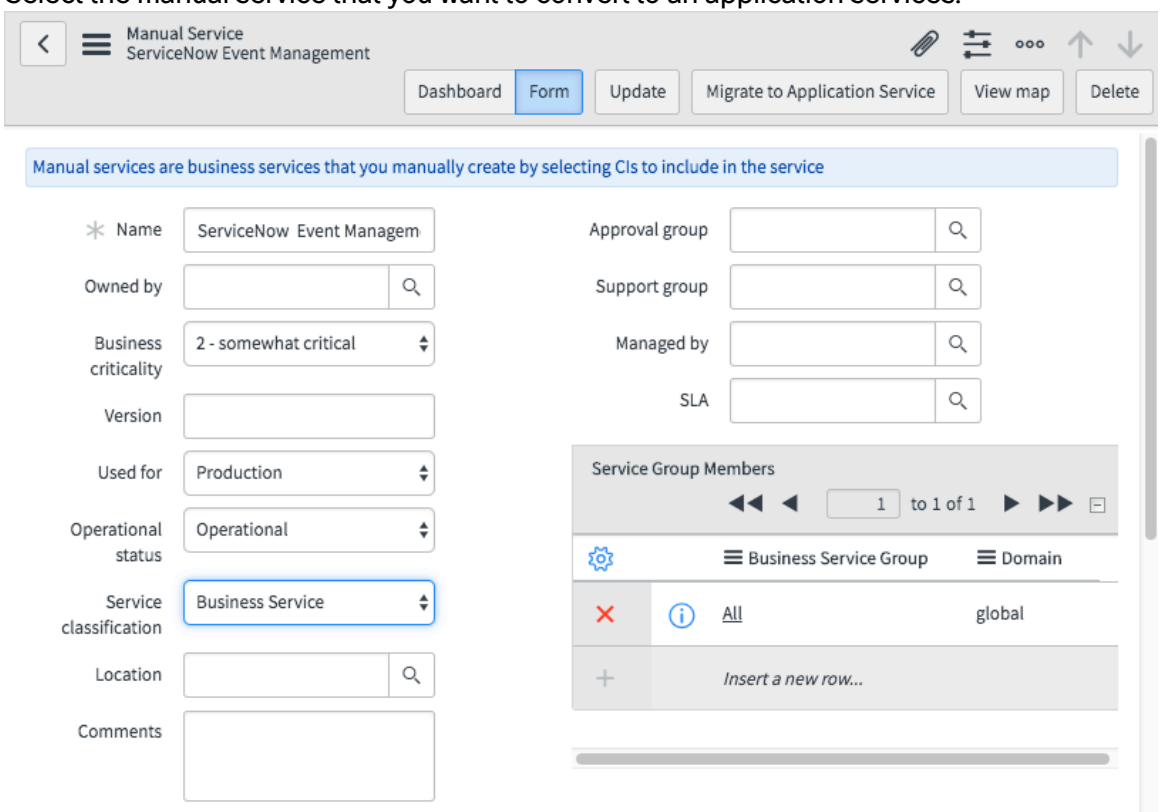
If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Manual Services**.



2. Select the manual service that you want to convert to an application services.



3. Click **Migrate to Application Service**.
4. Click **OK**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The CIs from the manual service are added to the converted application services.
- After the conversion process is complete, the application services form opens.

Convert manual services to application services using API

You can use a JavaScript API to convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services. Ensure that any automation of manual services (such as business rules or scheduled jobs) have been built and tested before converting to application services.

Note:
Manual services are static and retain their original structure after conversion to application services. To update imported manual services with the existing CMDB state, either populate the original manual services to ensure that all CIs are assigned to the correct service, or run the **update with CMDB changes** option after the conversion.

During the conversion process:

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.
- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

The maximum number of CI connections added to application services during this operation is controlled by the sa.service.max_ci_service_population property. By default, the value is 1,000 (one thousand connections). Increasing the number of CI connections may cause performance issues. To adjust the maximum number of added CI connections, add the sa.service.max_ci_service_population property, as described in Add a system property.

Attempting to process more CIs than the value specified in the sa.service.max_ci_service_population property causes the operation to fail.

Run the conversion process in small chunks of approximately 10 at a time, to make it easier to pinpoint the problematic service in the event of a conversion problem.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

The JavaScript API is:

```
BusinessServiceManager.migrateManualToApplicationService(String
 service_id)
```

Parameters

Name	Type	Description
service_id	String	sys_id of the manual service to be converted

Returns

Type	Description
Boolean	`true` for a successful conversion, `false` for a conversion that failed

Where the `sys_id` of an existing manual service is `451047c6c0a8016400de0ae6df9b9d76`, run the following API to convert it to an application services:

```
var bsManager = new SNC.BusinessServiceManager();
var res =
 bsManager.migrateManualToApplicationService("451047c6c0a8016400
de0ae6df9b9d76");
```

Configuring CIs in a manual service as a manual cluster

Configure or modify a CI as a specific CI or a generic CI class in a manual service (that was not discovered automatically) as a manually defined cluster. A manual cluster delivers redundancy capabilities in the cluster and provides continued operations or services of the entire cluster in case of failure of one or more CIs in that cluster.

Manual cluster allows you to group CIs under a logical cluster in a service. In the impact tree you can set the relative impact of a cluster member on the cluster.

Note:
Creation of nested manual clusters (cluster inside cluster) is currently not supported.

Once the CI is defined as a manual cluster its impact calculation shows the magnitude of an outage on its children CIs. Impact calculation uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs and determines how the impact applies to parent or child entities that are part of an application service.

The magnitude of an outage can be 100% down, 60% affected, 40% impaired, or 20% impaired.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Redundancy is defined in impact rules. For example, you can define that the parent CI is critical if at least two child CIs are critical. The impact from child to parent CIs is not always 100%. If the CIs of all three children are affected, the impact is 100% down.

In a service map, you can configure or modify a specific CI or a generic CI class in a manual service as a manually defined cluster. When configuring as a generic CI class, all the CIs of the selected class in that service are configured the same.

Note:
Visual representation of a manual cluster may differ from the visual representation of a cluster that is discovered automatically.

Related topics

Alert impact calculation

Configure a manual cluster

Provide redundancy capabilities of an entire cluster in case of failure of one or more CIs in that cluster. By viewing the relative impact of a cluster member on the cluster information, you can better understand the source of alerts and take remediation steps.

Before you begin
Role required: evt_mgmt_admin

About this task
In a manual service that was not discovered automatically, you can manually group a specific CI or a generic CI class under a logical cluster. The relative impact of a cluster member on the cluster can be configured in the impact tree.

For more information, see Alert impact calculation.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. Select **New**.
3. In the **Select a Service containing this manual cluster** section, select an application service to contain the new manual cluster based on a specific CI or general CI class.
   The cluster number is automatically generated and appears in the **Number** field.

   a. Select the Lookup using list icon ( ) in the **Service** field.

   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   To define a new application service, see Manually create an application service in Event Management.

   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).

4. In the **Select a Specific CI or generic CI class** section, in the **Defined As** field, select whether to define the manual cluster as a specific CI of a manual cluster or as a generic CI class of a manual cluster that will be applied to all CIs of this class.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Provide a Description** section, either provide a description in the **Description** field or leave it blank to contain an automatically generated description when you select **Save** or **Submit**.

   The **Description** field is automatically updated when you select **Save** or **Submit**. The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

   To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.

6. Activate the cluster by selecting the **Activate** check box.
7. Select **Submit**.

Result

The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Related topics

Configuring CIs in a manual service as a manual cluster

Modify a manual cluster

Modify an existing manual cluster by changing the service, the specific CI, the generic CI class, or the description in case of an incorrect initial configuration, changes in the network, or other issues.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. From the list, select a manual cluster.
3. Change the service containing the manual cluster by selecting a different one in the **Select a Service containing this manual cluster** section.
   The cluster number appears in the **Number** field.

   a. Select the Lookup using list icon ( ) in the **Service** field.

   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.

   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).
4. In the **Select a Specific CI or generic CI class** section in the **Defined As** field, modify the manual cluster either as a specific CI of a manual cluster or as a generic CI class of a manual cluster that will be applied to all CIs of this class.

   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. **Optional:** In the **Provide a Description** section, modify the description in the **Description** field.

   (Optional) The **Description** field is automatically updated when you select **Save** or **Submit**. The automatically generated description consists of the configuration item name

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.

6. Activate or deactivate the cluster by selecting or clearing the **Activate** check box.
7. Select **Update** to save your changes.

Result

The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Related topics

Configuring CIs in a manual service as a manual cluster

Create an alert query

An alert query is a set of alerts that meet specific criteria for a particular service.

Before you begin

Navigate to **Event Management** > **Administration** > **Event Management Properties** and ensure that the **Enable alert query support** (*evt_mgmt.impact_calulation.alert_group_support*) property is set to **Yes**.

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

The main motivation to use alert queries is a modeling solution based on data contained in the alert itself, as an alternative to using either discovered, application, or technical services. Create an alert query to combine similar alerts that meet the specific criteria.

You can learn about Event Management basics, including alert queries, from this video:

Getting started with Event Management

Procedure

1. Navigate to **Event Management** > **Services** > **Alert Queries**.
2. Select **New**.
3. On the **Alert Query** form, fill in the fields.

   For a description of the field values, see Alert Query form

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In the **Filter** field:

- When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table.
- Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed.

- Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.

4. Select **Update**.

Related topics

Create alert group manually

Create an application service group

Create service groups to combine similar services. Organize services by groups to perform actions simultaneously on multiple services and to control user access to services.

Before you begin
Role required: evt_mgmt_admin

About this task
Service groups are a way to organize and group services based on the application services or technical services they impact. Instead of looking at individual service from different infrastructure components (like servers, databases, or applications), Service groups help consolidate them under the umbrella of a service group. Application service groups enable faster identification of alert impact. Service groups appear in the **Group by** option on the Service Operations Workspace dashboard.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Groups**.
   The Application Service Group page opens.
2. Select **New**.
3. In the **Name** field, enter the name of the new service group.
4. **Optional:** In the **Parent Group** field, enter the name of another group in which to embed the new group.
   Users with access to a parent service group automatically have access to all its child groups.
5. Select **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Assign a role to a service group

Group application services

Assign a role to a service group

Assign an Event Management role to the application service group to ensure that group members can manage and act on alerts.

Before you begin

Configure a service group to enable users to manage application services or alert groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Group Responsibilities**.
2. Click **New**.
3. In the **Application Service Group** field, select the name of the service group.
4. In the **Role** field, select an Event Management role:
   - evt_mgmt_admin
   - evt_mgmt_integration
   - evt_mgmt_operator
   - evt_mgmt_user
5. Click **Submit**.
6. To find users who are assigned to the role, navigate to **User Administration** > **Users** > **Roles** and search for the role.

Roles installed with Event Management

Activate and configure Service Mapping for top-down discovery

A top-down discovery provides a list of CIs and their interrelationships. This information is useful for managing software services and hardware issues that are associated with alerts.

Before you begin

Role required: evt_mgmt_admin

About this task

In Event Management, Service Mapping relationships appear on alerts. You can view the related CI and other information in the Event Management dashboard. The mapping relationships appear in a service map with the generated alert, any CIs that are bound to the alert, and all related CIs.

Procedure

Use Service Mapping to get top-down discovery information.
Service Mapping, which is closely related to Event Management, provides tools to discover the relationships between network, hardware, software, storage, and other devices.

Configure email notification on application service severity change

Configure an email notification to notify users when there is an application service severity change.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure an email notification to notify users when there is an application service severity change. The notification involves specifying when to send it, who receives it, and what it contains.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Outbound Email Configuration** section, in the **Email sending enabled** option, select **Yes** to enable sending severity information by email.
3. Click **Save**.
4. Navigate to **System Notification** > **Email** > **Notifications**.
5. Click **New**.

   a. In the **Email Notification Actions** form, specify these values.

Field	Value
Name	Type a descriptive name, for example, *`Application Service severity change`*.
Table	Select the required service type and its corresponding table: Alert Group, Discovered Service, Technical Service, or Application service.
Active	Select the check box to enable email notification.

   b. Click the **Who will receive** tab.
   In the **Users** area, search for and select the required user (the user does not require System Administrator credentials). Repeat this step for as many users that are required to receive this notification.

   c. Click the **When to send** tab and in the **choose field** box, search for and select *`Severity`*.

   d. Click the **What will it contain** tab and in the **Subject** field, type meaningful text that makes it clear to the receiver of the email notification what the content of the email is.

   e. In the **Message HTML** message area, using the **Select variables** functions, compose the conditions under which the email notification is to be sent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, configure these variables to change severity:

```
severity changed
```

```
Severity: ${severity}
```

```
on application service
```

```
Name: ${name}
```

6. Click **Submit**.

Configure contextual colors and icons

Use the **Contextual colors and icons** form to configure color, text, and icons to have different default or custom contexts, identified by a context ID.

Before you begin

Role required: evt_mgmt_admin

About this task

You can customize the colors or icons of elements in the **Contextual colors and icons** form to affect the displayed colors or icons of severities in related Event Management screens, either when accessibility mode is off or on. For more information about accessibility, see Accessibility features .

In each color selection field, you have the option of entering the value of the color as any of the following Cascading Style Sheet (CSS) formats that determine how HTML elements should be displayed:

- Name: predefined color names, for example, red, green, olive, blue, darkblue, or lightblue
- RGB decimal: RGB(102, 153, 204)
- RGB hex: #223344

See the following websites for information about CSS color declarations (including hex or RGB notation):

- HTML Colors (W3CSchools) for more information on hex and RGB notation.
- HTML Color Names (W3CSchools) for valid color names.

The context IDs that are provided with the base instance are:

- information_severity
- warning_severity
- minor_severity
- major_severity
- critical_severity
- topology_connection

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Contextual colors and icons**.
2. Click **New** or modify an existing configuration.
3. Configure the following fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
Context details	
Context ID	Enter a unique ID for the context, for example, clear_severity.
Context Name	Readable name for the context. This text is available to be read out by screen readers.
Batch	The batch that this context is a member of.
Description	Description of uses for the context.
Colors **Note:** For each entry in the color fields, after you enter a color code, a block appears to the right of the field showing the specified color. Use of invalid color codes triggers an appropriate error notification.	
CSS Color	The corresponding CSS color code for the context color name.
CSS Color on Interaction	CSS color code that appears on hover or focus.
Accessible CSS Color	Accessible CSS color code that appears when accessibility mode is enabled.
Accessible CSS Color on Interaction	Accessible CSS color code that appears on hover or focus.
Icons	
Icon	Icon that is displayed when the context includes an icon.
Accessible Icon	Icon that is displayed when the context includes an icon and when accessibility mode is enabled. To add your own icon, or to see a list of available icons, see Upload one or more images.

4. Click **Submit**.

View Event Management license usage

Event Management is licensed based on the number of CIs bound to alerts during the last year. For alerts that are not bound to CIs, the system calculates the number of nodes (servers) that can send events to the instance directly or through a third-party monitoring tool during the last year.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

The **Event Management - Node Count Store** job calculates the number of unique nodes that send event information, either directly or through third-parties, to Event Management and are eligible for licensing in the last year. The information from this job is stored in the License Usage [em_unique_nodes] table for visibility by all users. CIs bound to alerts are counted towards licensing; if there are no CIs that are bound to alerts, the event node field is used. Node is a

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

reference to a server, not the instances of the software on it. Your node count is based on the amount of infrastructure (servers for example) that will be sending events.

Procedure

Navigate to **All** > **Event Management** > **Reporting** > **License Usage**.

The table is filled automatically based on the alerts in the system. The user has no permission to edit the table. It is used to calculate the usage of the Event Management licensing.

Using Event Management

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

This guide can assist you on a regular basis.

View alert information

View a list of all alerts for application services s, and then manage individual alerts as necessary.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Multiple related events may correlate into a single alert. Event Management only creates alerts when one or more events meet the conditions defined in event rules, alert action rules, and alert configuration settings.

When updating an alert, empty field values do not override values inherited from the alert's event.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

Note:
To stop the message from appearing, set the *show_sow_enhanced_experience_message* property in the [sys_properties] table to false.

2. To view or manage an alert, click the alert number.
3. Review the information on the Alert form.
   You can click tabs on the form for further information.
   - To view flapping information, click the **Flapping** tab.
   - To view alert history, click the **History** tab.

Alert form

Field	Description
Number	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Configuration item	JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the **Additional information** field. Maximum length: 1000 characters. Note: Reference pop-ups and click-throughs are hidden by default for read-only fields. For **Configuration item** and other read only fields, you can optionally change the read-only setting. For more information, see Configure pop-ups on read-only fields . Click to open the alert in dependency view.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Metric Name	Unique name that describes which metric data is collected.
Description	A description of the alert.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The state of the alert. ○ **Open**: The alert requires user action. ○ **Reopen**: The previously closed alert requires additional user action.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Flapping**: After the alert has been closed, it receives a high frequency of identical events from the same source that causes many alert reopenings. User action is required. ○ **Closed**: The alert is closed and no further user action is required.
Acknowledged	Select **Acknowledged** to indicate that a user has acknowledged the alert.
Maintenance	A check box that shows whether the resource that is affected by the alert is in maintenance.
Updated	The most recent time that the alert information was updated.
Parent	○ If this field is blank, you can specify an alert number. The current alert becomes a secondary alert to this parent alert. ○ If an alert number is displayed, then the current alert is already a secondary alert to this current alert, which is the parent alert.
Feedback	This field appears in alert forms only if the alert being modified is a parent alert. Your response provides feedback about the accuracy and usefulness of the group. Possible values are: ○ None - No value was selected. ○ No Feedback - There is no feedback for this alert. ○ Yes - The alert group is accurate and useful. ○ No - The alert group is not accurate and not useful. **Note:** Currently, the feedback option is available but does not trigger further actions after being logged.
Knowledge article	The knowledge article associated with the alert, if any.
Overall Event Count	The counter is increased every time an event is bound to the alert. The count value is kept even after the actual event has been purged. Primary alerts (virtual alerts) are updated based on their secondary alerts. The actual number of events that affected the alert is displayed. **Note:** Do not create an Alert Group based on Event Count. Where an Alert Group is based on Event Count, the impact of the group does not calculate properly because the Event Count field is not copied to the em_alert_history table for impact calculation.
Source instance	The name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44.
User name and role	The user and role of the person who made the most recent alert updates.
Acknowledged	The **Acknowledged** check box value after the most alert recent update. ○ *True*: The **Acknowledged** is selected. ○ *False*: The **Acknowledged** check box is cleared.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Correlated Alerts section	The secondary alerts that are correlated with this alert, where this alert is the primary alert. For more information, see Rule-based alert grouping.
Primary Alerts section	The primary alert that is correlated with this alert, where this alert is a secondary alert. For more information, see Rule-based alert grouping.

Additional tabs.

Field	Description
Impacted Services tab	
Impacted Services	The impacted services that are related to this alert are listed. For more information, see View the impact tree.
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.
History tab	
Initial event generation time	The time when the event that generated the alert first occurred. This time is the platform processing time, not the source system time.
Last event generation time	The last time the event that is linked to the alert occurred. This time is the platform processing time, not the source system time.
Created	The time that the alert was created.
Work notes	The additional notes about the alert.
Activities tab	
Activity	A record of the work that was performed. The text has a date and time stamp.
More Information tab	
Priority Breakdown	Displays the computation of the alert priority score.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.

What to do next

You can respond to the alert in the following ways:

Alert response options

Option	Description
Submit	Save the modifications that were made to the form and return to the **Alerts** list.
Acknowledge the alert.	Click **Acknowledge**. If the alert is reopened, this button reappears so you can reacknowledge the alert.
Create an incident.	Click **Create incident**. For more information, see Create incident or security incident from an alert.
If Security Incident Response is activated, create a security incident response.	Click **Create Security Incident**.
Designate that the alert is in maintenance.	Select the **Maintenance** check box. For more information, see View all alerts by the maintenance status.
Close the alert.	Click **Close**. For more information, see Close an alert.

Security incidents created from events and alerts

Priority group

For better triage and focus, alerts that have a higher priority are brought to the top of the alert list. This placement brings to your attention those alerts that require you to handle them at a higher priority than other alerts.

The priority group indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.

Thresholds

Thresholds on the calculated priority are used to determine to which category the alert is mapped to. Alerts with a priority above the value of the *evt_mgmt.top_priority_group_threshold* property are categorized as **Urgent**, which is the highest priority. The default value of this threshold is 1M.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Priority group categories

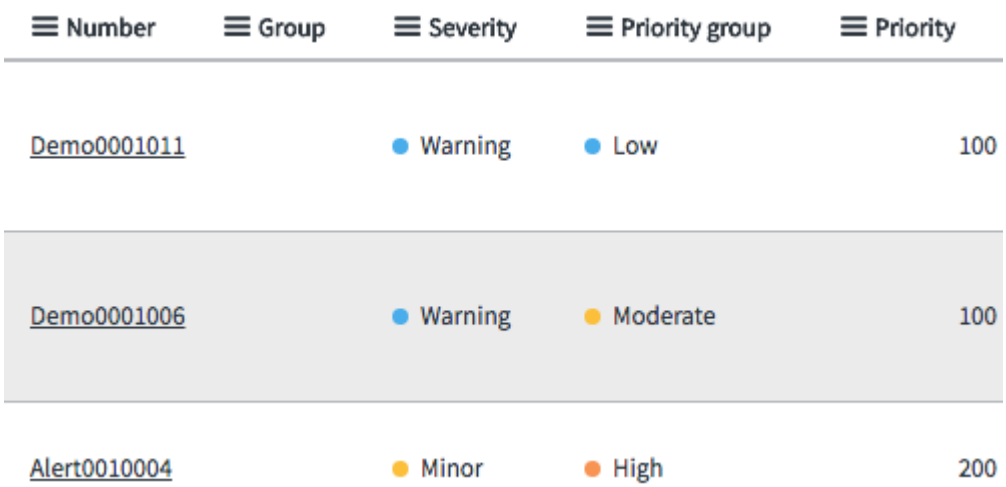
The priority groups into which alerts fall are listed in the following table.

Alert priority groups

Priority group	Icon
Urgent	
High	
Moderate	
Low	

The value of the alert priority group is more meaningful than the alert severity on its own. For example, an alert with a severity of Major, may not be in need of resolution ahead of an alert whose priority is Critical. The combined group priority value takes the weight of each factor into account, giving you a better indication of which alert to attend to first.

The alert priority group is available in alert lists in the Dashboard, Alert Intelligence, and All Alerts page. For example, in the **All Alerts** list, the alert priority group is displayed as depicted in the following image.



Triggers that cause recalculation

Changes to open alerts trigger the recalculation of the priority and then the alert is again categorized into the relevant priority group. Closed alerts are not considered for alert priority group calculation.

Related topics

Alert priority

Alert execution information

Alert execution information provides a reference to the actions that have been performed concerning the alert. Among the information presented is which alert management rules ran on the alert, incidents that were opened, and which remediation workflows ran.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Executions

In an alert form, the Alert Execution tab shows key related records for the alert. For example, it shows which actions were performed and which alert management rules were run. If an incident was opened, the related tasks are shown.

Fields in the Alert Executions section

Field	Description
Alert	Reference to the alert that ran under this rule.
Action name	Indicates how the alert was resolved.
Link to execution	Link action that was taken to resolve the alert.
Related task	Link to the incident that was created when the alert was resolved.
Log	Link to the log that details the actions taken to resolve the alert
Automatic run	Indicates if the rule was automatic (true) or manual (false).

Action name

This indicates what occurred, for example, if an incident was created.

Log

The log reveals which alert management rule initiated the action. It shows, for example, automatic execution 1 out 3, or manual execution, 2 out of 4.

View alerts in the flapping state

You can view alerts that are specifically in the flapping state.

Before you begin

Before starting this procedure, ask your administrator to configure alert flapping properties.
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

The frequency of events from an identical source within a given time interval determines whether an alert is in a flapping state or a new issue has occurred. Based on the *evt_mgmt.flap_frequency* and *evt_mgmt.flap_interval* property values:

- If the same issue is recurring, Event Management associates the new event with the existing alert and the state of the alert is set to **Flapping**.
- If the issue occurs after the time interval expires, Event Management creates an alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you can respond to an alert by rebooting a problematic server. After no events are generated for several minutes, it is assumed that the issue is fixed and the alert is closed. If the reboot did not actually fix the issue, this server can generate more events later. Then additional alerts are generated for the same issue.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the number of an alert that is in the **Flapping** state.
3. On the alert, click the **Flapping** tab.

Flapping tab on Alert form

Field	Description
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.

4. If the **Parent** field is empty, address this alert as a new issue.

Related topics

Configure alert flapping

View all alerts by the maintenance status

The **Maintenance** status indicates that the CI is under maintenance. For example, there is a software upgrade, and the issues can result from that activity, therefore all maintenance alerts are discarded.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The alert maintenance status can change due to any of these reasons:

- A user selected the **Maintenance** check box on the alert, or selected the alert from the list view, and then clicked the **Maintenance** UI action.
- A new alert that had been bound to a CI whose status is in maintenance status on the CMDB table.
- If all previous events associated with the alert are in maintenance, the alert **Maintenance** field can automatically be set to *`true`* showing maintenance is in progress. However, if an alert **Maintenance** field is *`false`* but the related CI status is changed to *`In Maintenance`* after the alert was created, any subsequent events do not put the alert into maintenance. For

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

example, if an alert is generated for a router and later the router is taken down for maintenance, it is still assumed that there was a problem before maintenance started and the issue must not be ignored.

Note:

- If a maintenance flag was set on an alert in Geneva, after upgrading to Helsinki it affects the impact as a regular alert.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Procedure

1. Navigate to **All** > **Event Management** > **All alerts**.
2. Review the **Maintenance** column for each alert.
   A value of *true* indicates that the CI is under maintenance.

Note:
If the **Maintenance** field is not visible on the Alert form, personalize the list to add the field. For more information, see Personal lists.

Collaborate from within an alert

You can collaborate with colleagues and write work notes while working in an alert.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can select to work either in a compact view of Connect that overlays the standard user interface or in a full-screen workspace. The conversations are not copied into the alert.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the required alert.
3. In the alert screen, click **Follow**.
   The label of the button changes to **Following**, showing the current connection to collaboration status.
4. To view the Connect sidebar in a full window, click the down arrow in the **Follow** button and select **Open Connect Full**.
   You can write text in the **Worknote** field. This text is not copied into the alert.
5. To collaborate with colleagues or with support, click the **Add User** icon.
6. To conclude the Connect collaboration session, click **Following**.

Create incident or security incident from an alert

When an alert must be escalated and assigned to someone who can resolve the underlying issue, you can open an incident.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
If Security Incident Response is activated, a security incident can be created.

You can manually create incidents and security incidents from the Alert form. To prevent duplicate tasks, the system checks the conditions of all task templates before creating an incident.

You can customize the created incident using the *EvtMgmtCustomIncidentPopulator.populateFieldsFromAlert* script include. The customization includes mapping fields from the alert to the incident or aborting the incident creation according to customized conditions. For more information, see Custom alert fields.

You can populate incident fields using custom alert fields values that where populated from additional information fields. Use the *EvtMgmtCustomIncidentPopulator* script include to copy the values to the incident after copying the data to the alert. For more information, see Custom alert fields.

Note:
If Security Incident Response is activated, the base system includes an alert action rule called **Create security incidents for critical alerts**. This alert action rule creates security incidents when critical security events are reported.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the alert **Number**.
3. To create an incident:
   - To create an incident, click **Quick Incident**.
   - To create a security incident, click **Create Security Incident**. You must install the Security (secops) plugin to enable this option.
4. Click **Update**.

Result
The created incident appears in the **Task** field of the Alert form.

Related topics
Security incidents created from events and alerts

Place an alert into maintenance
You can manually place any alert into maintenance to hide it from the Alerts list and Agent Workspace.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator

About this task
Placing the alert in maintenance does not place the CI into maintenance. The **Status** field on the CI record remains the same.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Perform one of the following actions.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
To put multiple alerts into maintenance	Select the check boxes next to each alert, and then click the **Maintenance** UI action at the top of the list.
To put one alert into maintenance	Open the alert, and either select the **Maintenance** check box and click **Update**, or click the **Maintenance** UI action at the top of the list.

Alert insight information

Alert insight aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the selected alert.

Use alert insight to find a solution and help find the root cause of the alert

Results from data analysis provide further information about the alert, beyond that of the alert form. This aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the alert.

Information shown is from repeated alerts, similar alerts, incidents, problems, and change requests on the same CI, similar CIs, and other CIs that are related by CMDB relations or grouping.

Apply a quick response in an alert

In an alert, use the *Quick Response* feature to apply remediation to the alert or to launch a web application.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

About this task

Quick Response is a feature that enables you to perform a quick action on the selected alert. The action is to apply remediation or to launch an application. If you have upgraded from Istanbul or earlier, this feature is a combination of the **Remediation** and **Launch an application** features.

If you select a remediation link when invoking a Quick Response, a workflow is executed according to the criteria specified in the alert management rule. Click a launch application link to launch the web application that was configured in the alert management rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the Alerts list, right-click the required alert and select **Quick Response**.

Launch web application from alert

Monitor service health

On the Operator Workspace, you can view alerts by application services, technical service, and alert group. For services, you can also open a service map to view relationships between CIs in the service.

Before you begin
Ask an administrator to create at least one application services, technical service, or alert group if none of these items exist.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
The Operator Workspace tiles represent a service, alert group, or CI. The tile color represents the overall alert severity.

Note:
Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

These tile icons are available:

Dashboard tile icons

Icon	Meaning
	Represents the status of a mapped application services.
	Represents the status of an Alert group with a set of corresponding open alerts.
	Represents the status of a dynamic CI group.

Each tile represents the highest severity of an alert for the service, alert group, or CI. For example, a tile appears in red if an alert is critical. A green tile indicates either information alerts or no currently active alerts. As the alert severities change, the tile colors update accordingly. The following severities are available:

- **Red**: critical severity (highest severity). Immediate action is required. The resource is either not functional or critical problems are imminent.
- **Orange**: major severity. Major functionality is severely impaired or performance has degraded.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Yellow**: minor severity. Partial, non-critical loss of functionality or performance degradation occurred.
- **Blue**: warning severity (lowest severity). Attention is required, even though the resource is still functional.
- **Green**: informational. No severity. An alert is created. The resource is still functional.

Procedure

To integrate with Operational Intelligence, activate the Operational Intelligence (com.snc.sa.metric) plugin.
Follow the steps in the Get started with Metric Intelligence topic. Metrics information appears on the **Metrics** tab in the Service Operations Workspace.

Related topics

View metric values in the Insights Explorer

View discovered service history

The discovered service history shows the frequency of discovered services for a particular time period.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
The discovered services history appears only when there are multiple discovered services that occur over a period. A discovered service is a service that is discovered by Service Mapping. The discovered services history is not available for application services. If no discovered services are generated for a particular service, the discovered services history is hidden.

Procedure
1. Navigate to **All** > **Event Management** > **Service Operations Workspace**.
2. Click a service tile and click **Service Map**.
3. Click the **History map** button.
   The history timeline appears, with changes to the service indicated by a clock icon ( ).

4. To view a map showing changes in the service's severity, click the More icon ( ) and select **Advanced map**.

   The displayed color corresponds to the discovered services severity, and the length of the bar in each color corresponds to how long the discovered services stayed at that severity.

   The following table explains the severity colors:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service severity colors

Severity	Icon color
Critical	Red
Major	Orange
Minor	Yellow
Warning	Blue

5. To change the information that appears on the discovered services history Advanced map, click a history icon.

   - **Calendar icon**: Show information for currently active discovered services.
   - **Hours**: Show information for discovered services that occurred in the past hour.
   - **Days**: Show information for discovered services that occurred in the past 24 hours.
   - **Weeks**: Show information for discovered services that occurred in the past week.
   - **Months**: Show information for discovered services that occurred in the past month.

Monitor alerts for an application services

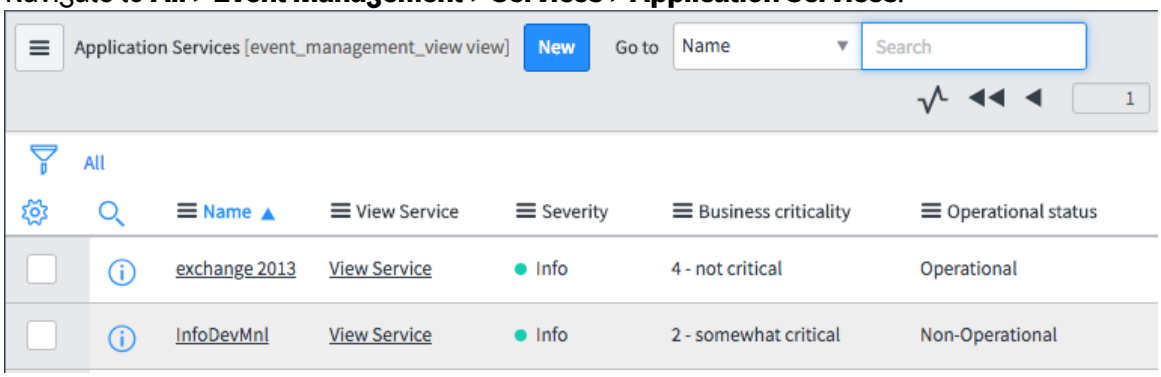
To view information for application services only, navigate to the application services list. From this list, you can open service maps to view and manage alerts for the CIs in each service.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.



2. In the row of the required application services, click **View Map**.
3. Do one or more of the following.

View monitored services

View all services that Event Management supports, such as, alert groups, discovered services, application services, and technical services. According to the type of service, you can view service definition details or drill down into the service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

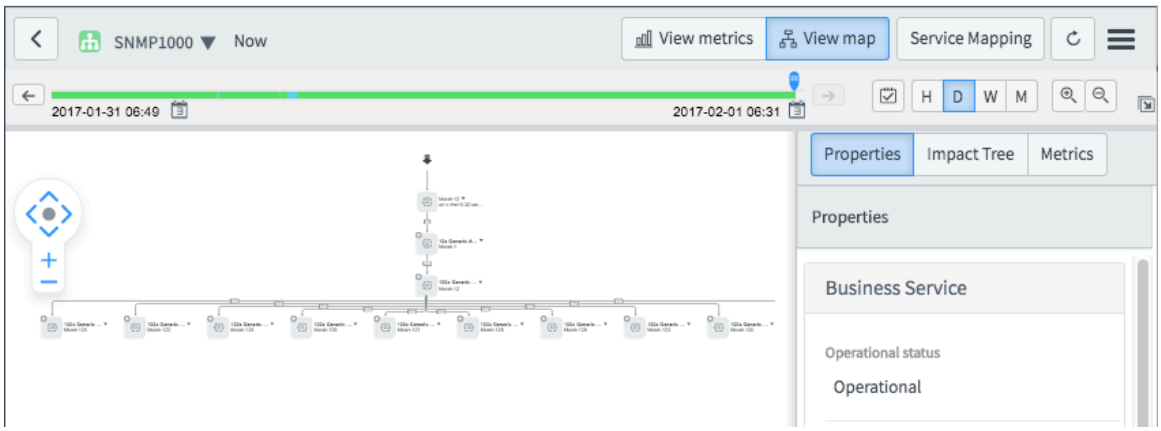
Role required: evt_mgmt_user

Note:
Application services that were created before activating the Event Management plugin are not listed in the in the **View Service** column of the Monitored Services list.

Procedure

1. Navigate to **All** > **Event Management** > **Monitored services**.
2. Click **View Service** to open the view that is relevant to that service.
   When you drill down to the contents of the service, either a map, alert list, or CI list appears according to the type of service.

   For example, if you click **View Service** for SNMP1000, you can drill down to the contents of the service and the related topology map appears.



3. To view service definition details of a service, click the name of the service on the **Monitored services** page.

   For example, in the **Name** column, click SNMP1000 (SNMP1000).

Monitor service health

Use the Event Management overview dashboard

The Event Management overview module uses Performance Analytics to present data from your instance for you to better visualize and understand your processes and drive continual improvement.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

From the Xanadu release onward, the Event Management overview module has been deprecated and replaced with the AIOps dashboards. The dashboards deprecated include the following:

- Event Management insights
- Event Management scorecards
- Event Management overview

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Performance Analytics and Reporting

Launch web application from alert

You can launch a web application from an alert that matches the conditions set in an alert action rule.

Before you begin

Create an alert action rule that is configured to prepare a URL when the conditions that you stipulate are met. For example, based on the results when the alert parameters are resolved, this feature can open a Knowledge Base article or construct a URL.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Right-click an alert in All Alerts or the Alert list in the Event Management Dashboard (for instances upgraded from a release before Orlando), and choose **Quick Response**. Click the required link to launch the web application that was configured in the alert action rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Right-click the required alert and select **Quick Response**.
   A window appears with a list of available web applications that were configured in the alert action rule and the filter that matches the alert. To see the target URL, point to the cursor over the application name.

   Note:
   If one or more of the alert action rule parameters cannot be resolved, the related application name appears in black. When the alert parameters are resolved, then the application name becomes a link.

3. Click the name of an application to open the URL in another tab or window in your browser.

Example:

A common use case is launch in context to the source management system.
Other examples include to search in knowledge bases, not only within ServiceNow, but externally as well. Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

Event Management Operator Tutorial

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Take the tutorial

Before you can work as an operator, you should take a tutorial to become familiar with several Event Management concepts and understand what operators typically do on a regular basis.

Start the tutorial by clicking the first lesson:

Lesson 1	An overview of events and alerts
Lesson 2	An overview of application services
Lesson 3	Event Management operator workspaces
Lesson 4	What operators do

An overview of alerts for Event Management operators

As an Event Management operator, you need to understand how an alert is generated from an event, what to look for in an alert, and how alerts can be grouped together.

This is the first lesson in the Event Management tutorial.

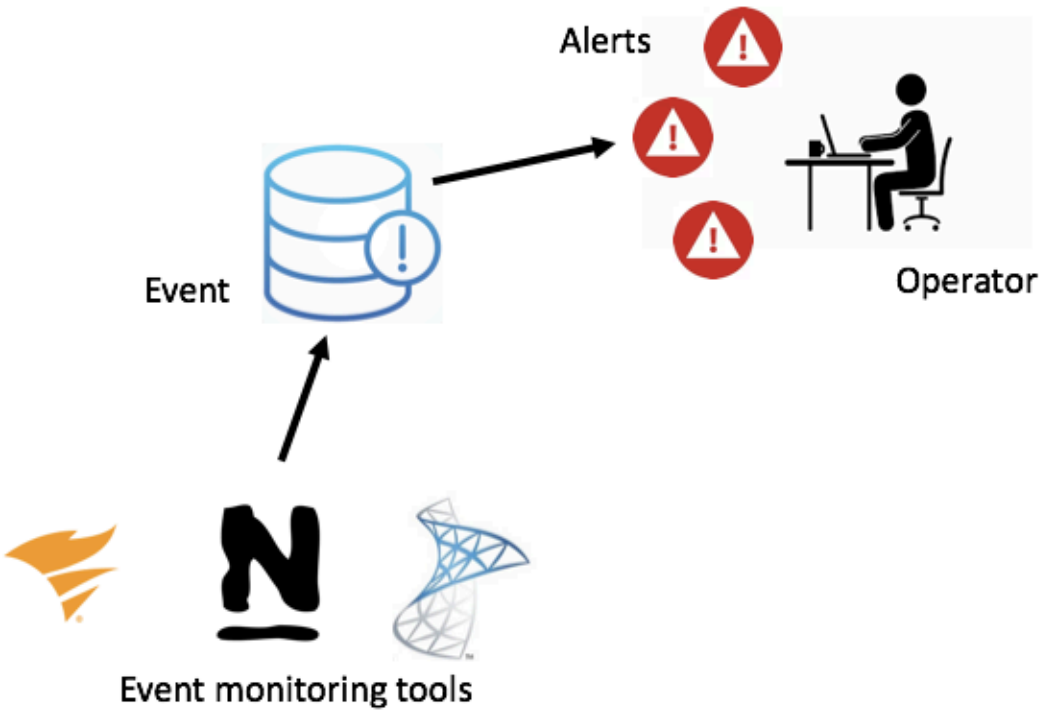
Lesson 1	○	**An overview of events and alerts**
Lesson 2	○	An overview of application services
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

Your organization already has an event monitoring tool in place, such as Microsoft System Center Operations Manager (SCOM), Nagios, SolarWinds, and so on. When an issue occurs on your network, such as a computer going down or a database failure, the event monitoring tools send events to your ServiceNow instance. The Event Management application processes the events

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

according to the settings that your administrator configured, and then generates alerts. An alert is an indicator that the issue requires some type of action.

Alert generation



As an Event Management operator, your role is to view alerts and, depending on how Event Management is implemented in your organization, take an action to help resolve the underlying issue or notify someone who can. Later in this tutorial, you will see the phases of a typical alert management process.

Alert priority and severity

The two most common characteristics of an alert are the priority and the severity.

- The priority of an alert is a score that helps you determine how important the impact is to application services. Multiple factors determine the alert priority score. Your Event Management administrator can configure the algorithm that the Event Management application uses to calculate priority.
- The severity of an alert is an indicator of how serious the underlying issue is. The event monitoring tool in your organization usually sends severity values with the event, which then gets carried over in the alert. These are the default severity types that you will see in this tutorial:

Severity	Description
Critical	The resource is either not functional or critical problems are imminent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

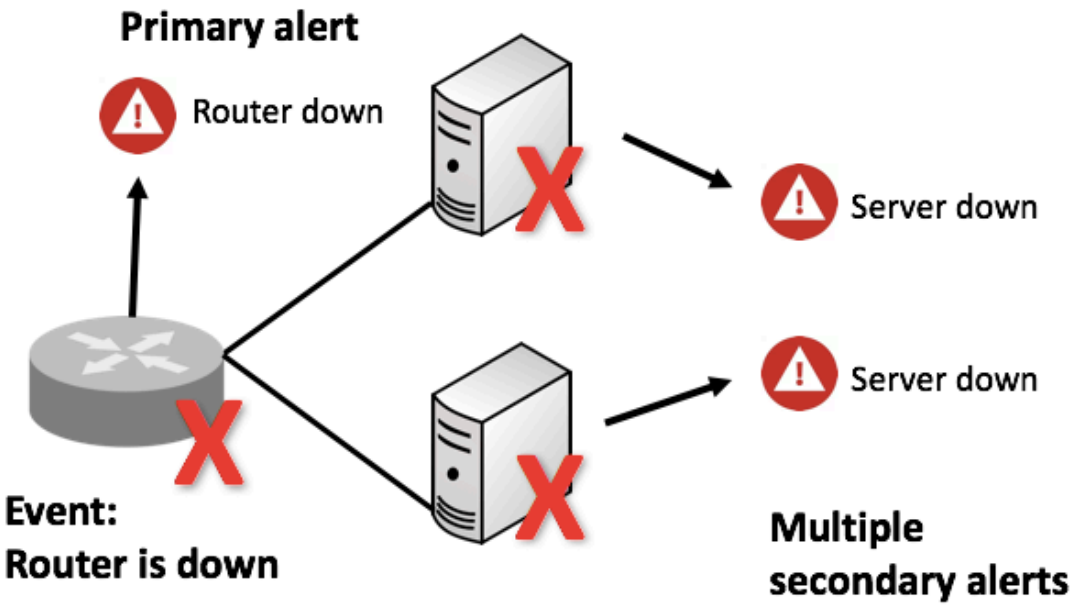
Severity	Description
Major	Major functionality is severely impaired or performance has degraded.
Minor	Partial, non-critical loss of functionality or performance degradation occurred.
Warning	Attention is required, even though the resource is still functional.
OK	No severity. An alert is created. The resource is still functional.
Clear	The alert no longer needs action.

Correlated alerts

Some alerts are related to each other. For example, if a router goes down, several separate alerts could be generated, one for each server connected to the router. All of these alerts are related, or correlated. To help you manage correlated alerts, Event Management can automatically group them and establish a two-level hierarchy with one root alert, called the primary alert, at the top, and other related alerts, called secondary alerts, under the primary alert. When you view alerts, primary alerts stand out by default so you know which alert to focus on without being distracted by the secondary alerts.

In our example, if a router goes down on your network, network communication is also affected for connected servers, assuming they cannot reach any other routers. The router outage becomes the primary alert and the alerts generated on the server are secondary alerts that are correlated under the router alert.

Secondary alert generation



Depending on your organization's Event Management implementation, alerts might be grouped automatically based on correlation rules that your administrator sets up. Your instance can also

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

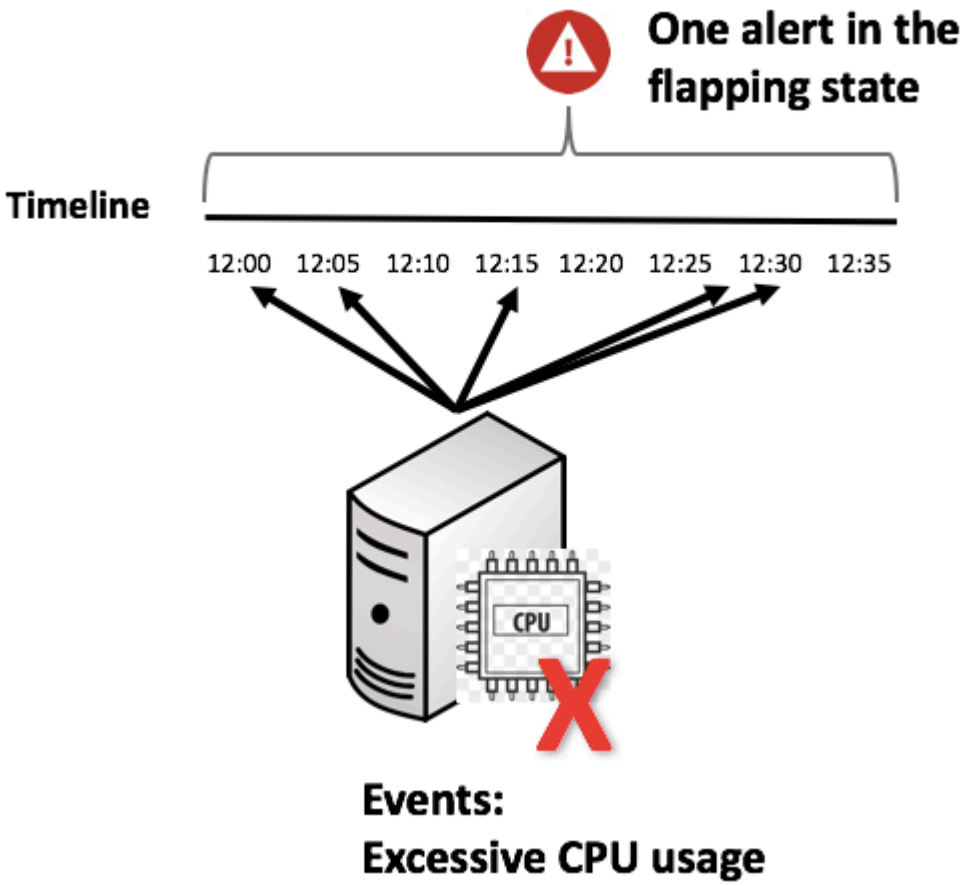
learn how to improve the way it correlates alerts based on these rules. As an operator, you should still verify the accuracy of the correlation and, if necessary, manually correlate additional alerts with the primary alert. Later in the tutorial, you will learn how to do this.

In this tutorial, you will learn how to manually correlate alerts.

Alert flapping

An alert can flap, meaning that it gets multiple open-close events in rapid succession. Flapping indicates that Event Management does not know whether the underlying events are genuine or not. The events could indicate small issues with the way CIs are configured, or larger issues, like network outages.

Alert flapping



For example, if a server that hosts a web service has too many active processes, it might trigger an event about excessive CPU usage. Since CPU usage can fluctuate rapidly depending on web service requests, several events might be triggered, leading to the alert being put in the flapping state. As an operator, you might need to create an incident to have the server restarted, or someone might have to reconfigure the CPU, or possibly make a hardware change on the device.

As another example, consider a loose network cable that causes momentary, repeated network outages. The thresholds that your administrator configures might not be optimal for this kind of alert and Event Management considers it a flapping alert.

Continue the tutorial

Proceed to the next lesson: Application services for Event Management operators.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services for Event Management operators

As an Event Management operator, you need to understand what application services are.

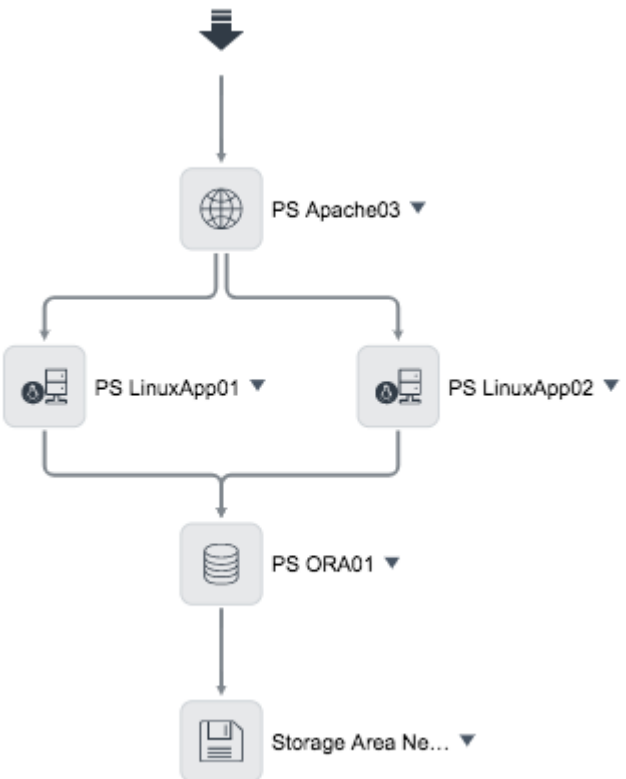
This is the second lesson in the Event Management tutorial.

Lesson 1	✓	An overview of events and alerts
Lesson 2	○	**An overview of application services**
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

An application service is a collection of components, such as network devices, computers, and applications that offer a service to your organization. The services can be something like an email system or a website that tracks orders or requests in a database. Your administrator should have already specified the application services in your ServiceNow instance.

Each component that makes up an application service is referred to as a configuration item or CI. This service map provides a visual representation of an application service:

Service map



In this example, you can see a Web Portal application service with these CIs:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **PS Apache03**: An Apache web server that hosts a company website.
- **PS LinuxApp01** and **PS LinuxApp02**: Two Linux servers that share the workload from the web server.
- **PS ORA01**: A database server that both Linux servers need to access.
- **Storage Area Network 001**: A mass storage device on which the other CIs depend.

You can see service maps like this on the Service Operations Workspace dashboard. Later in this tutorial, you will learn about the dashboard and what an application service looks like when an alert is associated with a CI.

Types of application services

Event Management classifies application services into the following types:

Technical services

A technical service is a dynamic grouping of CIs based on some common criteria. For example, a technical service could be comprised of all web servers or all Oracle databases for a specific location, like North America.

Application services

An application service can consist of discovered services, manual services, or both. A discovered service is an application service that the Service Mapping application finds (if your organization uses Service Mapping). A manual service is an application service that your administrator configures by selecting and adding each CI and specifying the relationships between CIs.

Alert groups

Alerts that are grouped together, either manually or automatically.

Alert impact

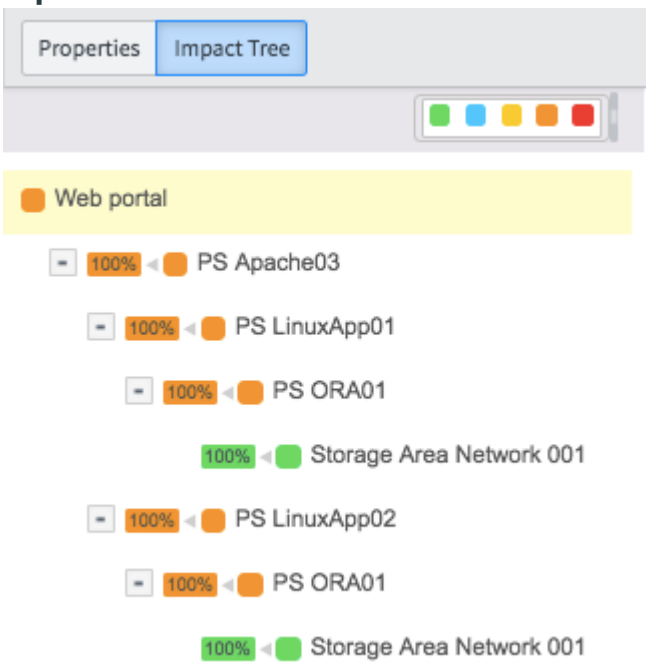
Application services are critical to the operations of your organization. If an issue occurs on one CI, the entire application service can be affected. Part of your role as an operator is to analyze alerts on CIs and see how they impact the application service as a whole, and then take an action to help remediate or solve the underlying issue. Your administrator can configure impact rules that go into calculations for the severity of an alert.

Later, when you learn how to use the Service Operations Workspace dashboard, you will learn how to view an impact tree for an application service so you can understand the relationship between the severity of an alert and the overall application service.

In this example, you can see how a **Major** alert on an Oracle database (**PS ORA01**) also causes a major alert on its parent CIs and on the Web portal application service itself.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact tree



Continue the tutorial

Proceed to the next lesson: Event Management operator environment.

Event Management operator environment

As an Event Management operator, your primary work environment is the Service Operations Workspace dashboard.

In this, the third lesson in the Event Management tutorial, you get an overview of your workspaces so you know how to find the information you need.

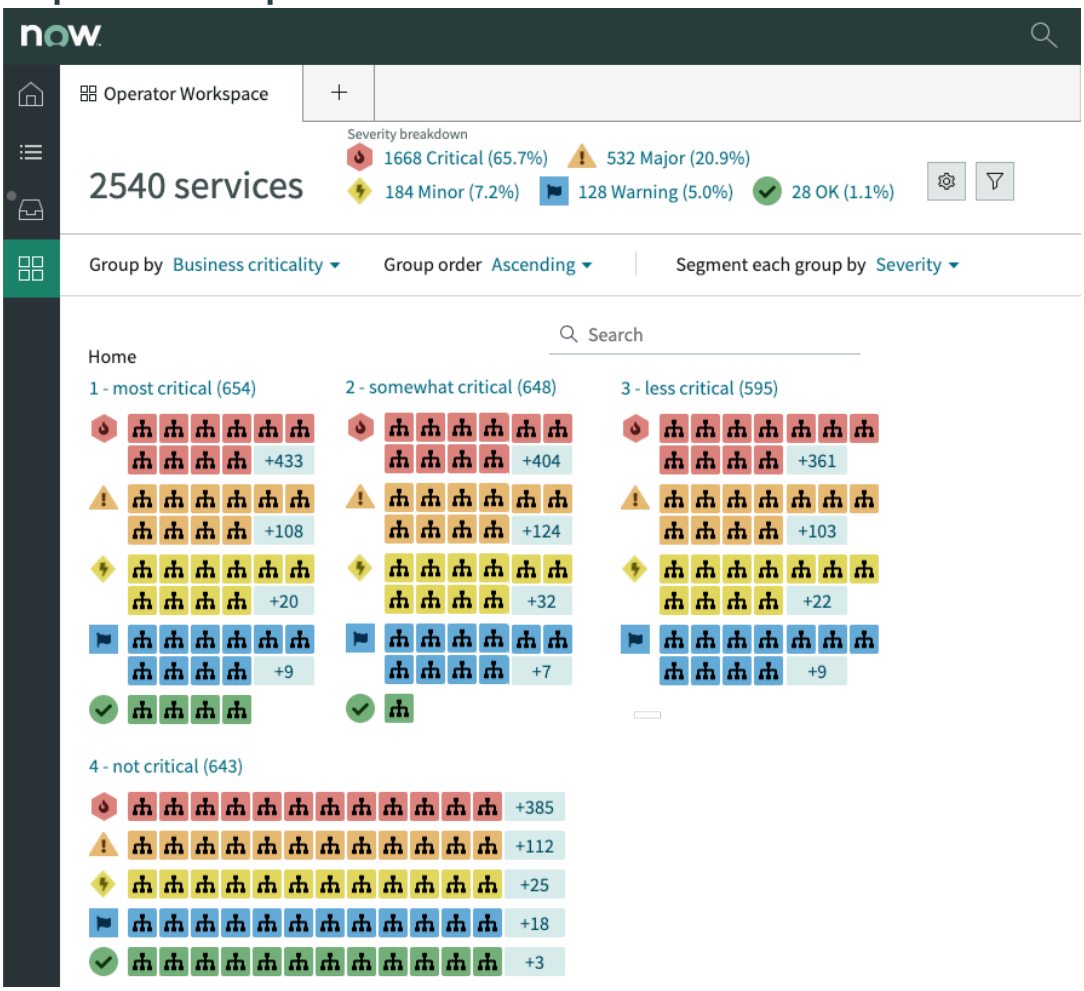
Tutorial lessons		
Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	○	Event Management operator environment
Lesson 4	○	What operators do

The Service Operations Workspace dashboard

Your main area of work is the Service Operations Workspace dashboard, which provides a view that focuses on how alerts relate to application services. From here, you can drill into each application services to see the affected CIs and get an understanding of the overall impact of whatever caused the alert. To open the dashboard, navigate to **Event Management** > **Service Operations Workspace**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Operations Workspace



The main sections of the dashboard are:

Banner

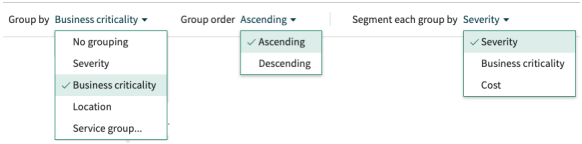
The banner contains controls that show or hide application services based on the criteria you select:

Click a severity level to show or hide application services based on the alerts associated with them.

Use the **Group** and **Segment** controls to organize the view.

Note:
Your administrator assigns an application the criticality and cost value to your application services.

Group and Segment filters

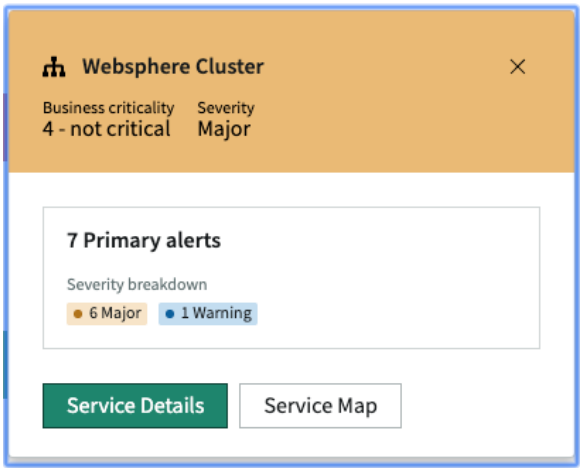


© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services

The Service Operations Workspace dashboard displays tiles that represent application services. The color of a tile represents the severity of the alerts that are associated with the application service.

Click a tile to show a summary of alerts associated with the application service. Click to view details or the service map.



Alerts

Click the List icon (

). On the Lists tab, click the kind of alert to view.

You can filter or sort the list to find an alert. Sort by any alert details, such as the **Priority**, which considers multiple factors for how serious the alert is, or the **Severity**, which is value provided by the event monitoring tool.

Open any alert by clicking the number.

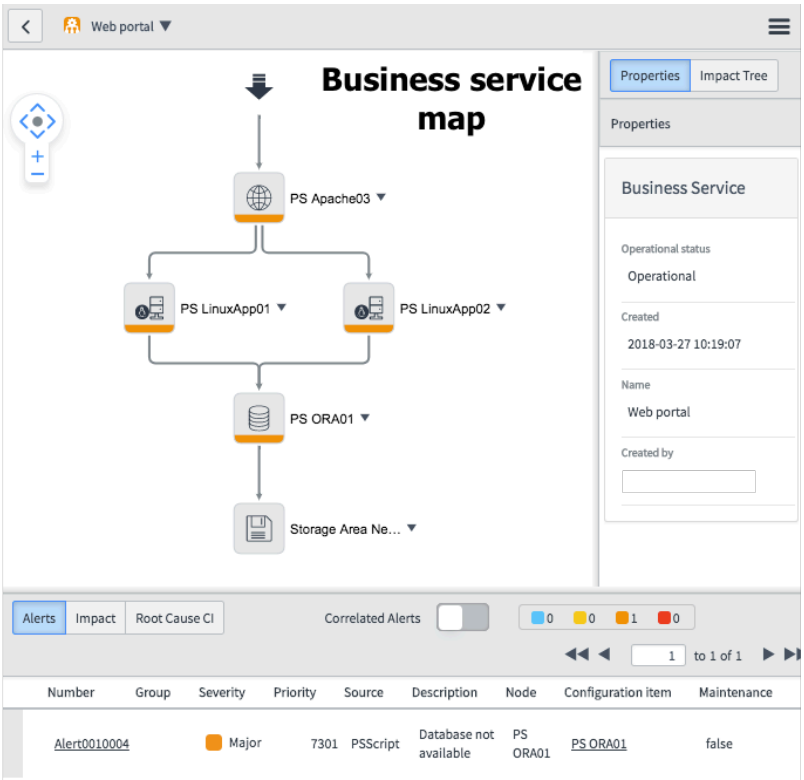
You will learn about what each of the columns means for an alert later on when you analyze an alert.

Application service map views on the Service Operations Workspace dashboard

Double-click the name of an application service tile to open one of the application service map views. The view that you see depends on the type of application service.

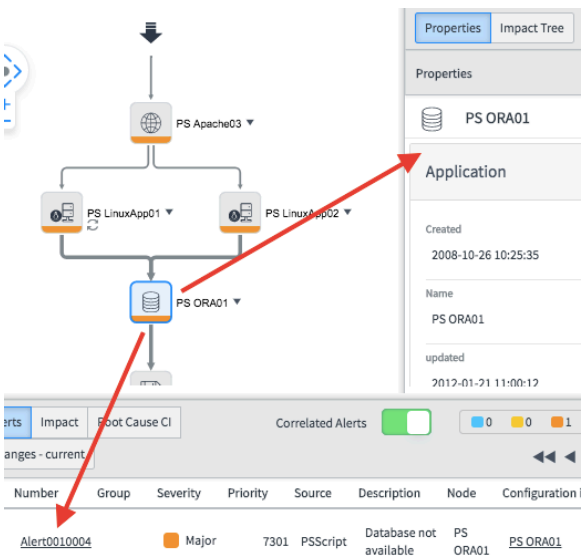
For a manual or standard application service, this view appears:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



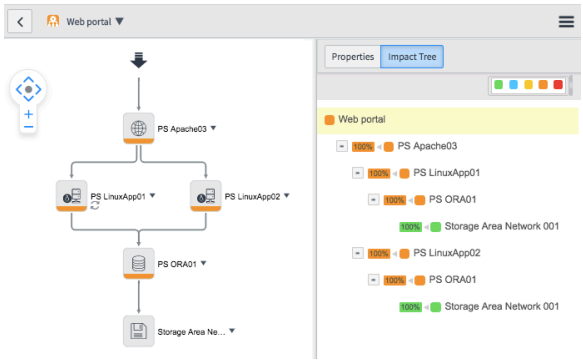
The application service map that you were introduced to in a previous lesson appears in the main panel. This is what you can do from this view:

Click any of the CIs to see the alerts only for that CI and to display the details about that CI in the **Properties** pane.



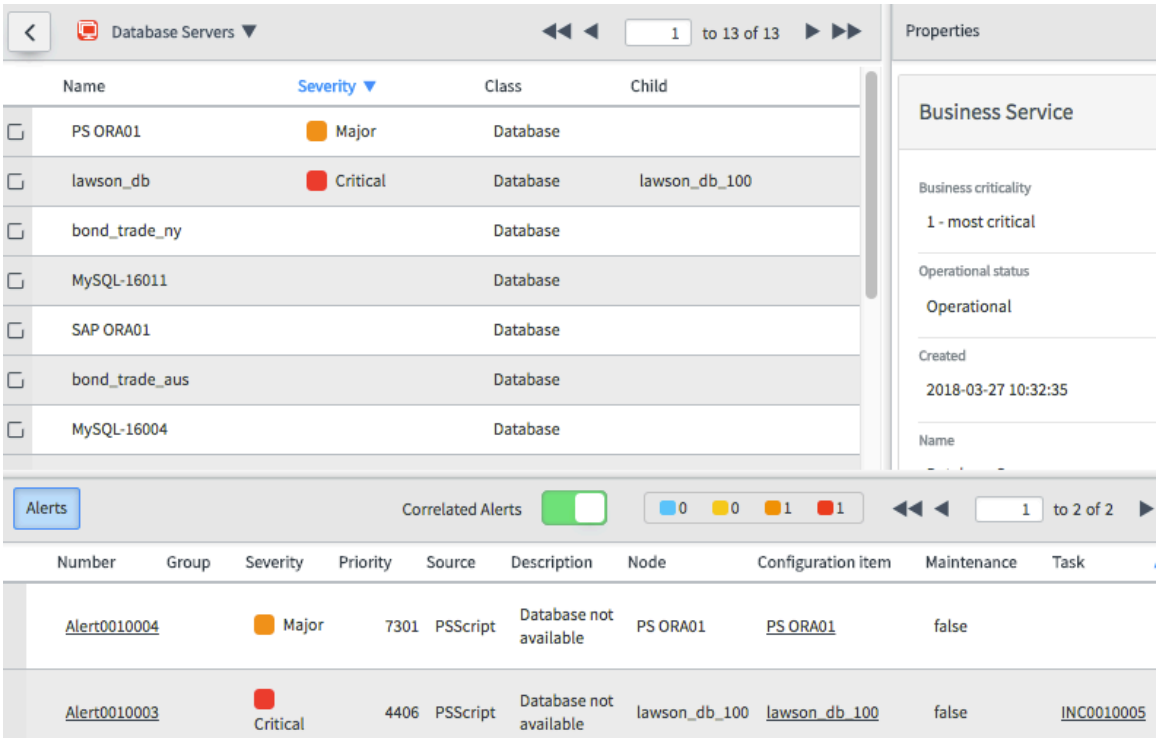
Click **Impact Tree** to see the state of all the CIs and how they affect each other when receiving an alert. You will learn more about the impact tree later on in the tutorial.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



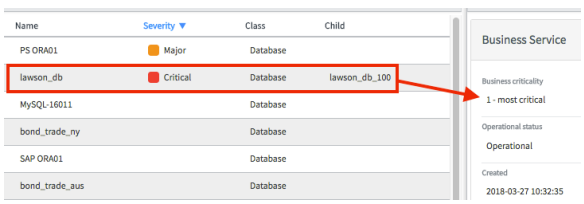
Open any alert from the **Alerts** list at the bottom by clicking the number.

For a technical application service, this view appears:



This is what you can do from this view:

Click any CI to view details about it.



Open any alert from the **Alerts** list at the bottom by clicking the number.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Continue the tutorial

Proceed to the next lesson: What Event Management operators do.

What Event Management operators do

As an Event Management operator, your typical workflow involves three phases: analyzing an alert and its effect on application services, taking some type of action, and making sure the alert is finally closed.

This is the last lesson in the Event Management tutorial. In this lesson, you will run through the three phases of a typical operator day-to-day workflow.

Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	✓	Event Management Service Operations Workspace
Lesson 4	○	**What operators do**

Your organization will have specific policies and procedures that may differ from the phases outlined in this topic. In addition, your administrator might have customized the Event Management application so that some of these phases are automated and do not actually require any action on your part.

For the purposes of this tutorial, we will walk you through each phase and allow you to perform the tasks manually.

Phase 1	Analyze and acknowledge an alert	In this phase, you will find an alert to work on, analyze the details, and acknowledge it so that other operators know it is a legitimate alert.
Phase 2	Triage an alert	In this phase, you take an action to help remediate the issue that caused the alert. The most common action to take is to create an incident and assign it to someone who can solve the underlying issue.
Phase 3	Close an alert	In this phase, you will verify that the alert is resolved, and then close the alert.

Start here

Start out by learning how to Analyze and acknowledge an alert.

Operator phase 1: Analyze and acknowledge an alert

As an Event Management operator, the first thing you should do is access alerts and then find the ones you want to focus on. You can open the Alert form to analyze the details, and then

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

acknowledge it to let other operators know that the issue causing the alert should be addressed in some way.

Before you begin

Phase 1	◯	**Analyze and acknowledge an alert**
Phase 2	◯	Triage alerts
Phase 3	◯	Close an alert

You must understand both of your operator environments: the Service Operations Workspace dashboard and Service Operations Workspace. Review Event Management operator environment if you have not already done so. This tutorial uses the Service Operations Workspace dashboard.

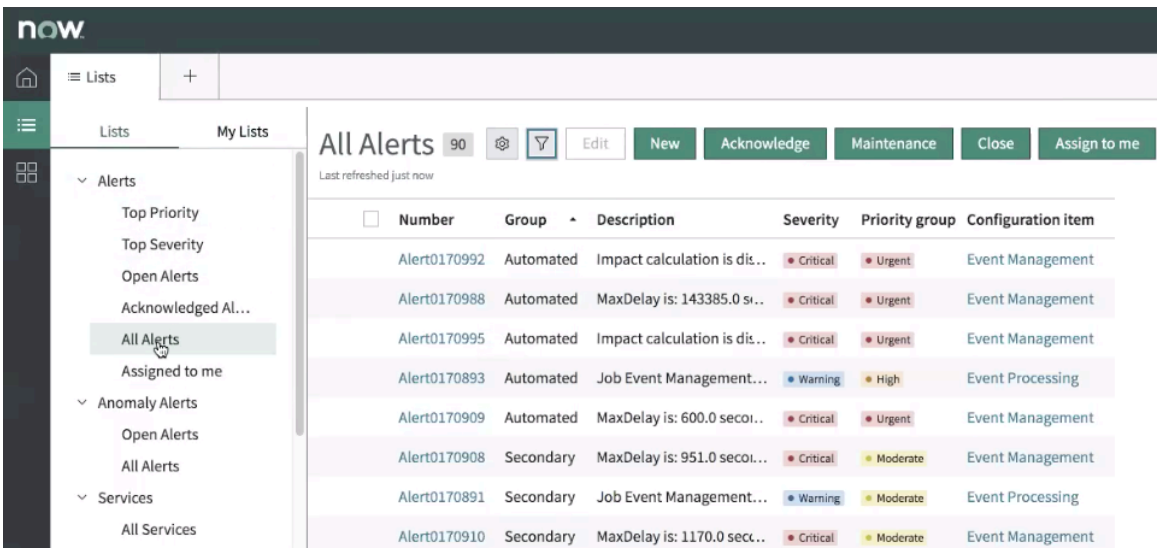
Role required: evt_mgmt_operator

Procedure

1. Navigate to **Event Management** > **Workspaces** > **Service Operations Workspace**.

   In the list, click **Alerts** > **All Alerts**. By default, all alerts appear in the list sorted by **Group**. Click any heading to sort by that value. To view current filter settings, click the filter icon

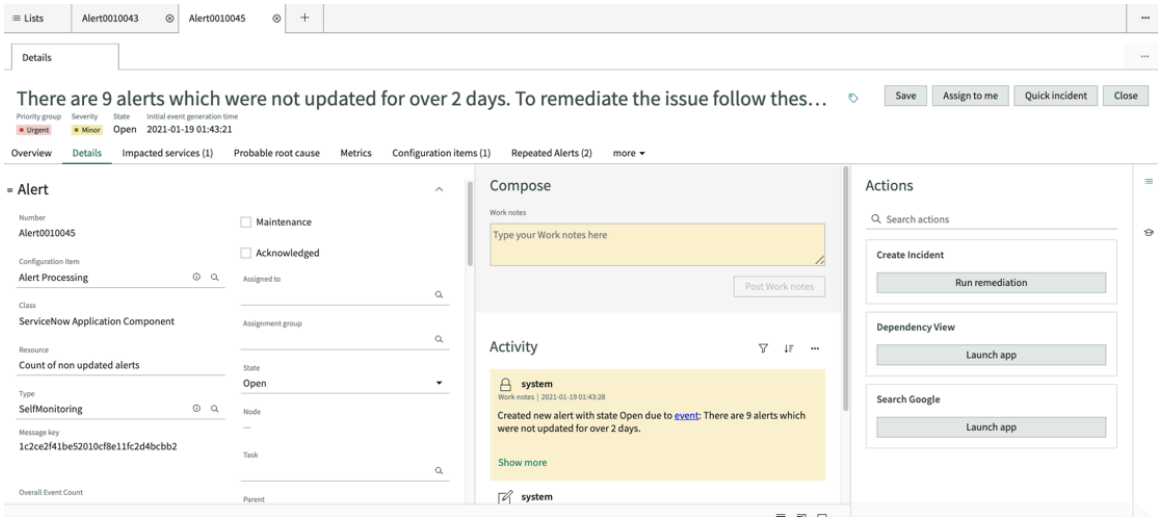
   . To modify filter settings, click **Advanced view**.



2. Find the alerts to focus on by clicking **Application Services** > **Services**, or by using any of the filtering and sorting options.
3. Click an alert name to open the **Details** tab for the alert.

   Example
   The important fields on the form and related items are described after the screenshot.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Fields on the Alert Details tab for an alert that is associated with a single CI

Field	Description
Number	The automatically generated alert number that you saw in the list of alerts on the Service Operations Workspace dashboard.
Node	The name of the CI with which the alert is associated. The event that generated the alert occurred on this CI. You might see a computer name, or an IP address or MAC address of a device.
Resource	The object on the node that caused the event. You might see values like the name of a hard disk, a CPU, or the name of a process or a service. You can add information to this field if necessary.
Configuration item	The CI in the CMDB to which this alert applies. If the **Node** field is filled in but this field is empty, and if you know which CI the node represents, you can enter the CI in this field to manually associate the alert with it. **Note:** Your administrator can configure rules that automatically bind CIs to an alert, usually based on what is in the **Node** field. However, it is possible that the system is unable to find the correct CI to bind the alert to. In this case, you might need to manually select a CI. For the purposes of this tutorial, we assume that the correct CI is bound to the alert. When an alert contains a CI, the **Overview** tab opens when selecting the alert.
Task	Any existing task that is associated with the alert, such as an incident, change request, or problem, is shown in this field. When you first look at an alert, this field is blank. You can associate a task when you triage the alert. You associate an incident to an alert and assign the incident to someone at a later stage in this tutorial.
Description	A description of the alert that came from the alert monitoring software in your organization. You can add information if necessary.
Severity	Severity value for the alert:

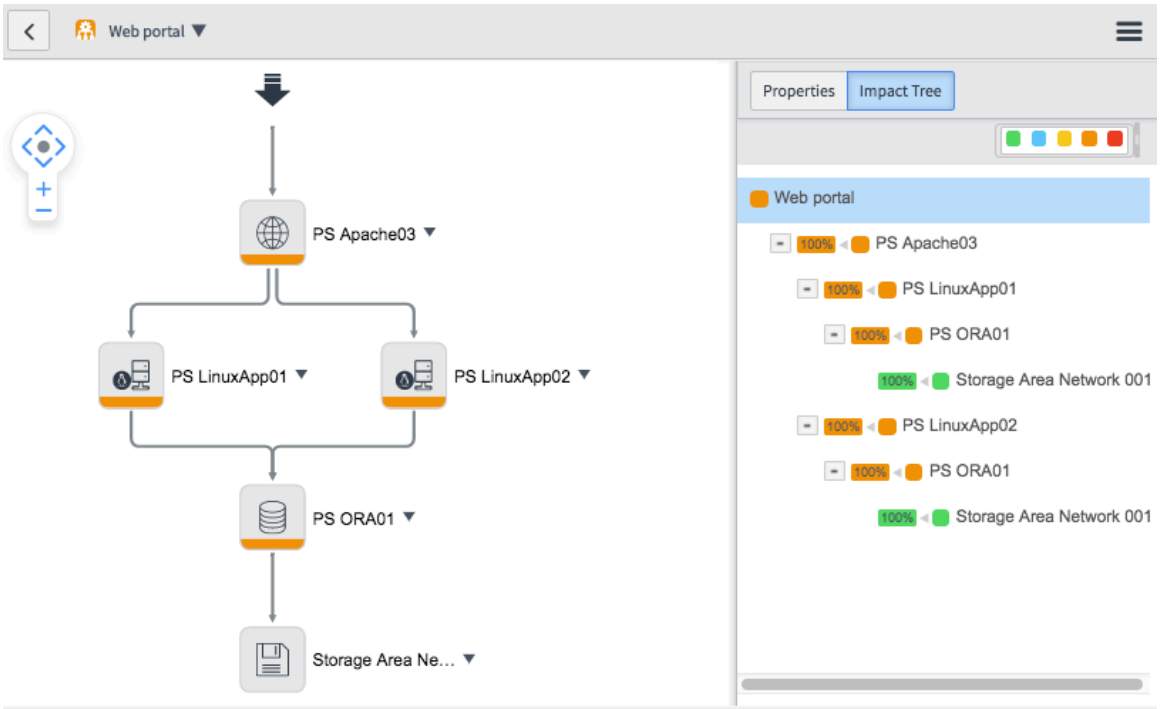
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Critical: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor: There is a partial, non-critical loss of functionality, or performance has degraded. ○ Warning: Attention is required even though the resource is still functional. ○ Info: An informational message. An alert is created, but the resource is still functional. ○ Clear or Resolved: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The processing state that the alert is in. A newly generated alert is in the **Open** state. Other states are: ○ **Reopen** indicates that a previously closed alert is open again, and it requires your attention. ○ **Flapping** indicates that the alert is receiving a high frequency of identical events from the same source, which can cause many alerts to re-open even after it is closed. ○ **Closed** indicates that the alert is closed and does not require any further action. You will close an alert as part of the last stage in this tutorial.
Maintenance	Indicates that the alert does not need to be worked on and is hidden from the list of alerts in the Service Operations Workspace dashboard. In this example, we do not want to put the alert in maintenance.
Acknowledged	Indicates that an operator verified that the alert is genuine and is triaging it. You acknowledge the alert at a later stage in this topic. Your Event Management administrator can also have alerts automatically acknowledged immediately after they are generated. If this is the case, the **Acknowledge** check box on the Alert form might already be selected.
Parent	Displays a value only for secondary alerts. The value indicates the alert number of the parent alert. The field is empty for primary alerts (alerts with no parent alert).
Knowledge article	Any existing knowledge base (KB) article that is associated with the alert. When you first open an alert, this field is blank. You can associate a KB article when you triage the alert.

4. Click the **Impacted Services** tab and then click the service name.
   Before you acknowledge the alert, you might want to learn more about the services that are affected due to the service that is the source of the alert.

   The service opens and displays the **Details** tab. Click **Service Map** to view the map of related application services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



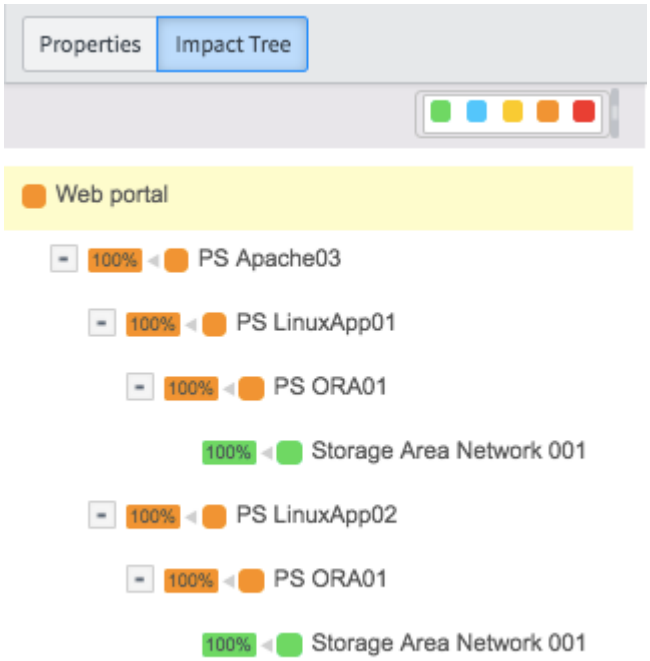
Notice that the major severity indicator in orange is displayed on several CIs. It starts with the Oracle database (**PS ORA01**) and propagates up to all CIs that depend on the database. From this, you can surmise that the alert with the highest level of severity on the Oracle database indicates the root cause of the issue.

This does not necessarily mean that the system generated separate alerts for each CI, but it is possible. When you triage an alert, you can determine whether alerts on other CIs should be correlated under a primary alert.

5. Click the **Impact Tree** tab and review the impacts on each CI.

   The percentages next to each CI in the impact tree show you the effect on each CI. In this example, each CI is impacted 100% by the alert, which means the underlying issue that led to the alert is serious enough to impact the functionality of the application service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Acknowledge the alert.

   Acknowledging an alert does not assign it to you, nor does it create a task like an incident or change request. It simply lets other operators know that you are aware of the issue. After you acknowledge an alert, you will take further action during the triage stage.

Option	Description
Acknowledge a single alert	With this process, you can acknowledge only the alert that you are viewing. **a.** Open the Alert Details form as described earlier. **b.** Select the **Acknowledged** check box.
Acknowledge one or more alerts	With this process, you can acknowledge one alert or multiple related alerts. **a.** Open the list of alerts as described earlier. **b.** Select each alert to acknowledge. **c.** Click **Acknowledge**.

7. Navigate back and look for the alert that you acknowledged.
   You can see that the **Acknowledged** value is **true**.

Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	Acknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false		true

What to do next

Go to Operator phase 2: Triage an alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operator phase 2: Triage an alert

After you analyze and acknowledge an alert, you must triage it. The triage phase involves verifying alert correlation and taking an action to help resolve the issue that caused the alert. This topic covers the most common triage task: creating an incident from an alert.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

Role required: evt_mgmt_operator

Procedure

1. Before you start to work on the alert, check whether other alerts should be correlated with the one you just reviewed:

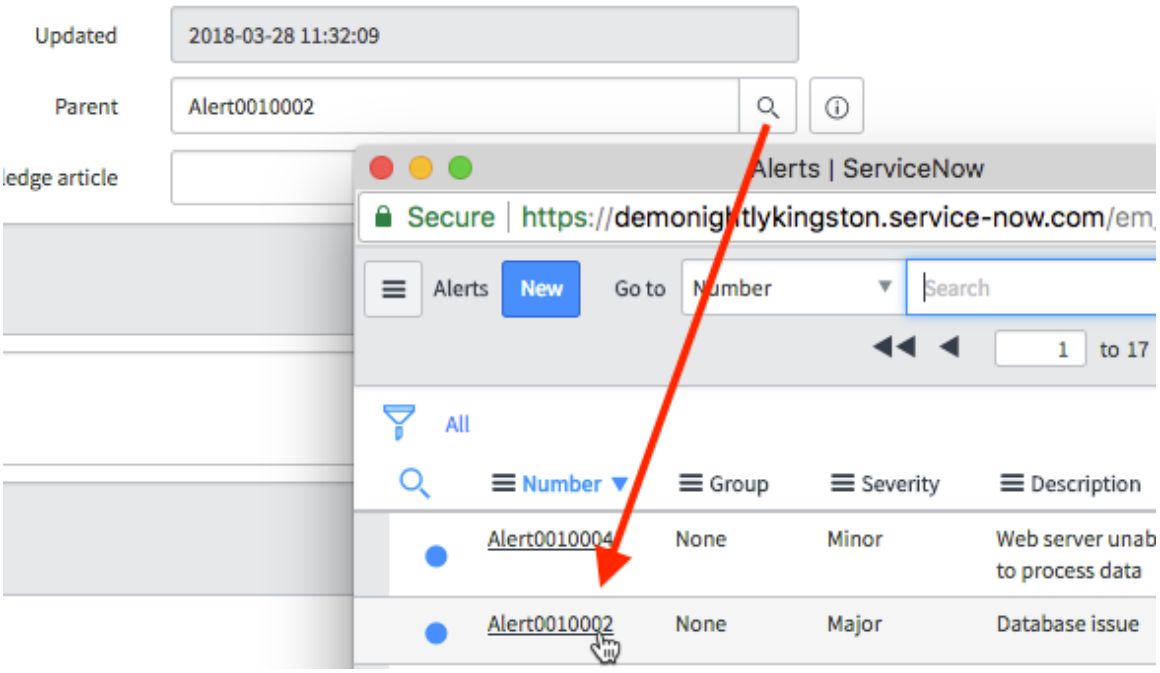
   a. Navigate to **Event Management** > **Service Operations Workspace**.

   b. Click the same application service tile and review the alerts in the **Alerts** list.

   c. If multiple alerts are present, open one to determine if it is related to the other alert, or if the underlying issue is the same in both alerts.
   For example, if an alert is associated with a web server and there is already an alert for the database issue, correlate the web server alert as a secondary alert with the database alert as the primary alert.

   d. Open the secondary alert, click the lookup icon ( ) in the **Parent** field, and then select the primary alert.
   This creates a primary (parent) / secondary (child) relationship between the two alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Repeat this process to correlate as many secondary alerts as necessary.

f. Navigate back to the Service Operations Workspace dashboard and verify that the primary alert displays an icon in the **Group** column.

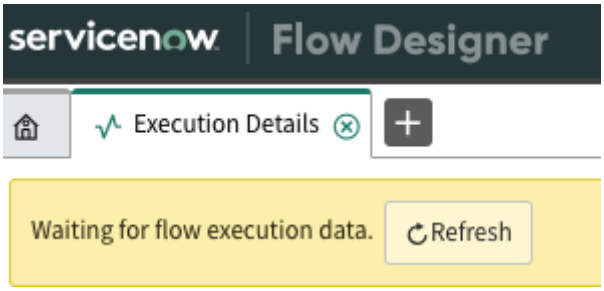
Note:
Your administrator can set up rules that let the system automatically correlate alerts so that you do not need to do so manually. In that case, a **Feedback** field appears on the Alert form. Select **Yes** if the system correlated the alert correlated correctly, or **No** if not. Currently, the feedback option is available but does not trigger further actions after being logged.

2. Open the primary alert.

3. On the Alert form, click **Actions** > **Create Incident**.
If your organization uses Security Incident Response, the button is **Create Security incident**.

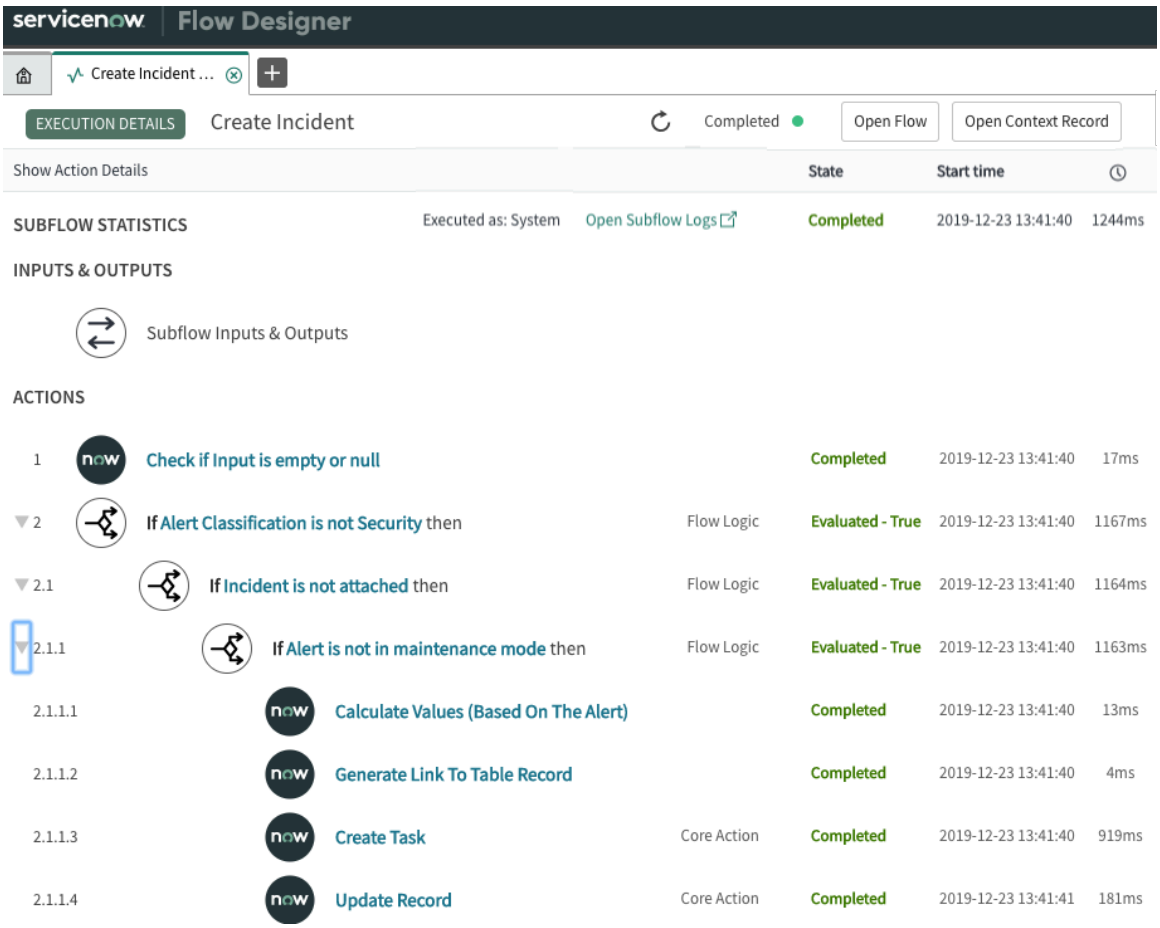
The Flow Designer opens.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



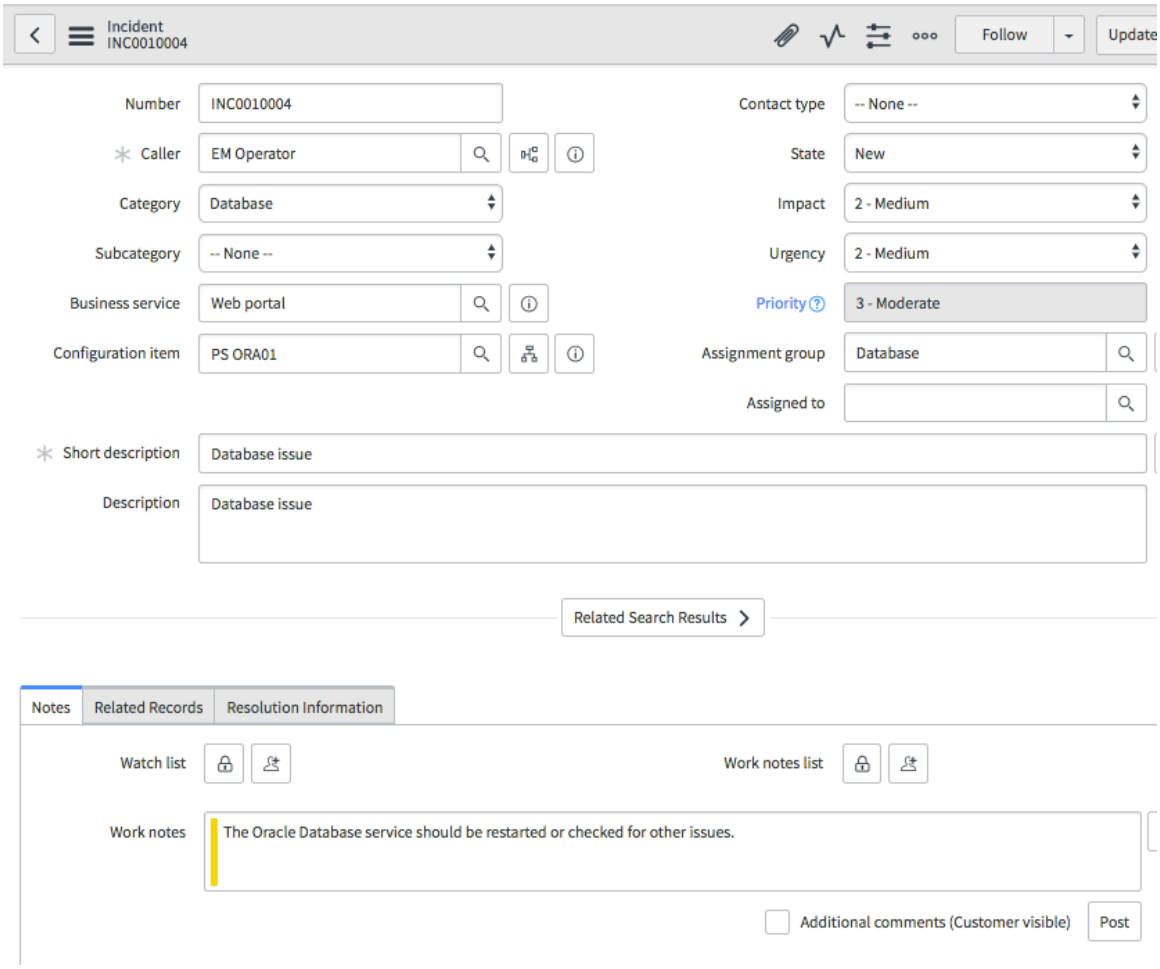
4. Click **Refresh**.

   The **Execution Details** page opens.



5. Click **Open Context Record** and then fill in the Incident form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

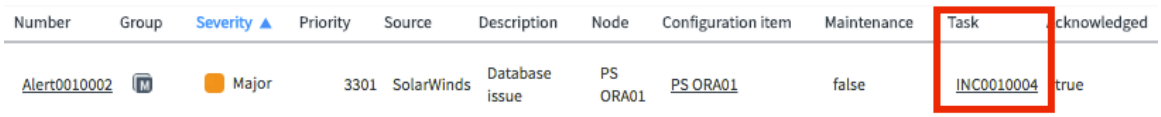


Field	Description
Caller	Click the lookup icon ( ) and then select your name. The caller is the person who discovered the issue that led to the incident.
Category and Subcategory	Select a category that best describes this alert. In this example, **Database** is the best choice.
Application service	Select the application service to which the CI belongs. In this example, the application service is **Web portal**.
Configuration item	If it is not already populated, select the CI. In this example, the Oracle database (**PS ORA01**) is automatically populated into the field.
Impact and Urgency	Select the impact and urgency levels that you think appropriate.
Assignment group Assigned to	Click the lookup icons ( ) for both or either of these fields, and then select the group or the individual that can handle the issue.

6. Click **Submit** to create the incident.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alert you are working on reappears. On the Alert form, the incident is populated in the **Task** field. You can also see the incident number in the Task column on the Service Operations Workspace dashboard.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	cknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false	INC0010004	true

What to do next

There are other tasks you perform as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Run a remediation workflow on an alert

As an Event Management operator, you can also run a workflow on your ServiceNow instance that helps remediate the alert. For example, you might run a workflow that automatically restarts a server on your network, which might resolve an alert about CPU usage.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

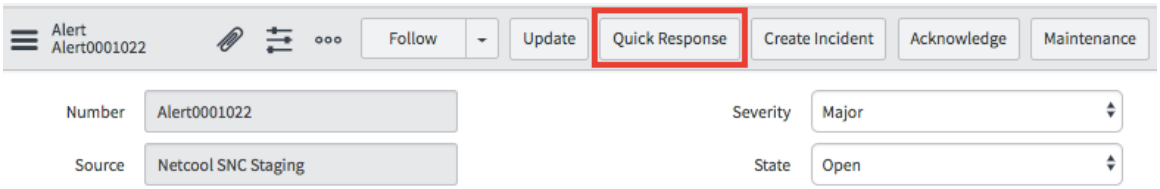
Note:
You can run a remediation workflow if your administrator already set up workflows for you to choose from. You should be familiar with your organization's policies regarding triaging of alerts.

Role required: evt_mgmt_operator

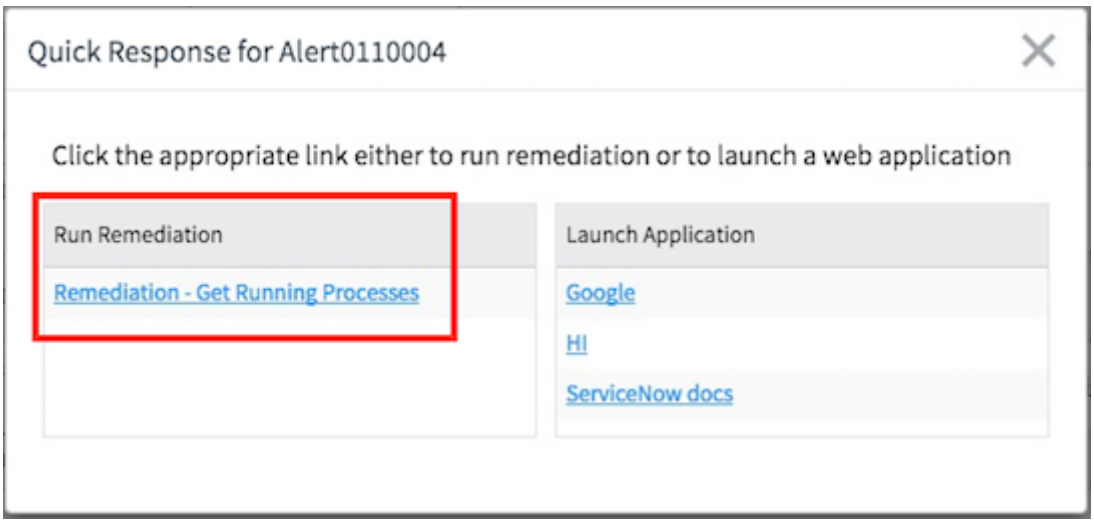
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.



3. In the Quick Response window, click the name of the remediation under **Run Remediation**.



What to do next

There are also other tasks you can take as part of the triage stage:

- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Launch a web application from an alert

As an Event Management operator, you can also launch a web application from an alert. The web application might be a console for the event monitoring tool that your organization uses, or any external website that provides additional information you might need about the alert.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

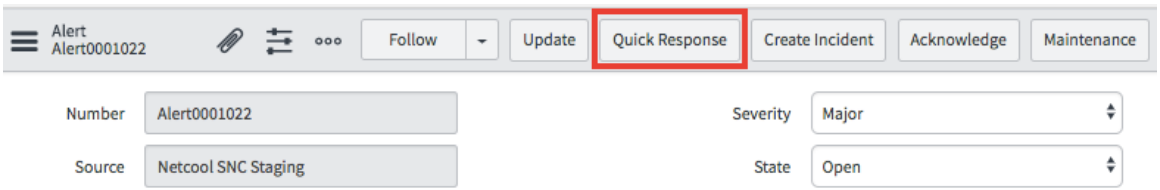
Role required: evt_mgmt_operator

You can launch a web application if your administrator has set up a link to the application. You should be familiar with your organization's policies on triaging alerts.

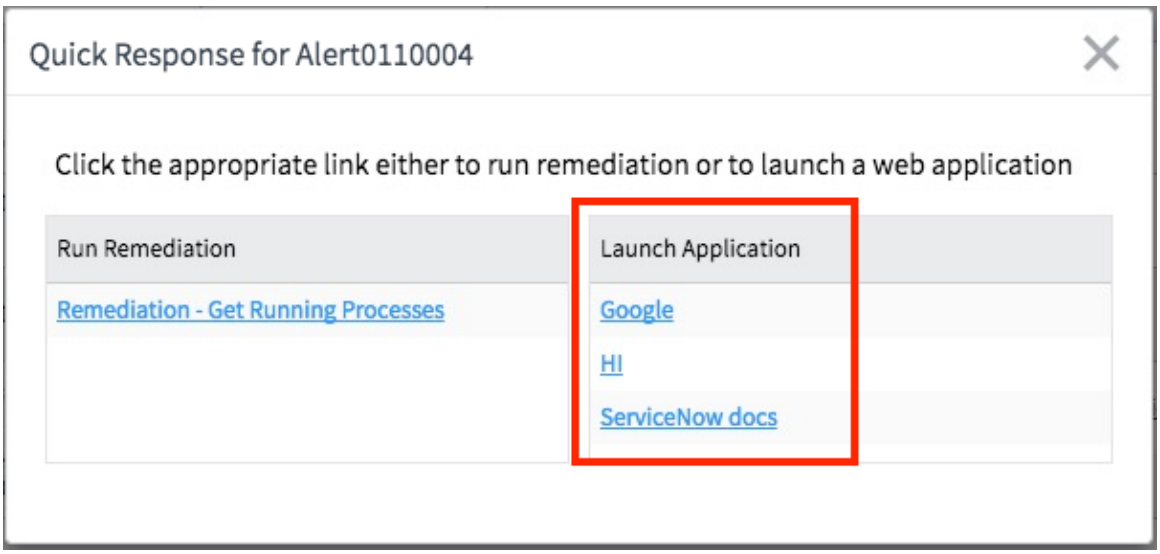
About this task

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.



3. In the Quick Response window, click the name of the application under **Launch Application**. Your administrator has specified which applications should appear in the list.



What to do next

There are also other tasks you can take as part of the triage stage:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Associate a knowledge base article with an alert

As an Event Management operator, you can associate a knowledge base (KB) article with the alert to capture additional information about the alert. This might include a procedure that someone has to follow to resolve the underlying issue on your network, or a best practice to prevent the issue from reoccurring.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

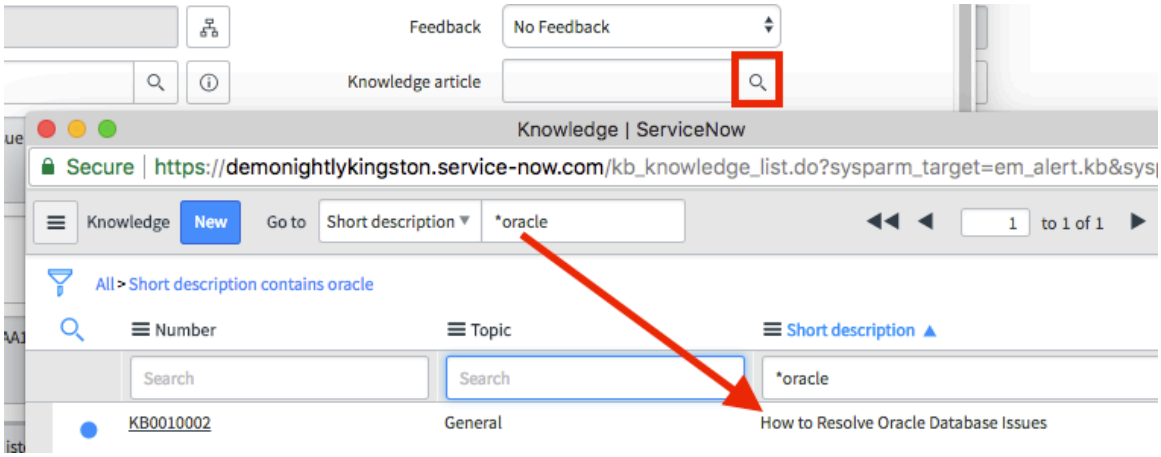
This task assumes that your organization uses the Knowledge Base application in your ServiceNow instance.

Role required: evt_mgmt_operator

Procedure

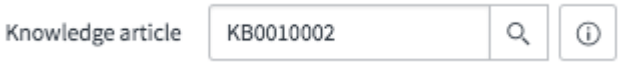
1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click the lookup icon ( ) next to the **Knowledge article** field.
3. Filter the list of existing KB articles by first selecting a field, such as **Short Description**, and then entering related text into the search text field.
   You can use the `contains` (*) operator to search for articles that contain keywords. For example, entering `*oracle` in the short description filters the KB articles that contain the word `oracle` somewhere in the short description.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. If you cannot find any related KB articles, you can click **New**, create a new one, and then click **Submit**.

   The KB article number appears in the **Knowledge article** field on the Alert form.



5. Click **Update** on the Alert form to save the information.

What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Put an alert into maintenance

As an Event Management operator, you can put an alert into maintenance if the alert does not require any further action, but you still want to keep the alert active. Putting the alert into maintenance hides it from the Service Operations Workspace dashboard so that other operators do not need to access it, but it does not close the alert.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 3	Close an alert

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. Select the **Maintenance** check box and click **Update**, or click the **Maintenance** button at the top of the list.
3. Click **Update**.
4. Navigate to **Event Management** > **Operators Workspace**.

   Notice that alerts in maintenance are not visible in the list by default. The filter excludes alerts where `Maintenance` | = | `true`.

What to do next

If the issue that led to the alert still needs further attention later, navigate to **Event Management** > **All Alerts**, open the alert, and then clear the **Maintenance** check box and click **Update**. From there you can perform other triage actions.

There are other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Operator phase 3: Close an alert

After you take action on an alert, you can verify several items on the alert and then close it.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	Analyze and acknowledge an alert

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 2		Triage alerts
Phase 3		**Close an alert**

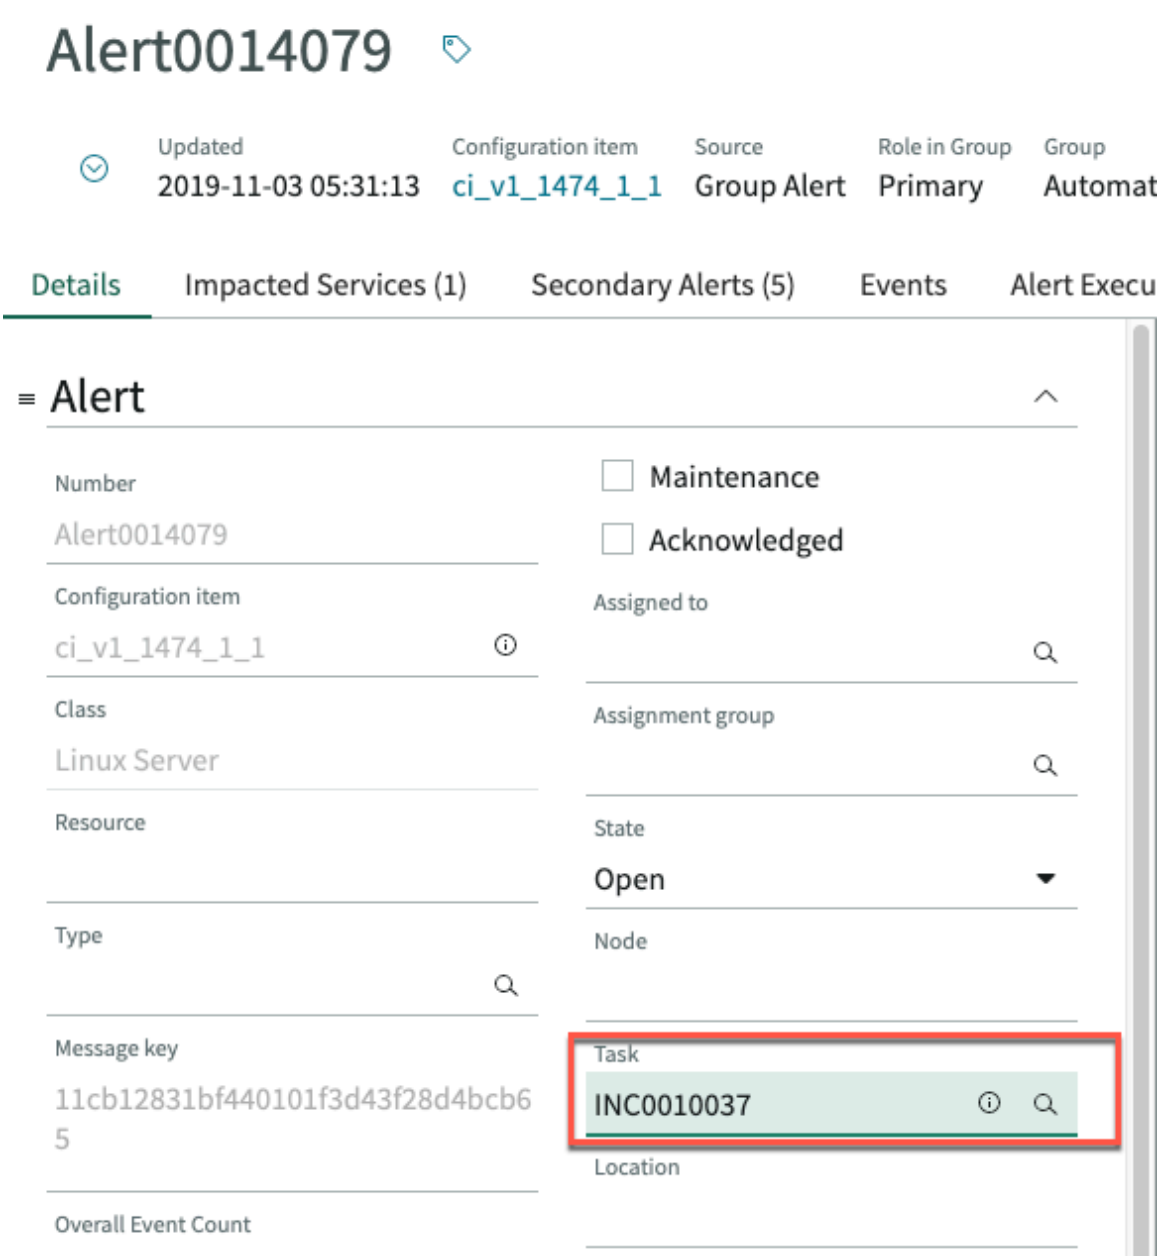
Role required: evt_mgmt_operator

About this task

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Find the alert you want to close.
   If the alert does not appear in the list, for example because it is in maintenance, change the filter options as needed.
3. Click the alert number to open the Alert Details tab and review key information about the alert.

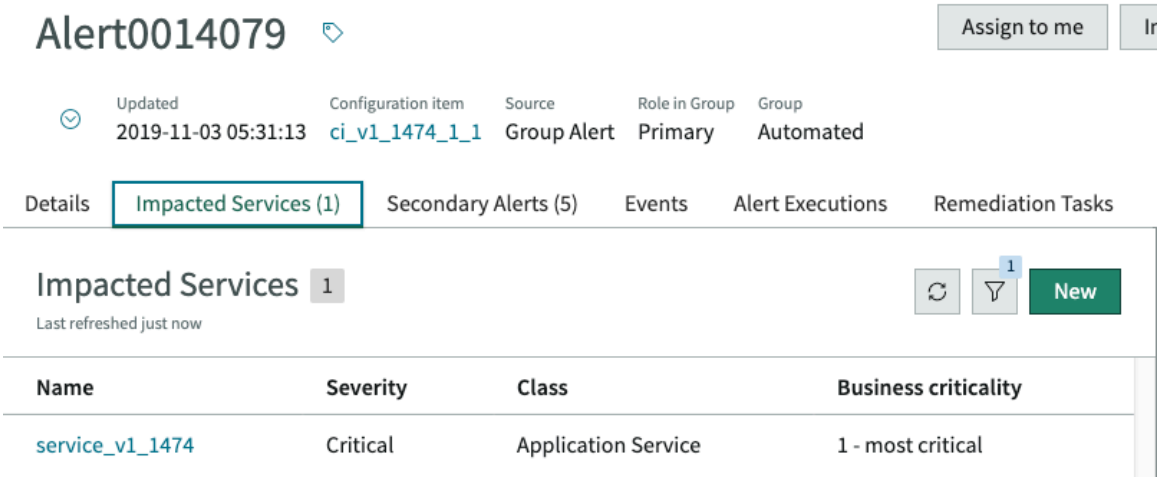
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Review information about application services on the **Impacted Services** tab.

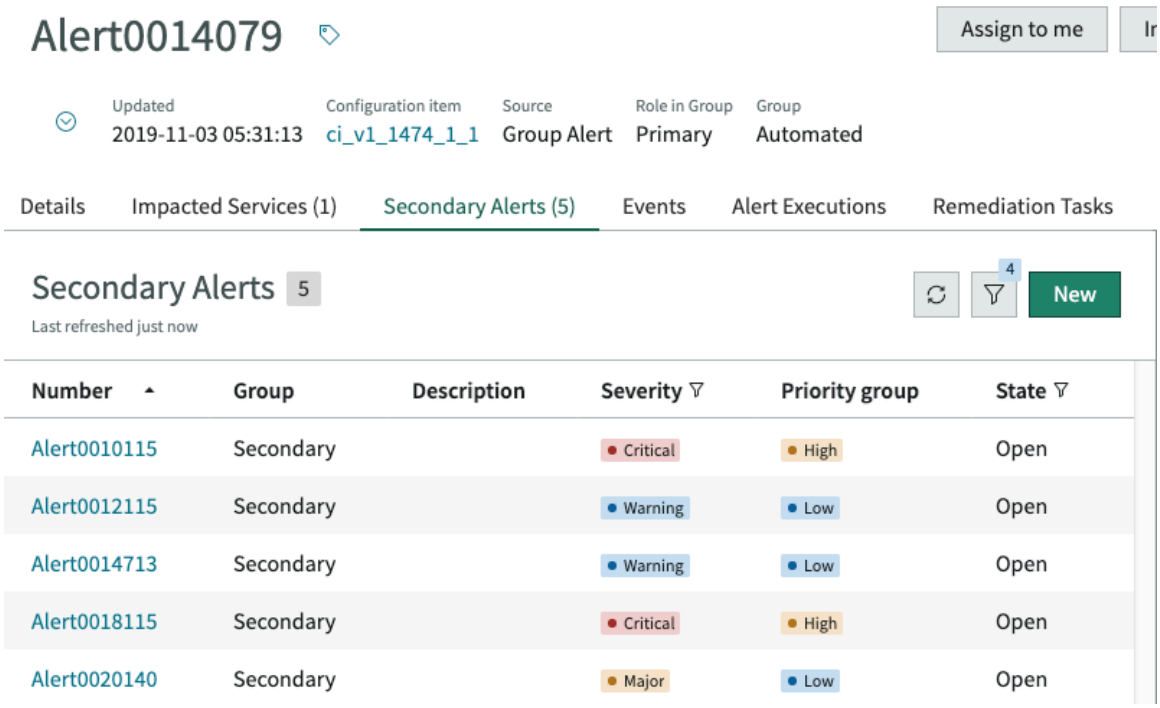
   In this example, the service_1474 application service appears in the list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you need more information about an application service and want to see the service map, click the service name and then click **Service Map**.

5. Look at the alerts related to this application service, and modify the correlation if necessary. The process for a primary alert differs from the process for a secondary alert.
   - On a primary alert, the secondary alerts that are correlated with the primary appear on the **Secondary Alerts** tab.



Typically, you do not have to do anything with the secondary alerts unless you want to add more secondary alerts or remove the correlation altogether.

Note:
When you close a primary alert, the secondary alerts are also closed by default.

   - On a secondary alert:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert number of the primary alert appears in the **Parent** field. You do not have to do anything with the parent alert, unless you want to re-correlate this secondary alert with another primary alert, or remove the correlation altogether by clearing the field.

Note:
When you close a secondary alert, the primary alert is not closed. You must close the primary alert separately.

6. When you are sure the underlying issue causing the event and corresponding alert has been rectified, click **Close**.
   If you think that the alert needs attention, do not close it. Instead, put it into maintenance by selecting the **Maintenance** checkbox.

What to do next

You are finished with the Event Management Operator tutorial, which covers a basic workflow of analyzing alerts, triaging them, and closing them out.

After you close an alert, you might need to follow up on these items:

Reopen an alert

If you think an alert requires further action, you can manually change its state to **Reopen**. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the rules that your administrator configured.

Note:
Any time you reopen an alert, always go through the triage and close phases again.

Work with alerts in the flapping state

In some cases, the same event that created the alert you just closed could be triggered again, even repeatedly, in a short amount of time. If this occurs, the **State** of the alert that you just closed changes to **Reopen**, and eventually to **Flapping** depending on settings that your administrator configures.

See Handle alerts in the flapping state for more information on what to look for.

For a summary of other tasks that you might need to perform at some time, see Advanced tasks for the Event Management operator.

Advanced tasks for the Event Management operator

As an Event Management operator, you might need to perform additional tasks that are outside of your typical workflow, or tasks that you need to perform only once.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced task	Description
Customize your alert list view	Get to the alerts you need to analyze as soon as possible.
Work with flapping alerts	If an alert is in the flapping state, it means that the underlying issue keep reoccurring. You should triage the alert again and look for another solution.
Handle alerts while CIs are in maintenance	Learn how to handle alerts on a CI that is in the maintenance state, which means it is undergoing some type of change.
Adjust alert impact while triaging an alert	You can change impact rules, which affects how alert impact is calculated and alert severity.

Customize your alert list view

You can create one or more customized alert list views that show only the information pertinent to you. For example, you might want to focus only on the alerts for application services in a specific location, or only the alerts for application services of high criticality.

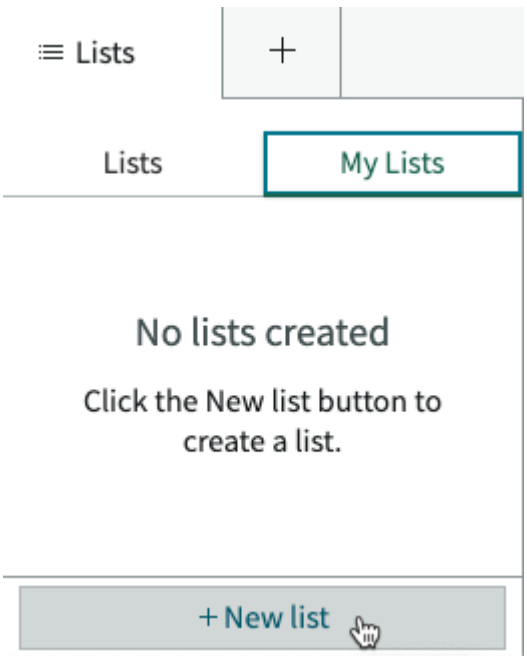
Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

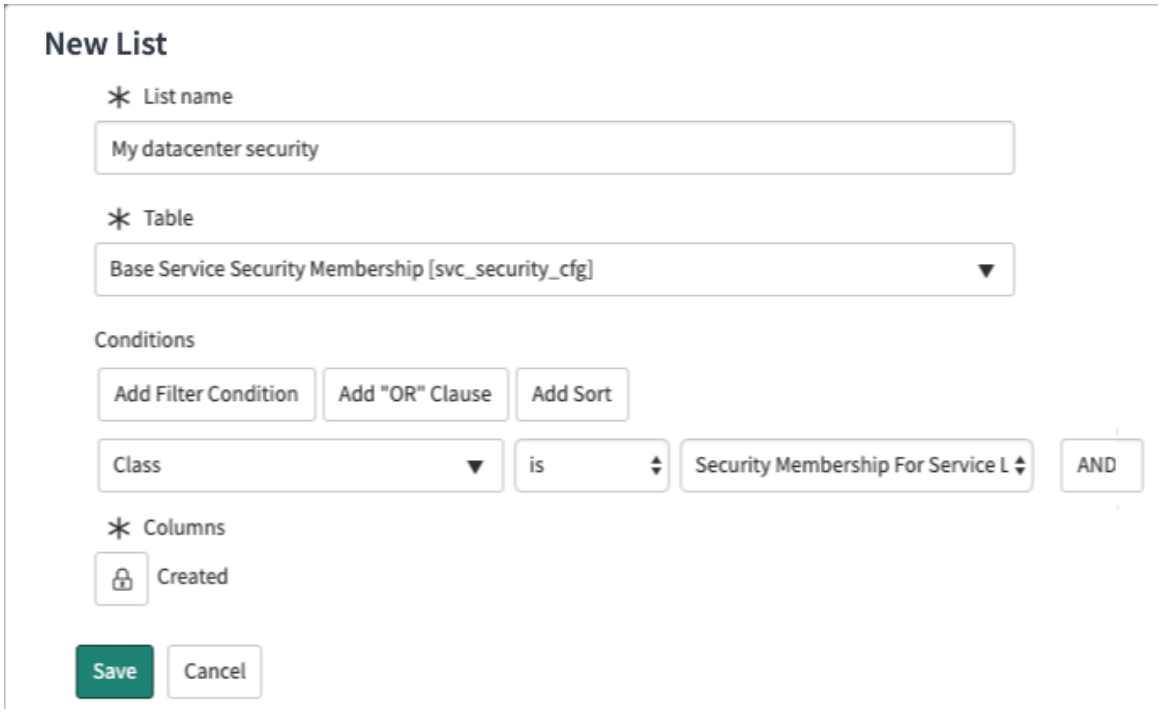
Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. On the **Lists** tab, click **My Lists**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **+ New list**, fill in the form with name and filter conditions, and then click **Save**.



The list appears on the **My Lists** tab.

Note:
The list applies only to application services, and not to application service groups. The groups appear whether or not they match the filter, and whether or not they contain any services that match the filter.

Work with flapping alerts

If an alert is in the flapping state, you might need to triage the alert again.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

If an event repeatedly triggers the same alert in a short amount of time, the alert is put into the flapping state, even if an operator closed it previously. The event can also be fluctuating between severity levels, such as Info and Critical. You should triage the alert again, and take action to try to prevent the event from reoccurring.

Note:
Your Event Management administrator can configure several settings that determine when to mark an alert as flapping, and other settings that determine what action you can take. This topic covers a generic example.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Find alerts in the flapping state:
   a. Navigate to **Event Management** > **Operators Workspace**.
   b. Modify the list of alerts by clicking the filter icon ( ) and specifying criteria to find flapping alerts.
   Click **Advanced view** to modify filter settings. For example, you can specify:
   `State|is|Flapping`.
2. Click the alert number to open it.
3. On the alert, click the **Flapping** tab and review the information:

Field	Description
Flap count	The number of times the alert started flapping since the time in the **Flap start window** field.
Flap start window	The time that flapping started.
Flap last update time	The last time flapping occurred. This time is the instance processing time, not the source system time.
Flap last state	The state of the alert before it entered the flapping state.

4. Decide which action to take based on how often flapping has occurred.
   You can do any of the following, depending on what your organization's standard operating procedures are and what your Event Management administrator configured:
   - Run a remediation workflow that might do something like reboot a server or reset a router.
   - Access a web application, like the application for your event monitoring software on your network.
   - Modify an associated incident or a KB article to include additional information or steps.
5. After you are certain that the underlying issue is addressed, close the alert.

Handle alerts while CIs are in maintenance

When an alert occurs on a CI that is in the maintenance state, the alert state is also changed to maintenance. You should find and monitor the states of these alerts. Later, when changes on the CI are complete, finish triaging the alert and close it.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Before completing this task, familiarize yourself with basic form configuration in an instance. You might need to add fields and related lists to forms.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example in this topic assumes that a network administrator opened a change request to reconfigure a problematic web server.

Role required: evt_mgmt_operator

Procedure

1. Find alerts in maintenance:

   a. Navigate to **Event Management** > **Operators Workspace**.

   b. Click the filter icon ( ) and in the Filter box, click **Advanced view** and specify:

   `State|is|Maintenance`.

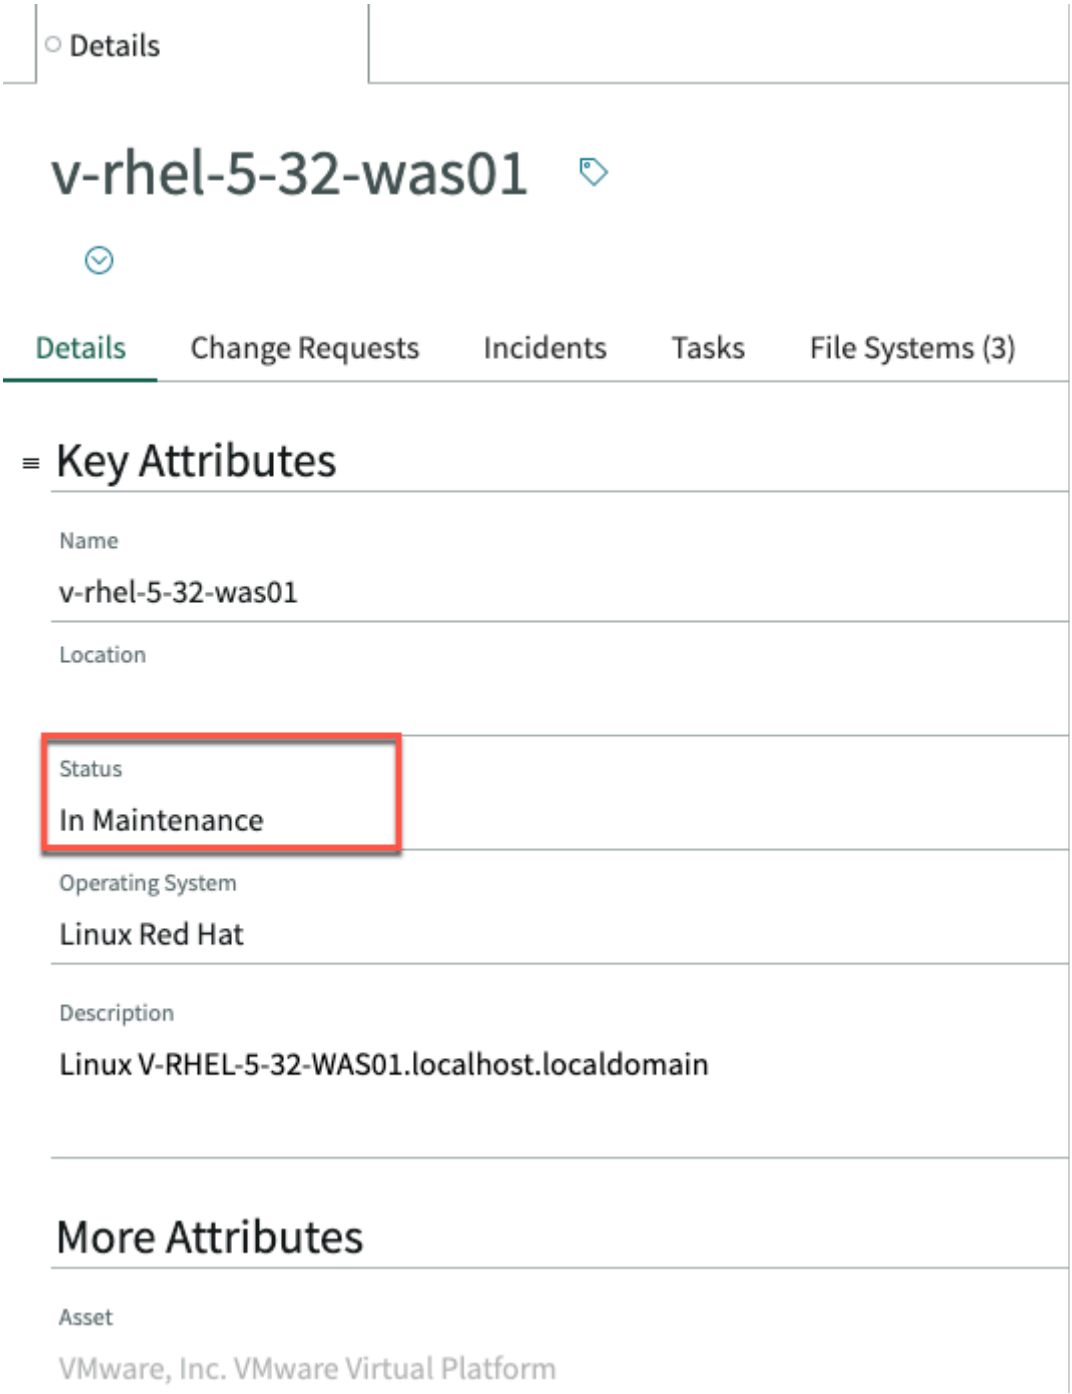
2. In the list of alerts, find an alert with a value in the **Configuration Item** column.
   This is the CI on which the alert occurred.
3. Click the CI name to open the form that displays information about the CI.

   In this example, the status of the web server is **In Maintenance** and there is a change request scheduled so that someone can reconfigure it.

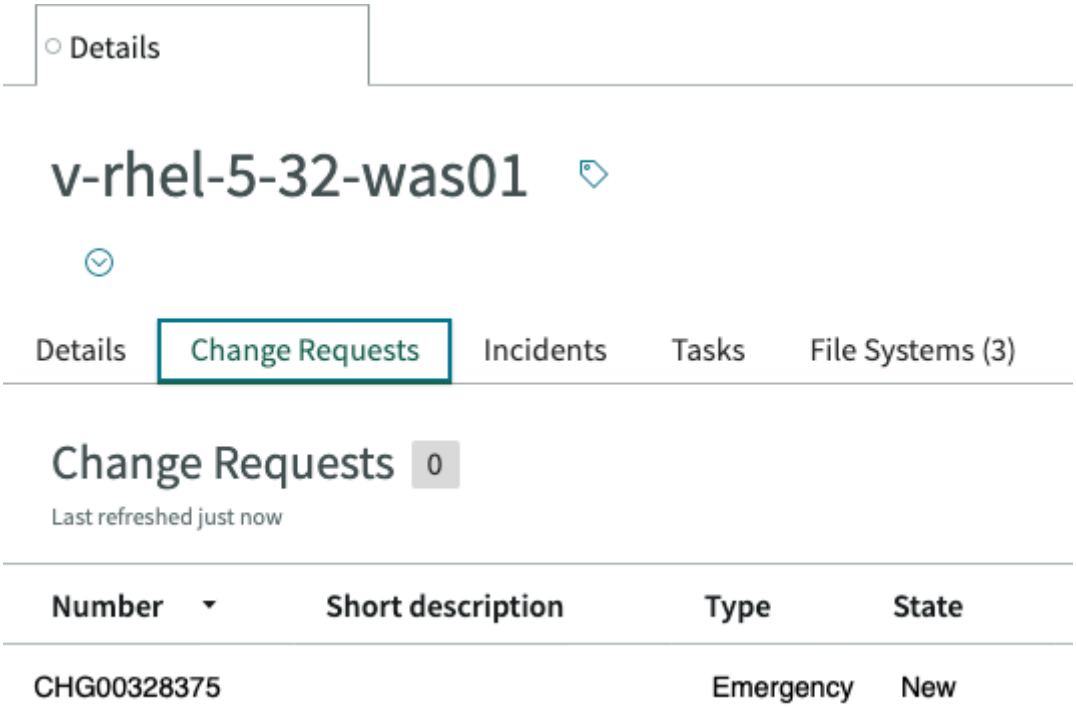
4. Click the CI name to open the form that displays information about the CI.

   In this example, the status of the server (on the **Details** tab) is **In Maintenance**. You can view the scheduled change request on the **Change Requests** tab (someone will reconfigure the CI).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. At this point, you should not modify the alert associated with this CI.
   You can open the change request to see if a schedule is attached, or coordinate with your team to find out when the CI will no longer be in maintenance.
6. After you verify that the **Status** field on the CI is not **In Maintenance**, open the alert again and clear the **Maintenance** check box.
7. Continue to triage the alert.

Adjust alert impact while triaging an alert

As an Event Management operator, you might need to modify the impact that an alert has on an application service and on the CIs in a service. Do this when you think that the impact does not accurately represent what you see in your network environment so other operators and administrators see the correct impact information.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

Before you make any modifications to impact calculations, make sure that you understand how the application services and the CIs actually function. You might need to perform tests on network infrastructure or contact someone who can.

Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. Double click the name of the application service that has the alerts you want to modify.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Details tab, click **Service Map**.
4. On the **Service Map** tab, click **Full Map** Tree.
5. On the map, click **Impact Tree**.
6. Analyze the application service to see whether the impact tree accurately reflects the impact of the alerts based on what you know about the CIs involved.

   In this example, a critical alert indicates a serious issue with a Linux server that is part of a Web portal application service.

   Notice that the impact on the Web portal itself is red, meaning critical, even though only one of the Linux servers that it relies upon actually has a critical alert. The other Linux Server does is not impacted by the alert. Assume for this example that the Linux servers perform different roles for the web service, and that even though **PS LinuxApp02** has a critical alert, the **PS LinuxApp01** server can adequately provide all the necessary services to keep the application service operational.

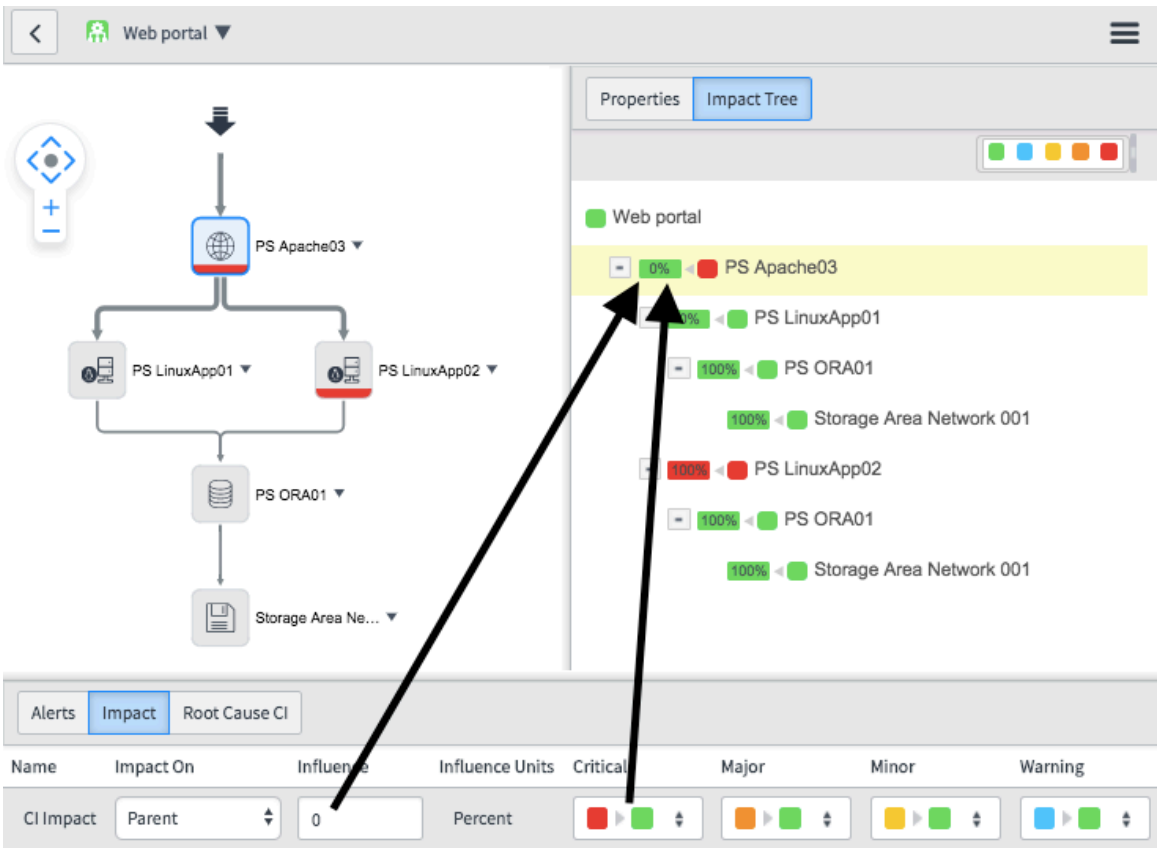
7. Click the **PS Apache03** CI, and then click **Impact** to display the impact rules for the CI. By default, the CI impact rule appears, showing you this information:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Impact On** and **Influence** columns show you that the CI (**PS Apache03**) should inherit 100% of the impact of all child CI impacts, which in this case includes the critical impact on the **PS LinuxApp02** server. This setting is why the **PS Apache03** web server, and the application service as a whole, inherits the impact 100%.
- The **Critical** column shows you that a critical alert (red) is inherited as critical alert (red).

8. Change the **Influence** value to 0 since the web server is still operational, and then change the **Critical** column to indicate that a critical impact status (red) should be inherited as a non-impact (green).
9. Wait for the dashboard to update automatically, or click **Event Management** > **Service Operations Workspace** and double-click the same application service to get an updated application service map.

   Notice that the influence on the Apache web server is 0% and the impact status is green. Also notice that the critical alert status (red) remains unchanged, even though the impact changed to green.



10. Navigate back to the Service Operations Workspace dashboard.
    Notice that the application service is now green, indicating that the overall application service is operational. The critical alert still displays at the bottom in the Alerts list, indicating that there is still an issue that you or other operators can address.

What to do next

Your administrator might configure additional impact rules that display when you click a CI in the application service map. You can make adjustments to the **Influence** fields on any impact rule to get the most accurate impact tree.

© 2025 ServiceNow, Inc. All rights reserved.

Event Management reference

Reference topics provide additional information about mapping and fine-tuning application services using Event Management lists and forms.

Components installed with Event Management

Activating the Event Management (com.glideapp.itom.snac) plugin adds several roles, scheduled jobs, and tables.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed with Event Management

Roles used by the Event Management application.

Event Management adds these roles.

Role title [name]	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts	• evt_mgmt_user • template_editor_global
Event Management Operator [evt_mgmt_operator]	In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Management User [evt_mgmt_user]	Has read access to all Event Management features. Has the itil role to be able to manage incidents that are created from alerts.	itil

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
Event Management Integrator [evt_mgmt_integration]	Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.	

Scheduled jobs installed with Event Management

List of scheduled jobs that are provided with Event Management.

To review the list of scheduled jobs, navigate to **System Scheduler** > **Scheduled Jobs**. Event Management adds the following scheduled jobs.

Scheduled job	Description
Event Management — Connector execution job	Compares current time with time when active connector instances were last run and sets relevant connectors to execute. Runs every 10 seconds.
Event Management — Handle Impact Stuck Service	Releases stuck services and marks them as requiring rebuilding in the Impact Changes table to rebuild the impact tree. Runs every 2 minutes, 31 seconds.
Event Management — Impact Calculator Trigger	Trigger the impact calculation. The Event Management dashboard and impact tree are refreshed using the calculated figures. Runs every 6 seconds.
Event Management — Impact Topology Consumer	Consumes topology changes and marks the related services as 'require rebuilding' in the Impact Changes table to rebuild their impact trees. Runs every 19 seconds.
Event Management — Update stuck connectors	Release connector instances that are stuck. Runs every 2 minutes.
Event Management — Alert Priority Queue	Calculate alert priority. Two Alert Priority Queue jobs are active and available and can be run multi-thread. Runs every minute.
Event Management — Auto Close Alerts	Alerts that are idle longer than 7 days (default time period) are closed. Modify the default using the `evt_mgmt.alert_auto_close_interval` property. Runs every 10 minutes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Event Management — Calculate Alert Priority Grouping	Runs and calculates the priority groups: urgent, high, moderate and low for the alerts according to the highest and lowest priority score in the system. Runs every 30 minutes.
Event Management — Close Flapping Alerts	Close flapping alerts. Runs every 5 minutes.
Event Management — Close Threshold Alerts	Close threshold alerts. Runs every 2 minutes.
Event Management — Evaluate Scoped Alert Rules Management0	Execute alert management rules. Two separate jobs run to ease the load on the system. Runs every 11 seconds.
Event Management — Evaluate Scoped Alert Rules Management1	
Event Management — Filter Services for Impact - Queue Handler	Process changes from em_impact_inclusion_class and em_impact_filter_service. Runs every minute.
Event Management — Impact Tree Builder	Handles all services with changes from the em_impact_changes table and rebuilds their impact trees. Runs every 11 seconds.
Event Management — Insert Health Monitor	Job to produce the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Maintenance Calculator	Calculate the maintenance for CIs. Runs every minute.
Event Management — Node Count	Calculate license usage. Runs once every hour.
Event Management — Populate Impacted Services Table	Scan cmdb_ci_service_auto and copy all services to em_impacted_service, along with all related classes to em_impact_inclusion_class. Runs once after upgrade.
Event Management — Process Events	Job that runs and processes each Ready event (apply event rule, mapping rule, and create or update alert)

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	Runs every 5 seconds.
Event Management — Process Metric Binding	Process metric binding. Runs every 5 seconds.
Event Management — Process Records in em_extra_data_json	Creates events for log analytics anomalies. Runs every 13 seconds.
Event Management — Queue Connector Processor	Bi-directional functionality. Processes all pending alerts in the Update Queue and sends them to the MID Server. By default, this dequeue process is performed in batches of 1,000 alerts. Runs every 30 seconds.
Event Management — Recalculate Impact for Groups	By default, this job is not active. Can be run on demand to correct the impact on service groups. Runs on demand.
Event Management — Recover Stuck Events	Handle all events that are in queued state and switch back to Ready to handle events from the beginning. Runs at system startup.
Event Management — Update Health Monitor	Update the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Update SLA Configuration Result	Synchronizes the CIs that match the SLA configuration filter with the Event Management SLA [em_ci_severity_task] table. Runs every 10 minutes.
Event Management — Update SLA Severity	Updates Event Management SLA [em_ci_severity_task] table with the new severity. Runs once every minute.
Event Management — Convert IT Service	Run this property on demand to convert manual services to application services. Runs every 30 minutes.
Event Management — Collect xmlstats	Collect event processing statistics. Runs once every minute.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Event Management — Impact Calculator for Alert Groups and SLA	Calculates the effect of alerts on alert group services.
Event Management — Manual Impact Calculator Trigger	Manually trigger of Impact Calculation on all operational Services.
4x Event Management — Impact Calculator for BS_0	Calculates the impact of alerts on application services, and builds the impact tree on the Event Management dashboard. Four separate jobs run to ease the load on the system.
4x Event Management — Impact Calculator for BS_1	
4x Event Management — Impact Calculator for BS_2	
4x Event Management — Impact Calculator for BS_3	
Event Management — Backfill Alert History table	Locates redundant records in the em_alert_history table and cancels them.
Event Management — Backfill Impact Status table	Locates redundant records in the em_impact_status table and cancels them.
Event Management — Impact for Groups	Calculates the impact of alerts on service groups.
Event Management — Clean Alert History Table	Cleans the Alert History (em_alert_history) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.
Event Management — Clean Impact Status Table	Cleans the Impact Status (em_impact_status) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.

Event Management adds the following scheduled jobs to support alert aggregation and RCA.

Name	Description
Service Analytics Purge Old Observation Data — Daily	Cleans the staging data.
Service Analytics Prepare RCA Learner Input Data — Daily	Prepares RCA input data. Stores and probes MID Server to learn statistical information about alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Service Analytics group alerts using RCA/Alert Aggregation	Applies RCA and alert aggregation to open alerts and prepares automated alert groups.
Service Analytics Alert Aggregation Learner — Daily	Learns information about existing alerts and groups new open alerts.
Service Analytics RCA Configuration	Configures root cause analysis.
Service Analytics Check File System Space on Analytics MID — Daily	Checks disk usage on the dedicated MID Server, and generates an event if it exceeds the threshold set in the *sa_analytics.rca.mid_max_allowed_space* property.
Service Analytics Gather Value Report Data — Daily	Gathers data for the Value Report.
Service Analytics — Update virtual alerts for aggregation groups	Update the virtual alerts that were created to represent alert aggregation groups, with any changes to alerts belonging to that group. Runs every minute.
Service Analytics Attribute Populator for Historical Alerts	Populate attributes used in feature identifier for historical alert data using event rules. Runs on demand.
Event Management - Analytics Alert Syncer	Gathers alert data that is used by grouping job.

Properties for personalizing domain separation for Event Management connectors

Properties provide the metadata to identify the domain.

You can change the values if you want to use any other table or fields for domain identification but make sure that the table is domain separated.

Note:
When personalizing domain separation for event management connectors, all the properties can be overridden at the connector level as well.

There are three caches maintained for personalizing domain separation (main, user_access, missing_domain). You can create a few system properties to control them.

Default System Properties

Property	Description
evt_mgmt. connector_domain_info_table_name	The table where you store domain information for personalizing domain separation. • **Type**: string • **Default value**: core_company
evt_mgmt. connector_domain_info_column_name	The field name in the table to identify the provided domain for personalizing domain separation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default System Properties (continued)

Property	Description
	• **Type**: string • **Default value**: name
evt_mgmt. connector_domain_id_column_name	The field to get domain ID from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain
evt_mgmt. connector_domain_path_column_name	The field to get the domain path from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain_path

Property	Description
evt_mgmt.connector_custom_domain_sep_cache_expire_in_seconds	For personalizing domain separation, if you don't want your main cache to expire every week.
evt_mgmt.connector_custom_domain_sep_user_access_on_domain_cache_size	For personalizing domain separation, if you want to increase the size of the user access cache.
evt_mgmt.connector_custom_domain_sep_missing_domain_cache_expire_in_seconds	For personalizing domain separation, if you want to increase the expire time for cache storing information regarding

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	the missing domain.
evt_mgmt.connector_custom_domain_sep_cache_size	For personalizing domain separation, if you need more main cache size for storing domain information.

Tables installed with Event Management

Tables that are provided when Event Management is activated.

Event Management adds these tables.

Table	Description
Alert [em_alert]	Alerts that Event Management manage.
Alert Correlation Rule [em_alert_correlation_rule]	Rules specifying primary and secondary correlated alerts.
Alert Aggregation Group Alerts [em_agg_group_alert]	Stores alerts associated with aggregated alert groups.
Alert Aggregation Group [em_agg_group]	Relationships between aggregated groups and primary alerts.
Alerts History [em_alert_history]	History of alerts. Used for impact calculation.
Alert Rule [em_alert_rule]	Mappings of alert fields to the Incident [incident] table.
Alert Template [em_alert_template]	Alert templates. This table extends the Template [sys_template] table.
Event Management SLA [em_ci_severity_task]	Event Management SLA tasks for CIs and services.
Connector Definition [em_connector_definition]	Settings for gathering events from external event sources.
Connector Instance	Connection details for external event sources.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[em_connector_instance]	
MID Server to Connector Instance [em_connector_instance_to_mid]	Mappings of MID Servers to connector instances.
Event Management License Usage [em_unique_nodes]	When events are received by ITOM AIOps, an entry is added or updated in this table based on the monitored target specified in the received message. The entry links to its corresponding CMDB CI. If none is found, the entry is assigned *Type = Unknown*.
Event [em_event]	Events received by Event Management.
Event Filter [em_event_filter]	Storage for defined event filters.
Event Match Rule [em_match_rule]	Updated events for alert processing. Used by event rules.
Event Match Field [em_match_field]	Mappings of event fields to alert fields. Simple mapping. Used by Event Rules.
Event Compose Field [em_compose_field]	Mappings of event fields to alert fields. Composite mapping. Used by Event Rules.
Event Mapping Rule [em_mapping_rule]	Updated event fields for alert processing.
Event Processing Statistics [em_event_stats]	Statistics on Event Management performance.
Event Type [em_event_type]	Event types.
Task Template [em_incident_template]	Templates that define how to populate new tasks. For example, how fields of an incident that is being created from an alert, must be populated. This table extends the Template [sys_template] table.
Registered Nodes [em_registered_nodes]	Registered nodes data.
Threshold Rule [em_threshold_rule]	Alert threshold rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Binding Device Map [Em_binding_device_map]	Event binding to network paths and storage paths.
Process to CI Type Mappings [Em_binding_process_map]	Event binding to specific processes.
CI Remediation [em_ci_remediation]	Remediation rule definitions.
Impact Graph [em_impact_graph]	Impact tree of CIs containing CI hierarchy and impact rules to be used for impact calculation.
Impact Graph History [em_impact_graph_history]	History of changes in impact tree.
Impact Rule Definitions [em_impact_rule_definition]	Definition of rules used for impact calculation.
Impact Rule instance [em_impact_rule]	Rules based on impact rule definitions.
Impact Inclusion Classes [em_impact_inclusion_class]	Specifies the classes to be used for impact calculation.
Impact Filter Services [em_impact_filter_service]	Specifies services to be included or excluded from impact calculation.
Infrastructure Relations [em_impact_infra_rel_def]	Child-parent pairs or CI types. CIs matching these definitions are added to impact trees.
Impact Maintenance CIs [em_impact_maint_ci]	CIs that are in maintenance and therefore are excluded from impact calculation.
Impact Status [em_impact_status]	Calculated status of CIs and services to be displayed in the dashboard and service maps for dynamic CI groups.
SLA Configuration [em_sla_configuration]	SLA configuration records that identify the CIs that SLAs can run on.
Service Analytics Metric Type Registration [sa_metric_registration]	Source registration details for processing raw data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Health monitor scripts [em_monitor_scripts]	These scripts determine how to monitor or check, for example, when using the Connectors Monitor script. You can create customized script to monitor a device or an entity. The scripts provided with the base instance are: • Check delay in event processing • Connectors Monitor • Get Event Processing state • MID Server Threshold Alerts
Monitoring configuration [em_monitor_conf]	Use this table to configure what to monitor according to the scripts that are listed. Configure how often to run each script. If a script has a threshold, it determines what alert severity to display. Threshold values are in units of minutes and specify the delay time. Navigate to **Event Management** > **Settings** > **Self-Health configuration** to see the list of Monitoring Configurations or to create a new one. Use this script to test Data Center Monitoring. The scripts provided with the base instance are: • Connector's idle state monitoring-monitor to verify whether any of the connectors was in idle state that surpassed the threshold [in minutes] that was configured. • Connectors Status- monitor to track the active status of the connectors. • Delay in event processing-monitor to track the duration [in minutes] of events that remained in 'ready' state and were not processed. • Event Processing job-monitors the state of the event processing jobs. • MID Server Threshold Alert-monitors MID Server health.
Monitoring Event Management Jobs [em_monitor_jobs_state]	Monitor Event Management jobs by adding the relevant jobs to the table. **Note:** The following jobs are not monitored by this table: • Event Management - Process Events • Event Management - Impact Tree Builder • Event Management - Recover Stuck Events • Event Processing
Monitoring state [em_monitor_state]	Use this table to set the threshold for each connector. When there is a value above the threshold, an alert is generated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
EM XMLStats Data [em_xmlstats_data]	Self-health statistics and diagnostic details for Metric Intelligence and Event Management, which are used to produce the XMLStats page.

Event Management adds the following tables to support alert aggregation and RCA.

Table	Description
SA RCA Status [sa_rca_status]	Information (such as IDs) for the latest messages that were sent to the ECC Queue for a service during RCA.
SA RCA Output [sa_rca_output]	RCA learner output data.
SA RCA Group [sa_rca_group]	Automated alert groups for the RCA query.
SA Analytics Alert Staging [sa_analytics_alert]	Staging table for alerts used for analytics.
SA RCA Input [sa_rca_input]	Input data for the RCA learner.
SA Analytics Status [sa_analytics_status]	Last run information to be used for alert aggregation and RCA.
SA RCA Group Alert [sa_rca_group_alert]	Alerts associated with automated alert groups.
SA RCA Service Configuration Item Association [sa_rca_svc_ci_assoc]	Associations between CIs and services.
SA Alert Aggregation Learned Pattern [sa_agg_pattern]	Learned patterns from alert aggregation.
SA Alert Aggregation Learned Pattern Elements [sa_agg_pattern_element]	CI/Metric Name pairs associated with learned patterns.
SA Alert Aggregation Query Group Patterns [sa_agg_group_pattern]	Relationships between groups discovered in alert aggregation queries and patterns found in learning.
SA Alert Aggregation Query -- Staged (Recent) Alerts	A staging table for alerts that have not yet been associated with any aggregated alert group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_agg_group_alert_staging]	
SA Agg Pattern Attribute [sa_agg_pattern_attribute table]	CI/alert attributes to be used for finding patterns for alert aggregation.
SA Alert Attribute Populator Status [sa_alert_attribute_populator_status table]	State and statistics for attribute populator job.
SA Alert Aggregation Learned Pattern Elements Pair wise Mutual Information and Joint Probability [sa_agg_pattern_element_pair]	Pairwise probabilities for pattern elements.
EM Agg Group Prediction [em_agg_group_prediction]	Alert predictions for alert groups.

Event Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics Solutions

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Event Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Event Management. The guided setup takes you through the entire setup and configuration process.

Data visualization in ITOM now includes a funnel component to help you track metric progression across stages, making it easier to identify drop-offs or bottlenecks in processes. For more details, see Data visualization in ITOM.

Related topics

Activate your Performance Analytics subscription

Customize Platform Analytics elements

Customize the appearance of widgets when viewing Platform Analytics visualizations.

Before you begin
Role required: user

Procedure

1. Navigate to **All** > **Performance Analytics** > **Dashboards**.
2. On the **Dashboards** page, select a dashboard to view.
3. Select the **Edit** button.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the relevant element to open the Configuration panel.
5. In the Configuration panel, edit the element's options.
6. Select **Save**.

What to do next

Users with the admin role can customize colors and fonts. To customize fonts, navigate to **sys_ux_theme_property.list** and edit the applicable fonts.

Machine learning solutions for Event Management

Build solutions for Event Management with Predictive Intelligence.

Solution definition

Solution Definition for Event Management

Solution Definition	Description
Closed alert similarity	Closed alert similarity is a similarity solution definition that is used to recommend similar Alert records based on these fields: Description, Node, Resource, CI Type,Source, and Metric Name from the Alert [em_alert] table. Results are visible to users on the Alert form and on the Similar Alerts tab in Workspace.
EM Alert Clustering Solution	EM Alert Clustering Solution is a clustering solution definition used in Event Management. Allows building clustering models enabling identification of common text patterns in alerts to create alert groups. Text clusters are based on these fields: Description, Metric Name, Configuration Item Class from the Alert [em_alert] table.

Performance Analytics Edit Widget dialog box

Fields in the dialog box for editing a Performance Analytics dashboard widget.

Section	Description
Show real-time updates	Select for updates to appear in the widget in real-time.
Show	Select or clear the boxes to show or hide the following on the widget: • Border • Header • Title
Title alignment	Select the alignment of the widget title: • Left • Center • Right
Title color	Select to configure the color of the widget title.

Section	Description
Header color	Select to configure the color of the widget header.
Interactivity	Select from the displayed options. • Follow interactive filter • Show when following filter

Event Management MID Web Server extension form

Fields in the form for creating or modifying a MID Web Server extension.

MID Web Server Context form

Field	Description
Name	Unique name for the extension for easy identification.
Short description	Brief, meaningful description of the extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: • Started: The extension is running. • Stopped: The extension is not running. • Offline: The MID Server is down. • Error: The extension failed with an error. The error message is displayed in the **Error Message** field. • Warning: A run-time exception has occurred. The extension continues to work.
HTTP/HTTPS Port	Port number the extension listens on for incoming requests.
Authentication Type	The available authentication types are: • **API Key** (default): Any client connecting to the extension must enter an API key into the request's authorization header. For details on viewing existing API keys, see Configure MID Web Server API key authentication. • **Keybased** (deprecated and kept only for compatibility with releases prior to the Zurich release): The value in the **Secret Key** field is used to generate an authentication token sent in the **Authorization** header of incoming client requests. For details, see Configure key-based MID Web Server authentication.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
	• **Basic**: Define a username and password in the **Basic Auth User** and **Basic Auth User Password** fields, which appear when selecting this option. • **mTLS**: A certificate-based authentication that uses the TLS protocol. For details, see MID Web Server and agent mTLS Authentication.
Secret Key	The value generated when Keybased authentication is selected for the value in the Authentication Type field.
Basic Auth User	Username to be used when selecting Basic authentication.
Basic Auth User Password	Password to be used when selecting Basic authentication.
Secure Connection	Option to indicate that the extension is to use the TLS protocol to encrypt incoming connections. A certificate and private key combination must also be provided to the extension. When selecting this option, the **MID Server Unified Keystore** check box appears.
Use MID Unified Keystore	Option for using the MID Server Unified Keystore option for a secure connection. Clear this option to use **Web Server Keystore**. For details, see Configure a secure MID Web Server extension.
Keystore Certificate Alias	The alias name of the keypair inside the selected keystore that the extension uses to establish a secure connection. Leave this field empty to use the default alias when using the MID Unified Keystore or when using the Web Server Keystore with a single alias.
Keystore Password	The password for the Web Server Keystore when it is used to establish a secure connection.
Keystore Key Password	The password of the private key entry mapped to the specified alias of the Web Server Keystore. This field can be left empty if the password matches the entry in the Keystore Password field.
Truststore Password	The password to the truststore that holds the Certificate Authority (CA) certificates

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
	used to validate the signatures of the client certificates. Appears when the **mTLS** authentication type is selected. Leave this field empty if the extension is configured to use the cacerts truststore of the JRE running the MID Server.
Error Message	Message describing any error that causes a command, such as Start or Stop, to fail. This field appears only when the value in the Status field is Error.
Execute on	Location for running this extension. The available options are **Specific MID Server** or **Specific MID Server Cluster**.
MID Server	Depending on your selection in the **Execute on** field, the name of the designated MID Server or MID Server cluster. • If you selected **Specific MID Server**, the name of the designated MID Server. • If you selected **Specific MID Server Cluster**, the name of the designated MID Server cluster.
Executing on	Displays the name of the MID Server on which the extension is running even if the MID Server is down. If the user stops the extension, this field is empty.

Event Management tag based alert clustering tag form

The form for creating or modifying a tag based alert clustering tag displays detailed information about the tag.

Tag based alert clustering tag form

Field	Description
Name	Name of the clustering tag. Defaults to a description of the configured tag (such as, **Exact match on Alert Field "metric name"**). The default name is visible only after saving the tag. Tag names must be unique.
Customized name	Select the check box to customize the value in the **Name** field.
Domain	The domain in which the current record was created. Read-only.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form (continued)

Field	Description
Description	Enter an optional description of the tag.
Source	Select the source from which to choose the field to be matched. • **Alert field** • **Alert additional info** • **Alert CI** • **Alert CI key** • **Alert tags** If you select **Alert additional info**, choose an **Additional Info Key** instead of a field. **Alert additional info** is a field on alert containing the key value pair in Jason format and we can use a specific key. **Alert CI key**: Create CMDB key values to cluster alerts based on CMDB Key Values [cmdb_key_value] table. Key values provide an additional method for determining commonalities between alert CIs.
Selected field	Indicate the field that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert Field** or **Alert CI** in the **Source** field. If you select **Alert CI** in the **Source** field, you need to select a CMDB key. A CMDB key is assigned to the CI of the alert.
Key	Indicate the Key that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert additional info** in the **Source** field, or appears when you select **Alert tags** in the **Source** field. When **Alert additional info** is selected, enter the name of one of the fields in the additional info field. When **Alert tags** is selected, enter the name of the relevant alert tag.
CMDB key	Indicate the CMDB key to match for the alerts to be included in a group. Appears when you select **Alert CI Key** in the **Source** field.

Tag based alert clustering tag form (continued)

Field	Description
Match method	Select the type of match required for the alerts to be included in a group. • **Exact**: Indicates that the field value must be an exact match for the alert to be included in a group. For example, you can configure an alert clustering tag indicating that the alert's **Metric name** field must be an exact match to form a group. When invoking that tag, all alerts with identical values in the **Metric name** field are included in the same group. • **Fuzzy**: Indicates that the field value needs to be an approximate match (depending on the value configured in the **Similarity** field) for the alert to be included in a group. • **Pattern**: Indicates that the field value needs to follow the pattern in the **Pattern** field. For correct syntax and usage examples, see Pattern matching.
Similarity	Specify the similarity percentage that must be met by the alerts to be included in a group. For example, entering 50 indicates that at least 50 percent of the indicated value must appear in the alert for the alert to be included in the group. Appears only when **Fuzzy** is selected as the **Match Method** value. Default value = 90

List of predefined alert grouping tags

A list of the predefined alert clustering tags provided with the Tag Based Alert Clustering Engine # application.

Predefined alert clustering tags

Name	Source	Match method
CI	em_alert.cmdb_ci	Exact match
Description	em_alert.description	Exact match
Metric Name	em_alert.metric_name	Exact match
Node	em_alert.node	Exact match
Resource	em_alert.resource	Exact match
Source	em_alert.source	Exact match

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predefined alert clustering tags (continued)

Name	Source	Match method
Source instance	em_alert.event_class	Exact match
Type	em_alert.type	Exact match
Assignment group	em_alert.assignment_group	Exact match
CI Class	cmdb_ci.sys_class_name	Exact match
Dns domain	cmdb_ci.dns_domain	Exact match
ip address	cmdb_ci.ip_address	Exact match
Location	cmdb_ci.location	Exact match
Environment	cmdb_ci.environment	Exact match
CI name	cmdb_ci.name	Exact match
Namespace	cmdb_ci.namespace	Exact match

Predefined tags extracted from connector payload

Name	Description	Default mapping from CMDB
t_ip_address	IP address	cmdb_ci.ip_address
t_application	Application	-
t_region	Region	-
t_location	Location	cmdb_ci.location
t_environment	Environment	cmdb_ci.environment
t_namespace	Namespace	cmdb_ci.namespace

Event Management tag based alert grouping definition form

The form for creating or modifying a tag based alert clustering definition displays detailed information about the definition.

Tag based alert clustering definition form

Field	Description
Name	Name of the alert clustering definition. Definition names must be unique.
Active	Select to activate the definition. This option is selected by default.
Order	The order by which definitions are tested for incoming alerts. Those with lower Order values are tested first. When an alert matches one of the definitions' filters, it continues searching for more definitions.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
	Default value = 1000
Domain	The domain in which the current record was created. Read-only.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.
Description	Enter an optional description of the alert clustering definition.
Filter	Set conditions that incoming alerts must meet to be measured by the alert clustering definition's tags. If the tags correspond to alerts that exist in the system and are within the **Clustering timeframe (minutes)** value, the incoming alerts join with the existing alerts to form an alert group. After configuring the filter, you can click the **Preview** button to view how many existing alerts match the filter's condition. **Note:** • Matching alerts are not automatically included together in an alert group. Alerts are grouped only if they have corresponding alert clustering tags. • Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**. • You can also configure alert fields to be excluded from the search, using the *sn_em_tbac.tag_excluded_alert_fields* property. By default, the following are excluded by this property: ○ type ○ event_class
Override group description	Default group descriptions begin with a "Group of alerts" prefix, followed by the description of the primary alert in the group. You may override this group description by

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
	selecting the **Override group description** check box. Then, in the **Custom description** field, type a description. This description is used as the description of the groups that are created by this alert clustering definition. **Note:** You cannot save the form if you left the Custom description field blank or with the default 'Group of alerts' text.
Clustering timeframe	The maximum time, in minutes, allowed between the first alert and subsequent alerts for them to be grouped together. For example, a value of 60 indicates that any alert generated within 60 minutes of the first alert in the group (the oldest alert) is included in the alert group. Any alert generated after this 60-minute window from the initial alert is not included in the group. Permitted values = 0-1440
Tag Based Alert Clustering Definitions Tags M2M	Select the alert clustering tags to be assigned to the alert clustering definition. Alerts that meet the criteria specified in the selected tags are included in the alert group. The available options are the tags created on the **Tag Based Alert Clustering Tags** page.

List of predefined tag-based alert grouping definitions

A list of the predefined alert clustering definitions provided with the Tag Based Alert Clustering Engine#application.

Predefined alert clustering definitions

Name	Description	Order
Group alerts from the same Application	Group all alerts from the same application, created in the last 10 minutes. In new systems, this definition is activated by default.	9010
Group all alerts from the same IP address	Group all alerts from the same IP address, created in the last 10 minutes.	9020
Group all alerts from the same Namespace	Group all alerts from the same namespace, created in the last 10 minutes. In new systems, this definition is activated by default.	9030
Group all alerts from the same Subnet	Group all alerts from the same subnet, created in the last 10 minutes. In new systems, this definition is activated by default.	9040

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predefined alert clustering definitions (continued)

Name	Description	Order
Group alerts from the same CI class and Location	Group all alerts from the same CI class and location, created in the last 10 minutes.	9050
Group alerts from the same Application and Environment	Group all alerts from the same application and environment, created in the last 10 minutes.	9060
Group all alerts from a similar Node	Group all alerts from a similar node name, created in the last 10 minutes.	9070
Group alerts from the same Location and Assignment group	Group all alerts from the same location and assignment group, created in the last 10 minutes.	9080
Group alerts from the same Region and Metric	Group all alerts from the same region and metric, created in the last 10 minutes.	9090
Group alerts from the same CI class and Metric	Group all alerts from the same CI class and metric, created in the last 10 minutes.	9100
Group alerts from the same Node and Metric	Group all alerts from the same node and metric, created in the last 10 minutes.	9110
Group alerts from the same Assignment group and Class	Group all alerts from the same assignment group and class, created in the last 10 minutes.	9120
Group alerts from the same Type, Metric and Source	Group all alerts from the same type, metric, and source instance, created in the last 10 minutes.	9130
Group alerts from the same CI	Group all alerts from the same CI, created in the last 10 minutes. **Important:** When this rule is active, CMDB grouping must be disabled.	9140
Group alerts from the same Node	Group all alerts from the same node, created in the last 10 minutes. In new systems, this rule is activated by default.	9150

Domain properties installed with Event Management

Use the domain properties installed with Event Management to provide the metadata that points to the appropriate table to identify the domain so that you know which domain to create the event in.

Default domain metadata properties

Property
evt_mgmt. connector_domain_info_table_name
evt_mgmt. connector_domain_info_column_name

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default domain metadata properties (continued)

Property
evt_mgmt. connector_domain_id_column_name
evt_mgmt. connector_domain_path_column_name

Connector domain metadata

Override push connector default domain metadata values installed with Event Management with the values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters. Override pull connector domain metadata values with connector parameters only.

Domain metadata parameters

Name	Description	Overrides System Property
connectorDomainInfoTableName	Name of the table containing the records with the domain information.	evt_mgmt.connector_domain_info_table_name • **Type**: string • **Default value**: core_company
connectorDomainInfoColumnName	Name of the column that has a value that should be matched with the domain identifier. For example, you might want to identify a record in the Domain Info table that has a matching value in the **company_name** field.	evt_mgmt.connector_domain_info_column_nar • **Type**: string • **Default value**: name
connectorDomainIdColumnName	Name of the table column that stores the domain ID.	evt_mgmt.connector_domain_id_column_name • **Type**: string • **Default value**: sys_domain
connectorDomainPathColumnName	Name of the table column that stores the domain path.	evt_mgmt.connector_domain_path_column_na

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Overrides System Property
		• **Type**: string • **Default value**: sys_domain_path

Order of preference for accessing domain metadata

You must provide domain metadata to configure personalized push connector domains. The metadata in preferred accessing order are:

1. Push connector parameters
2. URL query parameters
3. HTTP headers
4. Request body (payload)
5. Default system properties

URL query parameters

Push connectors have the following URL syntax:

- Instance Type: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>`
- MID Server type: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=<connector-transform-script-name>`

You can include domain metadata as additional query parameters in the ServiceNow push connector webhook URL. For example, if the domain information source is the sys_user table, the URL could be `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>&connectorDomainInfoTableName=sys_user`

Request headers

Any of the domain metadata properties can be passed as part of HTTP request headers. Check the documentation from your third-party monitoring tool for information about how request headers are set.

Request body (payload)

You can reference domain metadata from the request body (JSON payload) by setting the metadata parameters as root-level keys in the payload. The following example shows how the *connectorDomainInfoTableName* and *connectorDomainInfoColumnName* parameters might be passed as part of the request body:

```
{
    “source”: “Azure Monitor”,
    “host”: “127.0.0.1”,
    “company”: “ServiceNow”,
    “connectorDomainInfoTableName”: “sys_user”,
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

"connectorDomainInfoColumnName": "first_name"

}

Note:
For information on connector parameters, see Personalize domains for push connector events to use in event creation.

Dynatrace connector instance form

The Dynatrace connector instance form displays the fields you must fill in when creating a Dynatrace connector instance.

Connector instance page

Field	Description
Name	Unique name for the Dynatrace metric connector instance.
Description	Description for the use of connector instance.
Connector Definition	The connector definition to be used by the connector. Select **Dynatrace Metrics**.
Host IP	Hostname/IP address of the Dynatrace server.
Credential	Select the search icon and select the existing API key credential. If this credential does not exist, create a new credential, as follows: **1.** Ensure that you have an access token with Read Metric (metrics.read) permissions, created on the Dynatrace UI. **2.** Select **New** after selecting the search icon. **3.** Select **API Key Credentials**. **4.** In the **API Key** field, enter the access token from the Dynatrace UI. **5.** In the **Name** field, enter a descriptive name to uniquely identify the credential. **6.** Fill in any other relevant fields, and select **Submit**.
Metric collection	Selected by default. Read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the metric connector pulls metrics from the Dynatrace server. Default: 60.
Active	Select to activate the connector instance.

Dynatrace connector instance value parameters

The following table displays the Dynatrace connector instance value parameters that you can fill in, as needed, when creating a Dynatrace connector instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters

Parameter	Description
BaseApiPath	Custom base path for Dynatrace API calls. If your Dynatrace instance uses a different path than the default `/api/v2/metrics`, enter the custom path to ensure successful collection of metrics.
debug	Set to **true** to enable debug logs. Default: false
initialSyncInMins	Number of minutes before the current time that the initial metric collection runs. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. Default: 15
logPayload	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default: false
maxMetricsPerQuery	Maximum number of metric ids to query per API call to Dynatrace. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Default: 32
pageSize	Maximum number of records to return in an API response from Dynatrace. Default: 500
port	Port number for the Dynatrace server to connect to. empty
protocol	Protocol to use when connecting to the Dynatrace server. Default: https
throttleApiCalls	Determines whether throttling is enabled. When enabled (**true**), a limit is set on the number of API calls to Dynatrace per minute. Default: false

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
requestPerMinute	The limit on number of API calls to Dynatrace per minute. Relevant only when *throttleApiCalls* = **true**. Default: 1000

Datadog connector instance form

The Datadog connector instance form displays the fields you must fill in when creating a Datadog connector instance.

Connector instance page

Field	Description
Name	Unique name for the Datadog metric connector instance.
Description	Description for the use of connector instance.
MID Server	Select the MID Server configured with the Datadog capability.
Credential	Select the API Key Credential that you made in the authentication step. If this credential does not exist, create a new credential, as follows: **1.** Ensure that you have an access token with Read Metric (metrics.read) permissions, created on the Datadog UI. **2.** Select **New** after selecting the search icon. **3.** Select **API Key Credentials**. **4.** In the **API Key** field, enter the access token from the Datadog UI. **5.** In the **Name** field, enter a descriptive name to uniquely identify the credential. **6.** Fill in any other relevant fields, and select **Submit**.
Metric collection schedule (seconds)	Time interval (in seconds) at which the metric connector pulls metrics from the Datadog server. Default: 60.
Host IP	Enter the base URL for your Datadog API endpoint (e.g., api.datadoghq.com).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For collecting cloud-native metrics (e.g., from AWS, Azure, GCP), it is recommended to set the collection schedule to 300 seconds (5 minutes). This accounts for potential data latency from the cloud provider to the Datadog platform.

To go back to the procedure page, see Configure the Datadog metrics connector instance.

Datadog connector instance value parameters

The following table displays the Datadog connector instance value parameters that you can fill in, as needed, when creating a Datadog connector instance.

Connector instance value parameters

Parameter	Description
application_key	(Mandatory) Enter the Application Key generated from your Datadog account, used for authentication.
BaseApiPath	The specific API path for querying metrics. The default is `/api/v2/query/timeseries`.
debug	Set to true to enable detailed, high-level logging for this instance during troubleshooting. Default: false
hostApiPath	The specific API path for retrieving the list of hosts. The default is `/api/v1/hosts`.
hostBatchSize	The number of hosts to retrieve in a single API call. The default is 500, and any value above 1000 is automatically capped at 1000.
hostFilter	(Optional) A comma-separated list of regular expressions (regex) to filter for specific hosts to monitor. or example, ^prod-db-.* is a regex pattern that means "match any host whose name starts with prod-db-". Example Use Case: To monitor only hosts starting with app-server- and the specific host critical-db-01, you would set the hostFilter to: ^app-server-.*, ^critical-db-01$.
initialSyncInMins	For the first run of the instance, the number of minutes of historical data to retrieve. The default is 15, and any value above 120 is capped at 120.
logPayload	Set to true to log the full request and response bodies for deep debugging. Use with caution as it can generate very large logs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
metricBatchSize	The number of metrics to query in a single API call. The default is 50, and any value above 50 is automatically capped at 50.
port	Port number for the Datadog server to connect to. This is typically not needed when using https.
protocol	The protocol for the connection. Default: https

In the Connector Instance Metrics related list, specify which metrics to collect. To use all 23 out-of-the-box metrics, no action is needed.

To go back to the procedure page, see Configure the Datadog metrics connector instance.

Kafka connector instance form

The Kafka connector instance form displays the fields you must fill in when creating a Kafka connector instance.

Connector instance page

Field	Description
Name	Unique name for the Kafka Metric Consumer connector.
Description	Description to be used by the Kafka metric Consumer collection instance.
Connector Definition	Name of the required connector definition, which in this case should be **Kafka Metric Consumer**.
Credentials	Kafka SSL credential.
Metric collection last run time	Option is pre-selected and read-only.
Last metric collection status	Option is pre-selected and read-only.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the Kafka Consumer.
Last error message	This field is automatically set to the last error message.

Kafka connector instance value parameters

The following table displays the Kafka connector instance value parameters that you can fill in, as needed, when creating a Kafka connector instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters

Parameter	Description
bootstrap_servers	Set to **true** to enable debug logs. Default: false
consumer_group_name	Limits metric history retrieval to prevent system overload. Default: 180 minutes
topic	Adds a small time buffer to ensure no metrics are missed. Default: 5 minutes
Field_mappings	Maps field names from Kafka message payload to internal field identifiers. For example: - "node": "host" → maps host in message to internal node field. - "value": "value" → maps metric value. - "timestamp": "ts" → maps timestamp field. Default: "{ "metric_type": "metric_name", "resource": "mountpoint", "node": "host", "value": "value", "timestamp": "ts"}
logPayloadForDebug	Determines whether to print the raw log payload. Set to true only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
debug	Displays debug messages. Default value: false. Specify true to see debug messages.
max_poll_attempts	Number of times to attempt polling Kafka for messages before stopping. Default value: 10
max_poll_records	Maximum number of records fetched in a single poll. Default value: 5000
max_poll_retry	Number of times to retry polling if no records are returned consecutively. Default value: 2
poll_timeout_ms	Maximum time (in milliseconds) to wait during a poll operation before timing out. Default value: 60000

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push connector instance form

Push Connector Instance form displays the fields that you must fill when you create or modify a connector.

Field	Description
Name	A unique name for the connector instance record, such as the name of an event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Push Connector definition	Select the definition for the external system from which you want to receive events. You can select any existing definition, for example: • Thousandeyes • Dynatrace • Catchpoints For a list of the connector definitions available in the base system, see Configure Event Management connectors. **Note:** If there are available configuration parameters for the push connector type you select, they appear under Push Connector Instance Configuration Parameters.
MID Server	It shows the list of MID Servers that has at least one MID Server Event Listener context up and running. The MID Server section appears only when the MID type of definition is selected.
URL	This field is auto-populated only after saving the details of the connector instance. Instance: The URL has to be configured in an external system with the ServiceNow credential having a evt_mgmt_integration role to receive the events. MID push connector instance: The URL has to be configured from an external system with Configure the MID Web Server extension credential to receive the events.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears only after the form has been saved.
Active	Select this check box to enable receiving the events from this external event source. This field appears only after the form has been saved.

Nagios connector instance value parameters

The following table displays the Nagios connector instance value parameters that you can fill in, as needed, when creating a Nagios connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default: false
max_fetch_interval_min	Limits metric history retrieval to prevent system overload. Default: 180 minutes
offset_min	Adds a small time buffer to ensure no metrics are missed. Default: 5 minutes

Nagios connector instance form

The Nagios connector instance form displays the fields you must fill in when creating a Nagios connector instance.

Connector instance page

Field	Description
Name	Unique name for the Nagios metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Nagios Metrics**.
Metrics database host	Host IP address of the host where the Nagios server collects metrics.
Metrics database credentials	Credentials required to access the Nagios database.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Nagios server. Default: 60 seconds.
Active	Option to activate the connector instance.

Zabbix connector instance form

The Zabbix connector instance form displays the fields you must fill in when creating a Zabbix connector instance.

Connector instance page

Field	Description
Name	Unique name for the Zabbix metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Zabbix Metrics**.
Host IP	Host IP address of the host where the Zabbix server collects metrics.
Credential	Credentials required to access the Zabbix database. Select the search icon and select the Basic Auth credential. • Name: Provide the unique name for Zabbix cred. • UserName: Provide Zabbix server username • Password: Provide Zabbix server password • Select **Submit**.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Zabbix server. Default: 60 seconds.
Active	Option to activate the connector instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zabbix connector instance value parameters

The following table displays the Zabbix connector instance value parameters that you can fill in, as needed, when creating a Zabbix connector instance.

Connector instance value parameters

Parameter	Description
api_endpoint_suffix	Set this value based on your Zabbix server web interface installation: https://www.zabbix.com/documentation/current/en/manual/installation/frontend#welcome-screen Default value: /zabbix/api_jsonrpc.php [For Apache Server]
debug	Set to **true** to enable debug logs. Default value: false
enable_batch_processing	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: false
groupids	Provide the host group IDs. These IDs will be used to fetch metrics from the hosts attached to the specified groups. This applies only if `enable_batch_processing` is set to true.
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
max_fetch_interval_min	Configured from the 'max_fetch_interval_min' parameter: If the time exceeds 'max_fetch_interval_min', fetching starts from 'max_fetch_interval_min' before the current time; for an INITIAL run without 'lastMetricSignature', the time is set to 'max_fetch_interval_min' before the current time. Default value: 180 minutes
max_hosts_per_batch	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: 1000
offset_min	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 5 minutes
port	Port number for the Zabbix server to connect to.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	Default value: empty
protocol	Protocol to use when connecting to the Zabbix server. Default value: http
with_triggers	It will fetch the trigger information. Default value: false

Note:
When monitoring a large number of hosts in Zabbix, fetching massive metric data can impact performance and cause API timeouts; enabling batch processing (enable_batch_processing = true) mitigates this by fetching metrics in batches (default: 1000 hosts, configurable via *max_hosts_per_batch*), though it increases network calls and must be used when monitoring 10,000+ hosts or facing performance issues.

SCOM connector instance form

The SCOM connector instance form displays the fields you must fill in when creating a SCOM connector instance.

Connector instance page

Field	Description
Name	Unique name for the SCOM connector instance.
Description	Description for the use of the SCOM event collection instance.
Active	Select to activate the connector instance. Appears only when selecting a connector instance that has already been created.
Connector definition	The vendor and protocol used to gather events from the external event source. For a regular SCOM connector, select **SCOM**. For a connector instance that you want to monitor metrics, select **SCOM Metrics**. When selecting this option, the fields in the **Connector instance - metrics fields** table appear.
Assignment group	Select the group to whom the connector instance is assigned. For example, this may be a group of administrators or a support group.

© 2025 ServiceNow, Inc. All rights reserved.

Connector instance page (continued)

Field	Description
Host IP	Specify the SCOM IP address. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Credential	Select Windows credentials. **Note:** When configuring Windows credentials, if the credential applies to specific MID servers, ensure that the MID Servers you specify on the credential record match the MID Servers specified in the **MID Servers for Connectors** section on the Connector Instance form. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection last run time	The last event collection run time value updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last event collection status	The last event collection run time status updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SCOM Operations. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Bi-directional	Select to invoke the bi-directional option. This option enables the bi-directional exchange of values to-and-from the external event source. There is default implementation for SCOM. The **Last bi-directional status** option displays only when this option is selected. This field does not appear when **SCOM metrics** is selected as the Connector definition.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Last bi-directional status	The value of this field populates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last error message	The last error message field is automatically updated. This message is the last error message received by the connector. If the test connector fails, an error message is displayed in this field. This field does not appear when **SCOM metrics** is selected as the Connector definition.
MID Servers (MID Server for Connectors section)	Specify one or more MID Servers that are up and valid. MID Servers sort according to the order that their details were entered into the MID Server for Connectors section. The port requirement from the MID Server to the SCOM server is `1433`. If the specified MID Server is in a cluster, it may not be selected and another available MID Server is selected in its place. Ensure that the specified MID Servers match the MID Servers specified on the Windows Credentials page, as the connector uses Windows credentials to access MID Servers. If no MID Server is specified, an available MID Server that has a matching IP range is used.

Connector instance - metrics fields (displayed when Connector definition = SCOM Metrics)

Field	Description
Metrics collection	Selected by default. Read-only.
Metrics collection last run time	The last run time of the Metrics Collection scheduled job. This field is read-only.
Last metrics collection status	Status of the Metric Intelligence collection activity. The value of this field populates automatically. This field is read-only.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance - metrics fields (displayed when Connector definition = SCOM Metrics) (continued)

Field	Description
Metrics collection schedule (seconds)	The time, in seconds, to repeat the Metric Intelligence Collection scheduled job.
Metrics database host	The IP address or the host name of the metrics database host.
Connect using a named instance	When selected, the connection is made using the specified named instance. Otherwise, the connection is made using the specified port.
Metrics database port	The port used by the metrics database. The connection is made using JDBC. Default port number is 1433. If **Connect using a named instance** is selected, this option does not appear.
Metrics database named instance	The metrics database instance name.
Database login with Windows authentication	Perform database login with the credentials of the logged-in user defined on the MID Server service.
Metrics database credential	Credentials for the metric database. Use JDBC credentials for the local database user. If **Database login with Windows authentication** is selected, this option does not appear.

Solarwinds connector instance form

The Solarwinds connector instance form displays the fields you must fill in when creating a Solarwinds connector instance.

Connector instance page

Field	Description
Name	Unique name for the Solarwinds metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Solarwinds Metrics**.
Host IP	Hostname/IP address of the Solarwinds server.
Credential	Credentials for a SolarWinds user with Basic Authentication and read access to the SWIS REST API.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Solarwinds server. Default: 60 seconds.
Active	Option to activate the connector instance.

Solarwinds connector instance value parameters

The following table displays the Solarwinds connector instance value parameters that you can fill in, as needed, when creating a Solarwinds connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default value: false
max_fetch_interval_in_min	Number of minutes before the current time when the initial metric collection runs. For example, if the value is 180, the connector fetches metrics from the past 180 minutes. Default value: 180 minutes
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
offset	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 0 minutes
Port	Port number for the Solarwinds server to connect to. Default value: 17774
protocol	Protocol to use when connecting to the Solarwinds server. Default value: https

Event forwarding properties

Several system properties enable you to customize an event forwarding job.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To access the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Property	Description
evt_mgmt.event_forwarding.sources_to_exclude	List of event sources from which events should not be forwarded. By default, all events are forwarded. Separate multiple sources by commas. • **Type**: string • **Default value**: Empty
evt_mgmt.event_forwarding.event_fields_to_include	List of event fields to include when sending events to the target instance besides the required default fields: resolution_state, event_class, additional_info, node, resource, cmdb_ci,severity, time_of_event, message_key, sys_domain, metric_name, ci_type, ci_identifier, type, source, description, and sys_domain_path. Separate multiple fields by commas. • **Type**: string • **Default value**: Empty
evt_mgmt.event_forwarding.event_batch_size	Maximum number of events to batch while sending to the target instance. • **Type**: integer • **Default value**: 500
evt_mgmt.event_forwarding.max_payload_size_in_mb	Maximum size of the event payload, in MB, sent to the target instance at a single time. • **Type**: integer • **Default value**: 5
evt_mgmt.event_forwarding.max_events_to_forward_per_day	Maximum number of events that can be forwarded from the instance per day to minimize the performance impact on the source instance. • **Type**: integer • **Default value**: 100000
evt_mgmt.event_forwarding.log_debug	Enables or disables debug logging for event forwarding. Set this property to true to log debugging information.

	  ○ cmdb_ci.support_group, IntegrationGroup -
	
	Note:
	When you use an alert field in this property
	field in the **Additional Info** field, an alert tag
	the value of the **Assignment group** field mu
	For example, `{"Alert field name":"`
	`desired sys_user_group record>`

evt_mgmt.enable_group_level_event_rules	Activates team-based functionality for executing
	field-mapping rules. Global rules take precedenc
	based rules.
	
	• **Type**: Boolean
	• **Default value**:
	  ○ False - for upgraded customers
	  ○ True - for new customers

Alert Query form

You can combine similar alerts that meet specific criteria for a particular service by creating an alert query.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Query form

Field	Description
Name	The alert query name.
Business criticality	The importance of this alert query to the business. This field can determine disaster recovery strategies for this alert query. • 1: most critical • 2: somewhat critical • 3: less critical • 4: not critical
Used for	The purpose of the alert query. Select from: • Production (Default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Owned by	The party that is responsible for the alert query.
Email	The email alias for the alert query.
Business phone	The phone number for the business.
Operational status	The status of the alert query. • **Operational**: The alert query is running. Impact calculation runs only on alert queries in the Operational status. Select this option to use this service. If you customized preconfigured options for this category, select the option whose value is set to 1. Event Management calculates impact only on services in use. If you do not want to use this service now, select one of these options: • **Non-Operational**: The alert query is unavailable, disabled, or down. • **Repair in progress**: The alert query is receiving maintenance. • **DR Standby**: The alert query is available as a disaster recovery (DR) standby. • **Ready**: The alert query is prepared for use. • **Retired**: The alert query is withdrawn from active use.
Comments	Any additional notes and information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Query form (continued)

Field	Description
Service Group Members	The service group which contains this service.
Filter	The conditions for sending a notification to the alert query. The conditions must meet the alert values. **Note:** • When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table. • Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed. • Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.

Alert correlation rule form

Manage the fields that define how alerts are correlated and grouped.

Alert correlation rule form

Field	Description
Name	Name of the correlation rule.
Order	The evaluation priority for the rule. Rules with lower numerical values are given higher priority. An alert is evaluated against each alert action rule until a match is found. For example, if you have two alert correlation rules with priorities 10 and 20, respectively, the rule with priority 10 will be evaluated first. If an alert matches the criteria of the rule with priority 10, no further rules will be checked. If it doesn't match, the alert will then be evaluated against the rule with priority 20.
Active	Option to activate or deactivate the rule.
Advanced	Option to switch to advanced mode, which lets you use custom scripts to define your own logic. The sample correlation rule, **Alert correlation rule SAMPLE**, is provided out-of-the-box for reference. You can use the available script as a guide.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description
	Note: The **Filter** condition specifies which alerts the rule will apply to. Ensure that the same condition is used in the advanced script to identify alerts to be included in the group.
Description	Description of the rule.
Primary Alert	The filter condition to identify the alert that is the primary alert, or most important alert, in a set of related alerts. This field does not appear when **Advanced** is selected.
Secondary Alert	The filter condition to identify the alert that is related to the primary alert, however it is of lesser importance. This field does not appear when **Advanced** is selected.
Filter	The filter condition to identify the alert on which the script is run. **Filter** is available only when **Advanced** is selected. Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**.
Relationship Type	Specify the type of relationship between the primary and secondary alert: • **No Relationship**: Ignore the relationship when looking for a match. • **Same CI or Node**: Relate both alerts with the same CI. If the CI field is blank, the alerts must have the same Node value. • **Primary is Parent**: Relate the alerts where the primary alert is the parent in a parent-child relationship, as described in the CI Relationship Types table [cmdb_rel_ci]. • **Primary is Child**: Relate the alerts where the primary alert is the child in a child-parent relationship, as described in the CI Relationships table [cmdb_rel_ci]. This field does not appear when the **Advanced** check box is selected.
Time Difference in Minutes	The minutes between which the primary and secondary event must occur to match this rule. The default value is 60 minutes. **Note:** The value for this entry cannot exceed 1440 minutes (one day). This field does not appear when **Advanced** is selected.
Script	Custom script that you can modify to return a JSON string that specifies the primary and secondary alerts. Select **Advanced** to display the script field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description

	``
	(/* The function needs to return a JSON-
	{correlationType:[correlatedAlerts]}
	for example: if your filter matches the alert,
	set the alert as the primary alert and set
	alerts 1, 2 and 3 each as secondary alerts.
	
	You can use both multiple primary alerts and
	multiple secondary alerts.
	The correlationType can be PRIMARY or
	SECONDARY, and the alerts ID must be in an
	array.
	CurrentAlert is the GlideRecord of the
	currentAlert on which that rule runs.
	The system supports only one primary per
	alert, so:
	Do not correlate more than one alert under
	the PRIMARY array.
	Do not correlate alerts that already have a
	primary under the SECONDARY array.
	The system supports open alerts only, so do
	not correlate alerts that have been closed
	under either one of the arrays.
	*/
	
	(function findCorrelatedAlerts(currentAlert){
	
	var result = {}; //Insert your code
	here
	result =
	{'SECONDARY':['alertID1','alertID2','alertID3'
	]};
	return JSON.stringify(result);
	
	})(currentAlert);
	``

Relationship	Description of the CI relationship between primary and secondary, for example, *Allocated from::Allocated to* or *Allocated to::Allocated from*. This field displays only if either **Primary is Parent** or **Primary is Child** is selected for the **Relationship Type**.  This field does not appear when **Advanced** is selected.

Health Log Analytics

The ServiceNow® Health Log Analytics application helps prevent IT issues before your users are affected. It helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

Health Log Analytics collects raw log data streaming into your instance and structures textual data into key-value pairs. It detects meaningful patterns in the data, and when it discovers an anomaly, it sends an event to the Event Management application.

Health Log Analytics is available in the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Exploring Health Log Analytics

ServiceNow Health Log Analytics predicts IT issues before they affect your users by collecting, analyzing, and correlating machine-generated log data in real time. It discovers anomalies and alerts you to potential issues.

Health Log Analytics overview

Health Log Analytics typically receives and processes log data and sends events to ServiceNow Event Management. The application discovers anomalies as they happen and helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

Health Log Analytics can handle any kind of machine-generated textual log data. It can process application, infrastructure, and network logs, as well as other types of textual log data. Although a configuration management database (CMDB) can be helpful to generate high-quality events and alerts, it is not necessary.

Note:

- Health Log Analytics supports only UTF-8 logs. It does not support binary logs.
- If you are sending logs in a language other than English, additional configuration may be required.

© 2025 ServiceNow, Inc. All rights reserved.

Health Log Analytics users

Health Log Analytics Users

User	Description	Role
Administrator	Configures the Health Log Analytics application to make it ready for use by Operators. Performs administration tasks to keep the system running efficiently.	evt_mgmt_admin, admin
Operator	Analyzes Log Analytics alerts and takes action to help resolve the underlying issue.	evt_mgmt_operator

Health Log Analytics workflow

Health Log Analytics collects and processes log data automatically. It structures the data logically for operators to analyze, and generates meaningful alerts and suggestions that display in Event Management.

The diagram shows the Health Log Analytics workflow from collecting the data through sending an event or alert to Event Management.

Health Log Analytics workflow

Ingestion

This layer connects your environment to Health Log Analytics. You can stream your logs directly from servers and endpoints or from log repositories. The optional guided setup helps you create data input connectors for common data sources, such as:

- Rsyslog
- Beats
- Splunk
- Elasticsearch
- MID Server
- TCP

Structuring

This layer deals with structuring log data and auto-mapping it to logical silos, called Components. Data structuring can be done automatically or manually.

The system auto-structures log data by extracting the following properties from incoming log messages: Message, Timestamp, Host, Severity, and External-IDs. It extracts explicit values, like "property-name" and "value is IP." and semantic ones such as length, number of English words, and variance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-mapping assigns log samples and metadata to the appropriate tags automatically. The system tries to map log lines by analyzing the source that streams the data. The mapping is based on agent hints and common transport header fields.

Enrichment

This layer handles identifying the variable parts of a log message.

Health Log Analytics workflow - Enrichment

It also identifies keywords and contextual properties. In the image, "WARN" and "Failed" are the keywords to track. "User," "source IP," and "port" are the contextual properties.

Analysis

In this layer, each log line is indexed. Health Log Analytics extracts properties from the inner log message that contribute to models of behavior that the system learns to expect. Anomalous behavior departs from this expected behavior. You can search for an event and its most significant properties for manual triaging.

Machine Learning (ML) and Artificial Intelligence (AI)

Health Log Analytics uses advanced unsupervised machine-learning algorithms to discover patterns within logs and learn their unique data behavior. It then sets dynamic thresholds based on the data signature in real time to detect issues when they first occur. When the system detects a deviation from the typical pattern, it sends an event to Event Management.

Alert in Event Management

Health Log Analytics sends events to Event Management. In Event Management, Health Log Analytics alerts appear in the **All alerts** list. This list enables operators to see alerts from the event and the Health Log Analytics alert type in a single location.

What to explore next

- Health Log Analytics architecture
- How Health Log Analytics generates alerts

Health Log Analytics architecture

Health Log Analytics collects logs streaming into your ServiceNow instance from endpoints or data lakes, such as Splunk and Elasticsearch.

The ServiceNow instance receives the logs either via a MID Server connector instance or via MID-less Ingest, which supports integration with services such as Amazon Data Firehose. Health Log Analytics identifies and triages anomalies in your log data using unsupervised machine-learning (ML) models. It then groups the anomalies together and applies further algorithms to help identify the root cause of the issue.

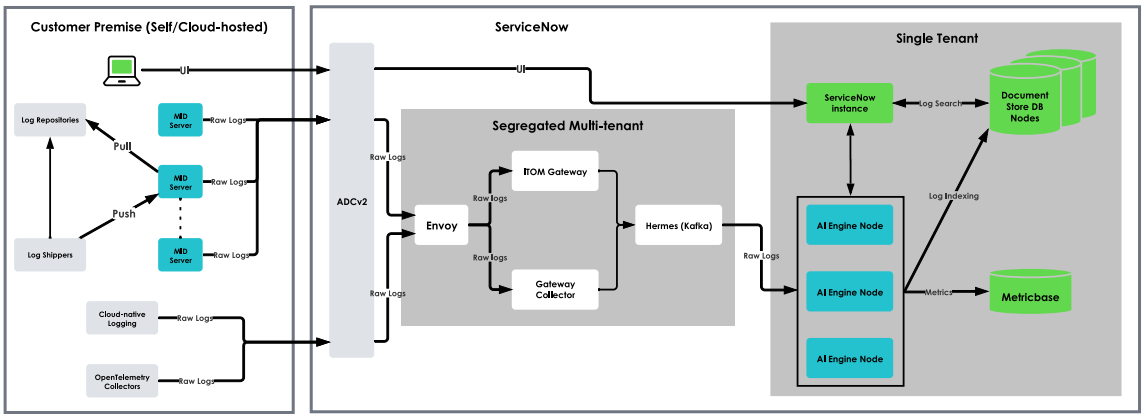
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics scaled architecture



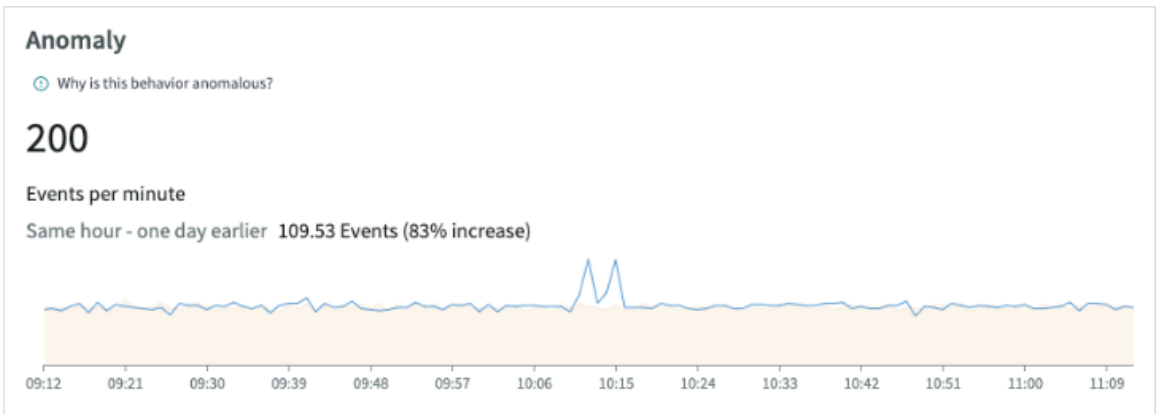
How Health Log Analytics generates alerts

Health Log Analytics identifies patterns in your log data and learns pattern behavior. When HLA's AI engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application. As an operator, you can use these predictive alerts to handle emerging IT issues before they impact users.

Log anomaly detection

There are many kinds of anomalous (abnormal or unexpected) behavior. In this example, the system tracks the baseline rate—the average number of events per minute—of particular messages. The chart shows the values for the previous day as the lightly peach-shaded area and the values for today as a blue line. The chart shows a dramatic deviation from the expected baseline values at around 10:10. This anomalous behavior generates an alert.

Anomalous behavior



Health Log Analytics uses various methods to detect anomalies and generate alerts.

Alert metrics

Health Log Analytics monitors multiple metrics in the log stream to detect anomalous behavior. Each metric is associated with a unique source: the combination of service instance and component. When the system identifies an anomalous pattern for a metric, it generates an alert.

As an operator, you can provide feedback about the generated alerts. Your feedback "teaches" Health Log Analytics that a specific alert is significant or irrelevant to you. The application then either raises the priority of the alert metric or mutes it to reduce noise.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant in Health Log Analytics
- Mute an alert for a specified source to eliminate distracting new alerts for unimportant issues. When a metric is muted, Health Log Analytics removes the current alert and any other alerts based on that metric from the feed. It also stops generating new alerts from that metric. For more information, see Mute an unimportant alert in Health Log Analytics.
- When the situation changes, you can return a significant metric to its default significance. You can also reactivate a muted metric to cause the system to start generating alerts again. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

Lexical keywords

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as "crashed" or "failed" signal a condition that can merit attention.

The system sets a threshold for each lexical keyword that is based on what it considers the normal occurrence pattern and frequency of that keyword in your logs. When it scans your logs, it finds all occurrences of the keyword. If the number exceeds the threshold, it generates an alert. For more information, see View the lexical keywords that generate alerts in Health Log Analytics.

For information about managing global keywords, see Add, edit, or delete lexical keywords in Health Log Analytics. To create or delete keywords for a specific source type, see Configure source type capabilities in Health Log Analytics.

Correlations

Log correlators are keys or values in log data that detect correlations between alerts. For example, a log correlator could detect when the ID of a particular network device occurs simultaneously in multiple warnings across different service instances. For more information, see Identifying related alerts in log data by using log correlators.

Advanced alert filtering

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time. For more information, see Create advanced log alert filters.

Custom alert rules

Define a Log Analytics alert rule when you encounter log data that should generate an alert. The alert rule generates an alert for a specified metric with a threshold that you specify and sets the properties of the generated alert. For more information, see Add a Log Analytics alert rule in Health Log Analytics.

Types of anomalous behavior in Health Log Analytics

Anomalous behavior in a CI or a service can indicate an important issue. For example, a spike in the frequency or number of messages of a particular type can indicate a problem.

Understanding anomalies

To build models of expected behavior, Health Log Analytics monitors the log stream to learn baselines for patterns, metrics, and gauges over various time periods. Time periods can be hourly, daily, weekly, or unlimited. Behavior that departs from the learned models is considered anomalous behavior.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of log property

Pattern

A pattern is a value or rate that repeats, whether in text, time, or relationships.

Meter

A meter property is a numeric or text value. For example, a status code, a response code, an action, or a pattern.

Gauge

A gauge property has a numerical value that is reported continuously. Gauge properties represent operations that consume resources. For example, CPU usage, memory usage, or response time.

How anomalies appear in Health Log Analytics

The Anomaly card illustrates the anomalous activity that led to the alert.

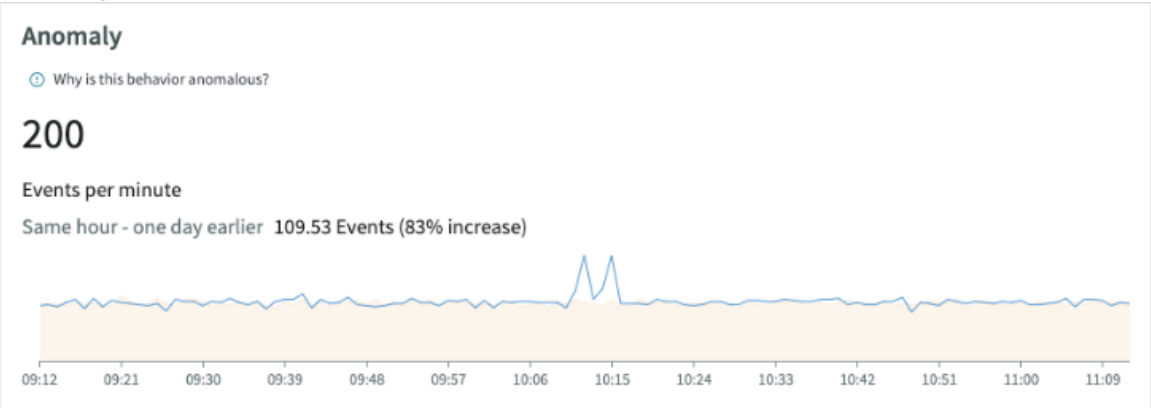
- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

- Click the information icon to see how the anomaly was identified: ⓘ.

In this example, the peach-shaded area shows the same data for the same hour one day earlier. The spike in the metric value (events per minute) is clearly visible.

Anomaly card



Kinds of anomalies

Some of the kinds of anomalies

Behavior	Description
New behavior	A pattern that has not ever been seen. The New Behavior alert type does not display a chart.
Signal dead/Stopped appearing	All pattern or log data from a source has stopped. There has been no signal for at least five minutes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Some of the kinds of anomalies (continued)

Behavior	Description
Signal alive/Appearing again	A pattern or log data from a "dead" source is appearing again. For a baseline of one hour, a pattern is "dead" if it appears less than once per minute.
Anomaly above average or below average	Activity that deviates from expected baseline behavior for pattern or meter or gauge metrics, such as keywords metrics or severity metrics.
Baseline reference increase or decrease	An increase or decrease in the value or volume of a log property as compared to the one-hour or one-week baseline.
Correlation of severity and keyword alerts	An increase in the volume of a severity level or keyword.

Types of Health Log Analytics alerts

Health Log Analytics generates several types of alerts.

In a list of alerts, all alerts that are generated by Health Log Analytics have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the kind of alert, as follows:

Component-based alert

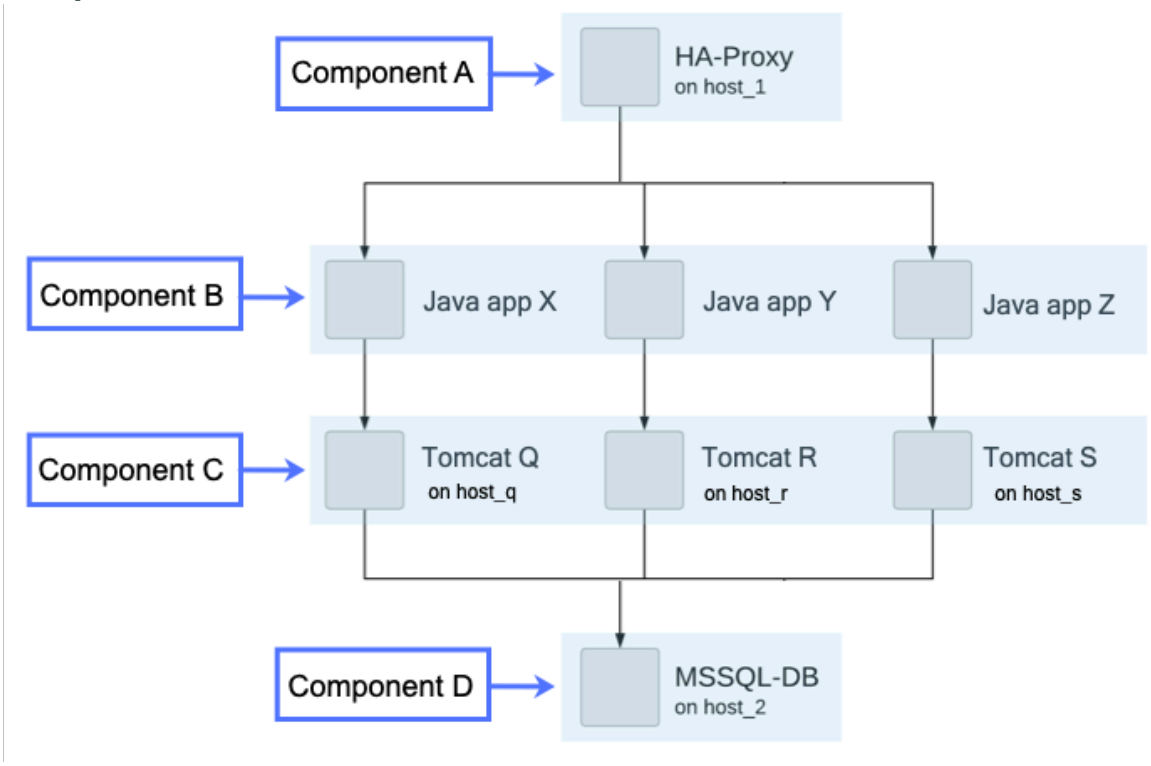
Component-based alerts involve more than one configuration item (CI). A component is a logical component of a service instance that caused the alert. A component can be multiple CIs that perform the same function, such as multiple redundant hosts.

> **Important:**
> Each Component-based alert is the parent of a number of read-only alerts. You do not work directly on read-only alerts. You work only on the parent Component-based alert.

In this example service instance, the identical Java apps X, Y, and Z make up a single component: Component B. Tomcat servers Q, R, and S and their hosts make up a different single component: Component C.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example service instance



Log Analytics alert

A Log Analytics alert identifies an anomaly that involves a single CI. A Log Analytics alert has the value **None** in the **Group** column. The anomaly that leads to the alert can be an unexpected number of log entries or an unexpected value of a metric.

Log Analytics group

When the system identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. A Log Analytics group can group up to four alerts. The system generates a Log Analytics group when the Log Analytics alerts share one or more of the following relationships:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Note:
You can mark an alert as significant. A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant in Health Log Analytics.

Configuring Health Log Analytics

As an Administrator, set up and configure Health Log Analytics for Operators to use, and carry out administration tasks to ensure that the system runs efficiently.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

Complete the following tasks for a successful setup and configuration of Health Log Analytics.

> **Important:**
> Regardless of how you implement Health Log Analytics, for log data ingestion via a MID Server you must first configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.
>
> For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

1. Install Health Log Analytics (HLA).

   Install the Health Log Analytics application.

2. Set up log data inputs for streaming raw log messages to your ServiceNow instance.

   Use any of the following methods:

   - Set up integrations for Health Log Analytics from the Integrations Launchpad.

     You're encouraged to set up data input integrations from the Integrations Launchpad, which provides a unified interface for convenient integration.

   - Set up data inputs in Health Log Analytics using guided setup.
   - Set up data inputs in Health Log Analytics manually.

3. Identify and resolve a log streaming issue in Health Log Analytics.

   Identify and address log streaming issues to ensure that the data inputs you have configured are streaming data properly to your instance.

4. Edit raw log data before processing in Health Log Analytics.

   Modify raw log messages before they are processed in the MID Server, and therefore before Health Log Analytics maps and structures it.

5. Map raw log data so HLA can correctly process it.

   Configure mapping for your raw log data so that Health Log Analytics can correctly parse and analyze it.

   > **Note:**
   > The user-friendly Log context mapping interface in the new HLA UI is simpler to use than Data input mapping in HLA's classic interface (UI16). For more information about Log context mapping, see Map logs to service instances and components for context in Health Log Analytics.

6. Refine the source type structure.

   Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

   Health Log Analytics enables you to reclassify auto-classified properties and change auto-mapped labels. These adjustments help the system's machine learning better understand your priorities.

7. Perform additional data input setup tasks.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After performing the mandatory data input setup and configuration, you can continue with optional setup tasks.

8. Perform advanced data input configuration tasks.

Install Health Log Analytics (HLA)

Install Health Log Analytics by requesting ServiceNow HLA installation from ServiceNow Customer Support.

Before you begin

The minimum version of the ServiceNow AI Platform required for Health Log Analytics installation is Zurich.

Important:
Health Log Analytics uses the default user sn_occ_occultus for internal communication. Make sure that this user is active and do not deactivate it.

Role required: admin

Procedure

1. Ensure that the Health Log Analytics application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements.
   To obtain the entitlements, contact your ServiceNow Solution Consultant.
2. Opt into the ITOM AIOps product.

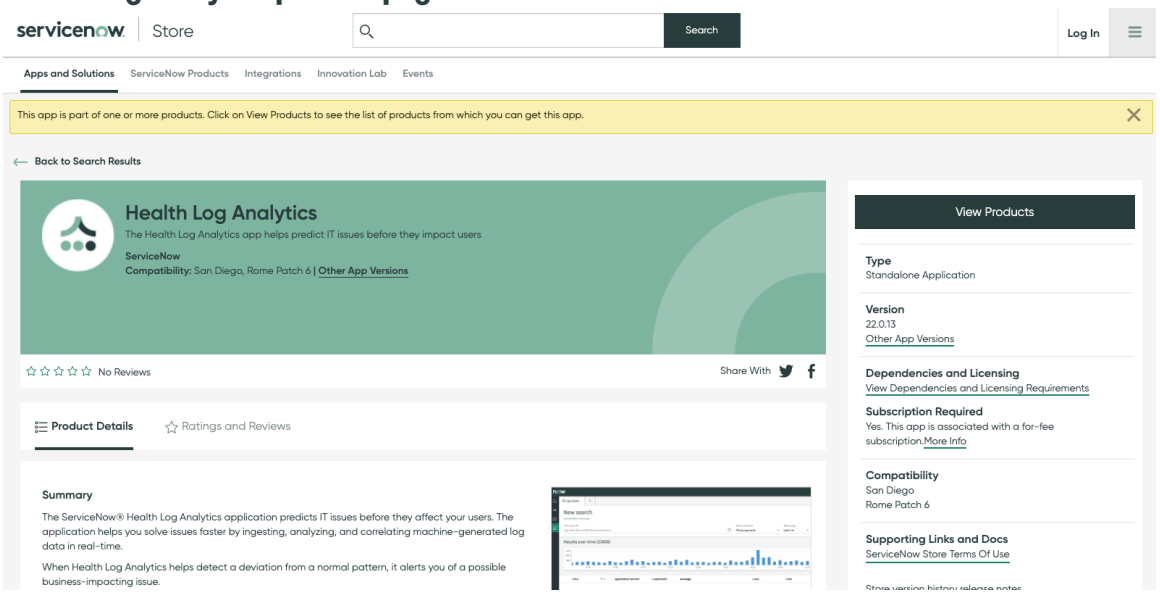
   a. Go to the ServiceNow Store website and search for the Health Log Analytics app.

Health Log Analytics app in the ServiceNow Store

   b. Select Health Log Analytics.
   The Health Log Analytics product page displays.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

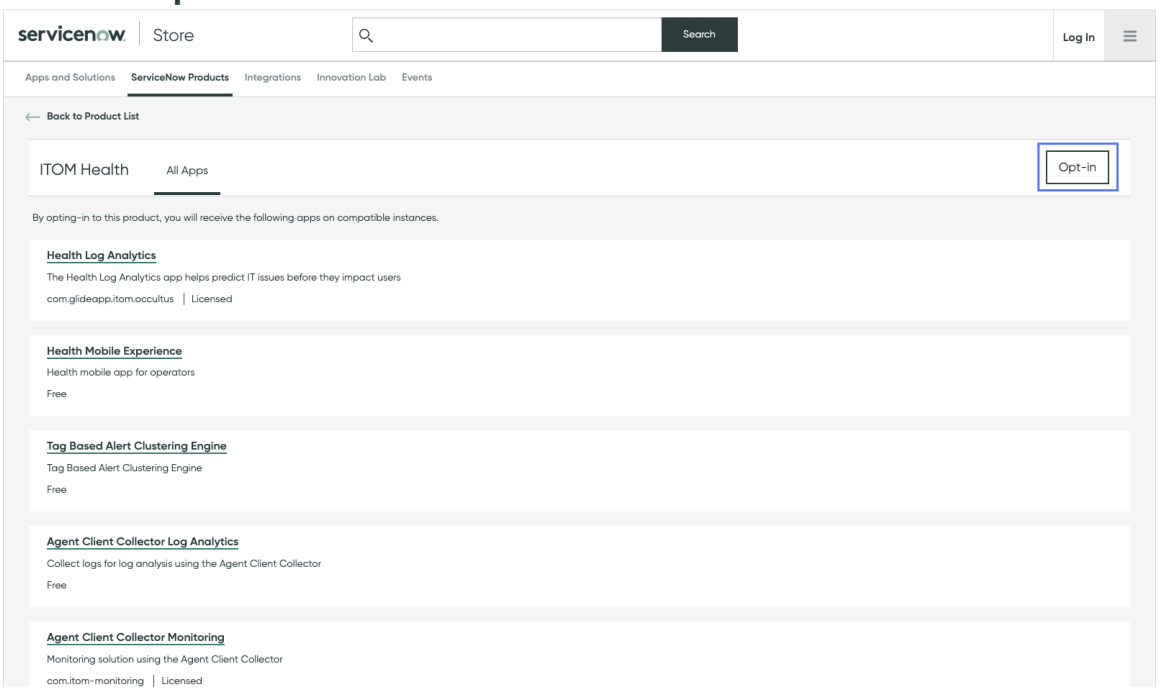
Health Log Analytics product page in the ServiceNow Store



c. Select **View Products**.

d. Select **Opt-in**.

ITOM Health product



3. Install the Health Log Analytics application on your instance.

a. Navigate to **System Applications** > **All Available Applications** > **All**.

b. Find the Health Log Analytics application using the search bar.

c. On the Health Log Analytics tile, select **Install**.

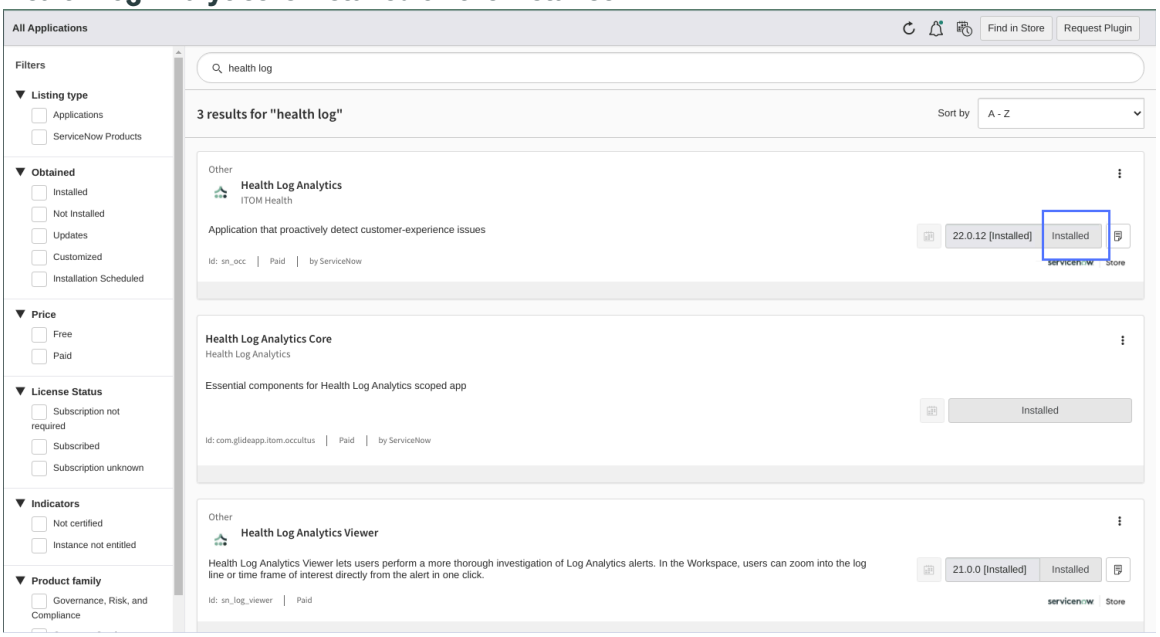
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the application is successfully installed on the instance, an automatic change request (CHG) is triggered to request provisioning for the necessary endpoints. The instance admin receives the request and any relevant notifications.

Note:
Even when the Health Log Analytics application is successfully installed, it will not work until the endpoints have been provisioned.

d. Ensure that the application and its dependencies were installed successfully, as illustrated in the figure.

Health Log Analytics is installed on the instance



4. **Optional:** Observe the status of the provisioning process by reviewing the CHG.

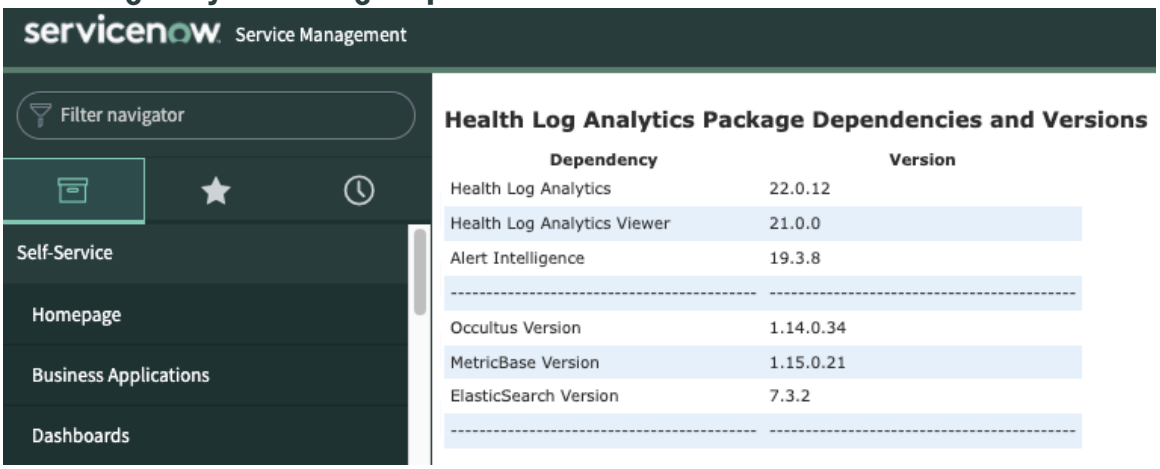
Note:
Some steps in the provisioning process might require your explicit approval. In such cases, ServiceNow Customer Support will reach out.

5. When provisioning is completed, ensure that the Health Log Analytics application is up and running.

a. In the Filter navigator, enter `sn_occ_stats.do`.
The Health Log Analytics Package Dependencies and Versions table displays.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics Package Dependencies and Versions table



The provisioned endpoints are listed along with their version number:

- Occultus
- MetricBase
- ElasticSearch

Result

The Health Log Analytics application is installed and provisioned on your instance.

What to do next

- Set up the data input process for Health Log Analytics
- (Optional) Install the ServiceNow® Agent Client Collector Log Analytics (ACC-L) plugin.

  Agent Client Collector Log Analytics enables you to stream log data from Linux and Windows hosts to a ServiceNow instance using the Agent Client Collector. For more information, see the Agent Client Collector Log Analytics documentation.

Set up Health Log Analytics on your ServiceNow instance

Implement Health Log Analytics on your ServiceNow instance.

Important:

- Install Health Log Analytics on your instance before implementation. For more information, see Install Health Log Analytics (HLA).
- Regardless of how you implement Health Log Analytics, you must configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.

  For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Setting up data inputs

You're encouraged to integrate data inputs with Health Log Analytics from the Integrations Launchpad. This tool provides a unified interface for convenient integration with connectors that feed raw log messages from external sources into your instance for processing and analysis. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, you can set up data inputs in one of the following ways:

- Using guided setup. The guided setup provides a sequence of tasks to help you configure data inputs on your ServiceNow instance. Using the guided setup ensures that you have the minimum required setup for the data input process. For more information, see Set up data inputs in Health Log Analytics using guided setup.
- Manually. For more information, see Set up data inputs in Health Log Analytics manually.

For supported data inputs, see Supported data inputs for Health Log Analytics.

Set up integrations for Health Log Analytics from the Integrations Launchpad

Set up integrations from the Event Management Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations Launchpad

The Integrations Launchpad tool provides a unified interface for convenient integration with connectors that feed raw log messages from external sources into your ServiceNow instance for processing and analysis. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations for Health Log Analytics

The Integrations Launchpad enables the following integrations for Health Log Analytics:

Pull integrations

These integrations pull log data from external data sources and stream the data to your instance via a MID Server. Select an integration in the table to open a page with the setup procedure.

Pull integrations

Integration	Description
Elasticsearch	Streams log data from Elasticsearch indices to your instance.
ServiceNow System Logs Retriever	Sends log data from the ServiceNow System Log table to the Health Log Analytics AI engine. **Note:** Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it. This data input doesn't run on a MID Server.
Apache Kafka	Streams log data from Apache Kafka to your instance.
Splunk Poller	Pulls log data from Splunk to your ServiceNow instance periodically by query.
Microsoft Azure Log Analytics	Streams log data from Microsoft Azure Log Analytics to your instance. The connector points the Health Log Analytics AI engine to a data

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pull integrations (continued)

Integration	Description
	source in your Microsoft Azure Log Analytics account.
Microsoft Azure Event Hubs	Streams events from Microsoft Azure Event Hubs to your instance.
Microsoft Azure Event Hubs (MID-less)	Streams events from Microsoft Azure Event Hubs to your instance without a MID Server.
MID Server	Collects log messages from the MID Server and streams them to your instance.

Push integrations

These integrations connect to external data sources that push log data to your instance via a MID Server. Select an integration in the table to open a page with the setup procedure.

Push integrations

Integration	Description
UDP	Sends raw log messages to your instance directly over a UDP socket.
TCP	Sends raw log messages to your instance directly over a TCP/SSL socket.
REST API	Streams log data to your instance in JSON format.
GCP PubSub	Receives log messages that were published to a Google Cloud Pub/Sub topic and streams them to your instance.
Splunk UDP	Streams log messages to your ServiceNow instance over the UDP transport protocol using a Splunk heavy forwarder.
Splunk TCP	Streams log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder.
Amazon Data Firehose	Streams log messages from Amazon Data Firehose directly to the collector service in ITOM Gateway, where it's queued for Health Log Analytics processing.
Cribl	Enables Health Log Analytics to process Cribl log messages streaming into the ServiceNow instance.
Edge Delta REST	Enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into the ServiceNow instance via REST.
Edge Delta TCP	Enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push integrations (continued)

Integration	Description
	These logs stream into the ServiceNow instance over the TCP transport protocol.

Set up an Apache Kafka integration for Health Log Analytics

Set up an integration for streaming log data from Apache Kafka to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important:
  Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

  In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  If you decide to use a MID Server cluster, verify the following:

  - The MID Server cluster includes only MID Servers that support basic authentication.

    Note:
    mTLS is not supported for log ingestion.

  - Log ingestion is enabled for each MID Server in the cluster.

    Note:
    If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

  - No more than the default maximum of 10 integrations will pull logs to a single MID Server.

    A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, search for `Kafka`.
5. Select the Kafka integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Apache Kafka integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Apache Kafka integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Apache Kafka integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up screen, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      Once the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:

Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration screen, select **Activate**.

   Select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

   Once the test is successful, the integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

Set up an Amazon Data Firehose (MID-less) integration for Health Log Analytics

Set up an integration to stream log data from Amazon Data Firehose directly to the ServiceNow data center, where it's queued for Health Log Analytics processing. There's no need to store AWS keys on your ServiceNow instance.

Before you begin

Role required: evt_mgmt_admin

About this task

This integration doesn't run on a MID Server.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Firehose` in the search field.
5. Select the Amazon Data Firehose (MID-less) integration tile.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Amazon Data Firehose integration configuration fields.
7. Select **Next**.
8. Follow one of the procedures provided on the **Set-up instruction** screen to install the integration in AWS.
   You can perform the installation procedure using either AWS CloudFormation or the AWS Management Console. Both methods require the same input. The appropriate choice depends on your requirements and the size of your deployment:
   - AWS CloudFormation is best for deploying standardized configurations across multiple environments. Use it when you need automation, repeatability, and infrastructure-as-code benefits. AWS CloudFormation prompts for input automatically.
   - The AWS Management Console is best for manual setups and quick configurations where you don't need automation.

   Before you perform either of these procedures, copy the access token, the ServiceNow endpoint URL, and the integration ID to the clipboard. You need these values during the installation process.
9. Select **Save draft**.
10. Select **Activate** to activate the integration.

Result
The integration is activated and the **Overview** tab is displayed. The tile for the integration is available in the **Installed integrations** tab on the Integrations Launchpad.

What to do next
Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

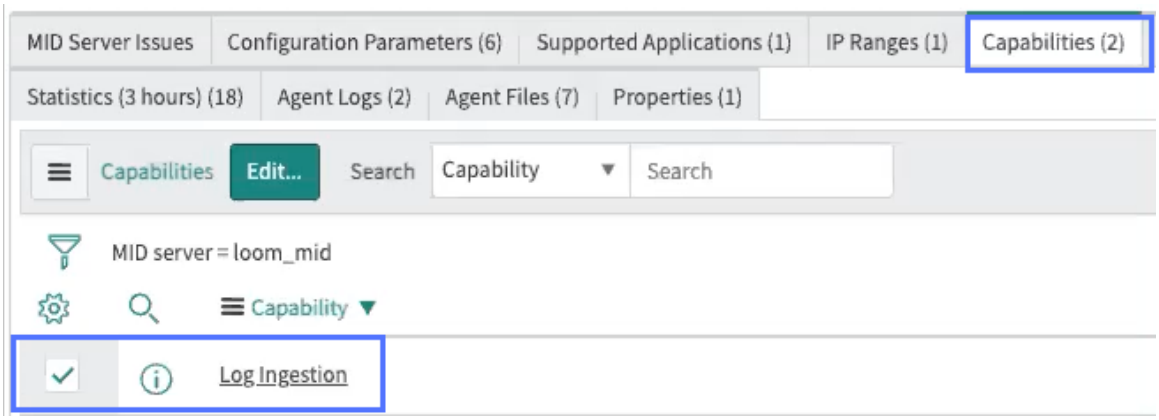
Set up a Cribl integration for Health Log Analytics

Set up an integration to enable Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Cribl for filtering and routing large volumes of log data from various sources, the log format received by Health Log Analytics is distinct from other types. The Cribl integration enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**. The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Cribl` in the search field.
5. Select the Cribl integration tile.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Cribl integration configuration fields.
7. Select **Next**.
8. On the **Set up connection** form, fill in the fields.
   For a description of the fields, see Cribl integration configuration fields.
9. Select **Save draft**.
10. Select **Activate** to activate the integration.

Result
The integration is activated and the **Overview** tab is displayed. The tile for the integration is available in the **Installed integrations** tab on the Integrations Launchpad.

What to do next
Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

Set up authentication credentials for the Cribl integration in Health Log Analytics

Configure credentials for the authentication method used by the Cribl integration.

Before you begin
Decide on the appropriate authentication method for your instance:

- Basic authentication is preferred for self-hosted (On-Prem) Cribl instances.
- Token-based authentication is required for Cribl Cloud instances.

Note:
Token-based authentication is also supported for self-hosted (On-Prem) Cribl instances.

For token-based authentication, create a client ID and a client secret on your Cribl instance and use them to generate a token. For example:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Client ID: 1234567890abcdef
- Client secret: abcdef1234567890

For detailed information on the Cribl API, refer to the Cribl API documentation.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select the default Cribl credential alias: Cribl_Credential_Alias.
3. Select **New** to create a credential record.
4. Select the appropriate credentials type for your Cribl instance:
   - For basic authentication, select **Basic Auth Credentials**.
   - For token-based authentication, select **Custom Header API Key Credential**.
5. On the displayed form, fill in the fields.
   - For basic authentication:

Basic Auth credentials fields

Field	Description
Name	A name that describes the credentials.
Username	Your Cribl server username. For example: admin.
Password	Your Cribl server password. For example: admin123.

   - For token-based authentication:

Custom Header API Key credential fields

Name	A name that describes the credential.
API Key	The authentication token you generated on the Cribl instance.

6. Select **Save** to save the credentials configuration.

What to do next

- Verify that the provided credentials have appropriate permissions to access your Cribl instance.
- Verify that only one active credential record of each credentials type exists under the credential alias.

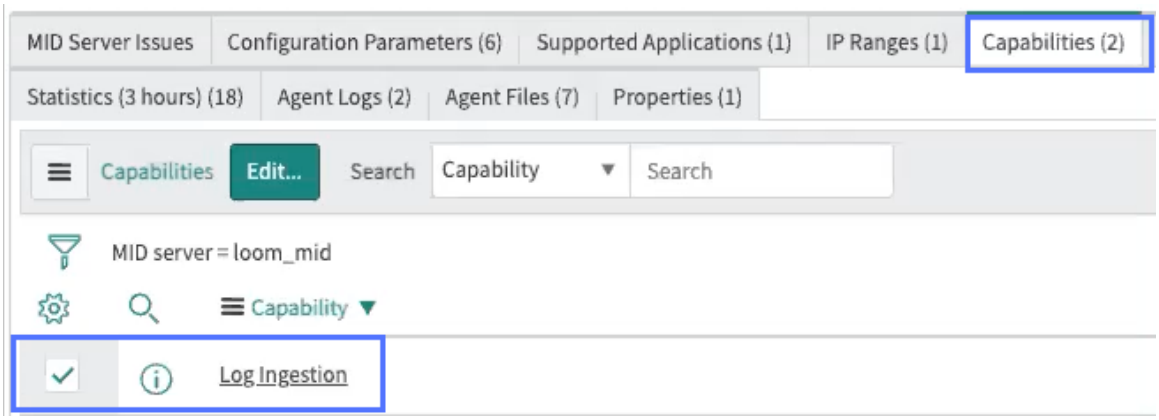
Set up an Edge Delta REST integration for Health Log Analytics

Set up an Edge Delta REST integration to enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into your ServiceNow instance via REST.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives from Edge Delta is different from other types. The Edge Delta integration enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**. The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Edge Delta` in the search field.
5. Select the Edge Delta REST integration tile.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Edge Delta REST integration configuration fields.
7. Select **Next**.
8. Follow the instructions in the **Set-up instruction** page to install the integration in the 3rd party console.
   a. Copy the displayed URL.
   b. In Edge Delta, create an HTTP destination.
   c. Paste the copied URL into the HTTP destination.
   d. Add the following headers:
      - Authorization

        Use either of the following:
        - Key <API_KEY>

          Find the API_KEY by navigating to **All** > **MID Web Server API Key** > **View API Key**.
        - Basic <Base64 (username:password)>

          Note:
          Verify that you use a username and password for a MID web server with Basic Auth enabled.
      - Content-Type: application/json.
9. Select **Save draft**.
10. Select **Activate** to activate the integration.

Note:
You can activate a configured integration only when you have fulfilled all the integration prerequisites. If you installed the integration in draft mode, you can activate it later by performing these steps:

a. Complete the integration prerequisites.
b. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration.
c. In the **Set-up instruction** screen, select **Activate** to activate the integration.

Result
The integration is activated and the **Overview** tab is displayed. The tile for the integration is available in the **Installed integrations** tab on the Integrations Launchpad.

What to do next
Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:

Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

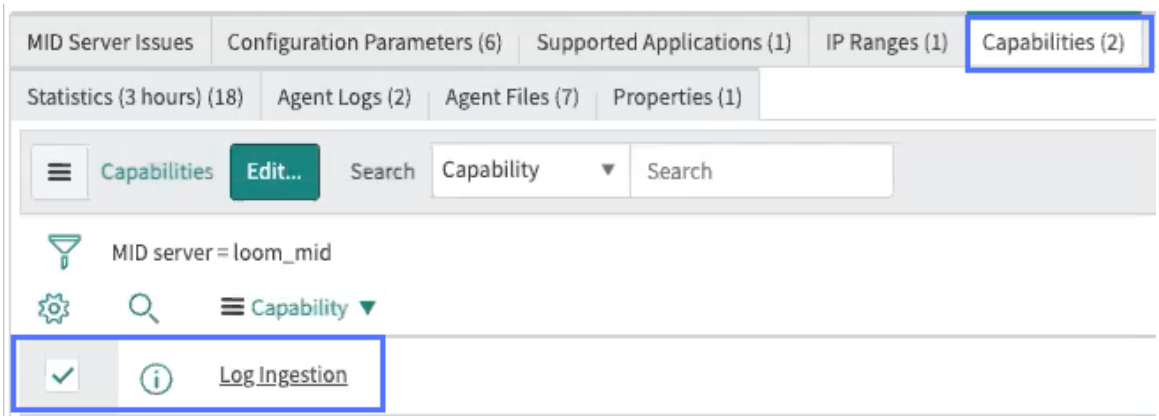
- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

Set up an Edge Delta TCP integration for Health Log Analytics

Set up an Edge Delta TCP integration to enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into your ServiceNow instance over the TCP transport protocol.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is different from other types. The Edge Delta integration enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Edge Delta` in the search field.
5. Select the Edge Delta TCP integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Edge Delta TCP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Edge Delta TCP integration configuration fields.
8. Select **Next**.
9. In the **Set-up instruction** screen, copy the displayed Host IP and Port values and paste them in your Edge Delta pipeline under TCP destination.

   Note:
   The Host IP and Port values are based on your configuration on the **Provide details** form.

10. Select **Save draft**.
11. Select **Activate** to activate the integration.

    Note:
    You can only activate a configured integration when you have fulfilled all the integration prerequisites. If you installed the integration in draft mode, you can activate it later by performing these steps:

    a. Complete the integration prerequisites.

    b. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration.

    c. In the **Set-up instruction** screen, select **Activate** to activate the integration.

Result

The integration is activated and the **Overview** tab is displayed. The tile for the integration is available in the **Installed integrations** tab on the Integrations Launchpad.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

Set up an Elasticsearch integration for Health Log Analytics

Set up an integration for seamless log data streaming from Elasticsearch indices to your instance for processing by Health Log Analytics.

Before you begin

Note:

Health Log Analytics supports Elasticsearch versions above 7.10.2 and below 8.18.2. For advanced information about streaming log data from Elasticsearch indices to your instance, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support knowledge base.

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.

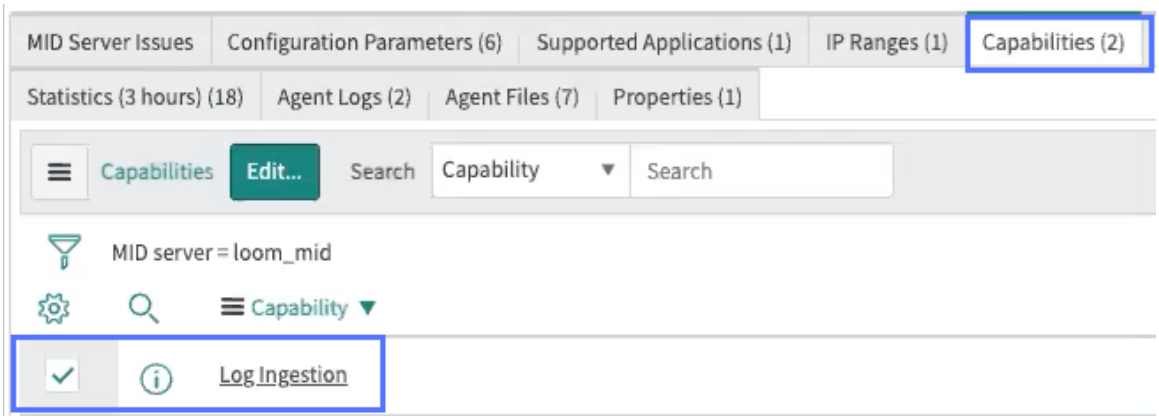
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**. The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter *`Elasticsearch`* in the search field.
5. Select the Elasticsearch integration tile.

Note:
If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see the **Provide details** table in Elasticsearch integration configuration fields.

7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see Elasticsearch integration configuration fields.
9. **Optional:** Select **Advanced settings** to set advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Elasticsearch integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up screen, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      Once the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration screen, select **Activate**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

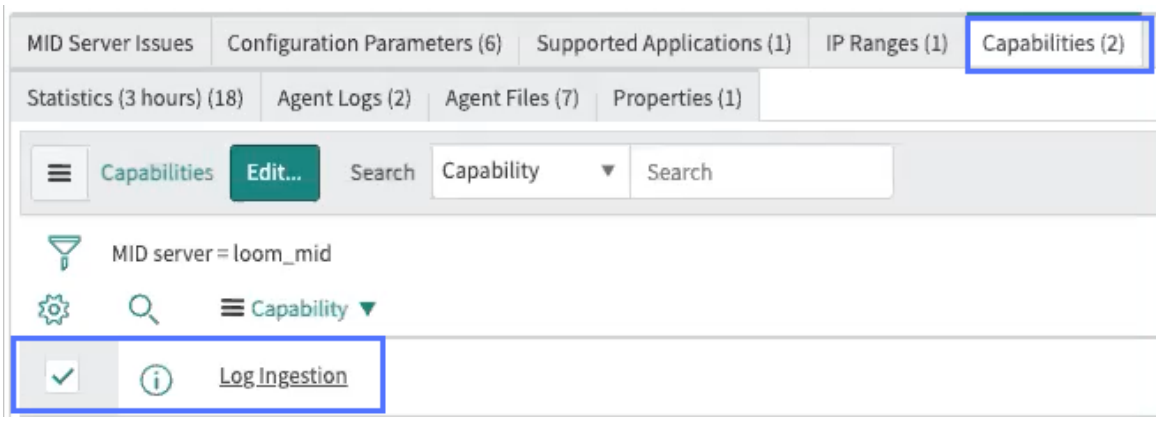
Once the test is successful, the integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

Set up a GCP PubSub integration for Health Log Analytics

Set up an integration for receiving log messages that were published to a Google Cloud Platform (GCP) Pub/Sub topic and streaming them to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.

3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Google Cloud` in the search field.
5. Select the Google Cloud Platform integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in GCP PubSub integration configuration fields.
7. Select **Next**.
8. On the **Set up connection** form, fill in the fields to connect to GCP PubSub.
   For a description of the fields, see the **Set up connection** table in GCP PubSub integration configuration fields.
9. **Optional:** Select **Advanced Settings** and fill in the fields.
   For a description of the fields, see the **Advanced Settings** table in GCP PubSub integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up screen, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      Once the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:

Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration screen, select **Activate**.

   Select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

   Once the test is successful, the integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

Set up a Microsoft Azure Event Hubs integration for Health Log Analytics

Set up an integration for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important:
  Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

Role required: evt_mgmt_admin

- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration screen, select **Activate**.

   Select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

   Once the test is successful, the integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

Set up a Microsoft Azure Event Hubs (MID-less) integration for Health Log Analytics

Set up an integration for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance without a MID Server.

Before you begin

Role required: evt_mgmt_admin

About this task

This Microsoft Azure Event Hubs integration eliminates the need for a MID Server, thereby simplifying setup and enabling more efficient log data ingestion into your instance. By removing the MID Server requirement, log data collection and processing are streamlined to promote faster analysis and root cause identification.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Azure Event Hubs (MID-less)` in the search field.
5. Select the Azure Event Hubs (MID-less) integration tile.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields and then select **Next**.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Event Hubs MID-less integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Description	Option to add a brief description of the integration to help identify it.
Transport	Protocol used to stream the log data. This field is read-only. This integration uses Microsoft Azure Event Hubs to stream log data to your instance.

7. On the **Set-up instruction** screen, perform the appropriate procedure to install the integration in your third-party console.
   - Install the integration with Bicep, a domain-specific language (DSL) that uses declarative syntax to deploy Azure resources.

     Using Bicep enables automation and consistency across environments through Infrastructure as Code (IaC), allowing you to manage your Azure environment more efficiently. It also supports version control and integration with CI/CD pipelines.
   - Install the integration in the Azure portal.

     Installing in the Azure portal is a good choice if you're doing a one-time setup or prefer a graphical interface. It provides a convenient way to configure resources, making it suitable for straightforward deployments.

   The screen provides a link to detailed configuration instructions for each of these two installation options.
8. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the **Set up connection** tab, select **Activate**.

   When the test is successful, the integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

Set up a Microsoft Azure Log Analytics integration for Health Log Analytics

Set up an integration for streaming log data from Microsoft Azure Log Analytics to your ServiceNow instance. The integration points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important:
  Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties,

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Azure Log` in the search field.
5. Select the Azure Log Analytics integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields and then select **Next**.
   For a description of the fields, see the **Provide details** table in Microsoft Azure Log Analytics integration configuration fields.
7. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Microsoft Azure Log Analytics integration configuration fields.
8. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Microsoft Azure Log Analytics integration configuration fields.
9. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
10. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up screen, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      Once the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration screen, select **Activate**.

   Select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

   Once the test is successful, the integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

Set up a MID Server integration for Health Log Analytics

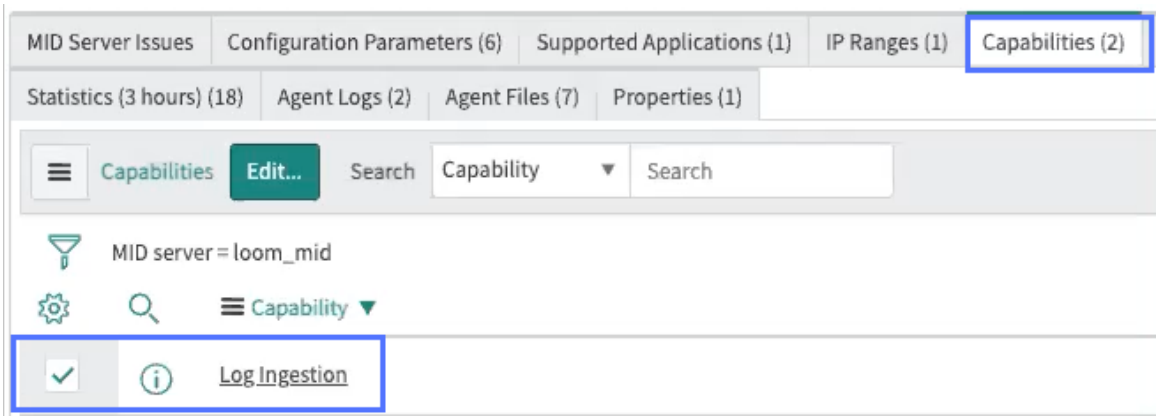
Set up an integration for collecting and streaming MID Server log messages to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

Important:
You can create only one MID Server integration per MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**. The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `mid` in the search field.
5. Select the MID Server integration tile.

Note:
If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see the **Provide details** table in MID Server integration configuration fields.

7. Select **Advanced Settings** and fill in the fields.
   For a description of the fields, see the **Advanced Settings** table in MID Server integration configuration fields.
8. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration screen, select **Activate**.

   The integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

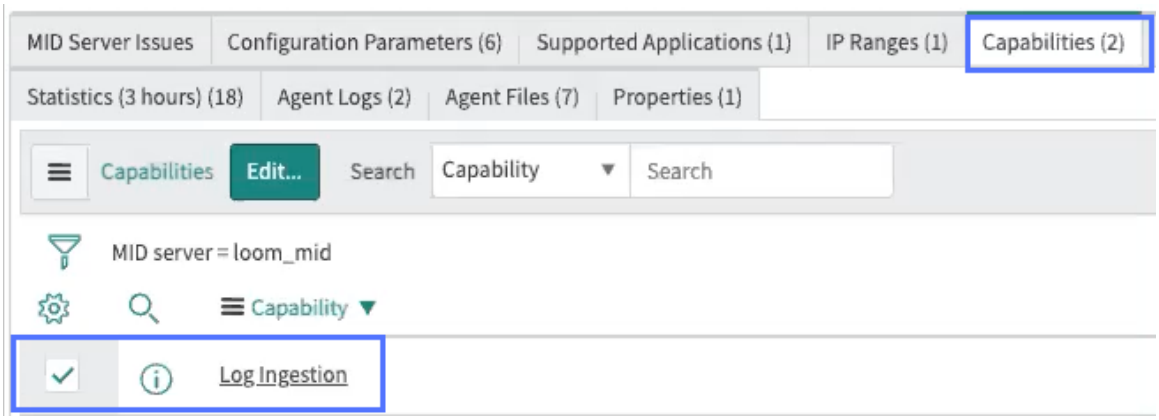
Set up a REST API integration for Health Log Analytics

Set up an integration for streaming log data to your ServiceNow instance for processing by Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

Note:
REST API integrations support only UTF-8 encoding for incoming data.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter REST in the search field.
5. Select the REST API integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see REST API integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, copy the provided URL to the clipboard.

   The format of the URL is: `http://(MID_SERVER_IP):(MID_WEB_SERVER_PORT)/ap1/mid/hla/raw`, where `/aps/mid/hla/raw` is the endpoint. HLA has replaced `(MID_SERVER_IP)` and `(MID_WEB_SERVER_PORT)` with the values you configured on the **Provide details** form.

9. Select **Save draft**.
10. Select **Activate** to activate the integration.

    Note:
    You can only activate a configured integration when you have fulfilled all the integration prerequisites. If you installed the integration in draft mode, you can activate it later by performing these steps:

    a. Complete the integration prerequisites.
    b. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration.
    c. In the **Set-up instruction** screen, select **Activate** to activate the integration.

Result

The integration is activated and the **Overview** screen is displayed. The tile for the integration is available in the **Installed integrations** tab on the Integrations Launchpad.

What to do next

Instruct your API client to send log messages to the MID Server.

1. In the API client, configure a request with the following parameters:
   - HTTP Method: POST.
   - URL: The URL you copied in the **Set-up instruction** screen.
   - Authentication: The required authentication credentials. For example, Basic authentication (username and password).

     Note:
     The authentication method must be the same as the method configured on the MID Web Server.

   - Headers: Set the `Content-Type` header to match your payload format.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For JSON: `application/json`.
- For raw text: `text/plain`.

- Body: The logs payload in JSON or raw text.

2. Send the request.

   A successful response indicates that the MID Server has received the payload. When the MID Server has processed the log messages, the data input streams them to your ServiceNow instance using the REST protocol.

Set up a ServiceNow System Logs Retriever integration for Health Log Analytics

Set up an integration for streaming log data from your ServiceNow platform's System Log table to the HLA engine.

Before you begin

Note:
This integration doesn't run on a MID Server. Only a single ServiceNow System Logs Retriever integration or data input can exist in the system.

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**. The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `System Logs` in the search field.
5. Select the ServiceNow System logs tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. The **Provide details** form is displayed.
   These fields are auto-populated, because only one ServiceNow System Logs Retriever integration or data input can exist in the system. For a description of the fields, see the **Provide details** table in ServiceNow System Logs Retriever integration configuration fields.
7. Select **Next**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** On the **Set data retrieval method** page, build conditions for filtering log data from the System Log table before it is streamed to the HLA engine.

   (Optional) This page helps you focus on the specific logs you want to monitor. For example, you might want to look at Discovery logs or exclude email logs. By default, all logs are included.

9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

Result

Log data starts streaming from the ServiceNow System Log table to the Health Log Analytics AI engine, based on the configured filters. The dedicated HLA engine for your instance starts analyzing your system logs in real-time.

Note:
Starting with Health Log Analytics version 37.0.15, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system log. By combining HLA's anomaly detection with Now Assist's GenAI capabilities, you can identify and resolve platform issues more effectively for a better user experience. For more information, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

What to do next

Leverage the information in the **Overview** tab to refine how HLA reads the log data by adjusting your integration configuration. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

The MID Server streaming status and the **Log streaming sources** table do not appear on the **Overview** tab for this integration, because it doesn't run on a MID Server. When the integration is first configured, it may take up to 24 hours for the first alerts to appear. Once the data is populated, you can refresh the screen to see real-time metrics.

Tip:
Use the View menu to go directly from the **Overview** tab to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the View menu also provides direct access to the **Log Viewer**, where you can see the raw logs that the integration ingests.

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the configuration screen, select **Activate**.

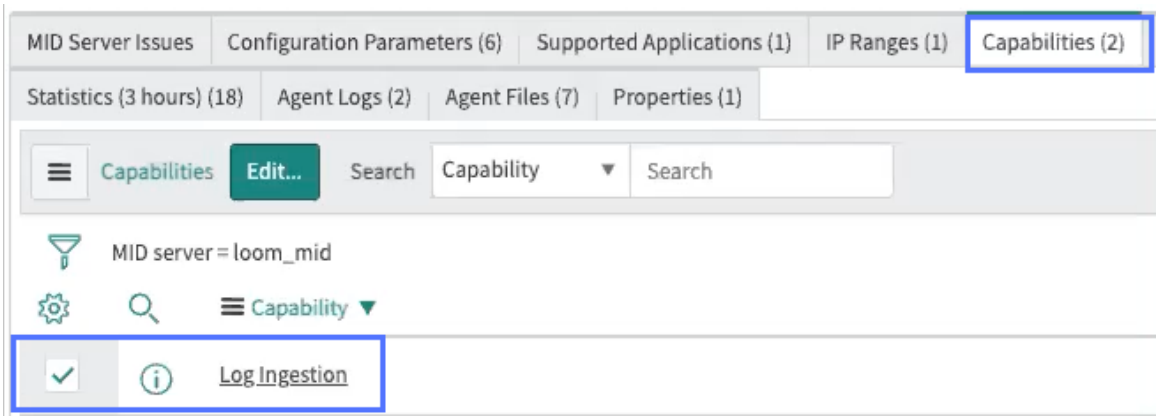
   The integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

Set up a Splunk Poller integration for Health Log Analytics

Set up an integration that periodically pulls log data from Splunk to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

- The MID Server must support basic authentication.

  Note:
  mTLS is not supported for log ingestion.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per_mid` to the MID Server and then changing the default value.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To find out how many data inputs are streaming logs to the same MID Server, navigate to the **Streaming Sources** table and count the data inputs that stream to a specific MID Server.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

  In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  If you want to use a MID Server cluster, verify the following:

  - The MID Server cluster includes only MID Servers that support basic authentication.
  - Log ingestion is enabled for each MID Server in the cluster.

    Note:
    If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

  - No more than the default maximum of 10 integrations will stream logs to a single MID Server.

    A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk Poller` in the search field.
5. Select the Splunk Poller integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Splunk Poller integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Splunk Poller integration configuration fields.
9. Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see Splunk Poller integration configuration fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up screen, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      Once the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see the **What to do next** section.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

If you saved the integration as a draft, perform these steps to activate it later:

1. Complete all the prior requirements.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration screen, select **Activate**.

   Select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

   Once the test is successful, the integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.

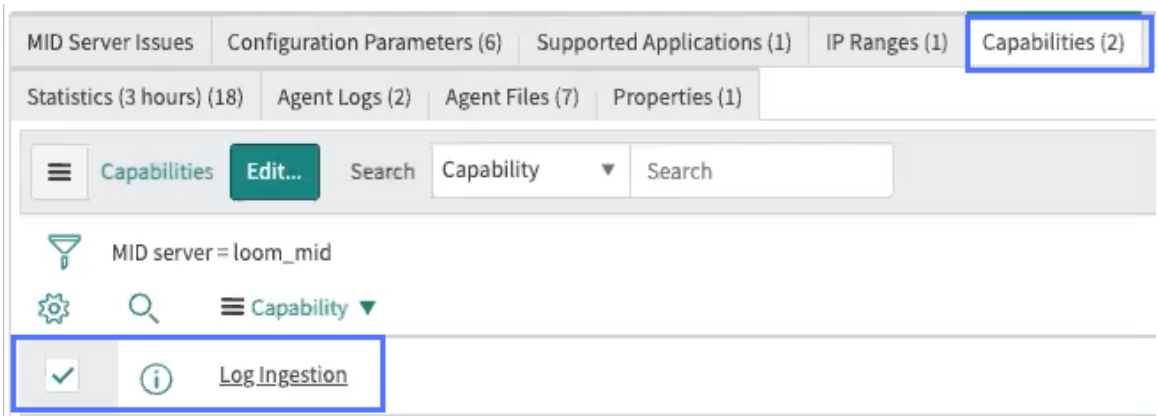
Set up a Splunk TCP integration for Health Log Analytics

Set up an integration to stream log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder. Health Log Analytics processes the ingested log data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

- The MID Server must support basic authentication.

  Note:
  mTLS is not supported for log ingestion.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per_mid` to the MID Server and then changing the default value.

  To find out how many data inputs are streaming logs to the same MID Server, navigate to the **Streaming Sources** table and count the data inputs that stream to a specific MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk` in the search field.
5. Select the Splunk TCP integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Splunk TCP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Splunk TCP integration configuration fields.
8. Select **Next**.
9. Follow the procedure on the **Set-up instruction** screen to install the integration in the third-party console.

   Note:
   The procedure varies based on your configurations.

10. Select **Save draft**.
11. Select **Activate** to activate the integration.

    Note:
    You can only activate a configured integration when you have fulfilled all the integration prerequisites. If you installed the integration in draft mode, you can activate it later by performing these steps:

    a. Complete the integration prerequisites.

    b. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration.

    c. In the **Set-up instruction** screen, select **Activate** to activate the integration.

Result

The integration is activated and the **Overview** screen is displayed. The tile for the integration is available in the **Installed integrations** tab on the Integrations Launchpad.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:

Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

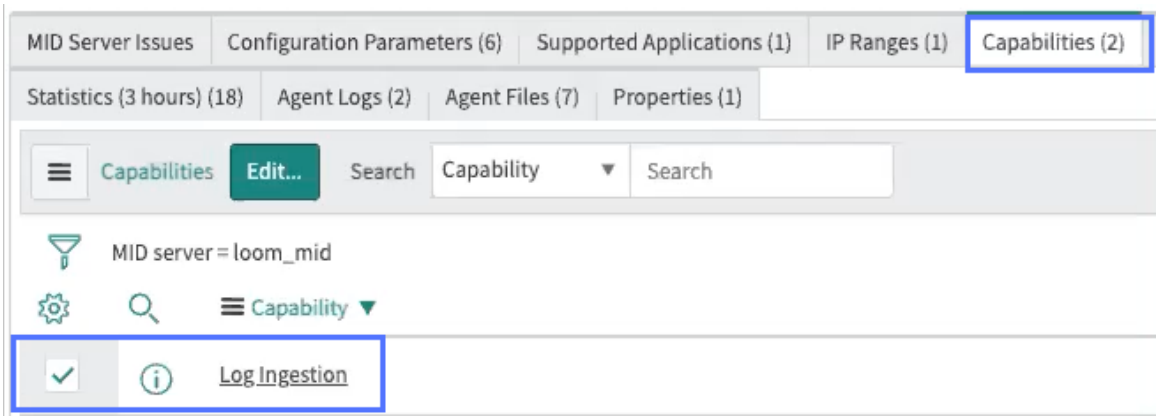
- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

Set up a Splunk UDP integration for Health Log Analytics

Set up an integration to stream log messages to your ServiceNow instance over the UDP transport protocol using a Splunk heavy forwarder. Health Log Analytics processes the ingested log data.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk` in the search field.
5. Select the Splunk UDP integration tile.

   Note:
   If you start an integration setup before meeting all prerequisites, a message appears. You can either cancel the setup and complete the prior requirements first, or continue in draft mode and complete them later. Note that you can't activate the integration until you meet all prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see **Provide details** table in Splunk UDP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Splunk UDP integration configuration fields.
8. Select **Next**.
9. Follow the procedure on the **Set-up instruction** screen to install the integration in the third-party console.

   Note:
   The procedure varies based on your configurations.

10. Select **Save draft**.
11. Select **Activate** to activate the integration.

    Note:
    You can only activate a configured integration when you have fulfilled all the integration prerequisites. If you installed the integration in draft mode, you can activate it later by performing these steps:

    a. Complete the integration prerequisites.

    b. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration.

    c. In the **Set-up instruction** screen, select **Activate** to activate the integration.

Result

The integration is activated and the **Overview** screen is displayed. The tile for the integration is available in the **Installed integrations** tab on the Integrations Launchpad.

What to do next

Leverage the information on the **Overview** tab to refine how HLA reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Tip:

Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**, where you can review raw log messages ingested by the integration.

For more information, see:

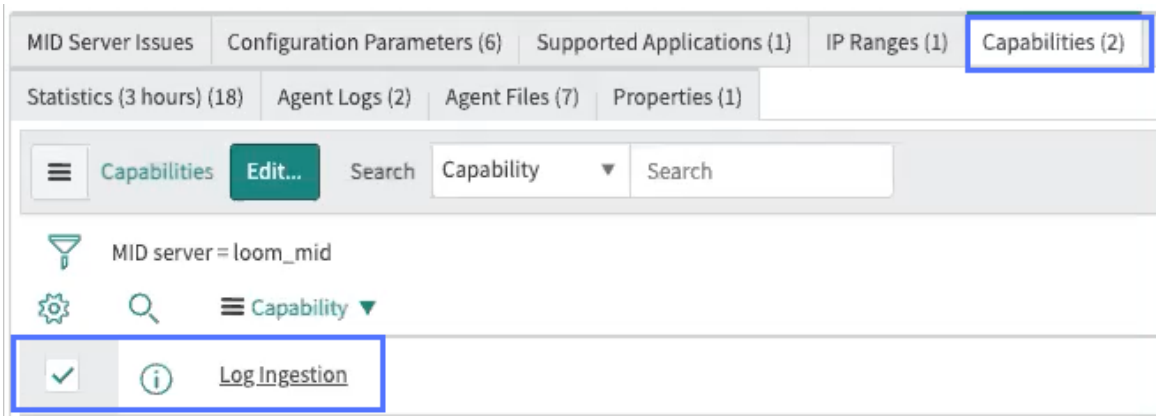
- Log data auto-mapping and mapping
- Source type structure adjustment
- Review logs on the Log Viewer

Set up a TCP integration for Health Log Analytics

Set up an integration for sending log data to your ServiceNow instance directly over a TCP/SSL socket.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect

- Review logs on the Log Viewer

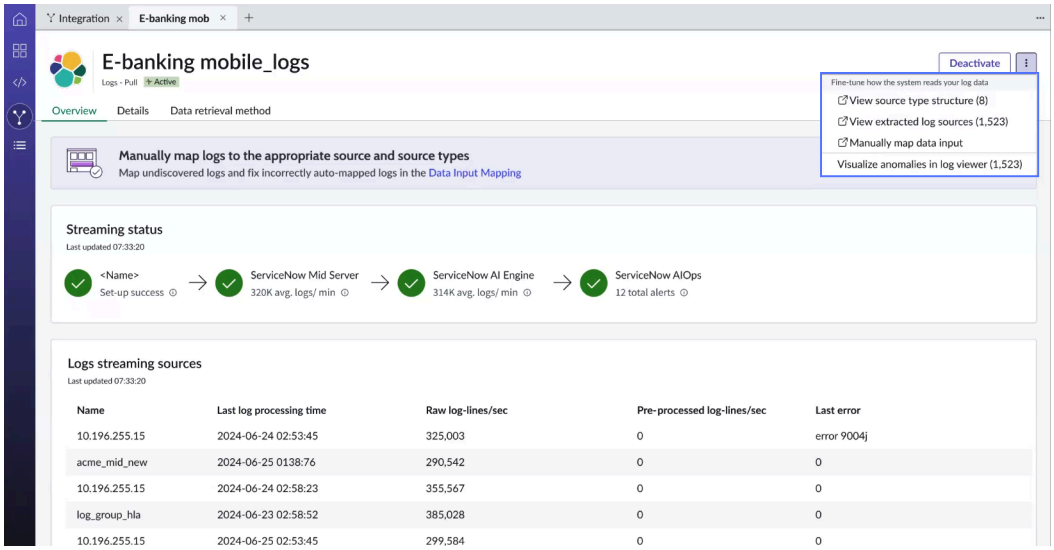
Monitoring log data flow and optimizing integration settings in Health Log Analytics

The Overview screen in Health Log Analytics provides a comprehensive view of the components in the log-processing pipeline of active integrations. From this screen, you can troubleshoot any streaming issues and adjust the integration's settings if needed.

The **Overview** screen shows the log data streaming status and streaming sources of an active integration. It provides direct access to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages, as well as the **Log Viewer**, all with context from the current integration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview screen and View menu items



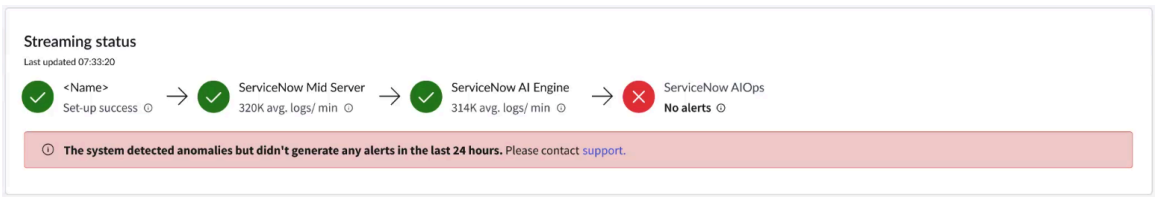
Streaming status

The **Streaming status** section on the **Overview** screen shows the status of data streaming between the log source and the MID Server and between the MID Server and the HLA engine. It displays the number of logs per minute passing through the MID Server and through the HLA engine.

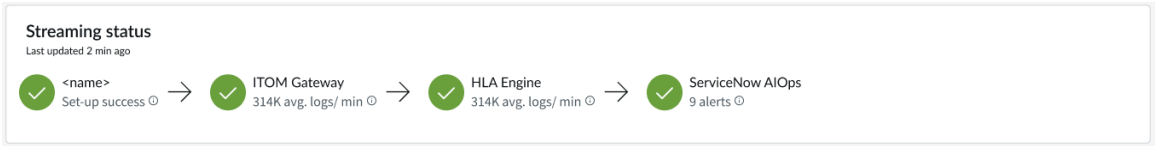
> **Note:**
> For the ServiceNow System Logs Retriever integration, the **Overview** screen doesn't display the MID Server streaming status because that integration doesn't run on a MID Server.

The ServiceNow AIOps component shows the total number of alerts that the HLA engine has created. These statistics are updated when the **Overview** screen loads and are automatically refreshed every minute to show live data. You can change the default auto-refresh time interval through the system property *`sn_itom_integ_app.overview_page_data_input_stats_auto_refresh_interval_second`*

If data streaming fails, the integration is automatically deactivated and the **Streaming status** marks the component where the failure occurred. In addition, a banner explains the failure and either proposes steps to take to fix it or refers to ServiceNow support.



For MID-less or OpenTelemetry Protocol (OTLP) integrations, such as Amazon Data Firehose, the **Overview** screen displays the ITOM Gateway as a component in the log-processing pipeline. The MID Server component is not shown in the pipeline, because log data is sent directly from the source to the ITOM Gateway. The logs are then processed by the HLA engine to find anomalies.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For these integrations, the **Overview** screen shows the average rate of logs per minute over the last 15 minutes passing through the ITOM Gateway and the HLA engine, similar to the metrics shown for MID-based ingestion.

Note:
The ITOM Gateway component is shown only if the MID Server property *mid.hla.itom_gateway_streaming.enabled* is set to true. For more information, see MID Server properties.

When the integration isn't streaming live data from the source, a warning message is displayed. There is a 4-hour interval between the last log source time and the current time before this message is generated. You can change the default time interval through the system property *sn_itom_integ_app.overview_page_log_source_time_threshold_hours*.

Note:
The warning message is displayed only when the HLA engine is up and running.

Log streaming sources

Depending on your integration, the **Log streaming sources** table displays the following information about the integration's log streaming sources.

Note:
This table isn't available for the ServiceNow System Logs Retriever integration.

Log streaming sources

Column	Description
Name	The name of the log data source.
Status	The streaming status: Active or Not active.
Data input	The integration streaming the data to your ServiceNow instance.
MID Server	The MID Server to which the log data is streaming.
Last event time	The time when the integration received the latest event.
Last log processing time	The time when the last log was received or processed.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Pre-processed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log streaming sources (continued)

Column	Description
	Note: This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

Review log streaming data and adjust integration settings in Health Log Analytics

Review log streaming data and adjust integration settings in Health Log Analytics

Review the log data streaming status and streaming sources of an active integration for Health Log Analytics on the integration's Overview screen. From this tab, you can investigate streaming issues and refine the integration settings. Leverage the displayed data to refine how HLA reads the log data by adjusting the integration's configuration.

Before you begin

Confirm that the integration has been activated on the Integrations Launchpad. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

For MID-less or OpenTelemetry Protocol (OTLP) integrations, verify that the *mid.hla.itom_gateway_streaming.enabled* property is set to true in the MID Server properties to enable displaying the ITOM Gateway component on the Overview screen.

To access the Log Viewer from the Overview tab with context from the integration, you must have the ServiceNow Service Operations Workspace Log Analytics application installed.

Role required: evt_mgmt_admin

About this task

For more information about the data shown in the **Overview** screen, see Monitoring log data flow and optimizing integration settings in Health Log Analytics.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Manage installed integrations**. The Integrations launchpad appears.
4. In the **Installed integrations** tab, search for an active integration and open it. The **Overview** screen displays, showing the integration's data streaming status and its log data sources data.

Note:
The ServiceNow System Logs Retriever integration doesn't run on a MID Server. Therefore, for this integration the **Overview** screen doesn’t display the MID Server streaming status.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Analyze the provided data and investigate any data streaming issues.
6. **Optional:** Adjust the configuration of the integration, if needed.
   Use the options on the View menu ( ) to navigate to the relevant table or the Log Viewer.

   Note:
   The View menu content changes dynamically depending on whether the referenced tables contain data.

   View menu options

Option	Description
Data Input Mapping	Opens the **Data Input Mapping** page. On this page, you can map sources manually if HLA didn't discover properties automatically. For more information, see Map raw log data in Health Log Analytics.
Source Type Structure	Opens the **Source Type Structures** page. In the Source Type Structure, log data is classified and organized based on its origin or type. You can adjust the structure and verify that the HLA AI engine extracts properties properly and classifies them correctly. For more information, see Source type structure adjustment in Health Log Analytics.
Log Sources	Opens the **Log Sources** table. This table enables you to verify that HLA has created all your log sources. If a log source is missing, you can add it manually. For more information, see Verify your log sources in Health Log Analytics.
Log Viewer	Opens the **Log Viewer**, which shows the frequency of anomalies in the log data during a specific time period. For more information, see Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics. **Note:** The Log Viewer option appears only if the Service Operations Workspace Log Analytics application is installed.

7. When you have resolved any data streaming issues and fixed the configuration, select **Test and save**.
   The system saves the updated configuration to the database and tests the configured port, returning either success or an error. If an error is returned, fix the configuration according to the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

suggestions on the screen and then select **Test and save** again. Once the test is successful, continue with the next step.

8. Reactivate the integration.

Map logs to service instances and components for context in Health Log Analytics

Map your logs to service instances and components so that Health Log Analytics can generate alerts in context. Contextualizing your log data is especially important when the integration processes logs from multiple service instances and components.

Before you begin

Configure and activate an integration before you perform this procedure. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

Role required: evt_mgmt_admin

About this task

Log context mapping enables you to configure the settings that Health Log Analytics (HLA) uses to map your raw log data to the appropriate log source. A log source is defined by a service instance and a component, enabling HLA to link logs to their corresponding service instance and component for more contextualized analysis.

For example, a large financial institution might face performance issues with its e-banking application, which relies on various components like web, application, and database servers. Without log context mapping, logs from these components appear isolated, complicating issue correlation. An anomaly in a Tomcat server log might be detected, but without proper context, the operator struggles to assess its impact. Log context mapping enables defining rules to map logs to the e-banking application service instance and the Tomcat server component, providing a contextualized view for root cause analysis and resolution.

By default, automatic log context mapping is enabled. Health Log Analytics uses the settings you define in this procedure to identify service instances and components in log examples and map log data to them automatically.

Important:
If a manually-defined mapping script exists in the **Data Input Mapping** page, automatic mapping overwrites it.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. Perform one of the following procedures.

Option	Description
From the Optimize section	**a.** Under Logs, select **Map log context**. **b.** From the **Log context mapping** page, select an integration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
From the Integrate section	**Note:** This method is supported in Health Log Analytics version 38.0.16 and later, available from the **a.** Under Integrations, select **Manage installed integrations**. The Integrations launchpad appears. **b.** On the **Installed integrations** tab, search for an integration and open it. The **Overview** screen displays. **c.** Under **Next steps**, on the **Log context mapping** card, select **View mapping**. **d.** From the **Log context mapping** page, select an integration.

The integration's **Log context mapping** screen displays.

Note:
If the selected integration has features that are unsupported in Service Operations Workspace, you're referred to the **Data Input Mapping** page. For more information, see Map raw log data in Health Log Analytics.

4. **Optional:** Use the toggle to disable automatic service instance and component mapping.
If you turn off automatic mapping, you must define a mapping script manually in the **Data Input Mapping** page. For more information, see Map raw log data in Health Log Analytics.

   The remaining steps in this procedure are only relevant when automatic mapping is enabled.

   Note:
   When you open the **Log context mapping** form for the first time, the system default values display in all fields.

5. Select the log field by which Health Log Analytics identifies a service instance from **Raw log field** drop-down list.
A service instance represents a complete business process.

   Note:
   If the selected field doesn't appear in the sample log, Health Log Analytics assigns the default value to the service instance.

6. Select the log field by which Health Log Analytics identifies a component from the **Raw log field** drop-down list.
A component represents the smallest part of a service instance. A single service instance typically comprises multiple components.

   Note:
   If the selected field doesn't appear in the sample log, Health Log Analytics assigns the default value to the component.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Select **Preview** to view the service instances and components the system has identified based on your settings in the previous steps.
   The service instances and components are grouped by service.
8. In **Advanced settings**, review the fallback service and set the log field by which the system identifies a source type.

   a. In the **Selected fallback service** field, review the fallback service the system uses if it can't identify the service instance in the log data.
   The displayed fallback service is the default service instance you selected when you configured the integration.

   Note:
   For some integrations, such as Filebeat, this field shows `N/A` instead of a value. In these integrations, if Health Log Analytics can't identify the service instance, it uses the system default value rather than the fallback service.

   b. From the **Raw log field** drop-down list, select the field by which Health Log Analytics identifies a source type in the log data.

   Note:
   If the selected field doesn’t appear in the sample log, Health Log Analytics assigns the default value to the source type.

   c. **Optional:** Select **Preview** to view the log sources the system has identified based on your source type settings.

9. **Optional:** Review a log processing simulation based on your current mapping.
   The simulation helps you understand how your mapping impacts Health Log Analytics log processing, enabling you to fine-tune your settings.
   - The **Log fields** tab shows the default service, component, and source type and the raw log.
   - The **Extracted values** tab shows the service instance, component, and log source that the system has extracted from the raw log based on your current settings.
10. Select **Save mapping** to save your settings.

Edit an installed integration in Health Log Analytics

Edit an installed integration for streaming log data to Health Log Analytics on the Integrations Launchpad. For example, you can switch to a different service instance.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations launchpad appears.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Installed integrations** tab, search for and select the tile for the integration you want to edit.
5. Select a tab that you want to edit.
6. Select **Deactivate** to deactivate the integration.

   Note:
   You must deactivate the integration before you can edit it.

7. Select **Edit**.
8. Edit the integration per your requirements.
9. Select **Test and save**.
   Health Log Analytics tests the MID Server connectivity, returning either success or an error. If an error is returned, make adjustments to your configuration as suggested on the screen, and then select **Test and save** again. When the test is successful, you can reactivate the integration.
10. Select **Activate**.

Deactivate a log data integration in Health Log Analytics

Deactivate an integration for streaming log data to Health Log Analytics on the Integrations Launchpad. A deactivated integration stops streaming logs to your ServiceNow instance, but is still available.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations launchpad appears.
4. In the **Installed integrations** tab, search for and select the integration tile for the integration you want to deactivate.
5. In the **Overview** tab, select **Deactivate**.

Result
The integration is deactivated and stops streaming log data to the instance. The deactivated integration is still available on the Integrations Launchpad in the **Installed integrations** tab, under **Waiting for your action**.

Set up data inputs in Health Log Analytics using guided setup

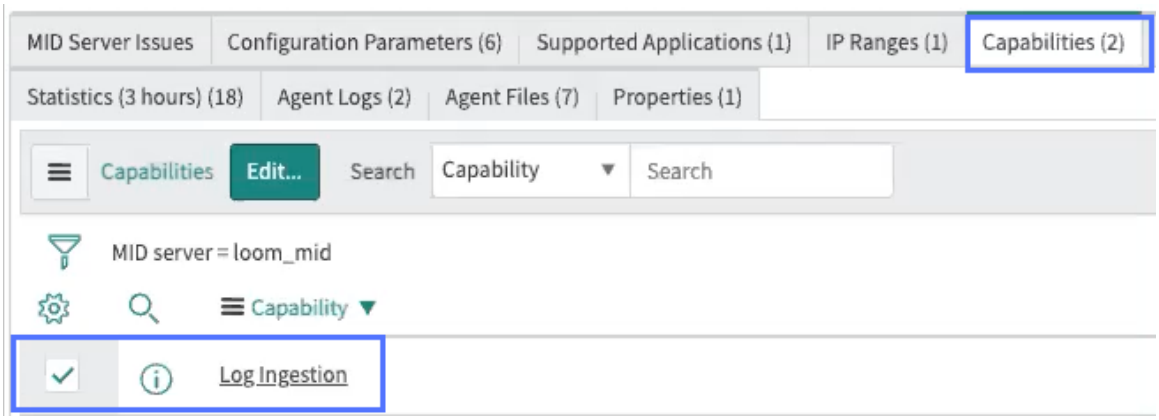
The Health Log Analytics guided setup provides a sequence of tasks to help you create data inputs on your ServiceNow instance. Data input configuration is an essential step in setting up the Health Log Analytics application. Using guided setup ensures that you have the minimum required setup for the data input process.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

- For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Role required: evt_mgmt_admin

About this task

For information about using the guided setup interface, see Using guided setup.

Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup** > **Health Log Analytics**.
2. Follow the instructions to select and set up a data input.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Once you've created the data input connector, proceed to map your raw log data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin. For the ServiceNow System Logs data input: admin.

Procedure

1. Setup a data input manually by performing the relevant procedure described in the product documentation.

Data Inputs

Data Input	Description
Rsyslog or Beats	The data input streams log data into your instance using Rsyslog or Beats.
Splunk	The data input streams log data into your instance using Splunk.
Splunk Polling	The data input periodically pulls log data from Splunk by using a query.
Elasticsearch	The data input pulls log data from Elasticsearch indexes into your instance.
TCP	The data input sends raw log messages to your instance directly over a TCP/SSL socket.
UDP	The data input streams raw log messages to your ServiceNow instance directly over a UDP socket.
GCP PubSub	The data input receives log messages that are published to a Google Cloud Pub/Sub topic and streams them to your ServiceNow instance.
MID Server	The data input collects MID Server log files and streams them to your instance.
Amazon CloudWatch	The data input streams log data from Amazon CloudWatch to your ServiceNow instance.
Amazon S3 Bucket	The data input streams log data from Amazon S3 (Simple Storage Service) buckets to your ServiceNow instance.
Microsoft Azure Log Analytics	The data input streams log data from Microsoft Azure Log Analytics to your ServiceNow instance.
Microsoft Azure Event Hubs	The data input streams events from Microsoft Azure Event Hubs to your ServiceNow instance.
Apache Kafka	The data input streams log data from Apache Kafka to your ServiceNow instance.
REST API	The data input streams log data to your ServiceNow instance in JSON format.
ServiceNow System Logs Retriever	The data input streams log data from the ServiceNow System Log table to the Health Log Analytics AI engine.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Input	Description
	Note: Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it. This data input doesn't run on a MID Server.
Cribl	The data input to enables Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.
Edge Delta	The data input enables Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.
Vector Agent	The data input enables Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.
Agent Client Collector	The data input streams log messages to your ServiceNow instance using the ServiceNow Agent Client Collector. This data input is supported for use with the Agent Client Collector Log Analytics application, available from the ServiceNow Store.

Note:
Selecting **Test connection** at the end of the procedure ensures that your data input is configured correctly. You can only publish a data input configuration when the connection between the MID Server and the data repository has been established.

2. Identify and address streaming issues to ensure that the data input is streaming log data to the MID Server from all sources.
   For more information, see Identify and resolve a log streaming issue in Health Log Analytics.
3. **Optional:** Edit raw log data before Health Log Analytics maps and structures it.
   For more information, see Edit your raw log data before processing.
4. Determine how Health Log Analytics handles raw log data that is streaming into your instance. By default, every incoming log line is auto-mapped to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function. For more information, see Map the raw data.
5. **Optional:** Tweak the source type structure to make sure that Health Log Analytics extracts and classifies all properties correctly.
   For more information, see Refine the source type structure in Health Log Analytics.
6. **Optional:** Perform additional data input setup tasks.
   For more information, see Additional data input setup tasks in Health Log Analytics.

Configuring data inputs for Health Log Analytics manually

Configure the data input process manually in Health Log Analytics. Data input configuration is an essential step in setting up the Health Log Analytics application.

Configure an Amazon CloudWatch data input in Health Log Analytics manually

Set up a data input for streaming log data from Amazon CloudWatch to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:**
> Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

> **Note:**
> If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Amazon CloudWatch data input.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Amazon CloudWatch data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. These fields are required.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

- If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
- If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

Note:
You can only publish the data input configuration when the connection is created successfully.

Note:
You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Amazon CloudWatch to your ServiceNow instance.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Cribl for filtering and routing large volumes of log data from various sources, the log format Health Log Analytics receives is distinct from other types. The Cribl data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Cribl data input.
4. On the **Getting Started** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
5. On the **Config** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
6. On the **Process** tab, select the required route and then select **Next**.

   For more information, see Cribl data input configuration fields.

Note:
For troubleshooting issues related to this step, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

The **Finish** tab opens.

7. On the Cribl instance, verify that the configuration of the data input is correct.
You can use the Cribl commands displayed on the **Finish** tab as needed.
8. When the configuration is correct, return to the data input configuration **Finish** tab and select **Publish** to publish the data input.

Result
The data input configuration process is complete. The data input starts streaming log data to your ServiceNow instance.

For resolving issues related to the ingestion of log data from Cribl, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

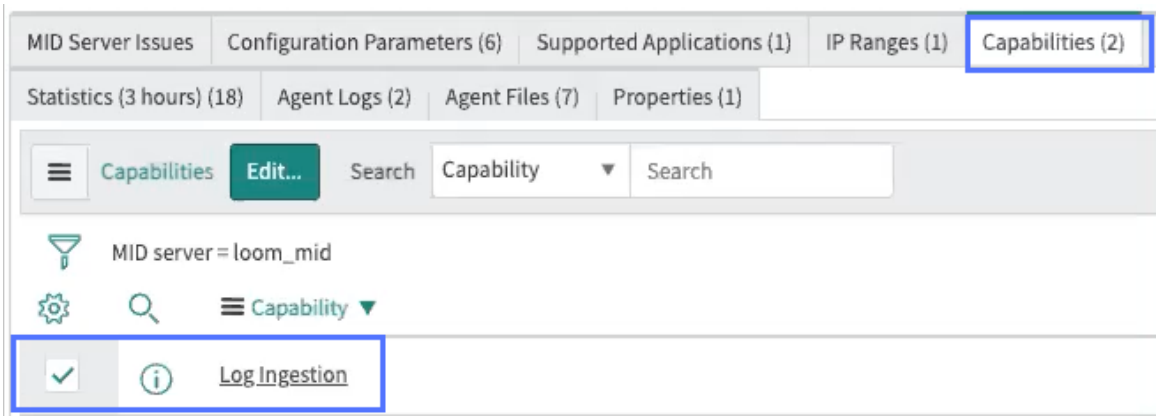
Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next
Make sure that the data input is streaming data.

Configure an Edge Delta data input in Health Log Analytics manually

Set up an Edge Delta data input to enable Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.

Before you begin
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses

are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is distinct from other types. The Edge Delta data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Edge Delta data input.
4. On the form, fill in the fields.
   For a detailed description of the fields, see Edge Delta data input configuration fields.
5. Select **Save** to save your configuration.
6. Select **Publish** to publish the data input.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

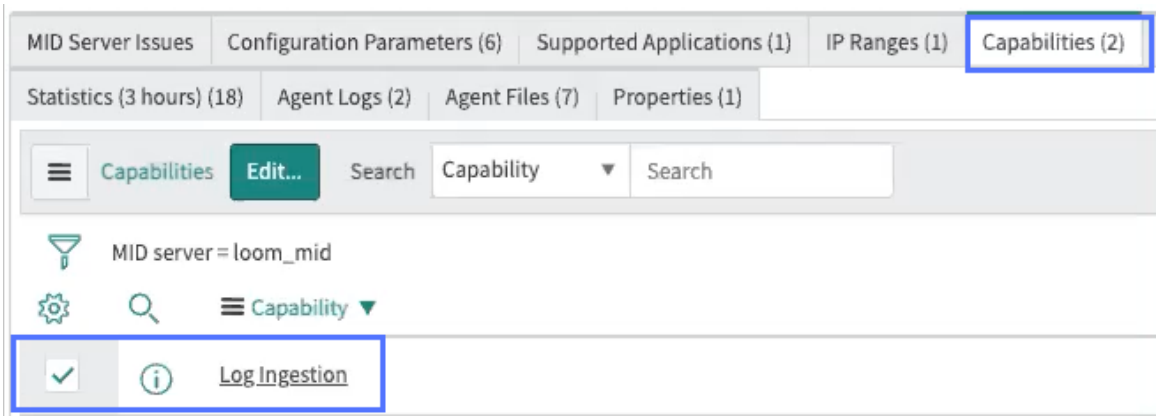
Configure an Elasticsearch data input in Health Log Analytics manually

Set up a data input for streaming log data from Elasticsearch indices to your ServiceNow instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

Health Log Analytics supports Elasticsearch versions above 7.10.2 and below 8.18.2.

Note:
For advanced information about streaming log data from Elasticsearch indices to your instance, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support knowledge base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Elasticsearch data input.
4. On the form, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
5. **Optional:** Select **Advanced** to set advanced configuration fields.
   For a description of the fields, see Elasticsearch data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Elasticsearch data inputs in Health Log Analytics manually.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
7. On the **Query Settings** tab, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

   Note:
   You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Elasticsearch indices to your ServiceNow instance.

For more information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next
Make sure that the data input is streaming data.

Note:
If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

Related topics

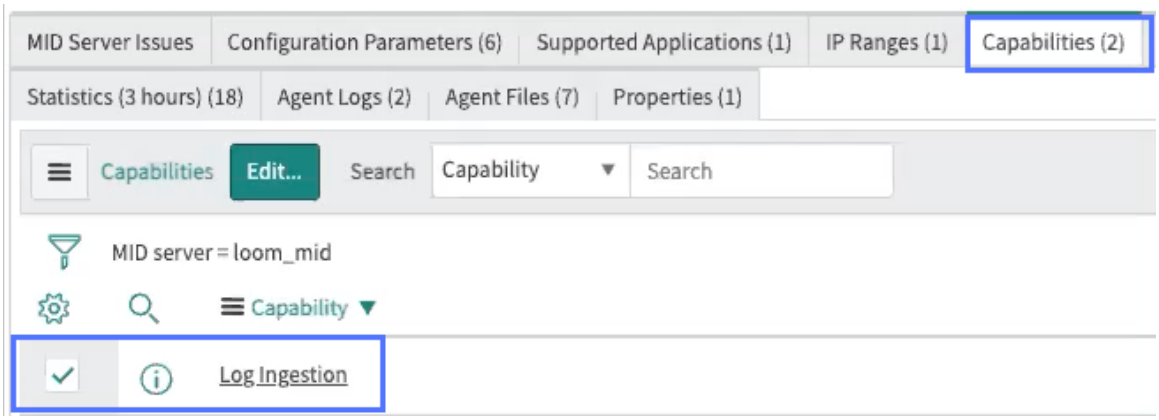
Configure advanced settings for Elasticsearch data inputs in Health Log Analytics manually

Configure a GCP PubSub data input in Health Log Analytics manually

Set up a data input for receiving log messages that were published to a Google Cloud Platform (GCP) Pub/Sub topic and streaming them to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the GCP PubSub data input type.

   Note:
   The selected data input type complements the passive data input (listener). For more information, see Supported data inputs for Health Log Analytics.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.
   For a description of the fields, see GCP PubSub data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see GCP PubSub data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you changed the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

   Note:
   You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts to receive log messages from the Google Cloud Pub/Sub topic and streams them to your ServiceNow instance via the MID Server.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

Configure a Microsoft Azure Event Hubs data input in Health Log Analytics manually

Set up a data input for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2025 ServiceNow, Inc. All rights reserved.

Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Microsoft Azure Event Hubs data input.
4. On the form, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
   For information about configuring the advanced settings later, see Configure advanced settings for Microsoft Azure Event Hubs data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Microsoft Azure Event Hubs to your ServiceNow instance.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next
Make sure that the data input is streaming data.

Related topics
Configure advanced settings for Microsoft Azure Event Hubs data inputs in Health Log Analytics manually

Configure a Microsoft Azure Log Analytics data input in Health Log Analytics manually

Set up a data input for streaming log data from Microsoft Azure Log Analytics to your ServiceNow instance. The data input points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.

Before you begin
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named `mid.public_ip` with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Microsoft Azure Log Analytics data input.
4. On the form, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Microsoft Azure Log Analytics data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.

   Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics.

   For example:

   ```
   {"query": "ContainerLog | where TimeGenerated > %s | take 500",
    "project": ["TimeGenerated", "LogEntry", "LogEntrySource"]}
   ```

   where:

   - `ContainerLog`: The data source name.
   - `TimeGenerated`: The event time property name.
   - `500`: The maximum number of rows retrieved in each query.
   - `["TimeGenerated", "LogEntry", "LogEntrySource"]`: The event time and the comma-separated list of column names to return.

   Alternatively, you can configure a custom query in the **Log query** field. The value you set in this field overrides the values in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics generates the query using the values set in the other fields on the tab.

   For a description of the **Query settings** fields, see Microsoft Azure Log Analytics data input configuration fields.

7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

Role required: evt_mgmt_admin

About this task

This procedure describes how to create a MID Server data input from the Data Inputs page. To configure the MID Server data input automatically, click the related link on the MID Server form.

Important:

- When you create a MID Server data input, all logs are automatically mapped to the predefined mid_server_log source type. This source type includes preconfigured mapping settings to maximize the value of monitoring your MID Server logs. To review the mapping script, navigate directly from the data input configuration form to the mapping form by selecting **Go to Mapping** under Related Links. Review the source type by navigating to Source Type Structures and select the mid_server_log source type.
- For optimal performance, debug MID Server log messages are not processed by default. If you want to send debug messages to Health Log Analytics for processing, add the following to your MID Server properties: mid.hla.mid_data_input.ignore_debug_level_logs = false.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the MID Server data input.
4. On the form, provide a description of the data input and the name of the MID Server from which the logs are streamed.
   For a description of the fields, see MID Server data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   On the form, fill in the fields. For a description of the fields, see MID Server data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for MID Server data inputs in Health Log Analytics manually.
6. Select **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts collecting and streaming MID Server log messages to your ServiceNow instance.

For a description of how this data input can help you detect and resolve emerging issues in your organization's ServiceNow instance, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

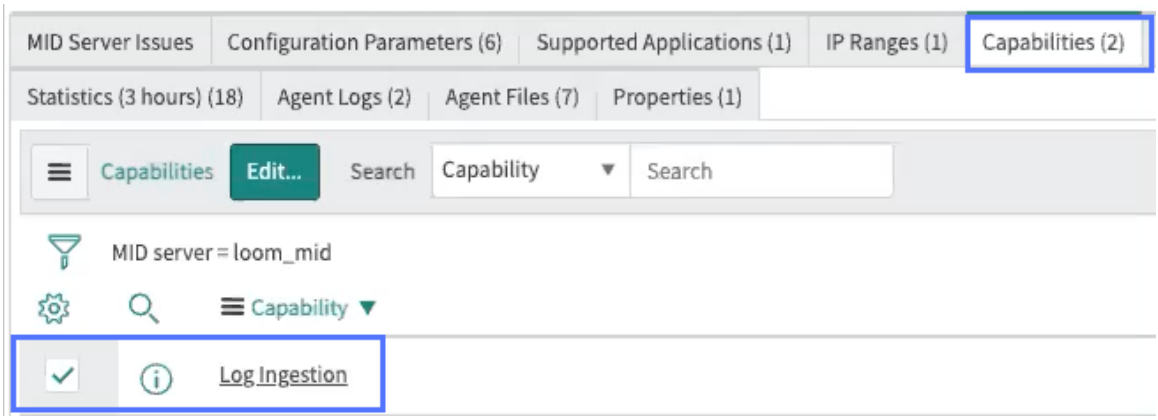
Make sure that the data input is streaming data.

Configure a REST API data input in Health Log Analytics manually

Set up a REST API data input for streaming log data to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named `mid.public_ip` with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the REST API data input.
4. On the form, fill in the fields.
   For a description of the fields, see REST API data input configuration fields.
5. Select **Save**.
   - Health Log Analytics adds the data input record to the **Data Inputs** table.
   - The system automatically generates the REST API data input URL for sending logs to the MID Server. The generated URL will be in this format: `http://(MID_SERVER_IP):(MID_WEB_SERVER_PORT)/api/mid/hla/raw`. HLA replaces `(MID_SERVER_IP)` and `(MID_WEB_SERVER_PORT)` with the values you configured.
6. Copy the generated URL.
7. Instruct your API client to send log messages to the MID Server.

   a. In the API client, configure a request with the following parameters:
      - HTTP Method: POST.
      - URL: The URL you copied in the previous step.
      - Authentication: The required authentication credentials. For example, Basic authentication (username and password).

        Note:
        The authentication method must be the same as the method configured on the MID Web Server.

      - Headers: Set the `Content-Type` header to match your payload format.
        - For JSON: `application/json`.
        - For raw text: `text/plain`.
      - Body: The logs payload in JSON or raw text.

   b. Send the request.
      A successful response indicates that the MID Server has received the payload. When the MID Server has processed the log messages, the data input streams them to your ServiceNow instance using the REST protocol.

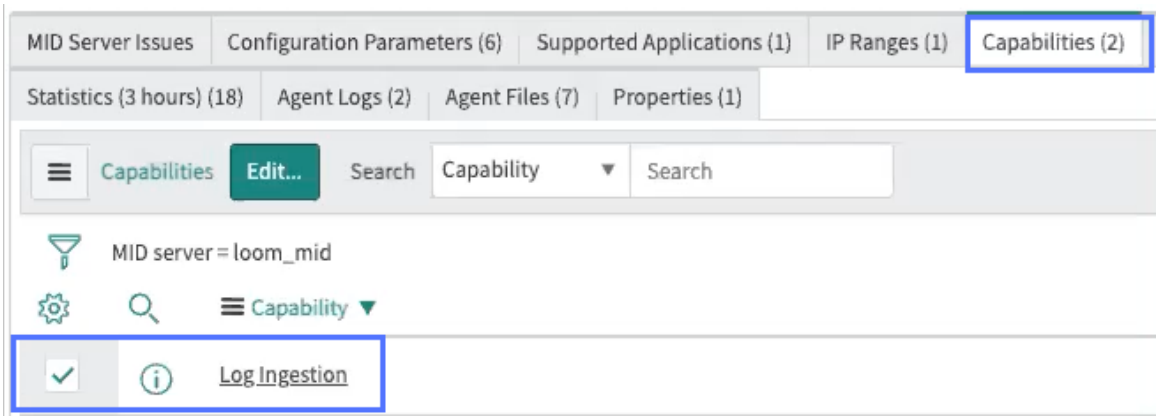
Configure a Rsyslog, Filebeat, or Winlogbeat data input in Health Log Analytics manually

Set up a data input for streaming log messages to your ServiceNow instance using an Rsyslog, Filebeat, or Winlogbeat agent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property.

Note:
If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the data input type to create from the available data input types described in the table.

Note:
The selected data input type complements the passive data input (listener). For more information, see Supported data inputs.

Data input types

Type	Description
Rsyslog	Streams log messages from UNIX-based servers to the ServiceNow AI engine using the Rsyslog agent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description
Linux using Filebeat	Streams system log messages and local files from Linux servers to the instance using the Filebeat agent.
Windows Application Logs using Filebeat	Streams local files from Microsoft Windows devices to the ServiceNow instance using the Filebeat agent.
Windows OS using Winlogbeat	Streams Windows event logs to the ServiceNow instance using the Winlogbeat agent.

4. On the **Getting Started** tab, fill in the form.

   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

   Note:
   When creating a data input for Linux using Filebeat, you can select a content pack from the **Content pack** drop-down. The content pack contains default source types and mapping script templates that save you the time it takes to create them from scratch. For more information, see Health Log Analytics content packs for quicker time to value.

5. If the Rsyslog, Filebeat, or Winlogbeat agent has not already been installed, download and install it from the **Installation** tab.
   For installation instructions, refer to the product documentation of the respective agent.

   Note:
   Make sure that you're running the latest version of the agent. Earlier versions will work, but with limited functionality.

6. On the **Tagging and Binding** tab, assign logs to an service instance in the Configuration Management Database (CMDB) to enable the service to correlate the log data and enable the system to do root cause analysis.

   a. For each source, configure the path and service instance for the logs to be streamed.

   Note:
   By default, only the required fields **Path** and **Service instance** appear.

   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

   b. If you want to ship multiline logs using Filebeat, configure the properties that control how Filebeat handles messages that span multiple lines of text.

Field	Description
Match	Specifies how Filebeat combines matching lines into an event.
Negate	Defines whether the pattern identified in the log lines is negated.
Regex	Specifies the regular expression to match.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Health Log Analytics currently doesn't support multiline properties for Rsyslog.

c. **Optional:** Define additional log paths to enable the data input to stream log types from multiple paths.
Do the following for each additional log path:

i. Insert a new row.

ii. Configure the log path.

iii. Choose a service instance.

iv. (Optional) Choose a component and a source type.

Note:
This option is not available or necessary when using Winlogbeat, because Health Log Analytics streams the Windows event logs.

7. On the **Finish** tab, complete the configuration for your data input type.

- Rsyslog:

a. Download the configuration file and install it on the endpoint device, in the `/etc/rsyslog.d/rsyslog.conf` directory.

Note:
If you are using the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store , do the following instead:

i. On the endpoint device, install the configuration file in the `/etc/rsyslog.d/` directory.

ii. Create a spool directory by running the `sudo mkdir -p/var/spool/rsyslog` command.

b. Validate the configuration by running the `rsyslogd -N1` command and verify the output.

c. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.

d. Verify the output. If it contains errors, check the `/var/log/messages` system log file for error messages and fix the errors.

- Linux using Filebeat:

a. Download the configuration file and install it on the endpoint device, in the `/etc/filebeat/` directory.

b. Start the agent service by running the `sudo service filebeat start` command.

Note:
The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

- Windows using Beats (Filebeat or Winlogbeat):

a. Download the configuration file and install it on the endpoint device, in the `C:\Program Files\` directory.

b. Start the agent service by running the appropriate command in PowerShell.

- Filebeat: `PS > Start-Service filebeat`
- Winlogbeat: `PS > Start-Service winlogbeat`

Note:
The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

8. Select **Save**.
Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

Health Log Analytics tries to connect the MID Server to the data repository.

- If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
- If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

  Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

Note:
You can only publish the data input configuration when the connection is created successfully.

Note:
You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance.

Note:
The configuration file Health Log Analytics generates for new Filebeat data inputs is compatible with Filebeat version 7.14 and above. The minimum Filebeat version that Elasticsearch currently supports is 7.17, which is nearing its end of life (EOL).

Existing Filebeat data input configuration files in HLA are compatible with Filebeat versions up to 8.x. For Filebeat version 9.0 and above, either migrate from log input to filestream input or generate a new configuration file. For more information on the migration process, refer to the Filebeat documentation.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

Configure advanced settings for Rsyslog, Splunk, or TCP data inputs in Health Log Analytics manually

Configure advanced settings for Beats data inputs in Health Log Analytics manually

Configure a ServiceNow Log Export data input in Health Log Analytics manually

Set up a data input for monitoring ServiceNow instance node logs from both Java code and JavaScript in Health Log Analytics (HLA). This data input provides a complete view of your instance status, including server context.

Before you begin

Note:
Only a single ServiceNow Log Export data input can exist in the system. This data input doesn't run on a MID Server.

- Verify that the Log Export Service (LES) is installed on your ServiceNow instance. LES is a ServiceNow Platform tool under a different license than Health Log Analytics that enables you to export your system logs seamlessly into HLA. For more information, see Log Export Service (LES).
- Verify that the Hermes Messaging Service is up and running:
  1. Navigate to **All** > **Hermes Messaging Service** > **Diagnostics**.
  2. Ensure that the status icon is green, signifying that the service is active: .

     If it isn't, contact ServiceNow support.
- Create an instance-signed PKI Certificate:
  1. Navigate to **All** > **Certificate Generator** > **Instance PKI Certificate Generator**.
  2. In the **Certificate Password** field, set a password to use for your certificate.
  3. Select **Generate**.

     The system generates the certificate.
  4. Download the `keystore` and `truststore` files to your machine.
- Create a Basic Auth credential and attach it to a credential alias.
  1. Navigate to **All** > **IntegrationHub** > **IntegrationHub Usage** > **Connections & Credentials** > **Credentials**
  2. Select **New**.
  3. Select **Basic Auth Credentials**.
  4. In the **Password** field, enter the certificate password.
  5. In the **Credential alias** field, attach the new Basic Auth credential to a new credential alias.

Role required: evt_mgmt_admin

About this task

The ServiceNow Log Export data input streams system node logs from Java code and JavaScript into HLA, providing a complete view of your ServiceNow instance status with server context. This enhanced visibility facilitates improved monitoring and generates more meaningful alerts

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to help you identify instance issues, detect security threats, optimize performance, and maintain regulatory compliance.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose **ServiceNow Log Export Hermes Consumer**.
4. Select the **Manage Attachments** icon ( ) and attach the `keystore` and `truststore` files to the form.
5. On the form, fill in the fields.
   For a description of the fields, see ServiceNow Log Export data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record.

Alerts generated by this data input have the `glide_node_log alerts` component alert tag in the **Express List Active alerts** page.

Configure a ServiceNow System Logs Retriever data input in Health Log Analytics manually

Set up a data input for streaming log data from the ServiceNow System Log table to the HLA engine (aka Occultus).

Before you begin

Note:
Only a single ServiceNow System Logs Retriever data input can exist in the system. This data input doesn't run on a MID Server.

Role required: admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the ServiceNow System Logs Retriever data input.
4. On the form, fill in the fields.
   For a description of the fields, see ServiceNow System Logs Retriever data input configuration fields.
5. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record.

The data input starts streaming ServiceNow log data from the System Log table to the Health Log Analytics AI engine, based on the configured filters. Admin users can set filters to query the System Log table. Operators can monitor the logs and view the alerts that Health Log Analytics generates from them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of how this data input can help you detect and resolve emerging issues in your organization's ServiceNow instance, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

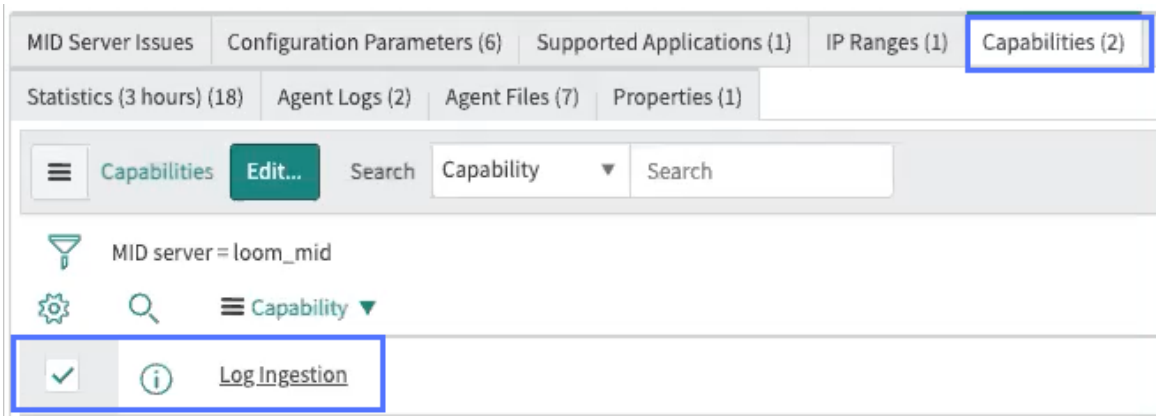
What to do next
Make sure that the data input is streaming data.

Configure a Splunk data input in Health Log Analytics manually

Set up a data input for streaming log messages to your ServiceNow instance using a Splunk heavy forwarder.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using the private IP address.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure Splunk to forward logs to your ServiceNow instance using Syslog.
- The configuration of this data input assumes the existence of an environment variable named $SPLUNK_HOME. In Unix-like environments, this variable typically points to `/opt/splunk`.

Note:
The Windows environment uses the same directory structure, but with backslashes (\).

Role required: evt_mgmt_admin

About this task

This setup procedure is for streaming logs to your instance using a Splunk heavy forwarder. If you can't use a heavy forwarder, you can use a Splunk Universal Forwarder instead. For more information, see the Splunk Universal Forwarder as a Shipping method [KB0961378] article in the Now Support Knowledge Base.

Starting in the Yokohama family release, you can use new Splunk data inputs to ingest data in the preprocessed ("cooked") log-forwarding format that Splunk uses by default. In cooked mode, the Splunk forwarder embeds configuration details, such as host, source type, source, and other settings into the log data. Ingesting the data into HLA in this format verifies that each log line retains all the relevant contextual information. If you are using the cooked data option in HLA, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.

Note:
All Splunk configuration files are located in the $SPLUNK_HOME`/etc/system/local/` folder. If a configuration file that you need to modify doesn't exist, create it and save it to this folder.

Note:
A MID Server that is down can cause a blockage in your Splunk pipeline. A full processing queue does not affect the pipeline.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Splunk data input for streaming logs via a Splunk heavy forwarder or universal forwarder.
4. On the **Getting Started** tab, fill in the form fields.
   For a description of the fields, see Splunk data input configuration fields.
5. On the **Outputs.conf** tab, add the following stanzas to the `outputs.conf` file to make the shipper forward log data over the selected transport protocol on the selected port, and then select **Next**.

   Note:
   If you have already configured outputs, merge these lines with your existing configuration.

   - Forwarding over TCP:

     Note:
     Use the first stanza only if you have not already configured a tcpout stanza. The second stanza is required for forwarding to Health Log Analytics over TCP.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
[tcpout]
indexAndForward = 1
defaultGroup = nothing

[tcpout:health_log_analytics]
server = ip-172-31-17-121.us-east-2.compute.internal:5000
sendCookedData = false
compressed = false
```

- Forwarding over UDP:

  Note:
  Use the first stanza only if you have not already configured a syslog stanza. The second stanza is required for forwarding to Health Log Analytics over UDP.

```
[syslog]defaultGroup = nothing

[syslog:health_log_analytics]
server = ip-172-31-17-121.us-east-2.compute.internal:5000
```

6. On the **Props.conf** tab, edit the `props.conf` file, and then select **Next**.

   Note:
   If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `props.conf` file.

   a. Modify existing stanzas or add stanzas to mark source types, service instances, and hosts for forwarding to Health Log Analytics.

      Note:
      For best results, mark only source types for forwarding.

      When adding stanzas, use the following name formats:

      - Source types: [<source type>]. For example: [syslog]
      - Sources (not recommended): [source::<source>]. For example, [source::myApp]
      - Hosts (not recommended): [host::<host>]. For example, [host::10.9.8.7]

   b. Add the following line to the end of each stanza that you want to forward to Health Log Analytics over either TCP or UDP.

      - Forwarding over TCP:

```
TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
 clone_for_hla
```

      - Forwarding over UDP:

```
TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
 clone_for_hla_udp
```

      This line applies the CLONE_SOURCETYPE transform on the data to prevent manipulation needed for Health Log Analytics processing from affecting your existing data pipeline. For example, to send all logs from the source type "syslog" to Health Log Analytics:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
[syslog]
                                        #existing configuration
 goes here
                                        TRANSFORMS-cloned_data =
 clone_for_hla_store_sourcetype, clone_for_hla_udp
```

c. Add the following stanza to apply all the relevant transforms needed for Health Log Analytics processing.

Note:
Splunk enables you to anonymize sensitive data on the cloned source type for the selected protocol. For more information, see the "Anonymize data" section in the Splunk documentation.

- Forwarding over TCP:

```
[send_to_hla_tcp]
TRANSFORMS-health_log_analytics =
 health_log_analytics_add_sourcetype,
 health_log_analytics_add_host,
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

- Forwarding over UDP:

```
[send_to_hla_udp]
TRANSFORMS-health_log_analytics =
 health_log_analytics_add_sourcetype,
 health_log_analytics_add_host,
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

7. On the **Transforms.conf** tab, add the following stanzas to the `transforms.conf` file, and then select **Next**.

Note:
If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `transforms.conf` file.

The third stanza clones the logs for further manipulation without affecting your existing indexing. The remaining stanzas add the information needed to enable correct Health Log Analytics processing.

Note:
You can obfuscate sensitive data by adding a transform here and then modifying the stanza of the cloned source type in the `props.conf` file.

```
[accepted_keys]
#Custom field for preserving sourcetype
```

```

8. On the **Finish.conf** tab, restart Splunk by running the `$SPLUNK_HOME/bin/splunk restart splunkd` command.
9. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
10. Verify that the data input is configured correctly by selecting **Test connection**.

    Health Log Analytics tries to connect the MID Server to the data repository.

    - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
    - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

      Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

      Note:
      You can only publish the data input configuration when the connection is created successfully.

    Note:
    You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

11. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance using a Splunk shipper.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the UDP data input type.

   Note:
   The selected data input type complements the passive data input (listener). For more information, see Supported data inputs for Health Log Analytics.

4. On the form, fill in the fields.
   For a description of the fields, see UDP data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see UDP data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

   Note:
   You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts sending raw log messages to your ServiceNow instance directly over a UDP socket.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next
Make sure that the data input is streaming data.

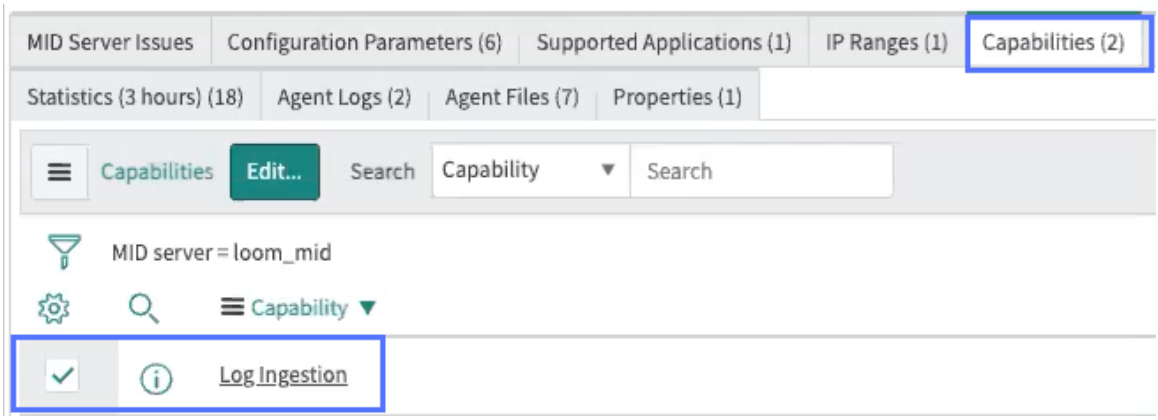
Related topics
Configure advanced settings for Rsyslog, Splunk, or TCP data inputs in Health Log Analytics manually

Configure a Vector Agent data input in Health Log Analytics manually

Set up a Vector Agent data input to enable Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- When the MID Server IP address is exposed through network address translation (NAT), a load balancer, or a similar device, the MID Server must have a public IP address to be reachable by external clients, such as Filebeat agents, located outside its network. Private IP addresses are not routable over the internet, so without a public IP, these external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property.

  Note:
  If the MID Server and external clients are on the same network, a public IP is not necessary, and connections can be made using a private IP address.

- Verify that you have a `vector.yaml` file on your system, or create one.

Role required: evt_mgmt_admin

About this task
If your organization uses Vector by Datadog to handle log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is distinct from other types. The

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vector Agent data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose **Vector - Stream logs from Vector Agent**.
4. On the **Getting Started** tab, fill in the form and then select **Next**.
   For a detailed description of the fields, see Vector Agent data input configuration fields.
5. On the **vector.yaml** tab, update the code with the relevant values as needed.
   For example, you can specify the sources or source file from which the logs will be streamed.

   Note:
   Code that you should not modify is preceded by a commented note.

   For more information, consult the Vector documentation.
6. Copy the updated code and paste it into the `vector.yaml` file on your system.
7. Select **Next**.
   The **Finish** tab displays a message confirming that the data input configuration process is complete.
8. Start streaming log data by running Vector with the configuration file.
   Run the following command:`vector --config /path/to/your/vector.yaml`, where `/path/to/your/` is the actual path to your YAML file.
9. **Optional:** Use the other commands displayed on the **Finish** tab as needed.
10. Select **Save** to save the data input.

Result

Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Identify and resolve a log streaming issue in Health Log Analytics

Find and address log streaming issues to verify that your data inputs are streaming log data to your instance properly.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Streaming Sources**.
   The Streaming Sources page shows all data inputs and the MID Servers that are receiving logs from them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- When **Look up hostnames** is selected in the advanced data input configuration, the Streaming Sources page shows the hostname of devices that use an Rsyslog or a Filebeat shipper. For Elasticsearch indices, it displays the index name.
- Streaming Sources is also available as a related list on the data input form. The related list displays only the endpoint devices that are relevant to that data input.
- If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Streaming Sources page. When this happens, contact ServiceNow support.

2. Select a data input record to view the streaming data of its sources and identify streaming issues and their possible cause.
   For example, if the last recorded event time for a data input's endpoint server is yesterday, that server might be down or configured incorrectly. A streaming issue might also be caused by the data input configuration file not being installed on the endpoint.

Filter	Description
Status	The status of the source. A red bullet indicates that this source has not streamed data in the last hour.
Last event time	The last recorded time an event arrived at the MID Server in the last one-minute interval. Health Log Analytics continuously updates the last event time. If the last event time is not up to date, data is not streaming.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Preprocessed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Investigate and resolve any data streaming issues.

Note:
If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

What to do next
When the logs are streaming properly, proceed to map your raw log data.

Note:
You can choose to edit incoming raw log data before Health Log Analytics processes it. For example, preprocessing enables you to discard log portions or remove sensitive data from your logs. This task is optional.

Additional data input setup tasks in Health Log Analytics

After performing the initial data input setup and configuration in Health Log Analytics, continue with the remaining data input setup tasks.

Add a timestamp format in Health Log Analytics

Define any timestamp format that does not appear in the list of defined formats. Health Log Analytics must be able to read timestamps of any format contained in your log files.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Timestamp Formats**.
2. To determine whether your timestamp format matches a predefined format in the system, do the following:
   a. Select **Find format**.
   b. Enter a sample of your timestamp.
   c. Select **Find format**.
   If the sample matches an existing format, the system provides its ID.
3. If your timestamp sample doesn't match an existing format, then manually define your custom format and add it to the available timestamp formats.
   a. On the Timestamp Formats page, select **New**.
   b. On the form, fill in the fields.

Timestamp format form

Field	Description
ID	ID of the timestamp format. This value is selected automatically.
Format	Valid timestamp format. For example, dd-MMM-yyyy, HH:mm.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Health Log Analytics uses the Java 8 API for timestamp syntax.
Sample	Example of the timestamp format. For example, 03-May-2018, 10:20.
Description	Description of the timestamp format.

4. Select **Submit**.

Result
The system validates the timestamp format and adds it to the list of available timestamps.

Add a source type manually in Health Log Analytics

Create a source type manually before you configure a data input if you want to stream log data to a specific source type rather than to the source type automatically extracted by Health Log Analytics during the mapping process.

Before you begin
This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
2. On the Source Types page, select **New**.
3. On the form, fill in the fields.

Source type form

Field	Description
Name	The name of the source type. The name must be between 3-50 characters long. Acceptable characters are letters, numeric values, dashes, and underscores.
Examples	One or more raw input samples for this source type. Enter each sample on a new line. **Note:** This field must contain data.

The fields in the following table are read-only.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Created manually	Option for indicating that this source type was created manually. Default: true.
Auto-extraction enabled	Auto-extraction for this source type is disabled by default.
Learning mode	Option for indicating that Learning mode for the source type is ongoing. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.

4. Right-click the form header and select **Save**.
5. Select **Load examples** to load the raw input samples for this source type that you provided in the **Examples** field.
   When loading the log samples is completed successfully, the **Examples** field and the **Load examples** buttons no longer appear on the form.
6. **Optional:** Check how the AI engine has parsed the raw input samples by selecting the **Go to Source Type Structure** related link and modify the extracted properties if necessary.
7. Click **Submit**.

What to do next

Configure a data input and then map it to the new source type. For more information, see Set up data inputs in Health Log Analytics manually and Map raw log data in Health Log Analytics.

Related topics

Refine the source type structure in Health Log Analytics

Configure source type capabilities in Health Log Analytics

Health Log Analytics extracts source types automatically in the mapping process. You can add timestamp formats and specify, delete, or exclude keywords for individual source types.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
   The Source Types table lists all source types that were extracted automatically during raw data mapping.

Source Types

Field	Description
Auto extraction enabled	Auto-extraction for this source type is either enabled or disabled. This value is set on the Source Type Structure form. Default: true.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Learning mode	Learning mode for the source type is either ongoing or completed. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.
Stack trace detection enabled	Detection of active stack frames for this source type is either enabled or disabled. Typically, a stack trace enables tracking an error to the log in which it originated.

2. Open a record.
3. **Optional:** Add a timestamp format for this source type.
   a. On the **Source Type Timestamps** tab, select **New**.
   b. In the **Timestamp format** field, select a format from the list of available timestamp formats.
   c. Select **Submit**.
4. **Optional:** Specify a keyword for this source type.
   a. On the **Lexical Keywords** tab, select **New**.

      Note:
      The **Lexical Keywords** tab contains both global and specified keywords. Selecting **New** creates a specified keyword for this source type.

   b. On the form, fill in the fields.

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	The regular expression ("regex") that defines matches.
Exact match	Boolean value. If selected, Health Log Analytics matches the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. Default: True
Case-sensitive	Boolean value. If selected, Health Log Analytics looks for a case-sensitive match of the regex. Default: False

   c. Select **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Delete a keyword specified for this source type.
   a. Select the row of the specified keyword that you want to delete.
   b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.
   c. Select **Continue** to delete the keyword.
6. **Optional:** Exclude a global keyword for this source type
   When you exclude a keyword, Health Log Analytics no longer looks for it in the log data of this source type.
   a. Select the row of the global keyword that you want to exclude.
   b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.

   Note:
   You can delete global keywords from the Lexical Keywords page.
7. Select **Update**.

Verify your log sources in Health Log Analytics

Verify that all your log sources are present and active after Health Log Analytics tagging has assigned a log to a service instance and components, and has automatically mapped the log to a source.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
   The Log Sources table provides information about the sources created when you mapped the streaming data. The table lists these sources by service instance.

Column	Description
Service instance	The service instance. Service instances represent large or complete business processes. A single service instance can consist of multiple components, whereas different service instances can include the same components.
Component	The components comprising the service instance. Components represent small technical parts or business processes. Typically, they represent Configuration Items (CIs). Several components are often clustered together in a single service instance.
Status	The status of the log source: Active or Inactive. The Active status indicates that logs streamed into the system from this source in the last hour.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Created	The creation date and time of this log source.
Last event time	The last time logs streamed into the system from this source.

2. Make sure that the system has created all your log sources.
3. Verify the creation, status, and log samples of a specific source in the source record.

> **Note:**
> Because auto-mapping can map log data to multiple sources, be sure to verify this information per source.

4. If a log source is missing, add it.
   a. Navigate to **Health Log Analytics** > **Data Input** > **Data Input Mapping**.
   b. Use the JavaScript function to manually map a log sample to the correct service instance, component, and source type.
   For more information, see Map raw log data in Health Log Analytics.
   c. Navigate back to the Log Sources page and verify that the status of the new log source is Active.

   The system creates a log source.
5. Make sure that the status of all your log sources is Active.
   If the status of a source is Inactive, double-click it and change it to Active manually.
6. Select **Update**.

Related topics

Delete a log source in Health Log Analytics

Stop extraction of unneeded log data in Health Log Analytics

Extract specific log data in Health Log Analytics

Delete a log source in Health Log Analytics

Delete a log source with or without its associated log data in Health Log Analytics.

Before you begin
Role required: evt_mgmt_admin

About this task
When you delete a log source, Health Log Analytics automatically deletes its related log data. You can also delete a source while keeping the log data. The associated data will then be deleted according to the log retention policy. For more information, see Storage space for log retention in Health Log Analytics.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. Open a source record.
3. Delete the log source in one of the following ways:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Delete the source and its related data by selecting **Delete**.
- Delete the source without its related data by selecting the **Delete without logs** related link.

Review properties extracted from a source type in Health Log Analytics

Inspect the properties that were extracted from all the source types in a source type structure in a single table to identify any setup issues.

Before you begin

Role required: evt_mgmt_admin

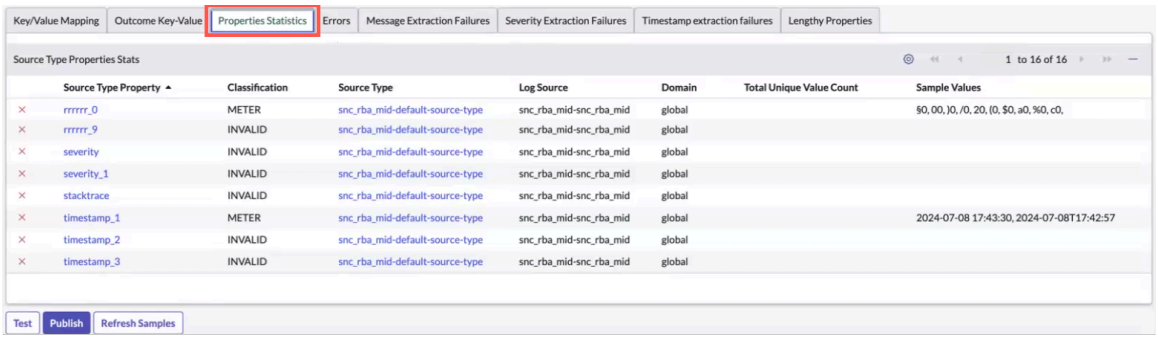
About this task

The Source Type Properties Stats table provides a comprehensive overview of the properties that were extracted from the source types. By reviewing the statistical distribution of their values, you can assess the classification of these properties and adjust your settings if needed.

The procedure in this section explains how to access the Source Type Properties Stats table via the Source Type Structure. From a source type record, you can navigate to the Source Type Structure by selecting the **Go to Source Type Structure** related link.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Open a source type structure record.
3. Open the **Properties Statistics** related links tab.



The **Source Type Properties Stats** table shows the properties of all the source types that are part of this source type structure.

Source Type Properties Stats

Column	Description
Source Type Property	The property extracted from the source type.
Classification	The classification of the property. The available types are: METER, GAUGE, ARC, and INVALID. **Note:** A property classified as INVALID (the default classification) isn't tracked for anomaly detection or shown in the Meaningful Properties analysis.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Source Type	The source type from which the property was extracted.
Log Source	The list of Log Sources in which this property appeared.
Domain	The domain to which the log source belongs.
Total Unique Value Count	Only for properties classified as METER: The total number of distinct values contained in it. This field is inactive when the property is classified as ARC or GAUGE. **Note:** The Total Unique Value Count is updated once a day. Records older than 24 hours are deleted automatically.
Sample Values	Only for properties classified as METER: Sample unique values tracked by the system. Default is 30 samples. This field is inactive when the property is classified as ARC or GAUGE.

4. Review the properties and identify possible classification issues.
5. **Optional:** View statistics for individual source type properties classified as ARC_ONLY or GAUGE.
   a. Open a source type property classified as ARC_ONLY or GAUGE from the **Properties Statistics** related links tab.
   b. On the **Source Type Property** form, select **Source Type Properties Stats**.
   The following information displays in a pop-up:
   - For an ARC property: The percentage distribution of terms, based on the processed logs. For example, the percentage of Bad Request vs. Success.
   - For a GAUGE property: The average, minimum, and standard deviation from the expected numerical value.
6. **Optional:** Change classification settings on the **Key/Value Mapping** tab.
   For more information, see Refine the source type structure in Health Log Analytics.

Review patterns extracted from a source type in Health Log Analytics

Inspect all learned patterns extracted from a source type in a source type structure, together with the log sources in which these patterns appeared. Reviewing these patterns can provide valuable insights into the log message patterns that Health Log Analytics tracks for each source type and log source.

Before you begin

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Select a source type in the **Source type name** column.
3. On the Source Type form, select the **Aggregated Log Patterns** related list.
   The tab shows the following data for each pattern that was extracted from this source type. The displayed data is updated every hour.

Aggregated Log Patterns

Column	Description
Pattern text	The content of the aggregated pattern.
Sources	The sources in which the pattern appeared.
Domain	The domain to which the pattern belongs.

Modify a data input configuration in Health Log Analytics

Change the configuration of a data input for Health Log Analytics by adding a new path to an existing data input configuration or modifying the data input's MID Server destination and port.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a record from the Data Inputs table.
3. Modify the data input configuration.

Column	Description
Name	Name of the data input.
Description	Description of the data input.
Port	The port on the MID Server. **Note:** The port must not be occupied by another process. Make sure that your organization's security team opens the selected port.
MID	The MID Server to which the logs stream.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	Note: ○ You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. ○ The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.

Settings

Column	Description
Path	The full path from which to stream logs. You can use a wildcard. **Note:** This column is not available on Windows systems using Winlogbeat.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example, Tomcat. Components typically represent CIs in the CMDB. Several components are often clustered together in a single service instance.
Source Type	The source type that defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types depending on the diversity of its log formats. Service instances and components can have any number of source types.
For handling multiline messages on Linux / Windows systems using Filebeat only:	
Match	Specifies how Filebeat combines matching lines into an event, either **after** or **before**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Negate	Boolean that defines whether the pattern identified in the log lines is negated. The default is **false**.
Regex	The regular expression to match.

Note:
You can modify the Rsyslog configuration file to make the agent ship system logs in addition to application logs. For more information, see the Shipping system logs using Rsyslog [KB0954507] article in the Now Support Knowledge Base.

4. Select **Update**.
5. For data inputs that use Rsyslog or Beats agents only, rebuild the server-side configuration file and install it on the endpoint device.
   a. Select **Rebuild configuration file**.

      Health Log Analytics rebuilds the file and saves it in the Manage Attachments section. Depending on the agent used, the rebuilt file is saved as either `rsyslog.yml`, `filebeat.yml`, or `winlogbeat.yml`.

      The system automatically renames the previous configuration file by adding a suffix with the date and time the file was rebuilt to the file name.

   b. Install the rebuilt configuration file on the endpoint according to your data input type.

Data input type	Action
Rsyslog	i. Download the file and install it on the endpoint device in the `/etc/rsyslog.d/rsyslog.conf` directory. ii. Validate the configuration by running the `rsyslogd -N1` command. iii. Verify the output. If it contains errors, check the `/var/log/messages` system log file for error messages and fix the errors. iv. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.
Linux	i. Download the file and install it on the endpoint device in the `/etc/filebeat/` directory. ii. Restart the agent service by running the `sudo service filebeat restart` command.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data input type	Action
	Note: The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.
Windows using Beats (Filebeat or Winlogbeat):	i. Download the file and install it on the endpoint device in the C : \Program Files\ directory. ii. Restart the agent service by running the appropriate command in PowerShell: ▪ Filebeat: `PS > Restart-Service filebeat` ▪ Winlogbeat: `PS > Restart-Service winlogbeat` **Note:** The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.

Related topics

Configure advanced settings for Rsyslog, Splunk, or TCP data inputs in Health Log Analytics manually

Configure advanced settings for Beats data inputs in Health Log Analytics manually

Advanced data input configuration in Health Log Analytics

When you have configured a data input successfully, Health Log Analytics adds a record to the Data Inputs table and attaches the configuration file to it. You can configure advanced settings for your data input. Configuring advanced settings is optional.

Configure advanced settings for Amazon CloudWatch data inputs in Health Log Analytics manually

Configure advanced settings for data inputs used for streaming log data from Amazon CloudWatch to your instance.

Before you begin

Role required: evt_mgmt_admin

About this task

You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open an Amazon CloudWatch data input record from the Data Inputs table.

   Note:
   If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced** and then select the **Advanced** tab.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.

   The **Character encoding** field is read-only. By default, the character encoding used for this data input is UTF-8.

5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve a log streaming issue in Health Log Analytics.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

   Note:
   You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Configure advanced settings for Amazon S3 data inputs in Health Log Analytics manually

Configure advanced settings for data inputs used for streaming log data from Amazon S3 buckets to your instance.

Before you begin

Role required: evt_mgmt_admin

About this task

You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open an Amazon S3 data input record from the Data Inputs table.

   Note:
   If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced** and then select the **Advanced** tab.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon S3 data input configuration fields.
5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve a log streaming issue in Health Log Analytics.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

Configure an Apache Kafka data input in Health Log Analytics manually

Configure advanced settings for Beats data inputs in Health Log Analytics manually

Configure advanced settings for data inputs that use Beats agents.

Before you begin
Role required: evt_mgmt_admin

About this task
You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

For information about how to change settings that were configured when the data input was created, such as adding a new path or changing the data input's MID Server destination or port, see Modify a data input configuration in Health Log Analytics.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a Beats data input record from the Data Inputs table.
   The data input configuration displays.

Note:
The number of log sources that the data input has created is shown in the **Sources count** field. For more information about data input sources, see Log data auto-mapping and mapping in Health Log Analytics.

Note:
If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced**.
4. On the form, fill in the fields.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

   Note:
   You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Stop or restart a data input in Health Log Analytics

You can stop using a data input for streaming log messages to your ServiceNow instance. Restart the data input if you want it to resume streaming data.

Before you begin

This functionality is available only when the data input configuration has been published.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Data Inputs**.
2. Open a data input record from the Data Inputs table.
3. Select **Stop Data Input**.
   The name of the button changes to **Start Data Input**.
4. To start using the data input again, select **Start Data Input**.

© 2025 ServiceNow, Inc. All rights reserved.

Edit raw log data before processing in Health Log Analytics

You can modify raw log data and drop or break up log messages before they are treated in the MID Server, and therefore before Health Log Analytics maps and structures them. For example, you could prevent sensitive data from reaching Health Log Analytics by replacing user names and passwords with an asterisk (*).

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input Preprocessor**.
2. Open a record.

   Note:
   The first time the preprocessing form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples manually by selecting **Refresh Samples**.

3. **Optional:** Prevent showing log samples that are taken from your organization's raw logs by selecting **Disable raw log samples**.
   Select this option if you don't want to expose your logs to Health Log Analytics.
4. **Optional:** View how the current JavaScript function affects the log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
5. In the **Raw input samples** field, choose a log sample that will show the effect of your new JavaScript function on log lines when you test it.
6. Define a JavaScript function that modifies your raw log data before Health Log Analytics maps and structures it.

   Note:

   (ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

   a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

      Note:
      In addition to the default JavaScript function for data preprocessing, Health Log Analytics provides a JavaScript function template named `Scrubbing`. This JavaScript function removes personally identifiable information such as email addresses, social security numbers, and passwords, from the raw log data. The template can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
(ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

JavaScript functions for preprocessing raw log data use the following objects:

- Signature: function process(sample, metadata)

Object	Description
sample	The current log sample.
metadata	Object that contains the event stream. To access the event stream, call the `metadata.eventStream` function. Because event stream is an object, you can access each of its properties by calling the `metadata.eventStream.origin` or `metadata.eventStream.LocalPort` functions. The list of available event stream properties is available in the **Event Stream: access via metadata** tab.

- Return type and structure

Note:
The JavaScript function returns a map of two entries. Do not change this return structure.

Object	Description
modifiedInput	The current log message after the JavaScript function has modified the original message. If null, the original log message is used.
splitEvents	Array of log messages after the JavaScript function has divided the original message.

- To discard a log message, call `return drop()`.

b. Test the JavaScript function by selecting **Test** and viewing the outcome on your log sample in related lists.

Tab	Description
Outcome	The result of running the JavaScript function on your log sample.
Event Stream: access via metadata	The key-value pairs that present the event stream metadata.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
Failures	The log samples on which the JavaScript function failed to run successfully.

Note:
If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. **Optional:** Make any necessary adjustments and then test the JavaScript function again.

7. Select the **Save template** option to save the JavaScript function.
   You can either save the JavaScript function as a new template or overwrite the currently selected template.
   - To save the JavaScript function as a new template, enter a new name in the **Template name** field.
   - To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.
8. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to pre-process your raw log data before mapping and structuring it.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next

Proceed to the **Data Input Mapping** page by selecting the **Go to Mapping** related link. Map raw data that streams into your instance to determine how Health Log Analytics processes it.

Log data auto-mapping and mapping in Health Log Analytics

By default, the HLA Engine tries to auto-map every incoming log line to the correct tags. You can change automatic mapping results manually by defining a JavaScript function.

Auto-mapping incoming log lines

Health Log Analytics auto-mapping assigns log samples and metadata to three tags: service instance, component, and source type. The service instance assignment is based on the service instance specified in the data input setup. The remaining tags are assigned automatically.

For example, in the following example log line, Health Log Analytics uses the "source" field to find the component and source type.

```
 ("pageUrl":\"http://www.acme.com","host":"abc3.prd.acme.com","@
version":"1","source":"/opt/oracle/weblogic/abc/online_store3/lo
gs/online_store3.out","offset":3951550786}
```

In the example, Health Log Analytics extracts the string "online_store". It analyzes the following fields if they exist in the log line: source, path, channel, namespace_name, name, pod_name, source_name, and aws_lambda_name. When data is sent over Syslog, it also analyzes the syslog tag.

Stop extraction of unneeded data

If an extracted string is not descriptive enough or contains redundant text or information, you can stop extracting such expendable data. For more information, see Stop extraction of unneeded log data in Health Log Analytics.

Ensuring extraction of specific data

You can make sure that Health Log Analytics extracts specific desired terms. For more information, see Extract specific log data in Health Log Analytics.

Mapping data input sources

You can change automatic mapping results manually by defining a JavaScript function. Data input mapping enables you to organize your log data by service instance and by availability zone. A single service instance can include multiple components, and a component can receive logs from many different source types. An service instance-component pair, however, is unique. Source types are based on a specific log structure and format. Service instances and components are defined more broadly and are therefore used mainly for logical mapping.

Activating **Test mode** avoids blowing up Elasticsearch storage with sample data that is used only for perfecting the log data mapping. When the data input is in Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow. It saves the streamed data in dedicated temporary Elasticsearch indices that appear as components in the Log viewer. When you publish the script and exit Test mode, these temporary indices are deleted to minimize storage space consumption.

When you're defining a JavaScript function, select **Test** to view the outcome of the script as it is currently specified. This functionality enables you to preview the created source types and sources. You can then refine the script until it achieves the desired outcome. For example, it can be useful to compare the test outcome of several versions of the JavaScript function.

Note:
By default, the test processes 100 log data samples. You can customize this number in the system properties. For more information, see Configure global Health Log Analytics system properties.

During the data input setup, the system might create an excessive total number of data input sources. For example, this can be due to a faulty mapping script. You can configure limits for the number of sources created per data input in the system properties:

System property	Description	Default
log_source.sources_warning_limit	The warning limit for the number of sources created per data input.	500
log_source.sources_critical_limit	The critical limit for the number of sources created per data input.	600

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The number of log sources that a specific data input has created displays in the **Sources count** field for that data input. When the total number of sources created during the data input setup reaches the warning limit, the system sends a warning notification by email. It also displays a message on the **Data Input mapping**, **Log sources**, and **Data input** pages. The notification and the message include the total number of sources created so far and the three data inputs that contributed the most sources to this total. If no action is taken, the system continues to create sources until the total number reaches the critical limit. When this happens, the data input setup and streaming from all data inputs stops automatically. You can't start data inputs again manually until the issue has been resolved. You can resolve this state by following the instructions in the How to handle too many sources in data inputs [KB0963067] article in the Now Support Knowledge Base.

Binding log data

Binding log data to Configuration Items (CIs) in the Configuration Management Database (CMDB) enables you to search the CMDB for endpoints that match a log. When you configure a data input, you bind log entries to a service instance that is bound to a CI in the CMDB. Binding log entries, service instances, and CIs enables the HLA Engine to correlate them for use in root cause analysis (RCA). For more information, see Configure a Rsyslog, Filebeat, or Winlogbeat data input in Health Log Analytics manually or Configure an Elasticsearch data input in Health Log Analytics manually.

Map raw log data in Health Log Analytics

Mapping raw log data that streams into your instance determines how the data is handled. Health Log Analytics automatically structures logs, creates metrics for anomaly detection, and presents alerts based on how your data is tagged.

Before you begin

Role required: evt_mgmt_admin

About this task

By default, Health Log Analytics tries to auto-map every incoming log line to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function.

In the JavaScript function, you are required to map only the service instance (here called application service). Mapping the component and the source type is optional: Health Log Analytics tries to extract their values from the log data automatically. If the attempt fails, it assigns the default values. If you map the component but not the source type or vice versa, the system tries to extract the missing value from the log data. If it fails, it assigns the component value to the source type or vice versa, depending on which one you have mapped. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Note:

(ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can manipulate raw log data before Health Log Analytics maps and structures it. For more information, see Edit raw log data before processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Open a record.

   Note:
   The first time the Data Input Mapping form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples by selecting **Refresh Samples**.

   Note:
   If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Data Input Mapping page. When this happens, contact ServiceNow support.

3. **Optional:** To forward the complete raw log message, disable automatic header properties detection for this data input by selecting **Disable header detection**.
   For more information, see Header properties detection in Health Log Analytics.
4. **Optional:** Activate Test mode by setting the **Test mode** value to ON.
   In Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow to avoid blowing up Elasticsearch storage with sample data. For more information, see Log data auto-mapping and mapping in Health Log Analytics.
5. **Optional:** View how the current JavaScript function affects log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
6. In the **Raw input sample** field, choose a log sample that will show the effect of your new JavaScript function on log lines when you test it.
7. **Optional:** Enable HLA to identify service instances and components from log fields and automatically map log data to them by selecting **Enable auto map from log field**.

   Note:
   - Automatic log context mapping can only be configured in the Service Operations Workspace. For more information about this feature, see Map logs to service instances and components for context in Health Log Analytics.
   - If a manually-defined mapping script exists, automatic log context mapping overwrites it.
   - To be able to define a JavaScript function manually in the current form, the **Enable auto map from log field** check box must be clear.

8. Define a JavaScript function that maps your data input sources to the correct service instance (here called application service), component, and source type.

   Note:
   (ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the JavaScript console, either modify the provided default JavaScript function or a custom JavaScript function selected from the **JS functions templates** drop-down list, or define a new JavaScript function.
The provided templates can act as a starting point for your custom script code. Available templates are:

- Default Mapping Script
- Glide Node Log Mapping Script
- Glide Sys Log Mapping Script
- Linux OS logs streamed with Syslog

> **Note:**
> Logs must have a syslog wrapper for this JavaScript function to work properly.

- Mid Server Log Mapping Script
- Windows - Winlogbeat logs streamed with Winlogbeat

The JavaScript function for mapping raw log data uses the following objects:

- Signature: function map(sample, metadata)

Object	Description
sample	The current log sample after preprocessing.
metadata	Object that contains: ▪ Event Stream: Access via: <metadata value>. For example: `metadata.eventStream.origin` ▪ Transform header 1: Access via: <metadata value>. For example: `metadata.headers.i1.type` ▪ Transform header 2: Access via: <metadata value>. For example: metadata.headers.i2.type ▪ type Transform header 3: Access via: <metadata value>. For example: `metadata.headers.i3.type` ▪ Fallback Assignment: Access via: <metadata value>. For example: `metadata.fallBacks.host`

> **Note:**
> You can create and associate multiple services per source type.

- Return type and structure

> **Note:**
> The JavaScript function returns a map of two entries. Do not change this return structure.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object	Description
applicationService	The existing application service (that is, the service instance) to which this sample will be assigned. **Note:** The service instance must be bound to anomaly alerts related to the log.
component	The component to which this sample will be assigned.
sourceType	The source type to which this sample will be assigned.

- To discard a log message, call `return drop()`.

b. Test the JavaScript function by selecting **Test**.

Testing the JavaScript function enables you to view the outcome of the script on the log sample. For a description of the displayed fields, see JavaScript function test outcome fields.

Note:
If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. Optional: Make any necessary adjustments and then test the JavaScript function again.

d. Optional: Compare the outcome of multiple tests.
Comparing the test results of several versions of the JavaScript function can help you refine the script until it achieves the desired outcome.

9. When you have finalized the JavaScript function, select **Save template** to save it.
You can either save the JavaScript function as a new template or overwrite the currently selected template.

- To save the JavaScript function as a new template, enter a new name in the **Template name** field.
- To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.

10. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to map data input sources.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next

- (Optional) Edit your raw log data before Health Log Analytics maps and structures it. If you want to perform this task immediately, click the **Go to Preprocessor** related link to proceed to the **Data Input Preprocessor** page.
- (Optional) Fine-tune how the system reads your log data by refining the Source Type structure. This step enables you to reclassify auto-classified properties and change auto-mapped labels.

Log data auto-mapping and mapping in Health Log Analytics

View the relationships between source types and log sources in Health Log Analytics

Header properties detection in Health Log Analytics

Stop extraction of unneeded log data in Health Log Analytics

Extract specific log data in Health Log Analytics

View the relationships between source types and log sources in Health Log Analytics

Explore the many-to-many relationships between source types and log sources to help you optimize your data input mapping.

Before you begin

Role required: evt_mgmt_admin

About this task

Health Log Analytics uses source types to parse logs and utilizes log sources as the framework for detecting anomalies. Each source type provides logs that are analyzed by multiple log sources, and each log source receives logs that are parsed by multiple source types. Reviewing the associations between source types and log sources can help you improve your data input mapping for better performance and outcomes.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Ensure that log data is streaming into your instance, and then open a data input mapping record.
3. View the associations between the log sources and the source types.
   - View the log sources that are associated with a source type:
     a. Open the **Source Types** tab to view the generated source type structures.
     b. Open a source type structure record.
     c. Select a source type.
     d. Under **Sources**, view all the log sources that receive data from this source type.
   - View the source types that are associated with a log source:
     a. Open the **Sources** tab to view the generated log sources.
     b. Select a log source record.
     c. On the **Source Types** tab, view all the source types that feed data into this log source.

Note:
The displayed results are updated once a day. Results that are older than 24 hours are deleted automatically.

Header properties detection in Health Log Analytics

In Health Log Analytics, automatic header properties detection separates the transport header from the inner log message and forwards only the inner log message to the source type structure. The inner message contains the actual log data without including shipping information.

The Health Log Analytics application supports header properties detection for Fluentd, Beats, and Syslog (RFC 3164, RFC 5424).

Starting with Version 33.0.27 - August 2024, the system also supports header properties detection for logs that follow the OpenTelemetry logs data model and semantic conventions. For more information, see the OpenTelemetry Logs Data Model documentation.

Disabling header properties detection

When you disable header properties detection for a data input, the Health Log Analytics AI Engine stops extracting properties from the header. Forwarding the complete raw message can be useful in the following situations:

- The inner log message lacks information for parsing, such as timestamp and severity.
- The data input contains information that can be used for structuring.
- The data input forwards the logs fully parsed.

For the procedure to disable header properties detection, see Map raw log data in Health Log Analytics.

Extract specific log data in Health Log Analytics

Set Health Log Analytics to extract specified terms from logs and map them to specific components.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Extracted values**.
2. Select **New**.
3. In the **Value to extract** field, enter the term that you want Health Log Analytics to extract from your logs.
4. In the **Map to component** field, enter the component that you want the value mapped to.
5. In the **Property** field, choose a property from the list.
6. **Optional:** Further specify the value to extract by selecting additional options:
   - Exact match
   - Case sensitive
7. **Optional:** In the **Description** field, add a description of the value.
8. Select **Submit**.

Stop extraction of unneeded log data in Health Log Analytics

If an extracted string of data is not descriptive enough or contains redundant text or information, you can set Health Log Analytics to stop extracting such data from your logs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Excluded values**.
2. Select **New**.
3. In the **Value to exclude** field, enter the string that you want Health Log Analytics to stop extracting.
4. **Optional:** Further specify the values to stop extracting by selecting additional options:
   - Starts with
   - Ends with
   - Contains
   - Case sensitive
5. **Optional:** In the **Description** field, add a description of the value.
6. Select **Submit**.

Source type structure adjustment in Health Log Analytics

Health Log Analytics enables you to reclassify auto-classified properties and change auto-mapped labels. These adjustments help Health Log Analytics machine learning to better understand your priorities.

Health Log Analytics automatically separates the transport header from the inner log message and sends the inner log message to the source type structure. It extracts properties from incoming log messages and auto-maps labels to source type fields.

Modifying the source type structure and classification is your chance to make sure that the HLA engine extracts all the properties properly and classifies them appropriately.

Note:
Because a single data input can contain more than one source type, the system structures log data by source type and not by data input.

For example, consider the following log:

```
{
  "TenantId": "abc-01-02-03-04-05050708091011121314",
  "@timestamp": "2020-08-28T08:29:23.967Z",
  "Computer": "john Doe_computer",
  "EventType_s": "LogMessage",
  "Job_s": "johnDoe_cell",
  "IP_s": "1.00.00.00",
  "message": "This is the extracted message. This part of the
 message includes superfluous content and values",
  "MessageType_s": "OUT",
  "Timestamp_d": 1598603359017850000,
  "Type": "my_LogMessage_is",
  "_ResourceId": ""
}
```

The sample code contains `"key":"value"` pairs. The key is the property name, and the value is the property value.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The key "message" has the following value: `"This is the extracted message. This part of the message includes superfluous content and values"`. If you wanted your logs to contain only the meaningful part of that message, you would add JavaScript code instructing the system to extract only that part.

```
//Added JavaScript to extract only the first sentence in the
 message! if (output['message'] != null){ output['message'] =
 output['message'].slice(0, output['message'].indexOf("\.")); }
 (edited)
```

You could use the same logic to reclassify a value. For example, if the key "Computer" is insignificant, you could set its value to "Invalid".

For more information about the source type structure, see the Source Type Structure – Labels & Classifications [KB0863562] article in the Now Support Knowledge Base.

Note:
You can reactivate the learning mode for a source type structure if you'd like to use the AI Engine's learning functionality again after the initial learning period has become outdated. On the **Source Type Structure** form, select **Relearn** to reset parsing, extraction, classification, and labeling for the source type structure and start the learning process anew.

Related topics

Refine the source type structure in Health Log Analytics

Refine the source type structure in Health Log Analytics

Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

Before you begin

To better understand the reasons for adjusting auto-classified properties and auto-mapped labels in the source type structure, see Source type structure adjustment in Health Log Analytics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Inputs** > **Source Type Structure**.
2. Open a record.

   Note:
   - By default, **Auto extraction** is selected to make Health Log Analytics automatically separate the transport header from the inner log message.
   - The first time the Source Type Structure form displays, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch the latest samples by selecting **Refresh Samples**.

3. **Optional:** View how the current JavaScript function affects the log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. In the **Key/Value Mapping** tab, note how the JavaScript function affects the log lines.
4. In the **Raw input sample** field, choose a log message.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you test your JavaScript function, Health Log Analytics uses this sample message to show the joint effect of automatic extraction and the JavaScript function on the log lines.

The following fields are read-only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Dropped	The total number of logs dropped in all the samples.
Errors	The total number of errors that occurred in all the samples.
Timestamp extraction failures	The number of timestamp extraction failures that occurred in all the samples.
Severity extraction failures	The total number of severity extraction failures that occurred in all the samples.
Message extraction failures	The total number of message extraction failures that occurred in all the samples.
Lengthy properties	The total number of lengthy properties in all the samples. Lengthy properties are properties with more than 256 characters. **Note:** Because Health Log Analytics doesn't extract such properties, they are not indexed as keywords in Elasticsearch.

5. Define a JavaScript function that customizes automatically extracted properties or adds properties to the source type structure.

   a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

   Note:
   In addition to the default JavaScript function, Health Log Analytics provides several JS function templates for refining the source type structure. The templates can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

JS function templates	Description
Extract Key_Values Using Regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. Depending on the log data being sent to the source type, it parses either the inner message or the full log line. You can view

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
	how the data appears in the samples that are loaded into the source type structure. This process is iterative; it is repeated until all key:value pairs are found.
Extract Key_Values Using split-regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. This process captures the values in a LIST form first, then uses the Java split function to create the key:value pairs. Depending on how the data appears in the raw input, this function might be more efficient than `Extract Key_Values Using Regex`. The raw input is either the inner message that header detection passes on, or the full raw log if header detection is disabled or doesn't work on that particular log.
JSON Parse - flatten	Script used for extracting JSON information that is part of another text string from the raw input. For example, the information could be a JSON request written as part of a longer inner message. Inner JSON sections are difficult to split. In such cases, this script can be used to "flatten" or parse out the key:value pairs.
Extract a new field from raw input	Script used for extracting a new field from the raw input by using a regular expression with capture groups to identify the pattern of the new field.
Parse XML format	Script used for extracting key:value pairs from the XML by using a regular expression to identify the XML format. This process is iterative; it is repeated until all key:value pairs are found.
Set numerical severity level as textual values	Script used for converting numerical severity values to their corresponding textual severity values. **Note:** To enable the system to correctly identify the severity level of a log, the severity must be given in text format. No numerical severity values should remain.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
Trim function	Script used for removing the double quotes that surround the string from VALUE. You can adapt this function to remove any other characters that surround the output VALUE of a key:value pair.

The JavaScript function for refining the source type structure uses the following objects:

Signature - function construct (sample, output)

Object	Description
sample	The inner message extracted from the sample message.
output	Object that contains the key-value pair map.

b. Test the JavaScript function by selecting **Test**.

c. View the outcome of the JavaScript function in the related lists and make changes if needed.

- The **Key/Value Mapping** tab shows the effect of your JavaScript function combined with the system's automatic extraction on your raw input sample.

  You can modify keys where appropriate.

  - The **Classification** field enables you to reset the classification of a property. The available types are:

Type	Description	Example
Meter	A property with this classification detects anomalies in the number of times the property appears in each log message. It presents changes in the quantity of this value as part of Automatic Root Cause analysis. **Note:** Properties classified as Meter consume resources.	Status codes, response codes, actions, or patterns
Gauge	A property with this classification detects anomalies in a numerical value that is reported continuously.	CPU, memory, or response time

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description	Example
	Note: Properties with a classification of Gauge consume resources.	
Timeless Gauge	A property with this classification detects anomalies in a numerical value that is not reported continuously. The system notifies about an anomaly in this value regardless when the anomaly occurred. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.	
Automatic Root Cause (ARC Only)	A property with this classification reports the property as part of the Automatic Root Cause analysis of another anomaly and not as an anomaly by itself.	User name, IP addresses, application components, or datacenter
Invalid	A property with this classification is not calculated or shown in the Automatic Root Cause analysis. **Note:** Properties classified as Invalid save resources.	

- The **Labels to assign** field enables you to set a property on a label.

Label	Description
Timestamp	The property that holds the timestamp of the event.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Description
	Note: If automatic header properties detection is enabled and the source type lacks a timestamp, the system extracts the timestamp from the transport header. If header detection is disabled or doesn't work for the relevant log lines in the data input, all log lines must have proper timestamps.
Severity	The property that represents the severity level of the log.
Message	The log message. The system uses this property to identify textual patterns in the data.
Host	The property that represents the host from which the event was sent. **Note:** If automatic header properties detection is enabled and the source type lacks a host, the system extracts the host from the transport header. If header detection is disabled or doesn't work for the relevant log lines in the data input, all log lines must have a host.
External ID	The property that serves as a unique identifier for this event type. For example, Event ID in Windows event log.

    - The **Rename key** field enables you to rename the key.
- The **Outcome Key-Value** tab shows how your JavaScript function processed the data.
- The **Data Input Mappings** tab shows the data input mappings for the current source type.

  The **Last event time** column on this tab shows the last date and time the AI engine processed a log for the data input mapping. The system refreshes this information every 5 minutes. Knowing when the last log was processed for this data input mapping makes it easier to verify that log data is streaming.

- The remaining tabs show errors, message extraction failures, severity extraction failures, timestamp extraction failures, and lengthy properties.

Note:
If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

d. Optional: Make any necessary adjustments and then test the JavaScript function again.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the **Save template** option to save the JavaScript function.
   You can either save the JavaScript function as a new template or overwrite the currently selected template.
   - To save the JavaScript function as a new template, enter a new name in the **Template name** field.
   - To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.
7. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to fine-tune how it reads your inner log messages and detects anomalies.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

What to do next

Continue with the remaining data input setup tasks: Verify that all your log sources are present and active, and add timestamp formats if necessary.

Health Log Analytics content packs for quicker time to value

Shorten onboarding time for the Health Log Analytics application by installing content packs. The packs contain default source types and mapping script templates that save you the time it takes to create them from scratch.

After installing a content pack, Health Log Analytics begins to stream and parse your log data immediately. The application recognizes and analyzes the data, generates more relevant alerts, and reduces noise from the moment of the integration. You can still customize the mapping configuration later on, if needed.

You can integrate content packs in two different ways:

- Select a content pack when you're configuring a data input. Health Log Analytics activates the selected pack automatically and uses its mapping script for mapping the data input sources.
- Activate a content pack before you configure a data input. When you have configured the data input and you're mapping the raw log data, select the content pack's mapping script from the **Data Input Mapping** form.

Currently, a content pack is available for streaming logs from Linux using Filebeat.

> **Note:**
> All configurations in content packs exist in the global domain. If you're using domain separation, the content pack content is only available for logs in the global domain.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

Activate a content pack in Health Log Analytics

You can activate a content pack before configuring a data input.

Before you begin

For an overview of this feature, see Health Log Analytics content packs for quicker time to value.

Role required: evt_mgmt_admin

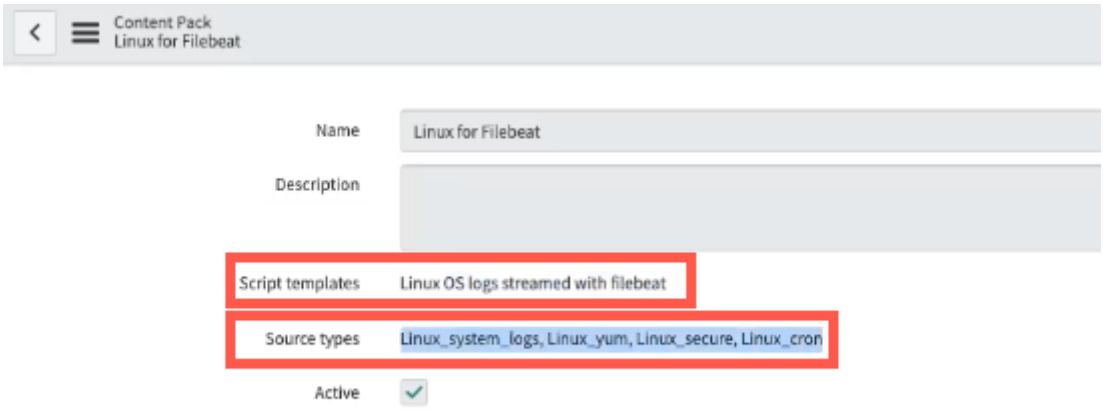
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Content Packs**.
2. Open the appropriate content pack for your data input.

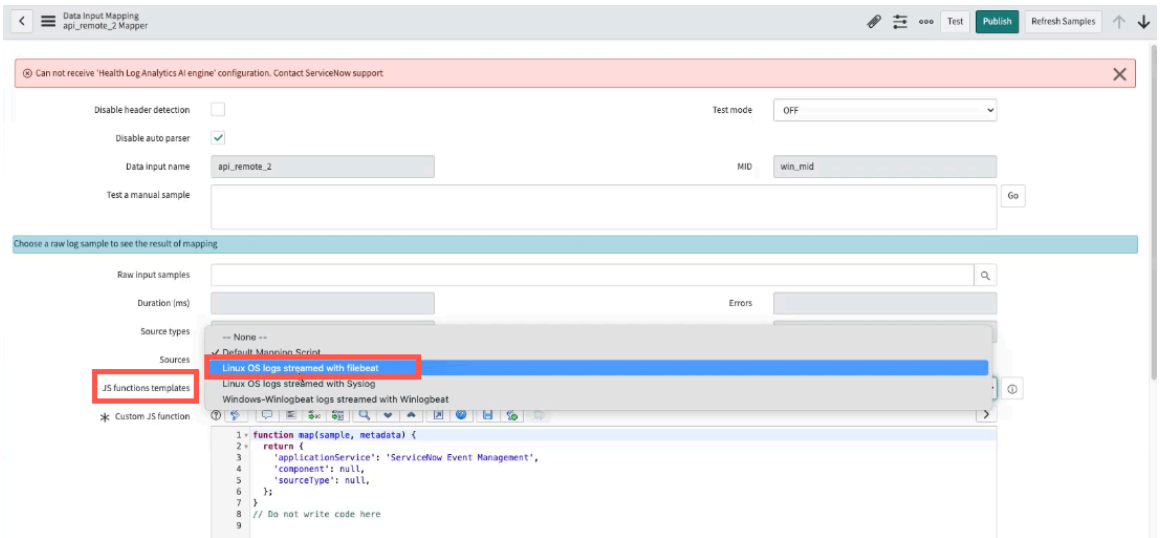
> **Note:**
> Currently, a content pack is available for streaming logs from Linux using Filebeat.

3. On the **Content Pack** form, select **Activate**.
   The **Active** check-box appears selected. The activated content pack displays the script templates and source types that are associated with it.



> **Note:**
> The source types included in the content pack may already exist on your ServiceNow instance. In this case, Health Log Analytics automatically renames the content pack source types by adding a content pack suffix to their name. If you want to use the content pack source types and their mapping, delete or rename the original source types and then remove the suffix from the content pack source types. Otherwise, Health Log Analytics uses the original source types.

On the **Data Input Mapping** form, the mapping script is listed as a JavaScript functions template option.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

When you have configured the data input and you're mapping your raw log data, you can select the content pack's mapping script from the **JS functions templates** drop-down.

Migrating a Health Log Analytics data input configuration between instances

Export a Health Log Analytics data input and source types configuration as an update set and import it to a different ServiceNow instance. In the target environment, you can use the migrated data input for streaming and processing log data. This functionality saves time and reduces possible errors by avoiding the need to configure the settings again on the target instance.

The migrated configuration includes mapping and all other relevant settings, except credentials. Depending on the data input that you're exporting, you may need to configure credentials in the target environment. For example, when exporting Amazon CloudWatch or Amazon S3 data inputs, you must configure Amazon Web Services (AWS) credentials.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

Starting with Health Log Analytics Version - December 2025, you can also export all source types related to one or more selected log sources to the update set together. For more information, see

For general information about update sets in the ServiceNow AI Platform, see System update sets.

Export a Health Log Analytics data input configuration

Export the configuration of a Health Log Analytics data input with or without the related source types to an update set. You can then import the update set to the target environment.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

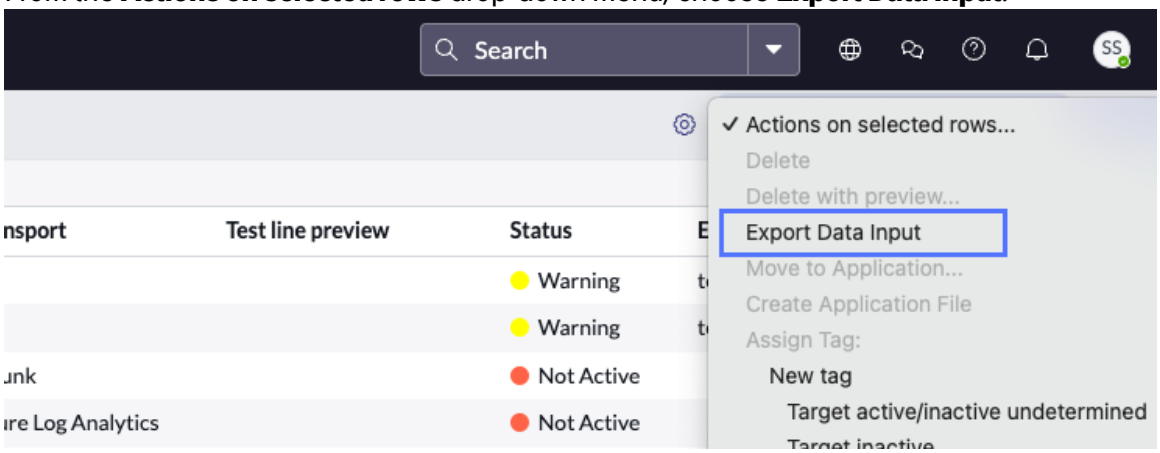
Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. In the Data Inputs list, select the data input that you want to export.
3. Export the data input to an update set.

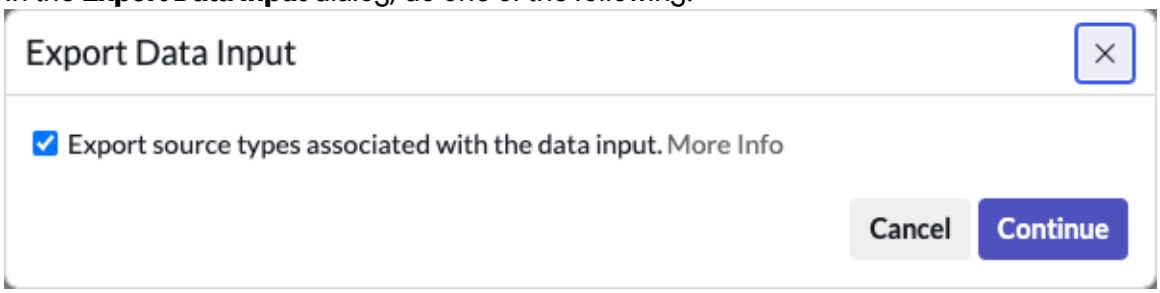
Note:
The exported configuration doesn't include the service instance configured for the data input.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the **Actions on selected rows** drop-down menu, choose **Export Data Input**.



b. In the **Export Data Input** dialog, do one of the following:



- Leave the check box selected to include the source types that are associated with the data input in the update set.

  When the box is selected, the update set will include the following source type-related tables:

  - sn_occ_source_type
  - sn_occ_source_type_structure
  - sn_occ_sources
  - sn_occ_timestamp_formats
  - sn_occ_lexical_keywords
  - sn_occ_log_correlator
  - sn_occ_log_source_retention
  - sn_occ_quick_replacements
  - sn_occ_reconstructors
  - sn_occ_replacements
- Clear the box to export the data input without the associated source types. For example, if you want to reuse the data input configuration, but configure the source types from scratch.

  When the box is clear, the update set will not include the source type-related tables.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can export source types separately. For more information, see Export source types to an update set in Health Log Analytics.

c. Select **Continue**.

The data input, with or without the source types, is exported to an update set.

Note:
An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
The update set is downloaded as an XML file.

What to do next
Import the update set to the required ServiceNow instance. For more information, see Import a Health Log Analytics data input to a target instance.

Import a Health Log Analytics data input to a target instance

Import a data input configuration that you've exported from another instance as an update set.

Before you begin
For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Before performing this procedure, export the data input to an update set. For more information, see Export a Health Log Analytics data input configuration.

Role required: admin

Procedure
1. On the target instance, import the update set that contains the data input configuration.

   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.

   b. In the Related Links, select **Import Update Set from XML**.

   c. Select **Choose file** and open the update set XML file from the Downloads folder.

   d. Select **Upload**.
   The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.

2. Identify and address errors in the update set.

   a. In the **Retrieved Update Sets** list, open the update set record.

   b. Select **Preview Update Set Batch** to detect errors.
   The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.

   c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list.

   For more information, see Preview a remote update set.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can ignore errors that start with 'Could not find a record in [table]' for the following tables:

- aws_credentials
- azure_sas_credentials
- azure_service_principal
- basic_auth_credentials
- cmdb_ci_service_auto - Service instance
- ecc_agent - MID
- ecc_agent_cluster - MID Server Cluster
- kafka_ssl_credentials
- sn_occ_data_input_preprocess_example
- sn_occ_data_input_preprocess_example_row
- sn_occ_gcp_credentials
- sn_occ_mapper_example
- sn_occ_source_type_examples
- sn_occ_source_type_structure_data

d. Select the errors that you ignored and then select the **Select All** check box.

e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.

f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.

3. When all errors in the update set have been resolved, select **Commit Update Set Batch**. The imported data input appears on the Data Inputs list. The import includes mapping settings and all other relevant configuration.
4. In the imported data input, configure the following.
   - The MID Server to which the logs stream.
   - Credentials.

     Note:
     Whether you need to configure credentials depends on the data input that you've imported. For example, you must configure Amazon Web Services (AWS) credentials for Amazon CloudWatch and Amazon S3 data inputs.

   - (Optional) The service instance to which to bind the log data.

   For more information, see the configuration documentation for the relevant data input: Set up data inputs in Health Log Analytics manually.

Result
You can begin using the data input for streaming and processing log data.

Export source types to an update set in Health Log Analytics

Export source types to an update set separate from the Health Log Analytics data input configuration. You can then import the update set to the target environment.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Source Types**.
2. In the Source Types list, select one or more source types that you want to export.
3. From the **Actions on selected rows** drop-down menu, choose **Export Source Types**.
   The source types are exported to an update set.

   Note:
   An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import Health Log Analytics source types to a target instance.

Export source types to an update set by log source in Health Log Analytics

Export all source types related to one or more selected log sources to an update set together. You can then import the update set to the target environment.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. In the Log Sources list, select one or more log sources for which you want to export the related source types.
3. From the **Actions on selected rows** drop-down menu, choose **Export Related Source Types**.
   The source types are exported to an update set.

   Note:
   An update set can act as the parent for multiple child update sets.

4. In the **Related Source Type Exporter** screen, select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import Health Log Analytics source types to a target instance.

Note:
Only the related source types and tables for the selected log sources will be imported, not the data inputs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import Health Log Analytics source types to a target instance

Import source types that you've exported separate from the Health Log Analytics data input configuration.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Before performing this procedure, export the source types to an update set. For more information, see Export source types to an update set in Health Log Analytics.

Role required: admin

Procedure

1. On the target instance, import the update set that contains the source types.
   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.
   b. In the Related Links, select **Import Update Set from XML**.
   c. Select **Choose file** and open the update set XML file from the Downloads folder.
   d. Select **Upload**.
   The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.
2. Identify and address any errors in the update set.
   a. In the **Retrieved Update Sets** list, open the update set record.
   b. Select **Preview Update Set Batch** to detect errors in the update set.
   The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.
   c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list.
   You can ignore errors that start with 'Could not find a record in [table]' for the following tables:
   d. Select the errors that you ignored and then select the **Select All** check box.
   e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.
   f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.
3. When all errors in the update set have been resolved, select **Commit Update Set Batch**.

Result

The imported source types appear in the Source Types list.

Check gRPC and network connectivity for Health Log Analytics on the MID Server

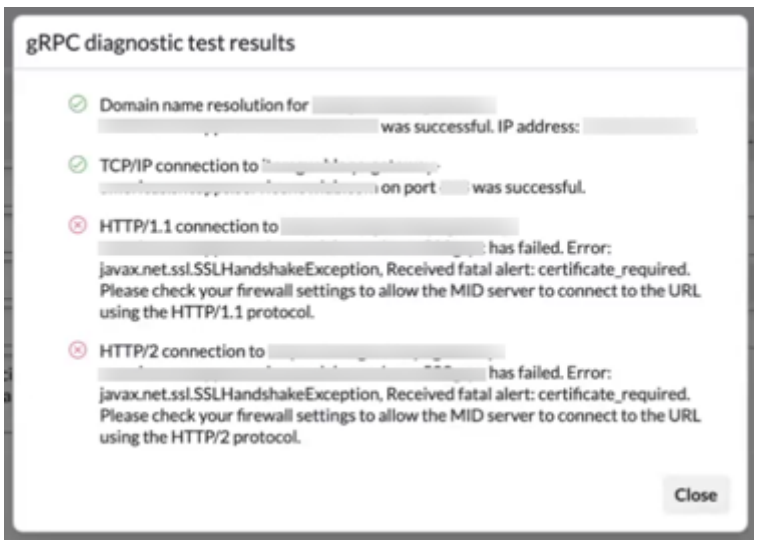
Verify that Health Log Analytics can function properly by performing diagnostic tests on the MID Server to check gRPC and network connectivity.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
Your organization's network and security configuration may be keeping Health Log Analytics from functioning properly. For example, complex configurations with proxy and firewall settings might block outbound connections. To avoid operational issues, you can test gRPC and network connectivity on the MID Server.

Procedure
1. Navigate to **All** > **MID Servers** > **Servers**.
2. Open the relevant MID Server record.
3. Under Related Links, select **Test gRPC connection**.
   The system performs gRPC connectivity tests, such as domain name resolution, TCP/IP, and HTTP connection. When the testing is complete, the test results are displayed. Successful tests are preceded by a green check-mark, while failed tests are preceded by a red x mark.



4. Fix the issues that caused any tests to fail by following the instructions on the **gRPC diagnostic test results** screen.
5. Select **Test gRPC connection** again and confirm that all the tests are completed successfully.

Administering Health Log Analytics

This section covers tasks involved in Health Log Analytics administration. It provides you with information needed to keep Health Log Analytics running efficiently.

Configure Health Log Analytics system properties for a single log source

Configure system properties for a specific log source if you need to alter the default values, which should not usually be necessary.

Before you begin
Role required: evt_mgmt_admin

About this task
Changing Health Log Analytics system properties affects back-end processes and can produce unexpected results. Therefore, if you need to make changes to these properties, keep a record of your adjustments. For example, note the value before and after a modification and the time of the change.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
2. On the **Source properties** tab, right-click a property.
3. Select **Override property value** from the pop-up menu.
4. In the **Value** field, enter the appropriate value.
5. Select **Submit**.

Result
The new value overrides the previous setting for the selected log source.

Related topics

Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties if you need to alter the default values, which should not usually be necessary.

Before you begin
Role required: evt_mgmt_admin

About this task
Changing Health Log Analytics system properties affects back-end processes and can produce unexpected results. Therefore, if you need to make changes to these properties, keep a record of your adjustments. For example, note the value before and after a modification and the time of the change.

Note:
To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **System Properties**.
2. Select a property with the scope Source.
3. In the **Value** field, enter the appropriate value.
4. Select **Update**.
   The setting will apply to log sources created from this point forward.
5. Determine the scope of application of the new setting.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To apply the setting only to log sources created from this point forward, select **Update**.
- To override values for this property in all existing log sources and apply the modified setting to all new log sources, select **Override source property**.

Related topics

Configure Health Log Analytics system properties for a single log source

Enable or disable Health Log Analytics system features

Customize the basic configuration of Health Log Analytics by enabling or disabling system features.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Features**.
   By default, the table shows the system features that administrators modify most commonly. To view the complete list of features, use the filtering options.
2. Select a feature record from the table.
   The record contains the following information:
   - The name of the feature
   - A description of the feature's purpose
   - The default state of the feature
   - The current state of the feature
3. Set the state of a system feature to ON to enable the feature or to OFF to disable it.
4. Select **Update**.

Health Log Analytics alert notification in Slack or Microsoft Teams channels

Health Log Analytics sends notifications for new anomaly alerts in real time to Slack or Microsoft Teams channels. This built-in functionality frees you from having to continuously monitor logs to prevent incidents.

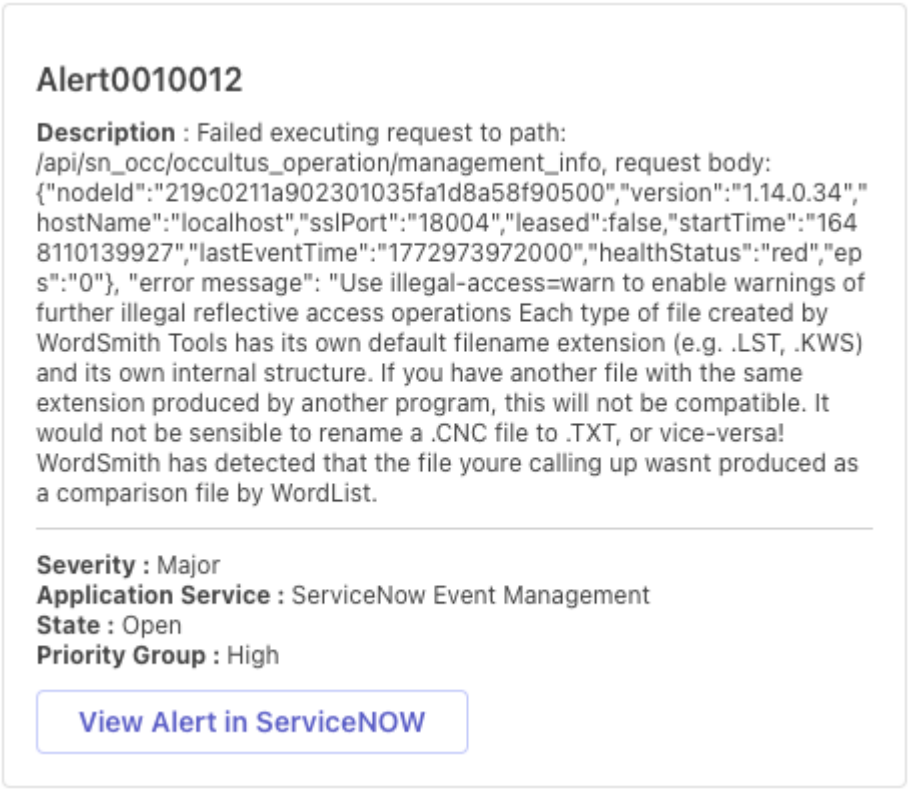
The notifications include the number of the alert, its description, severity, configuration item, state, and priority group. You can filter the alerts for which notifications are sent to your channel. For example, you may only want to receive alerts of a Major severity or a High priority group. By default, no notifications are sent on secondary alerts.

To support channel notification, the channel must be configured to receive Health Log Analytics notifications.

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. The application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure in Set up Health Log Analytics alert notifications in channels. Otherwise, see Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample HLA alert notification in Microsoft Teams



Set up Health Log Analytics alert notifications in channels

Set up notifications for new Health Log Analytics anomaly alerts in either a Slack or Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications for new anomaly alerts. The new application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure below. Otherwise, refer to Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

Note:
If you upgrade from an earlier version to Version 33.0.27 - August 2024 or later, redo the setup using the procedure in Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

For alert notifications in Slack channels, verify that the plugin Slack Webhooks Spoke for ServiceNow Integration Hub (com.sn.slack.ah) is installed:

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

Role required: evt_mgmt_operator or evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a Webhook URL for a channel in Slack or Microsoft Teams.

   Health Log Analytics uses the Webhook to notify about the alerts in the channel.

   Perform the appropriate procedure:

   - Create a Webhook URL for a channel in Slack
   - Create a Webhook URL for a channel in Microsoft Teams

2. Map the Webhook URL for the channel to the service instance associated with the alert.

   a. Navigate to **Health Log Analytics Administration** > **Webhook Notification**.

   b. Select **New**.

   c. On the form, fill in the fields.

   Alert Notification Webhook form

Field	Description
Webhook	The Webhook URL that you created for the channel.
Active	Select to activate the Webhook.
Configuration item	The service instance associated with the alert. If this field is empty, the system uses the default property for the channel: default.slack.webhook.url for Slack or default.teams.webhook.url for Microsoft Teams.

   d. Select **Submit**.

3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the appropriate channel.

   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.

   b. Locate the appropriate rule:

   - For Slack: Submit HLA alerts to slack.
   - For Microsoft Teams: Submit HLA alerts to teams.

   c. In the **Active** column for the rule, set the value to `true`.

4. **Optional:** Filter the alerts on which notifications will be sent to the channel.

   a. In the Alert Management Rules table, select the rule for your channel.

   b. Select **Alert Filter**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the form, set the conditions that must be met for sending a notification on the alert to the channel.

d. Select **Update**.

Set up Health Log Analytics alert notifications in a Microsoft Teams channel

Set up notifications for new Health Log Analytics anomaly alerts in a Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. For more information, see . If you're using an HLA version earlier than 33.0.27, refer to the setup procedure in Set up Health Log Analytics alert notifications in channels.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Install the latest version of the Microsoft Teams Graph spoke from the ServiceNow Store.
2. Set up the Microsoft Teams Graph spoke.
   For instructions, see: .
3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the Microsoft Teams channel.
   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
   b. Locate the appropriate rule: Submit HLA alerts to teams.
   c. In the **Active** column for the rule, set the value to `true`.
4. Map the service instance to the Microsoft Teams channel.
   a. In the **All** navigation menu, type `sn_occ_teams_alert_notification_config` and then press Enter.
   b. Select **New**.
   c. On the form, fill in the fields.

      Note:

      - You can obtain the Teams ID and Channel ID from the Microsoft Teams channel.
      - The **Configuration Item** field must correspond to the Service instance. If no CI is needed, leave this field empty. In this case, the record is used for alerts when there's no record that matches their CI.

   d. Select **Submit**.
   e. **Optional:** Repeat steps 1 to 4 to add additional configurations.

Storage space for log retention in Health Log Analytics

The Health Log Analytics base system typically provides 1,000 GB storage space for log source retention, although the storage capacity may vary depending on your license. The default retention time for logs is three days, but you can modify that period.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

When the storage space used by all log sources exceeds 80 percent of the total, you receive an email notification. You can change the default threshold percentage by modifying the *sn_occ.elastic_storage.utilization_limit.percent* system property in the System Properties table.

Automatic reduction of log retention days

By default, logs are retained for three days. You can adjust this period to 3, 7, 14, or 30 days. For more information, see Modify the log source retention period in Health Log Analytics.

If the storage space used by all log sources reaches 100 percent, the number of retention days allocated per source is automatically lowered by one level and you receive an email notification with the specifics. The automatic reduction process starts with the sources that were allocated the highest number of retention days. For example, for a source with 30 retention days, the number is reduced to 14. If the source has 14 retention days, the number is reduced to 7, and so on.

You can change the threshold percentage for the automatic reduction of log retention days by modifying the *sn_occ.log_retention.automatic_reduction_utilization_percent* system property in the System Properties table.

Related topics

Modify the log source retention period in Health Log Analytics

Modify the log source retention period in Health Log Analytics

Modify the period that Health Log Analytics retains logs from a specific source. You can calculate the impact of your intended change on storage to help you make an informed decision.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

To display **Log source retention** in the filter navigator:

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Enter the property name *sn_occ.activate_log_source_retention* in the Search box.
3. Ensure that the property value is set to **true**.

Role required: evt_mgmt_admin

About this task

By default, the log retention duration per source is set to three days. You can change this number to 7, 14, or 30 days. For more information, see Storage space for log retention in Health Log Analytics. Note that longer log retention results in higher storage usage.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log source retention**.
2. **Optional:** Calculate how changing the retention period for logs from a particular source affects storage.
   a. Open a log source record.
   b. In the Related Links section, select **Calculate how retention impacts storage**.
   c. From the New retention list, select the proposed number of retention days for logs from this source.
   d. Select **Calculate**.
   The **Projected storage usage (GB)** field displays the amount of storage space in GB that the source would use if the new policy were implemented.

   Note:
   Health Log Analytics bases its calculation of projected storage usage on the volume of log data that was streamed in the past. The estimate could change as the volume of streamed log data varies.

   e. Compare the projected usage to the amount of storage needed for the current policy that is shown in the **Current storage usage (GB)** field.
   f. Select **Cancel** to close the dialog box.
3. Update the log retention policy per source or for several sources together.
   - To update log retention for a single source:
     a. Open a log source record.
     b. From the Retention days list, select the required number of retention days for logs from this source.
     c. Select **Update**.
   - To update log retention for multiple sources:
     a. Select several log source records.
     b. From the Actions on selected rows choice list, select **Update multiple source retentions**.
     c. From the New retention policy list, select the required number of retention days for logs from the selected sources.
     d. Select **Update**.

   The updated policy takes effect in up to 15 minutes.
4. **Optional:** Restore the default log retention policy per source or for all log sources.
   - To restore the default policy for a single source:
     a. Open a log source record from the table.
     b. In the Related Links section of the record, select **Restore default**.

     The log retention policy for this log source reverts to the default value of three days.
   - To restore the default policy for all sources:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Related Links section, select **Restore defaults**.

b. In the confirmation dialog, select **Continue**.

The log retention policy for all log sources reverts to the default value of three days.

Scaling Health Log Analytics to stream logs at a higher rate

Stream log data to Health Log Analytics in a scalable, more stable way using the advanced ServiceNow infrastructure.

The new ServiceNow architecture leverages queueing technology in IT Operations Management Cloud Services for authentication and log ingestion. The Health Log Analytics AI engine has been enhanced to scale dynamically in response to increased log ingestion by your organization. Health Log Analytics can be scaled to support more than 50,000 events per second (EPS) or more than 10,000 subscription units (SUs).

You can switch to the advanced ServiceNow infrastructure by submitting a scaling request through the Now Support catalog. For more information, see Submit a Health Log Analytics scale request through the Now Support catalog. You can also contact your ServiceNow account manager to request scaling. When your scaling request is approved, ServiceNow provisions the number of Elasticsearch and HLA AI Engine nodes required to support your subscription units.

Submit a Health Log Analytics scale request through the Now Support catalog

Request Health Log Analytics scaling to support streaming logs at a higher rate.

Before you begin
Role required: None

About this task
This procedure explains how to submit a scaling request through the Now Support catalog. You can also contact your ServiceNow account manager to request Health Log Analytics scaling.

Procedure

1. On Now Support, navigate to **All** > **Service Catalog** .
2. In the Request scale dialog, select the appropriate option:
   - Install the Health Log Analytics Prime app from the ServiceNow Store.

     When the app is installed, the additional services for supporting your request can use shared resources in other datacenters besides the one hosting your ServiceNow instance. This ability enables better resource allocation for supporting your current and future requests.

     Note:
     To install the Health Log Analytics Prime app, you must accept its terms and conditions.

   - Request scale without installing the Health Log Analytics Prime app.

     When you select this option, the additional resources for supporting your request reside in the same datacenter as your instance. You may experience some limitations in terms of capacity.
3. Fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request scale fields

Field	Description
Select instance	The name of your ServiceNow instance.
Number of subscription units	The number of subscription units Health Log Analytics must support.

4. Select **Submit**.
   Your scale request is submitted. When it's approved, ServiceNow notifies you by email.

Enhancing the CMDB with host data Health Log Analytics found in logs

When Health Log Analytics streams logs, it extracts host data from the log events. If host data is discovered that doesn't match the information in the Configuration Management Database (CMDB), the system creates a configuration item (CI) candidate for you to review based on the data it found in the logs.

After reviewing a CI candidate, you can choose to either add it to the CMDB or dismiss it as irrelevant. The **Log-Based CI Candidates** table lists all CI candidates that Health Log Analytics has created, sorted by system update time. The **Operation** column shows the suggested action to take on each CI candidate. You are automatically notified when there are new CI candidates for your consideration. For more information, see Add log-based CIs to the CMDB in Health Log Analytics.

For a description of the related system properties, see the "logsourceinfo (CMDB)" section in the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Add log-based CIs to the CMDB in Health Log Analytics

Keep the Configuration Management Database (CMDB) updated with host data Health Log Analytics discovered in your logs by adding log-based configuration items (CIs) to the database.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Log-Based CI Candidates**.
2. Handle a single CI candidate or multiple CI candidates together.

Analyzing and resolving Log Analytics alerts

Analyze and resolve Log Analytics alerts by investigating log data and taking action to resolve the underlying issue.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of analyzing and resolving a Log Analytics alert

As an Operator, you are responsible for analyzing and resolving the alerts that Health Log Analytics generates. When HLA creates an alert, you review the alert's severity, the affected Configuration Item (CI), the log data associated with the anomaly, and the impacted services. You try to identify the root cause by investigating the logs that surround the anomaly.

In the Express List, review alert details and use Now Assist to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. By drilling down into the alert, you can quickly identify the issue and proceed to resolve it before it affects your users.

Using the Log Viewer, you can browse the alert logs by timestamp or range for further investigation. You can visualize the frequency of anomalous log lines in a chart.

- Start remediation of a Log Analytics alert from the Overview tab

  Begin the remediation process of a Log Analytics alert from the alert **Overview** tab. This tab provides information on the alert, log data associated with the anomalous behavior, CIs associated with the alert, and services impacted by it.

- Analyze the logs that surround the anomaly

  Review the log lines surrounding the anomaly for clues about the state of faulting systems. This information can help you narrow down the root cause of the alert.

- Use log correlators to identify relationships in log data

  Identify relationships between alerts to help you determine whether an alert is part of a larger issue.

- Navigate to the Express List and select an alert from the Alerts list.

  Use Now Assist to get an in-depth analysis of the alert and potential resolutions. By drilling down into the alert, you can quickly identify the issue and proceed to resolve it.

- Review the logs for an alert on the Log viewer

  For further investigation you can navigate to the **Log Viewer** to browse the alert logs by timestamp or time range, and visualize anomaly frequency within a time period for a comprehensive view of log data over a specified time range.

- Add a KB article to a Log Analytics alert

  When you have resolved an alert that Health Log Analytics generated, you can add a knowledge base (KB) article to it. For example, provide information that might help others resolve similar issues.

Use cases

Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics - Use Health Log Analytics to detect and resolve emerging issues in your organization's ServiceNow instance before they affect platform users.

Start remediation of a Log Analytics alert from the Overview tab

Begin the remediation process of a Log Analytics alert from the alert **Overview** tab. This tab provides information on the alert, the log data associated with the anomalous behavior, CIs associated with the alert, and services impacted by it.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace.

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the Service Operations Workspace, select the lists icon ( ).
3. Select the appropriate list in the Alerts sub-list and navigate to the relevant alert or group.

   All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the type of Log Analytics alert. See Types of Health Log Analytics alerts for a more detailed description of each type of alert or group.

   Tip:
   To preview an alert in the list, click its info icon ( ).

4. Select the alert number.

   The **Overview** tab displays.

5. View the section of the **Overview** tab that provides the information that you need.

   For a description of the sections and cards, see Sections and cards on the alert Overview tab in Health Log Analytics.

   Note:
   Because some sections on the **Overview** tab show only a portion of the information, many sections include a link that displays different or more complete information.

6. **Optional:** Run predefined remediation tasks to resolve alert issues.
   a. Select **Launch playbook**.
   b. Select the **Playbook** tab.

      The **Run remediation** card displays the available remediation actions.

   c. Select the tile corresponding to the action you want to run.
   When the action is complete, it appears in the **Completed** card.

Analyzing the logs around an anomaly to help find the alert's root cause

When Health Log Analytics identifies an anomaly, viewing the logs that surround the anomaly provides clues about the state of faulting systems. This information can help you narrow down the root cause of an alert.

While viewing a Log Analytics alert, the **Surrounding logs** tab lists the log lines that were generated one minute before and one second after the anomaly occurred. The log lines are related to the metric or pattern that triggered the alert. The list is filtered to the relevant component.

Logs generated immediately before the anomaly might point to warning signs or conditions that led to the issue. By reviewing these logs, you can trace the sequence of events that led to the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

anomaly, helping you understand what went wrong. Logs created right after the anomaly can help you evaluate the impact of the event by analyzing how the system responded and whether other components were affected. The timeline of the logs around the anomaly can help clarify what might have caused the issue, for example a configuration change or a software update.

You can modify the time range of the displayed log lines, for example to investigate logs from more than one minute before the anomaly, or more than a second afterward.

Note:
Logs that surround the anomaly are retained and available for 30 days after the creation of the alert. The system does not delete these logs when the global retention period of logs expires. When the retention period expires, the surrounding logs are available only on the **Surrounding logs** tab and not in the Log viewer.

Health Log Analytics enables you to view the anomalous log data graphically on the Log viewer, accessed from the Service Operations Workspace. The Log viewer displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log lines. It automatically shows the query that relates to the anomaly, the selected component, and the appropriate time filter. For more information, see Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics.

Related topics

Analyze log lines around the anomaly to help find the root cause

View the log lines around an anomaly to help you identify the root cause of a Log Analytics alert.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Important:
From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Analyze log lines that surround an anomaly in Health Log Analytics.

Identifying related alerts in log data by using log correlators

Log correlators are keys or values in log data that detect correlations between alerts to help you determine whether an alert is part of a larger issue. For example, a log correlator could detect when the interface ID of a particular network device occurs simultaneously in multiple warnings across different service instances.

You can identify related alerts in your log data by using log correlators. The base system includes several log correlators, and you can define custom correlators for a specific log source, all log sources, or only log sources created after the correlator is activated.

Most log lines include a metadata portion plus a message portion. Some log lines, however, include only message text with metadata included in the text. The two types of log correlators, free text correlators and log property correlators, analyze the different portions of each log to identify relationships between log data from multiple log sources.

Free text correlators

Free text correlators analyze the text within the log message portion of log lines that are associated with an anomaly. The system uses free text correlators to identify correlations between alerts. You use free text correlators to add a term that you expect to appear within log messages. A good choice is a term that is not structured

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and would not otherwise be extracted as a log property. For example, “policy-id” or “thread-id”.

You also typically add free text correlators for the names of systems, applications, and services that are unique to your environment. Because such a value can be referred to by multiple sources, layers, middleware, or databases, the free text correlator can be an effective detector of correlated alerts. For example, if your organization's service is called TeaTime, then you might add "teatime" as a free text correlator. The correlator would identify alerts that are related because they were generated for resources that support the TeaTime service, such as a database lock or a connection failure between TeaTime components.

Log property correlators

Log property correlators analyze the metadata portion of log lines. For example, the correlator can analyze the name of a service instance, the interface ID of a network device, or the request ID of a web-facing component. A log property correlator could flag a correlation when the interface ID of a network device simultaneously occurs in multiple warnings in different log sources. Log property correlators are specific to the business context of your environment.

You can specify the set of log sources whose log data are analyzed by a log correlator. Choices are as follows:

- **Only new sources**: The system applies the log correlator only to log lines from log sources that were created after this log correlator is activated.
- **All sources**: The system applies the log correlator to log lines from all log sources.
- **Specified source**: For a log correlator, the system analyzes only log lines from the log source that you specify.

Add a log correlator to identify relationships between alerts in log data

Detect related alerts in log data by adding log correlators. The base system includes several log correlators and you can define custom log correlators.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

For information about the types and functions of log correlators, see Identifying related alerts in log data by using log correlators.

Procedure

1. Use one of the following methods to add a log correlator.
2. Fill in the Log correlator form.
   For a description of the fields, see Log correlators form fields.
3. Select **Active** and then click **Submit**.

Exclude a source from a log correlator

Prevent the system from analyzing log lines from a specific source by excluding that source from the log correlator.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Health Log Analytics** > **Data Input** > **Log Sources**.
2. Open the relevant source on the Log Sources form.
3. On the **Log Correlators** tab, select the option for the log correlator.
4. In the Actions on selected items list, select **Exclude from this source**.

Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics

The **Log Viewer** tab lets you browse the logs for an alert by timestamp or time range, and visualize anomaly frequency within a specific time period. Customizing the displayed data and adjusting time filters enables you to better understand the framework in which the anomaly occurred, helping you find the root cause faster.

The Log Viewer presents all data connected with the Log Analytics alert. It shows the query that relates to the anomaly, the selected component, and the appropriate time filter. You can personalize the displayed data, and manually adjust the time range without affecting the other settings. The applied filters appear in the **Filters** pane. You can add or remove filters as needed to show only the data you want to view.

The **Log Viewer** displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log data. This information helps you identify trends leading up to and following the event, providing context for root cause analysis.

As you analyze the logs for an alert on the **Log Viewer**, you can modify the query to fine-tune the search, save useful searches, and share them with others. For a description of the information displayed in the **Log Viewer** table, see Log Viewer table fields.

You can perform the following tasks on the **Log Viewer**:

- View log data for an alert in Health Log Analytics

  View a chart of the frequency of anomalous log lines and the associated log data.

- Define, save, and share a search of log data in Health Log Analytics

  Fine-tune the search query to help determine the causes of the issue, and save and share useful searches.

- Use or modify a saved log data search in Health Log Analytics

  Use a saved search. As the owner of a saved search, you can modify the search values and save your changes.

- Filter search results on the Log Viewer in Health Log Analytics

  Apply filters to show only the data you want to view.

- Customize the Log Viewer table in Health Log Analytics

  Add or remove columns in the table to show only the data you want to view.

If you discover an important metric in the log data, you can use it to define a new Log Analytics alert rule. For more information, see Add a Log Analytics alert rule in Health Log Analytics.

Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics

Use Health Log Analytics to detect and resolve emerging issues in your organization's ServiceNow instance before they negatively impact users.

Using the ServiceNow System Logs Retriever integration to detect platform issues automatically

Starting with version 35.0.26 of Health Log Analytics, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system logs. As an operator you can view, manage, and respond to the generated alerts in the Express List. Filter the list to show only alerts for the impacted service. Then, use Now Assist to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. This AI-driven tool demonstrates a deep understanding of the Glide system and offers actionable insights.

Combining HLA's anomaly detection with Now Assist's GenAI capabilities provides a comprehensive toolkit for identifying and resolving platform system issues more effectively. This collaboration enables Health Log Analytics to help prevent system issues from impacting your platform users.

Using the MID Server and System Logs Retriever data inputs together to monitor your instance

You can also stay ahead of disruptions to your ServiceNow environment by using the MID Server data input and the ServiceNow System Logs Retriever data input together.

As an admin, you select a MID Server from the MID Servers list. Under Related Links, choose **Create MID Server Data Input using HLA** to create a data input specific to the selected MID Server. Then activate the System Logs Retriever data input and configure it to collect your ServiceNow instance's system logs.

As an operator, you navigate to the Express List and select an alert from the Alerts list. Review the alert details, including duration and impacted services, and analyze the logs that surround the anomaly. Use Now Assist to get an in-depth analysis of the alert and potential resolutions in

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

straightforward, human-readable language. If needed, for further investigation, you can navigate to the Log Viewer for a visual presentation of the system logs. Select System Logs Retriever from the components drop-down list to view all the errors that have occurred in the ServiceNow instance. You can customize the visualization by using filters.

By drilling down into the alert and MID Server logs, you can quickly identify the issue and resolve it before it affects your platform users.

Controlling Health Log Analytics alert generation, prioritization, and anomaly detection

Influence how Health Log Analytics generates and prioritizes alerts and identifies anomalies. Use alert filters to reduce noise from unimportant issues.

Overview of impacting alert generation, prioritization, and anomaly detection

Explore how to influence alert generation and anomaly detection in Health Log Analytics. You can create and modify rules to generate alerts for specific metrics, ensuring that you are informed of important issues. You can also assign different levels of significance to alerts, helping Health Log Analytics prioritize them based on their relevance. In addition, you can influence anomaly detection by managing the keywords that Health Log Analytics looks for in your log data, and use advanced log alert filters to reduce noise.

- Use alert rules to control when Health Log Analytics generates alerts

  Manage alert rules to generate Log Analytics alerts for specified metrics.

- Assign higher or lower significance to an alert in Health Log Analytics

  Assign higher or lower significance to an alert to help prioritize the alerts that Health Log Analytics generates.

- Influence anomaly detection in Health Log Analytics with lexical keywords

  Influence how Health Log Analytics finds anomalies by managing keywords it looks for in your log data.

- Reducing noise by adding advanced log alert filters in Health Log Analytics

  Use advanced log alert filters to reduce noise by making Health Log Analytics drop alerts that don't indicate a significant issue.

Use alert rules to control when Health Log Analytics generates alerts

Alert rules enable you to set thresholds and conditions that determine when Health Log Analytics triggers an alert. When the conditions of an alert rule are met, the system generates a Log Analytics alert. You can add, change, or delete alert rules to create Log Analytics alerts for a specified metric.

In Health Log Analytics, alert rules enable you to specify when alerts are triggered. By using these rules, you ensure that an alert is generated when certain conditions are met, enabling proactive monitoring and remediation of emerging issues. You can create alert rules when you encounter log data that should trigger an alert, and modify or delete alert rules that you have defined.

You can perform the following tasks related to alert rules:

- Add a Log Analytics alert rule in Health Log Analytics

  Add a Log Analytics alert rule when you come across log data that should generate an alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Change a Log Analytics alert rule in Health Log Analytics

  Edit a Log Analytics alert rule that you have defined.

- Delete a Log Analytics alert rule in Health Log Analytics

  Delete a Log Analytics alert rule that you have defined if it's no longer needed.

Add a Log Analytics alert rule in Health Log Analytics

Define a Log Analytics alert rule when you encounter log data that should generate an alert. The alert rule generates an alert for a specified metric with a threshold that you specify and sets the properties of the generated alert.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

> **Important:**
> From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Add a Log Analytics alert rule in Health Log Analytics.

Change a Log Analytics alert rule in Health Log Analytics

You can alter a Log Analytics alert rule that you have defined.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

> **Important:**
> From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Change a Log Analytics alert rule in Health Log Analytics.

Delete a Log Analytics alert rule in Health Log Analytics

Delete a Log Analytics alert rule that you have defined if it is no longer necessary.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

> **Important:**
> From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Delete a Log Analytics alert rule in Health Log Analytics.

Assign higher or lower significance to an alert in Health Log Analytics

Label an alert in Health Log Analytics as meaningful or insignificant, or restore normal importance to the metric involved in generating it.

Assigning higher or lower significance to an alert helps you prioritize the alerts Health Log Analytics generates. Here are some common use cases for adjusting the importance of an alert:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Labeling alerts as meaningful: You can make a significant alert more likely to be included in a Log Analytics group when its associated metric behaves anomalously. This ensures that important alerts receive appropriate attention.
- Muting distracting alerts: You can mute alerts for insignificant issues to reduce noise and avoid being overwhelmed by alerts for minor problems. This enables you to focus on more critical alerts. You can view a list of muted metrics to ensure you are aware of metrics that are no longer generating alerts.
- Reducing sensitivity to certain anomalies: You can lower the sensitivity of anomaly detection to a specific anomaly. This can help you focus on more significant anomalies.
- Restoring normal significance: If you previously marked an alert as significant, muted it, or if you lowered sensitivity to certain anomalies, you can return the associated metric to its normal significance. This is useful when you no longer want to treat the alert specially.

You can do the following to adjust the importance of an alert or reduce sensitivity to specific anomalies:

- Mark an alert as significant in Health Log Analytics

  Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

- Mute an unimportant alert in Health Log Analytics

  Eliminate distracting new alerts for insignificant issues by muting them. View the list of metrics that were muted and no longer generate alerts.

- Decrease sensitivity to similar anomalies in Health Log Analytics

  Make Health Log Analytics anomaly detection less sensitive to anomalies like the one that triggered the current Log Analytics alert.

- Restore normal importance to an alert metric in Health Log Analytics

  Return normal significance to the metric involved in generating a Log Analytics alert.

For detailed information about alert metrics, see How Health Log Analytics generates alerts.

Mark an alert as significant in Health Log Analytics

Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important:
From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Mark an alert as significant in Health Log Analytics.

Mute an unimportant alert in Health Log Analytics

Eliminate distracting new alerts for insignificant issues by muting them.

Before you begin

View the list of muted metrics in Health Log Analytics

View the list of metrics that were muted so that they no longer generate alerts.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Muted Metrics**.

Muted Metrics

Field	Description
Service instance	Service instance where the muted alert with which the metric is associated appears.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Pattern text	Text for the metric that is associated with the muted alert.
Metric	Log text or key that represents a meter or gauge value in the data. For example, patterns, raw metrics, keyword, severity, all events metrics.
Created	Date and time when the metric was added to the list.

Influence anomaly detection in Health Log Analytics with lexical keywords

Influence how Health Log Analytics finds anomalies by managing keywords it looks for in your log data. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as 'crashed' or 'failed' signal conditions that may require attention. The application sets a threshold for each lexical keyword based on its normal occurrence pattern and frequency in your logs.

When Health Log Analytics scans your logs, it identifies all occurrences of the keyword. If the frequency of a lexical keyword in the log data for a source exceeds the specified threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics comes with many default global keywords. You can add, edit, and delete these global keywords or phrases, which apply to all source types.

Note:
To add a specified keyword associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

You can manage lexical keywords as follows:

- Add, edit, or delete lexical keywords in Health Log Analytics

  Add, edit, and delete global keywords or phrases.

- View the lexical keywords that generate alerts in Health Log Analytics

  View the list of lexical keywords that can indicate important issues in log entries. By default, the table lists only global keywords.

Add, edit, or delete lexical keywords in Health Log Analytics

Manage the keywords that Health Log Analytics looks for in your log data.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task
In log data, terms like "crash" or "failed" are called lexical keywords because they indicate issues that can merit attention. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Important:
A lexical keyword differs from a key in a `key : value` pair in a log line. For example, *`Hostname`* is a key that takes on a value: the name or IP address of the host. In contrast, a keyword like *`Failed`* is important by itself and does not take on a value.

The application comes with many default global keywords. You can add, edit, and delete global keywords or phrases. These keywords apply to all source types.

Note:
To add a specified keyword that is associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
   By default, the Lexical Keywords table lists only global keywords.
2. **Optional:** Add a global keyword.
   a. Select **New**.
   b. On the form, fill in the fields.

Lexical keyword form

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	Regular expression (regex) that defines matches.
Exact match	Option to make Health Log Analytics match the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. This field is automatically set to **True**.
Case-sensitive	Option to make Health Log Analytics look for a case-sensitive match of the regex. This field is automatically set to **False**.
Range of analysis	Range of sources types where Health Log Analytics looks for the keyword in the log data. Choices are as follows: ▪ **All source types** ▪ **Specified source type**
Excluded source types	Source types that are not associated with the keyword. Health Log Analytics does not look for the keyword in the log data of these source types.

   c. Select **Submit**.
3. **Optional:** Edit a global keyword.
   a. Click the keyword that you want to edit in the list.
   b. On the form, edit the relevant fields.
   c. Select **Update**.
4. **Optional:** Delete one or more global keywords.
   a. Select the rows of the keywords that you want to delete.
   b. From the Actions on selected rows list at the bottom of the page, select **Delete**.
   c. Select **OK**.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
The Lexical Keywords table appears. By default, the table lists only global keywords.

For information about adding, editing, or deleting global keywords, see Add, edit, or delete lexical keywords in Health Log Analytics.

To add a specified keyword that is associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

Reducing noise by adding advanced log alert filters in Health Log Analytics

Use advanced log alert filters to determine whether to allow an alert or to drop it. These filters reduce noise by dropping alerts that don't indicate a significant issue.

You can add advanced log alert filters to scan alerts for your defined conditions. For example, you can define a filter that drops alerts coming from specific log sources, or alerts for anomalies that do not cross the specified threshold.

Some examples of the actions that advanced filters can enable:

- Alert only on anomalies that are shared across multiple hosts.
- Do not alert on anomalies that happen outside of working hours.
- Do not alert if the anomaly does not cross the specified threshold.
- Alert only on anomalies that are part of a correlation.

You can manage advanced log alert filters as follows:

- Create advanced log alert filters

  Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

- Continue modifying the filter by reopening the filter record from the filters list. You can then edit, test, publish, and activate the filter.

For more technical information on log alert filters, see the Advanced Log Alert Filtering [KB0863538] article in the Now Support Knowledge Base.

Create advanced log alert filters

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The Disable Alert Rule Engine feature and the Disable Detection Rule Engine feature must be in the OFF state. You set the values by navigating to **Health Log Analytics** > **Health Predictive AI Ops Administration** > **Features**.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Health Log Analytics** > **Log Anomaly Detection** > **Advanced Log Alert Filter**.
2. Select **New**.
3. Enter a unique and descriptive name for the filter.
4. **Optional:** Enter a description of the operation of the filter.
5. In the **Script template** field, select the script that most closely matches your intended logic. The template can act as a starting point for your custom script code.
   After you select a template, the Custom JS function text box is populated with the appropriate JavaScript function. The JavaScript function applies the filter to the alert payload data and either allows or drops the alert. The alert payload is the text and metadata for the kind of alert that the filter will analyze.
6. Save the record by selecting **Submit**.
   To continue modifying the filter, you must reopen the record from the filters list. You can then edit, test, publish, and activate the filter.
7. Edit the default **Alert payload** text in preparation for testing your intended logic.

   To remove your changes and revert to the default text for the Alert payload text box, click **Reset**.

   For your convenience, Health Log Analytics provides sample alerts with preconfigured payloads. Select a sample alert in the **Example alert** field to display its payload in the Alert payload text box.
8. **Optional:** Save the current values of the filter without testing by selecting **Update**.
9. When your content for the alert payload and your JavaScript function are complete, select **Test**.
   To simulate the alert operation, the system saves the filter values, applies the filter to the **Alert payload** text, and then displays one of the following results:
   - `Alert will be dropped.`
   - `Alert will be allowed.`

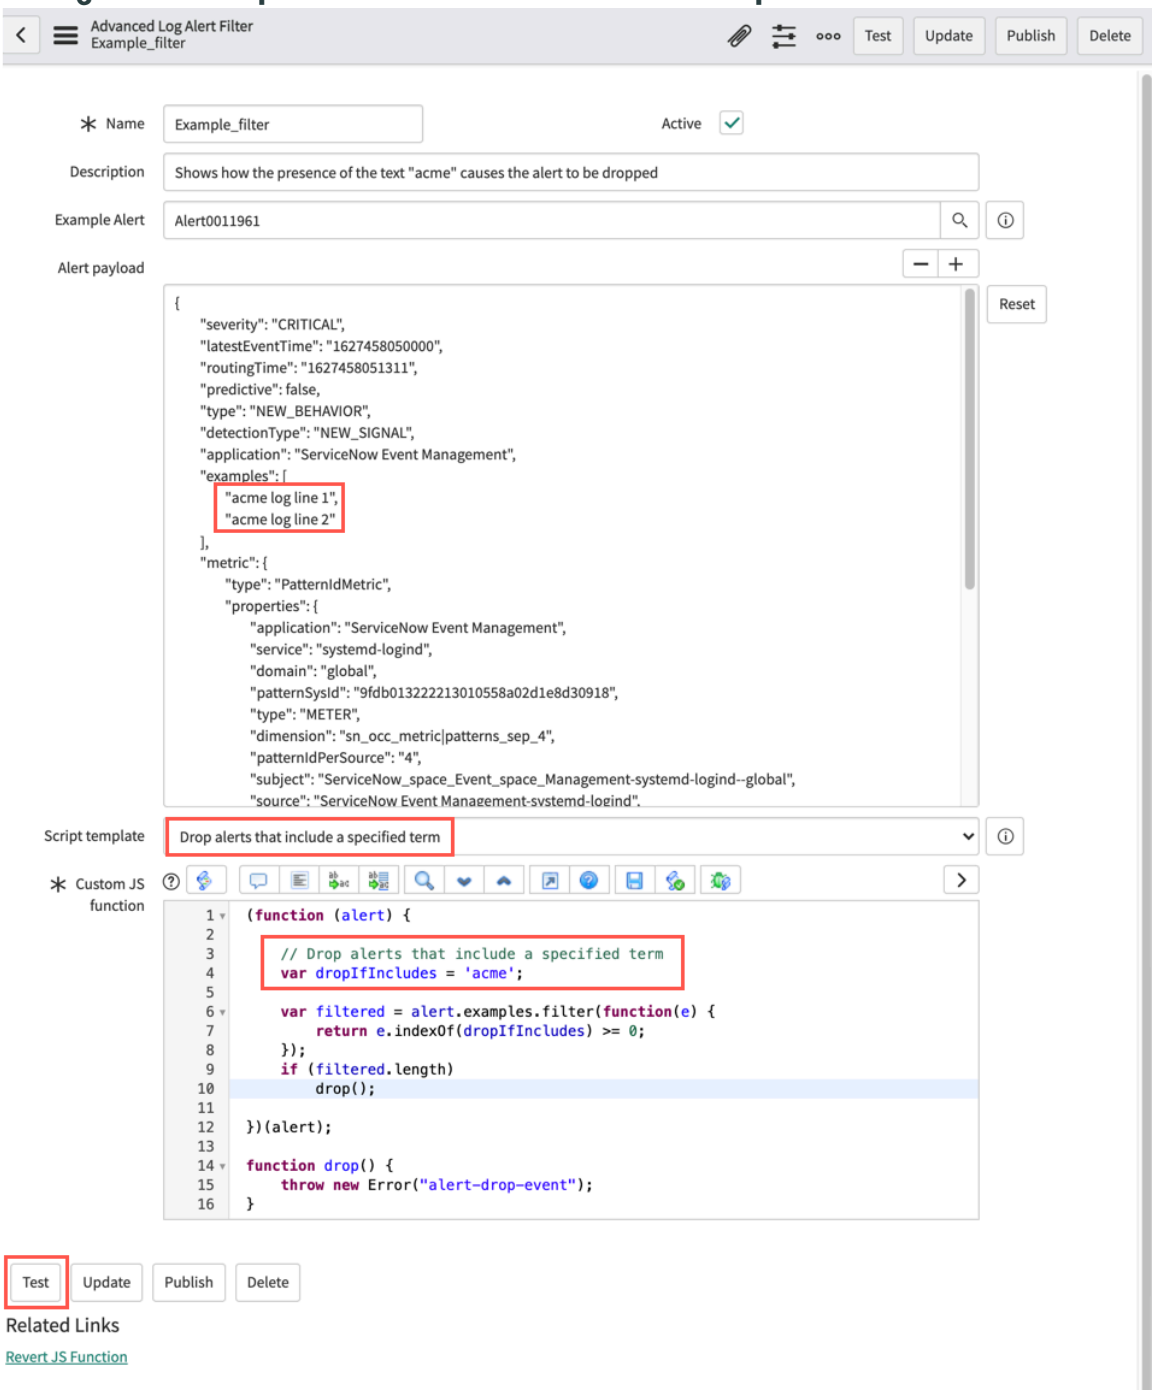
Testing the JavaScript to determine whether to allow or drop the alert



Note:
If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

10. Repeat the process of updating the alert payload and testing the JavaScript function as often as needed.
11. When you are satisfied with the filter, save its values and determine whether to apply it to the log stream.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To save the values and apply the filter to the log stream, make sure the **Active** check box is selected and select **Publish**.
- To save the filter without applying it to the log stream, clear the **Active** check box and select **Publish.**

Note:
If you modify a published filter, you must publish the modified filter to apply it to the log stream.

Result
The values of the active filter are saved. If you selected the Active option, the filter is applied to the log stream.

Viewing system features and system health alerts in Health Log Analytics

View all Health Log Analytics system features that your admin can activate or deactivate for you. In addition, you can view a model of the Health Log Analytics core components and the system health alerts that affect them.

Overview of Health Log Analytics system features and system health alerts

Health Log Analytics enables you to view all of its system features and their description. The admin can enable or disable a feature for you. You can also view a model of the core components of Health Log Analytics and the system health alerts that could impact them. Health Log Analytics and the Event Management application together form a single service. Examining the configuration items (CIs) that comprise Health Log Analytics and their relationships helps you understand the impact of HLA system health issues on the service.

- View the settings of Health Log Analytics system features

  View the settings for all Health Log Analytics system features. These features configure many operations that affect your work. The admin can enable or disable features for you.

- Identify Health Log Analytics system health issues on the service map

  The ServiceNow Event Management service instance map includes a model of the Health Log Analytics core components and the system health alerts that affect them.

View the settings of Health Log Analytics system features

View the settings for all Health Log Analytics system features. These features configure many operations that affect your work. The admin can enable or disable features for you.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Predictive AI Ops Administration** > **Features**.

   A full definition of each feature appears in its **Description** field.

   By default, the table shows the system features that administrators modify most commonly. To view the complete list of features, use the filtering options.

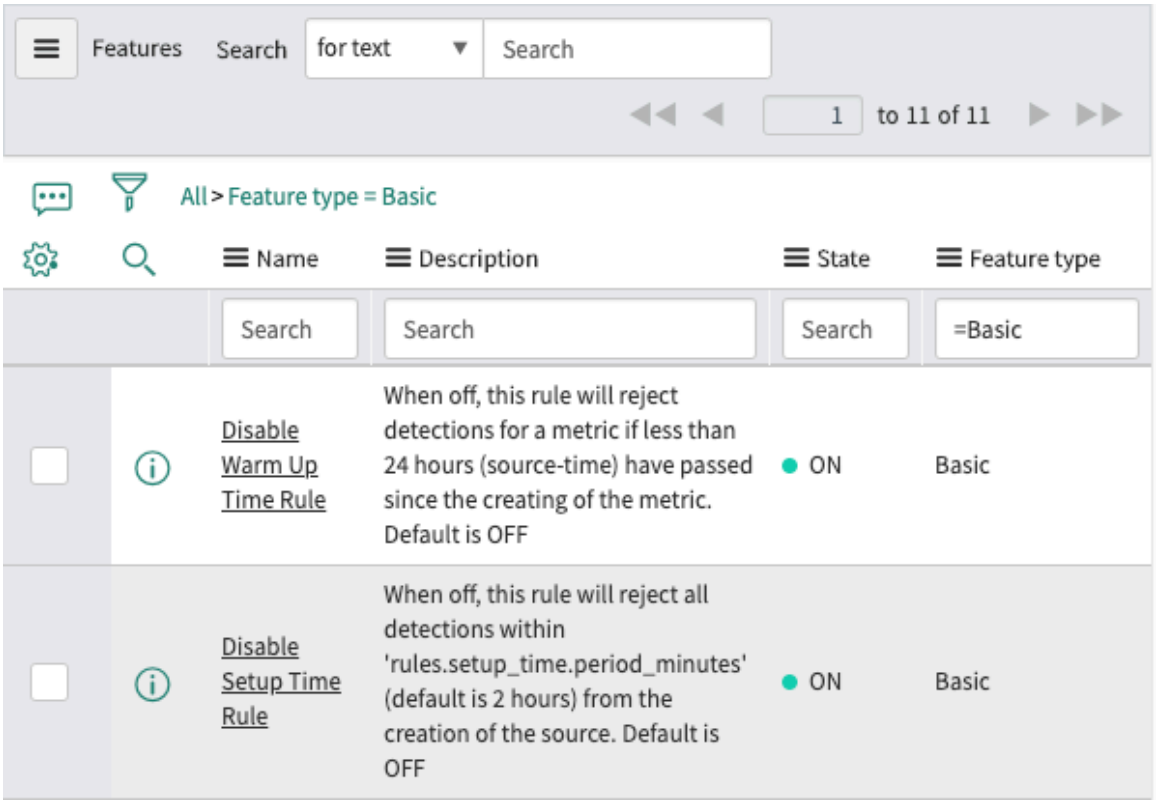
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



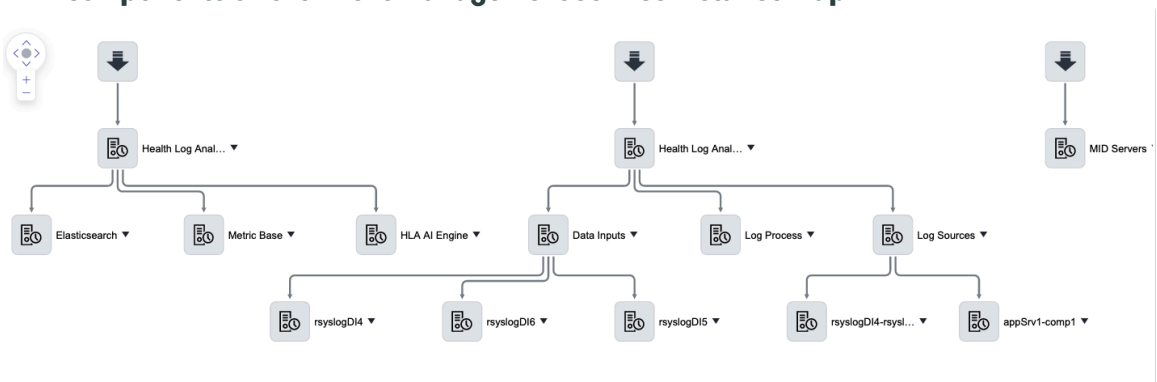
2. **Optional:** Ask your admin to activate or deactivate a feature by updating the **State** setting.

Viewing Health Log Analytics system health alerts on the service map

The ServiceNow Event Management service instance map includes a model of the Health Log Analytics core components and the system health alerts that affect them.

Health Log Analytics and the Event Management application form a single service. Viewing the configuration items (CIs) that comprise Health Log Analytics and their relationships helps you visualize the impact of HLA system health issues on the service.

HLA components on the Event Management service instance map



Health Log Analytics uses self-health checks to monitor the health of its components. When it discovers a system health issue, a notification triggers an alert. System health alerts display on the affected CIs on the service map. A colored bar on an affected CI indicates the criticality level of the alert: A red bar signifies a critical alert, an orange bar a major alert, and a yellow bar a minor alert.

For example, the red bar indicates a critical alert on this CI:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the alert impacts the parent object, the parent object has a bar of the same color. For more information, see View an alert impact on CIs in a service map.

You can drill down into an alert to view details about the issue and then address it by performing the action proposed in the notification. For more information, see Health Log Analytics self-health checks, notifications, and proposed actions.

Monitored components

Component	What is monitored
Health Log Analytics core	• Elasticsearch • Metric Base • HLA AI Engine
Health Log Analytics	• Data inputs • Log sources **Note:** New data inputs and log sources are automatically added to the service map.
Log ingestion process	All elements that affect the log ingestion process.

Analytics and Reporting in Health Log Analytics

Gain valuable insights into the number of IT issues predicted before your users were affected and the money it saved your organization by using Analytics and Reporting in Health Log Analytics.

Platform Analytics Solutions for Health Log Analytics

Platform Analytics Solutions contain prepackaged Performance Analytics and Reporting content for use with other ServiceNow AI Platform products. This Platform Analytics Solution provides valuable insights into the number of IT issues Health Log Analytics predicted before your users were affected, and the money it saved your organization by preventing critical outages.

Required roles

The following roles and tasks are associated with this solution:

- ServiceNow AI Platform administrator (admin): Install and activate this solution and make any necessary changes to system properties.
- Performance Analytics administrator (pa_admin): Review the indicators, breakdowns, widgets, and dashboards. Set up and start data collection. Share the dashboards with appropriate stakeholders.

Activate the Platform Analytics Solution for Health Log Analytics

Activate the content pack ServiceNow Store application for the Platform Analytics Solution.

Before you begin

Activate the full, subscription version of Performance Analytics on the instance where you are activating this Platform Analytics Solution. You can activate Performance Analytics on a non-production instance without purchasing a subscription. For more information, see Activate your Performance Analytics subscription.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Applications** > **ServiceNow Store**.
2. Browse for Health Log Analytics and verify that you have the necessary valid entitlements.

   You need a HI account and permission to request applications for the instances under consideration. The HI account and the instance need to be part of the same company. For more information, see Install a ServiceNow Product on the ServiceNow Store.
3. Search for `Health Log Analytics (sn.occ)`.
4. Install the application.

   When you install this application, you also activate the Performance Analytics - Premium (com.snc.pa.premium) plugin.

   Note:
   This plugin requires an additional fee.

Configure the Platform Analytics Solution for Health Log Analytics

Run diagnostics, review and customize components, and start collecting data.

Before you begin

A ServiceNow AI Platform administrator must have installed the content pack plugins or ServiceNow Store application for this Platform Analytics Solution.

Role required: pa_admin

Procedure

1. Run diagnostics on all records.

   These diagnostics can catch many mismatches between the configuration of your Platform Analytics Solutions and your tables.
2. Navigate to **All** > **Performance Analytics** > **Administration Console**.
3. Verify the name of the dashboard that has been installed with this Platform Analytics Solution: Health Log Analytics Overview dashboard.
4. Open the **Indicator Sources** tab.
5. For each dashboard included in this Platform Analytics Solution:

   a. Filter the indicator sources on the dashboard name.

   b. Review the facts table, conditions, and frequency of the indicator sources compared to the data structure on your own instance.

   Important:
   Pay particular attention to time stamp fields such as Resolved or Created that are referenced in the **Conditions** field. You may need to use different time stamp fields.

   c. If necessary, open an indicator source and make corrections.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. If you are editing an indicator source record, go to the Indicators related list and review the Conditions field for each indicator.
Changing the indicator source can also affect the additional conditions on the individual indicators.

6. If you changed the time field stamps in any indicator sources, then change any related Performance Analytics scripts.
7. Open the **Breakdown Sources** tab.
8. For each dashboard included in this Platform Analytics Solution:
   a. Filter the breakdown sources on the dashboard name.
   b. Review the conditions on the breakdown source as described in Review the breakdown sources.
9. Navigate to **All** > **Performance Analytics** > **Jobs**.
10. Set up and run the historical job for this Platform Analytics Solution, *[PA HLA] Historic Data Collection*.
11. Edit and activate the scheduled data collection job for this Platform Analytics Solution, *[PA HLA] Historic Data Collection*.

Health Log Analytics Overview dashboard

The Health Log Analytics Overview dashboard uses Performance Analytics to provide a trend of historical data as well as regular reports.

From the Xanadu release onward, the Health Log Analytics Overview dashboard has been deprecated and replaced with the HLA Operational dashboard. The HLA Operational dashboard uses Performance Analytics to enable you to monitor log data, alerts, and error rate information in Service Operations Workspace and address issues as they occur in the system. For more information, see HLA Operational dashboard.

Health Log Analytics reference

Reference topics provide additional information about the Health Log Analytics application.

Components installed with Health Log Analytics

Activating the Health Log Analytics, Health Log Analytics Viewer and Health Log Analytics Core plugins adds several components.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Plugins

Plugin	Description
Health Log Analytics	Health Log Analytics is an AI-powered log analysis solution capable of preventing IT incidents before users are affected. It automatically identifies your environment and logs, predicts IT incidents, generates alerts,

Plugin	Description
	and provides expert suggestions for fixing issues. Health Log Analytics is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it. Dependency: • Health Log Analytics Core • The ServiceNow® Event Management application
Health Log Analytics Viewer	Event Management operators use the Health Log Analytics Viewer plugin to browse logs by timestamp or time range. Health Log Analytics Viewer enables Event Management operators to search for a specific log text and visualize the frequency of hits in a particular time period. Dependency: The ServiceNow® Event Management application.
Health Log Analytics Core	This plugin contains essential components for Health Log Analytics, such as the AI Engine and Elasticsearch. Health Log Analytics Core is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it. Dependency: The ServiceNow® Event Management application.

Roles

Health Log Analytics uses the following roles.

Role title [name]	Description
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Health Log Analytics.
Event Management Operator [evt_mgmt_operator]	Has read access to all Event Management features. Has write access to alerts to manage the alert life cycle. Has the itil role to manage incidents created from alerts. Can also activate operations on alerts, such as to acknowledge, close, and open an incident and run remediation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lists

Health Log Analytics adds the following lists.

Table [name]	Description
Advanced Log Alert Filtering [sn_occ_advanced_alert_filtering]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine. Beginning with the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store, this representation no longer displays.
Advanced Log Alert Filter [sn_occ_advanced_alert_filter]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.
Data Inputs [sn_occ_base_data_input_config]	Enables setting up data input connectors to stream log data into the instance.
Data Input Mapping [sn_occ_event_mapper]	Enables mapping raw log data that streams into the instance to determine how Health Log Analytics processes it.
Data Input Preprocessor [sn_occ_data_input_preprocess_screen]	Enables editing raw log data before the system maps and structures it.
Define Alert [sn_occ_custom_alert]	Enables creating custom alerts based on a predefined set of rules.
Excluded Values [sn_occ_auto_service_normalizer]	Enables configuring Health Log Analytics to stop extracting specific log data that is not descriptive enough or contains redundant text or information.
Extracted Values [sn_occ_auto_service_mapper]	Enables configuring Health Log Analytics to extract a specific term found in a field and map it to a specified component.
Features [sn_occ_features]	Lists all Health Log Analytics features. The features can be activated and deactivated.
Lexical Keywords [sn_occ_lexical_keywords]	Shows all default lexical keywords that Health Log Analytics looks for in log data.
Log Correlator [sn_occ_log_correlator]	Shows all correlators that determine whether to correlate different alerts to the same group. Enables adding correlators to Health Log Analytics.
Log Sources [sn_occ_sources]	Provides a view of all data input sources when the log data has been mapped. Enables controlling properties and correlators for these sources.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table [name]	Description
Muted Metrics [sn_occ_metric_state]	Shows all muted alert metrics together with the muted components. Enables reactivating the muted alert metrics.
Source Type [sn_occ_source_type]	Contains the source types extracted in the mapping process.
Source Type Structure [sn_occ_source_type_structure]	Enables fine-tuning the source type structure. Provides a view of all source types when the log data has been mapped. Source types define how Health Log Analytics treats specific sources and how it parses the logs.
Streaming Sources [sn_occ_log_streaming_source_stats]	Enables monitoring all entities that stream log data to the instance.
System Health – Notifications [sn_occ_health_check]	Shows all system health notifications together and enables updating their status.
System Properties [sn_occ_system_settings]	Displays system properties and enables customizing their values.
Timestamp Formats [sn_occ_timestamp_formats]	Displays predefined timestamp formats. Enables defining and adding timestamp formats.
Time Zones [sn_occ_time_zones]	Enables deleting records in sn_occ_time_zones for users with the evt_mgmt_admin role.

Forms

Health Log Analytics adds the following forms.

Table [name]	Description
Beats Data Input [sn_occ_data_input_config_filebeat]	Enables configuring advanced settings for Beats data input connectors.
Beats Linux (Filebeat) [sn_occ_data_input_connector_filebeat]	Enables configuring Filebeat data input connectors.
Elasticsearch Data Input [sn_occ_data_input_config_elastic]	Enables configuring an Elasticsearch data input.
MID Server Data Input [sn_occ_data_input_config_midserver]	Enables configuring a MID Server data input.
Rsyslog [sn_occ_data_input_connector_rsyslog]	Enables configuring Rsyslog data input connectors.
Rsyslog Data Input [sn_occ_data_input_config_rsyslog]	Enables configuring advanced settings for Rsyslog data input connectors.
TCP Data Input Configuration [sn_occ_data_input_config_tcp]	Enables configuring advanced settings for TCP data input connectors.
Windows Beats [sn_occ_data_input_connector_winbeat]	Enables configuring Windows Beats data input connectors.
WinLog Beats [sn_occ_data_input_connector_winlogbeat]	Enables configuring WinLog Beats data input connectors.

Supported data inputs for Health Log Analytics

Health Log Analytics (HLA) enables you to connect your ServiceNow instance to several types of data input.

HLA supports the following data input types:

- Passive data inputs (listeners), which wait for log data to be pushed to them. These data inputs require a network port to be open on the MID Server:
  - Rsyslog
  - Beats
  - Splunk
  - TCP
  - UDP
  - MID Server
  - GCP PubSub
  - REST API

  The Agent Client Collector data input is supported for use with the Agent Client Collector Log Analytics application, available from the ServiceNow Store.
- Active data inputs (pullers), which pull data from repositories:
  - Elasticsearch
  - Splunk Polling
  - Amazon CloudWatch
  - Amazon S3
  - Microsoft Azure Log Analytics
  - Microsoft Azure Event Hubs
  - Apache Kafka

  For all active data inputs, Health Log Analytics supports MID Server clusters for failover protection. The active data input runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  The Elasticsearch data input fetches data from a data repository or database using credentials. If your data is in Elasticsearch, Health Log Analytics must have the following:
  - Permissions to query Elasticsearch

    One of the following types of credentials:
    - Basic authentication (user and password)
    - AWS, for Elasticsearch on Amazon AWS Cloud
  - Network connectivity to the relevant Elasticsearch cluster

  Note:
  Health Log Analytics must be pointed to the correct index to start pulling the data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In addition, Health Log Analytics supports Cribl, Edge Delta, and Vector Agent data inputs. These data inputs enable HLA to process log messages that are streaming from these tools into your instance.

Native ServiceNow data inputs

Streaming logs from Cloud Observability to Health Log Analytics

Health Log Analytics can process log data it ingests from the ServiceNow® Cloud Observability application, formerly#Lightstep. HLA automatically sets up the configuration needed to enable log streaming from Cloud Observability as part of its native integration. Setting up the connection from Cloud Observability to HLA must be done in the Cloud Observability application. In HLA, you handle log records from Cloud Observability in the same way as any other Data Input Mapping and Source Type Structure records, as explained in Log data auto-mapping and mapping in Health Log Analytics and Source type structure adjustment in Health Log Analytics. For more information about Cloud Observability, see Explore Cloud Observability documentation.

General guidelines for streaming data to Health Log Analytics

This section helps you identify the appropriate data input for streaming your specific data type to the Health Log Analytics application.

Data inputs for streaming log data to Health Log Analytics

Data type	Data input	Details
Flat files	ACC agent (Agent Client Collector Framework)	Use the ServiceNow ACC agent to stream flat files directly to Health Log Analytics. This method is suitable for log files, CSVs, and other structured file formats.
Cloud applications	Depends on the cloud: Microsoft Azure Event Hubs, Amazon Data Firehose, other methods	• Microsoft Azure Event Hubs: Configure your Microsoft Azure Event Hubs to send data to Health Log Analytics using the Microsoft Azure Event Hubs data input. • Amazon Data Firehose: Set up an Amazon Data Firehose delivery stream to send data to Health Log Analytics using the Amazon Data Firehose data input. • More examples.
Data lakes	Apache Kafka, Cribl	• Apache Kafka: Export data from your data lake to a Kafka topic and use the

Data inputs for streaming log data to Health Log Analytics (continued)

Data type	Data input	Details
		Apache Kafka data input to stream it to Health Log Analytics. • Cribl: Use Cribl to export data from your data lake and use the Cribl data input to stream it to Health Log Analytics.
Databases	Treat as flat files	Treat database logs, such as Oracle error logs, as flat files and use the ACC agent to stream them to Health Log Analytics.
Third-party tools	Varies by tool	• VMware: vCenter can use UDP to stream data to the MID Server and Health Log Analytics using the UDP data input. • More examples.
APM tools	Varies by tool	• New Relic: Use the New Relic plugin to stream events directly to Health Log Analytics. Export raw logs to a flat file and use the ACC agent to stream them to Health Log Analytics. • Dynatrace: Set up the Dynatrace integration to stream data directly from Dynatrace to Health Log Analytics. • Nagios: Use the Nagios plugin to stream events directly to Health Log Analytics. Export logs to a flat file and use the ACC agent to stream them to Health Log Analytics. • Datadog: Use the Vector Agent data input to stream data from Datadog to Health Log Analytics.

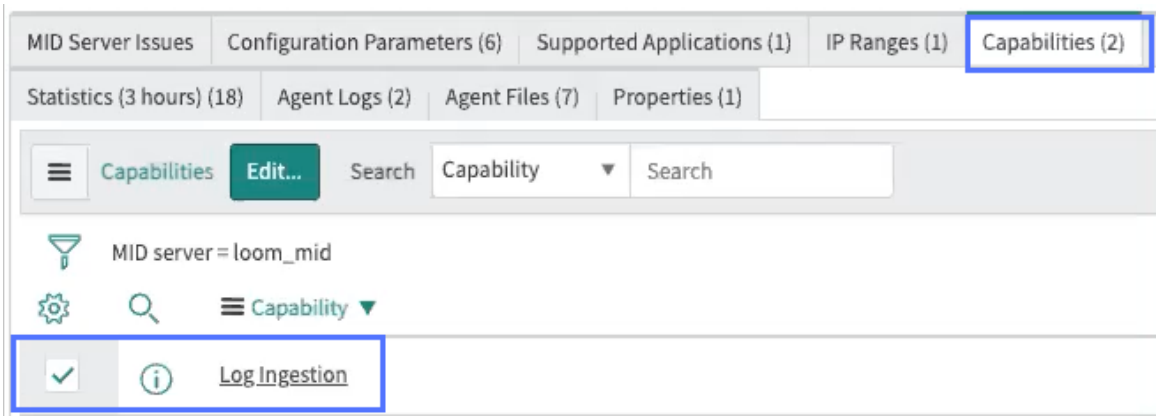
MID Server proxy preconditions for streaming logs to Health Log Analytics

Requirements for using a MID Server proxy to stream log data to Health Log Analytics.

- Use a Squid MID Server proxy to enable streaming log data to Health Log Analytics. For more information, see Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance.
- Install and configure the MID Server proxy with the log ingestion capability enabled.



In addition, configure the following properties:

- mid.proxy.use_proxy = true
- mid.proxy.host = <proxy_ip>
- mid.proxy.port = <proxy_port>

Health Log Analytics configuration preferences

Commonly used settings for Health Log Analytics properties and general configuration.

MID Server settings

- The MID Server log ingestion capability must be enabled.

> **Note:**
> Enabling **All capabilities** on the MID Server includes enabling the log ingestion capability.

- Use dedicated MID Servers for log ingestion whenever possible.
- To enable MID Servers to run multiple products, Health Log Analytics must have at least the Java Virtual Machine (JVM) memory setting for the standard product for each MID Server thread configuration.

The preferred MID Server settings for Health Log Analytics are:

- CPUs: 8
- RAM: 32 GB
- Network Bandwidth: Up to 10 Gbps
- EBS Bandwidth: Up to 4,750 Mbps
- Maximum Java heap size for MID Server: 8,192 MB

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With the above specifications, the expected log ingestion throughput on a Washington DC instance is as follows:

- For a log message of 300 bytes: 20,000
- For a log message of 1.1 KB: 12,300
- For a log message of 2 KB: 7,970

The minimum requirements for streaming logs to Health Log Analytics are:

- CPUs: 4
- RAM: 16 GB
- Java heap size for MID Server: 8 GB

For general information, see: MID Server system requirements.

- To increase log ingestion throughput, you can either increase the ulimit or the network bandwidth, or decrease the size of the logs being streamed. The ulimit setting can be configured on an individual MID Server. However, the correlation between the ulimit and the throughput can't be modified.

  The following table lists the ulimit settings for open files relating to network throughput on the MID Server. It shows the size of the logs being streamed from the MID Server to the agent, and the gRPC streaming rate equivalent to the throughput.

  Ulimit settings in relation to throughput

Queue Type	Log line size	gRPC rate
In Memory Queue	300 bytes	18,000
In Memory Queue	1.1 KB	13,000
In Memory Queue	2 KB	10,000
Disk-based Queue	300 bytes	11,000
Disk-based Queue	1.1 KB	5,000
Disk-based Queue	2 KB	3,000

  Starting from the August 2024 release, you can enhance MID Server communication with the ServiceNow instance by using the Lightning gRPC client, which can increase log streaming speeds to Health Log Analytics by up to six times. The Lightning gRPC client requires manual configuration to activate. For more information, see the Lightning gRPC client - Enabling the new MID gRPC streaming architecture [KB1648419] article in the Now Support Knowledge Base.

- By default, the number of data inputs per MID Server is limited to 10. You can configure this limitation for an individual MID Server or for all MID Servers.
- Both in FIPS and non-FIPS mode, MID Servers with Health Log Analytics capability must run on the Java Runtime Environment (JRE) 11 or above.

  Note:
  To support BC-FIPS version 2.0, Health Log Analytics requires an upgrade to version 34.0.37, December 2024.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Log source retention settings

By default, log retention per source is set to three days. This setting can't be modified.

When using Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store , you can modify the log retention policy per source or for multiple sources together. For more information, see Modify the log source retention period in Health Log Analytics.

Health Log Analytics system health notifications

Health Log Analytics system health notifications help to ensure that you're aware of potentially dangerous conditions. You can manually adjust the status of a notification as the issue is being addressed.

Health Log Analytics uses self-health checks to monitor the health of its components. When it discovers a system health issue, a notification is created and an email sent to all subscribers. The Health Log Analytics Administration **System Health - Notifications** list displays all HLA system health notifications, including those about internal errors. You can ask your admin to subscribe you to the system health notifications.

Health Log Analytics System Health - Notifications

Field	Description
Name	Notification header.
Description	Description of the notification.
Created	Date when the notification was created.
State	State of the notification. • **New**: The notification was newly added. • **Acknowledged**: The notification record was read. • **Work in progress**: The issue described in the notification is being addressed. Adjust the value manually. • **Closed**: The issue is no longer active. Adjust the value manually. **Note:** Changing the state of a notification does not affect the state of the issue described in it. A notification in the Closed state will still display in the table. The notification is automatically filtered out of the table only when the issue is detected as fixed (that is, when the Healthy status is **True**).
Healthy	Field that indicates the status of the issue mentioned in the notification. The table shows only notifications with a Healthy value of **False**. When the issue is detected as fixed, the value is automatically

	changed to **True** and the notification is filtered out of the table.

Health Log Analytics self-health checks, notifications, and proposed actions

Health Log Analytics provides self-health checks, notifications, and proposed problem-solving steps.

Health Log Analytics system health notifications

Self-health check	Notification	Proposed action
Maximum AI engine queue size exceeded	The AI engine is running at overcapacity (size=%s, threshold=%s, duration=%s). As a result, the accuracy of anomaly detection might deteriorate.	Contact ServiceNow support.
High rate of unclassified errors in %s %s	"%s %s has a high rate of unclassified errors and is failing frequently.	Contact ServiceNow support.
Errors invoking glide API	Errors invoking '%s' for %s.	Contact ServiceNow support.
Log size limitation was exceeded	Log messages from %s: %s are being dropped because the log size limitation was exceeded.	If the difference is minor, increase the log size limitation by adjusting the property *mid.data_inputs.max_length_bytes* on the MID Server Properties form. If the logs are too long or multi-line, you can also modify the log size at the source of the logs.
Excessive data volume for data input %s.	The data volume for data input %s is too high. Log messages are being discarded.	Contact ServiceNow support.
Log messages are being dropped due to failed auto-structuring	Log messages are being dropped because auto-structuring of Source Type %s failed.	In the Source Type, find out what could be causing auto-structuring to fail. Inspect the error logs to determine which component or parsing action is failing.
Excessive number of script errors per second in %s:%s	The rate of script errors in %s: %s is too high.	Review the JavaScript Parsing Error in the source given in the message: Data Input Mapping Screen or Source Type Structure Screen.
Log messages that exceed the permitted number of properties are being discarded	The source type %s contains multiple log messages with too many properties. Such	On the relevant Source Type Structure record, review the properties that are being

Health Log Analytics system health notifications (continued)

Self-health check	Notification	Proposed action
Log messages are being dropped due to a timestamp parsing failure	Log messages from %s %s are being dropped due to a timestamp parsing failure. Search for 'Failed parsing timestamp from log message' in the logs for the relevant Service instance and Component and fix the issue.	On the Data Input Mapping form, locate the extracted timestamp. If it is missing, navigate from the form to the relevant Source Type Structure and open the Timestamp Parsing Error tab. The tab displays the issue that led to the parsing error. Fix the issue.
No memory consumption drop	Memory consumption hasn't dropped in the last few minutes.	Contact ServiceNow support.
Pings the Elasticsearch clusters' health endpoints to determine the health of the connection	Elasticsearch connectivity issues.	Contact ServiceNow support.
Uses the Metric base client connection check to determine the health of the connection	Metric base connectivity issues.	Contact ServiceNow support.
Uses the Glide client connection check to determine the health of the connection	Glide connectivity problems.	Contact ServiceNow support.
The data input is in Failed state	The data input %s failed to stream logs.	On the Data Input form, check the connection to the MID Server and review the error message.

Health Log Analytics language support

Health Log Analytics provides international language support. The default language is US English.

Language support coverage

The current available languages for Health Log Analytics are as follows: US English, UK English, French, German, Italian, Japanese, and Spanish.

Note:
To receive keyword-based alerts for languages other than English, keywords in the relevant language must be added to the system before you start streaming. Contact ServiceNow Support for assistance.

Domain separation and Health Log Analytics

Domain separation is supported for Health Log Analytics. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Health Log Analytics overview

Domain separation is present in all aspects of the Health Log Analytics application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Health Log Analytics

When data is domain separated using a single Health Log Analytics server, each Managed Service Provider (MSP) can see the log data only in its own domain or the child domains below it . Users can view alerts that Health Log Analytics generates only in their own domain. Actions to remediate the alerts apply only for the scope of that domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

The Health Log Analytics Domain Separation plugin must be installed before you configure your data inputs in the Health Log Analytics application. There is no setup procedure for the plugin. Install the plugin with the Health Log Analytics application Version 21.0.1 - September 2021, and then activate it. Make sure that you map your data into logical silos and configure rules and entities.

You define the domain-separated environment when you configure your data inputs. Users can use data inputs that are only available in their own domain. Health Log Analytics creates alerts only for logs that arrive in those data inputs. All relevant records and all data processing in the Health Log Analytics program flow reside in the same domain as the data input. A data input's domain name is shown in the **Domain** column displayed in the tables in your instance.

Using domain separation in your instance is transparent to Health Log Analytics. The application manages all aspects of the data, such as system settings and custom operations, separately. When a property is changed, the new value affects new sources only in the specific domain. System properties affecting the server are common to all domains because all domains use the Health Log Analytics server.

Note:
Health Log Analytics supports up to 60 kilobytes events per second (EPS) across all domains, without the ability to provide a service level agreement (SLA) to a specific domain and without fairness. If a domain streams a large amount of data, the Health Log Analytics server processes it. Other domains might suffer latency, drops, or other issues as a result, even if they stream a low number of logs. On the MID Server side, 10 kilobytes EPS is expected.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

- An MSP wants to provide the Health Log Analytics application to multiple customers in a similar environment with a single instance.
- An organization with many tenants wants to isolate its sensitive data, such as security logs.
- An administrator of a tenant organization wants to define a data input only for their own domain.
- An operator in a tenant organization wants to view logs only in their own domain.
- An operator in a tenant organization wants to provide feedback for alerts only in their own domain.
- An MSP Admin wants to view log data from all of their organization's tenant domains.

Related topics

Domain separation for service providers

JavaScript function test outcome fields

Description of the JavaScript function test outcome fields.

The following fields are read-only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Source types	The number of source types predicted or created for this data input.
Sources	The number of sources predicted or created for this data input.
Errors	The number of JavaScript errors that occurred in all the samples.
Unmapped	The number of log lines that could not be mapped. These log lines are mapped to default tags.
Samples	The number of log samples on which the test is run. The default value is 1,000. **Note:** You can increase the number of log samples up to a maximum of 5,000 samples in the system property data_input_mapping.max_examples. For more information, see Configure global Health Log Analytics system properties.

In the related lists, view the predicted or created source types and sources.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List/Tab	Description
Outcome Key Value Mapping	The results of running the JavaScript function on the log samples.
Source Types (from samples)	The predicted or created source types. **Note:** You can open source types that have already been created by selecting the appropriate link.
Sources (from samples)	The predicted or created sources. **Note:** You can open sources that have already been created by selecting the appropriate link.
Test Outcome	The log samples used for testing your JavaScript function, ordered by sources and source types. The **Test Outcome** list displays the number of log samples for each source-source type combination, and is updated when the log samples are refreshed and you start testing your script. The list links to samples in the **Mapping Samples** table, which shows the outcome of the JavaScript function for each sample. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
Source Type Structures	The source type structures for this data input. Reviewing the source type structures can help you gain a better understanding of the data flow. The **Last event time** column on this tab shows the last date and time the AI engine processed a log for the source type structure. The system refreshes this information every 5 minutes. Knowing when the last log was processed for this source type structure makes it easier to verify that log data is streaming.

Health Log Analytics severity mapping

Health Log Analytics (HLA) uses common severity values to identify severity labels in the Source Type Structure.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Log severity mapping** table illustrates how HLA identifies severity words from raw logs (shown in the left column), maps them to its own severity values (middle column), and then presents them in Event Management alerts (right column).

Log severity mapping

Raw log severity	HLA log severity	Event Management alert severity
TRACE	TRACE	Keywords-based
VERBOSE	TRACE	Keywords-based
FINE	TRACE	Keywords-based
FINER	TRACE	Keywords-based
FINEST	TRACE	Keywords-based
DEBUG	DEBUG	Keywords-based
DBG	DEBUG	Keywords-based
CONFIG	DEBUG	Keywords-based
INFORMATIONAL	INFORMATIONAL	Keywords-based
INFORMATION	INFORMATIONAL	Keywords-based
INF	INFORMATIONAL	Keywords-based
INFO	INFORMATIONAL	Keywords-based
UNKNOWN	UNKNOWN	Keywords-based
NOTICE	NOTICE	LOW
NOTIFICATION	NOTICE	LOW
WARNING	WARNING	MEDIUM
WARN	WARNING	MEDIUM
ERROR	ERROR	HIGH
ERR	ERROR	HIGH
CRITICAL	CRITICAL	CRITICAL
CRIT	CRITICAL	CRITICAL
FAT	CRITICAL	CRITICAL
FATAL	CRITICAL	CRITICAL
SEVERE	CRITICAL	CRITICAL
ALERT	ALERT	CRITICAL
EMERGENCY	EMERGENCY	CRITICAL
EMER	EMERGENCY	CRITICAL

Note:
If your raw log contains numerical severities or unrecognized words, map these values to the HLA Log Severity column by creating a conditional statement using the JS function in the Source Type Structure. For more information, see Source type structure adjustment in Health Log Analytics.

Integration configuration field descriptions

This section provides descriptions of the fields on the integration configuration forms for Health Log Analytics.

Apache Kafka integration configuration fields

Description of the fields on the Apache Kafka integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Kafka integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Apache Kafka is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per` to the MID Server and then changing the default value. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Kafka. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method

Field	Description
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. This field is required. The list does not have to include all the Apache Kafka Cluster servers.
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.
Kafka credentials	The Apache Kafka credentials. You can select existing Kafka SSL credentials, or create new ones by selecting **Create Kafka credentials** from the drop-down list. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.
Group ID	The name of the Apache Kafka Consumer Group.

Advanced settings

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.	GMT
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30

Advanced settings (continued)

Field	Description	Default value
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Amazon Data Firehose integration configuration fields

Description of the fields on the Amazon Data Firehose integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Firehose integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Transport	The protocol used for streaming log messages to your instance: Amazon CloudWatch Logs. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Cribl integration configuration fields

Description of the fields on the Cribl integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Cribl integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
MID Server name	The MID Server to which the Cribl logs are streamed. This field is required.
Port	The port on the MID Server. This field is required. Choose a port within the range 6000-6200 from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport (for push integrations)	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Source (for pull integrations)	The source of the log data that the integration pulls to your ServiceNow instance: Cribl. This field is read-only.

Set up connection

Field	Description
Cribl URL	The URL of the Cribl instance. This field is required. HLA uses this URL to establish the connection with the Cribl instance and make the necessary API calls. For example: • On-Prem: https://my-cribl.company.com:9000 • Cloud: https://myorg-12345abcde.cribl.cloud • Sandbox: https://sandbox-xyz789.sandbox.cribl.io
Authentication method	The authentication method used by the Cribl integration. This field is required. The Cribl integration supports: • Token-based authentication: Required for Cribl Cloud and also supported for self-hosted (On-Prem) Cribl instances. • Basic authentication: Preferred for self-hosted (On-Prem) Cribl instances. Both of these authentication methods use the default credential alias: Cribl_Credential_Alias.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up connection (continued)

Field	Description
	For information about setting up credentials for the authentication method used by the Cribl integration, see Set up authentication credentials for the Cribl integration in Health Log Analytics. **Important:** Verify that only one active credential record of each credentials type exists under the credential alias.
Worker Group	The Cribl Worker Group from which to stream log data to the instance. This field is required. The drop-down list displays Worker Groups based on the provided Cribl cloud instance URL and authentication method. For example: • default • dev-workers • prod-workers • staging-workers
Cribl route	The Cribl route that directs log data to a specific destination. This field is auto-populated with a drop-down list of all available routes, each configured with a default destination. Select the desired route from the list. This field is required. For example: • default • demo-route
Cribl destination	The Cribl destination to which the log data is directed. This field is auto-populated and read-only. When HLA populates this field, it provides a link to the destination on the Cribl server. For example: sn_hla_cribl_tcp_json_abcdef

Edge Delta REST integration configuration fields

Description of the fields on the Edge Delta REST integration configuration form for Health Log Analytics.

Provide details

Field	Description
Integration name	Unique name of this integration. For example: My Edge Delta REST integration. This field is required.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID web server	The MID Web Server to use. This field is required.
Service instance	The service instance to which to bind the log data. This field is required.
Port	The port for the MID Server. This field is read-only. It is auto-populated when the MID Web Server is chosen.
Transport	The transport method used for streaming log messages to your ServiceNow instance: REST. This field is read-only.
MID server name	The MID Server to which the log data is pushed. This field is auto-populated when the MID Web Server is chosen. It is read-only.
Description	Option to add a brief description of the integration to help identify it.

Edge Delta TCP integration configuration fields

Description of the fields on the Edge Delta TCP integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Edge Delta TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which the Edge Delta logs are streamed. This field is required.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
Port	The port on the MID Server used for listening on logs. This field is required. Choose a port within the suggested range from the array. The port must not be occupied by another process. Ensure that your organization's security team opens the selected port.
Service instance	The service instance to which to bind the log data. This field is required.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Character encoding	The character encoding for this data input. Default is UTF-8.
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.
Default timezone	The time zone of events that the system uses if a log does not specify the time zone. By default, the system uses GMT, but you can specify a different time zone.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Elasticsearch integration configuration fields

Description of the fields on the Elasticsearch integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Elasticsearch integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to determine whether to use a specific MID Server or a specific MID Server cluster.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
MID server name	(Only when **Execute on** is set to Specific MID Server) The MID Server to which log data from Elasticsearch indices is pulled. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server Cluster) The MID Server cluster to which the log data is pulled. This field is required. When you select a cluster, the MID Servers in the selected cluster and their status are displayed. The integration runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the integration tasks to the next available MID Server in the cluster according to the configured order.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the integration form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Elastic. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data retrieval method

Field	Description
Server URL	The URL used to access the cluster. This field is required.
Authentication method	The authentication method used to authenticate the integration to Elasticsearch. Default is none. When you select the authentication method, the corresponding credentials fields display on the form. **Note:** As an admin, you can create an authentication method by navigating to **All** > **Health Log Analytics** > **Authentication Methods** and selecting **New**.
Index prefix	Prefix prepended to the names of the Elasticsearch indices from which you want to read data. The integration only reads data from indices that match the configured prefix. For example: network-logs-* matches indices such as network-logs-2024.01.01. This field is required. This setting ensures that HLA only ingests data from the relevant indices. For example: only-read-these-indices-*
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword. For example: {"severity": ["error", "warning"]}

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings

Field	Description
Max connections per route	The maximum number of connections to be opened per node.
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.
Use cross-cluster search	Option for searching for data across Elasticsearch clusters. When this check box is selected, the **Clusters to search** field displays. **Note:** Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.
Clusters to search	The Elasticsearch clusters to search.This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
	• Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"
Use minimal privileges	Option for reading log data directly from the Elasticsearch indices with the configured prefix. • When selected, the integration reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the integration fetches all indices with the prefix, filters them, and reads the log data from the filtered indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch integration, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.
Max documents per query	Maximum number of documents fetched in a single query.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Sliced-scrolling tie breaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id
Search-after tie breaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.
Use search-after API	Option for toggling between using sliced-scrolling and search-after APIs. **Note:** Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty. For example: uuuu.MM.dd
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data.The configured number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,
Polling interval	How frequently the system polls for new log data.

GCP PubSub integration configuration fields

Description of the fields on the GCP PubSub integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My GCP PubSub integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
MID Server name	(Only when **Execute on** is set to Specific MID Server.) The MID Server to which the logs are streamed. **Note:** • You can only select a MID Server with log ingestion capability that supports basic authentication. MID Servers that support mTLS are not listed. • If log ingestion is not enabled on the selected MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
MID Server cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set up connection

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id. This field is required. You can obtain the project ID from your Google Cloud homepage by selecting My Project. The project ID will be displayed.
Authentication method	The credential alias ServiceNow® uses to access Google Cloud. The default value is

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up connection (continued)

Field	Description
	sn_occ.HLA_Credential_Alias. This field is required. **Note:** You can add more credential aliases to the list of available aliases to choose from by selecting **Manage credential aliases** from the list and adding a credential alias.
Topic name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic. This field is required. You can obtain the topic name from your Google Cloud homepage by searching for Pub/Sub. All topic names will be displayed.
Subscription name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic. If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

Advanced Settings

Field	Description	Default value
Subscriber thread pool size	The number of concurrent threads that are downloading files from the Google Cloud Pub/Sub topic.	1
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Settings (continued)

Field	Description	Default value
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	Clear

Microsoft Azure Event Hubs integration configuration fields

Description of the fields on the Microsoft Azure Event Hubs integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Event Hubs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.

Set data retrieval method (continued)

	credentials to use. If you create new Azure SAS credentials, you must provide the SAS policy name and key.

Advanced settings

Field	Description
Restore point rate	The number of logs the integration can read before a restore point is saved.
Processor threads count	The total number of processor threads.
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.
Operation timeout (seconds)	The number of seconds to wait before timing out event hubs operations.
Receive idle timeout (seconds)	The number of seconds to wait before timing out receive operations.
Max length in bytes	The maximum length, in bytes, of log messages. The default value is 32766.
Prefetch count	The number of logs received in advance of event hubs operations.
Max batch size	The maximum number of events passed to a single process call. The default value is 100.
Default timezone	The default time zone of logs. The system uses this default when the log does not specify a time zone. The default value is GMT.
Character encoding	The character encoding for this integration. The default value is UTF-8.
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.

Microsoft Azure Log Analytics integration configuration fields

Description of the fields on the Microsoft Azure Log Analytics integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Azure Log Analytics integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Azure Log Analytics. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Redirect url	The redirect URL of the access log application. This field is required. The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	(GET request) section in the Microsoft Azure documentation.
Authentication method	The credentials used to access Microsoft Azure resources. This field is required. If no credentials exist, select **Create new Azure Service Principal credential**. Create a credential by filling in the fields and then selecting **Submit**. For information on the **Tenant ID**, **Client ID**, and **Secret key** fields, refer to the Microsoft Azure documentation. When you have created a credential, you can select it from the drop-down list.
Workspace ID	The Customer ID used to call the Microsoft Azure Log Analytics REST API. This field is required.
Table name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.

Advanced settings

Field	Description
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.
Workers queue size	The queue size of the Event Processor workers.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Max documents per query	The highest number of rows retrieved in each query.
Columns to select	Comma-separated list of column names to return.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
	Note: This field is ignored when you provide a custom query.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no events.
Polling interval	The interval, in seconds, to wait before polling for new events.
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.

Log Query	Option to define your own Log Analytics query. This field overrides the values configured in the other query settings fields.
	Note: If this field is empty, Health Log Analytics generates the query using the values set in the other fields.
	For your custom query, use the following JSON format:
	`{"query": "query | where TimeGenerated > %s | take 500"}`
	For example:
	`{ "query":"ContainerLog | where LogEntry contains 'cartservice' | where TimeGenerated > %s | take 500", "workspaces": ["defaultworkspace-3ab145ff-f9cd-433f-8533-d1b1ee24aee6-eus"], "project": ["TimeGenerated", "LogEntry", "LogEntrySource"] }`

MID Server integration configuration fields

Description of the fields on the MID Server integration configuration forms for Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
MID server name	The name of the MID Server from which the integration collects log messages and streams them to the instance. **Note:** You can only create one MID Server integration per available MID Server. If an existing MID Server integration or data input uses the same MID Server, you can't create an additional one for this MID Server. This field is required.
Integration Name	The name of the integration. When you select the MID Server name, this field is auto-populated with the selected MID Server. This field is read-only.
Service instance	The service instance to which to bind the log data. This field is required. By default, it is set to ServiceNow MID Server. **Note:** This field is only available for MID Server integrations created in version 36.0.17 or later versions.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The ratio of events to drop. The default value is -1.
Sub sample receive ratio	The ratio of events to receive. The default value is -1.
Max length in bytes	The maximum length of log messages, in bytes. The default value is 32,766.
Character encoding	The character encoding for this data input. The default value is UTF-8.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.

REST API integration configuration fields

Description of the fields on the REST API integration configuration forms for Health Log Analytics.

Note:
REST API integrations support only UTF-8 encoding for incoming data.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My REST API integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID web server	The MID Web Server to use. This field is required.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create a service instance and add CIs (Configuration Items) to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance: REST. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.
MID server name	The MID Server to which the log data is pushed. This field is auto-populated when the MID Web Server is chosen. It is read-only.
Port	The port for the MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details tab (continued)

Field	Description
	This field is read-only. It is auto-populated when the MID Web Server is chosen.

ServiceNow System Logs Retriever integration configuration fields

Description of the fields on the ServiceNow System Logs Retriever integration configuration form for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My System Logs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. The default service instance for this integration is ServiceNow System Logs.
Description	Option to add a brief description of the integration to help identify it.

Splunk Poller integration configuration fields

Description of the fields on the Splunk Poller integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID server name	(Only when the **Execute on** field is set to Specific MID Server)

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Splunk. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
REST API Server URL	The URL used to access the Splunk REST API. This field is required.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	Note: • By default, the Splunk REST API endpoint is available on port 8089. Therefore, the default endpoint for the Splunk REST API is: `http://<splunk-server>:8089`. • The REST API endpoint is different from the front-end endpoint.
Authentication method	The credential alias to be used. This field is required. The Splunk integration uses credential aliases instead of direct references to credentials for authentication. The credential aliases are listed by type: aliases that contain basic auth credentials, and those that contain token auth credentials. If an alias holds both credential types, it appears in both categories. You can select **Manage credential aliases** to manage your credential aliases and create new ones in the **Connection & Credential Aliases** list.
Query	The query Splunk uses to search your data. This field is required. For example, the query `sourcetype="adc_access_log"` instructs the Splunk Poller integration to retrieve all logs with the source type adc_access_log.

Advanced settings

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.
Splunk Request Timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

Splunk TCP integration configuration fields

Description of the fields on the Splunk TCP integration configuration forms for Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
Port	The port for the MID Server. This field is required. Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings

Field	Description
Use SSL/TLS	Option for selecting to use SSL/TLS, for enhanced data security and protection. **Note:** SSL/TLS must be enabled if you want to send logs in a compressed format.
Lookup hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is displayed when **Use Cooked Data** is selected. It is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is displayed when **Use Cooked Data** and **Use SSL/TLS** are selected. It is relevant when using Splunk Universal Forwarders.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Character encoding	The character encoding for this data input. Default is UTF-8.
Boss thread count	The number of threads that manage connections.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Worker thread count	The number of threads that handle incoming data.
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.

Splunk UDP integration configuration fields

Description of the fields on the Splunk UDP integration configuration forms for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.

Provide details (continued)

Field	Description
Port	The port for the MID Server. This field is required. **Note:** Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: UDP. This field is read-only.

Advanced settings

Field	Description
Lookup hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.

TCP integration configuration fields

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the logs are streamed. This field is required. • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.
Port	The port for the MID Server. This field is required. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port.
Service instance	The service instance to which to bind the log data. This field is required.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Use SSL/TLS	Option for selecting to use SSL/TLS.
Lookup hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Read timeout seconds	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.
Sub sample drop ratio	The ratio of events to drop.
Sub sample receive ratio	The ratio of events to receive.
Max length in bytes	The maximum length of log messages in bytes.
Character encoding	The character encoding for this data input.
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".

UDP integration configuration fields

Description of the fields on the UDP integration configuration forms for Health Log Analytics.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced (continued)

Field	Description
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.

Data input configuration field descriptions

This section provides descriptions of the fields on the Health Log Analytics data input configuration forms.

Amazon CloudWatch data input configuration fields

Description of the fields on the Amazon CloudWatch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon CloudWatch is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.)

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Amazon CloudWatch to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From	The date and time to start reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Group Name(s)	The log groups to search. If multiple log groups must be searched, specify the groups in a comma-separated list. To fetch log data from all groups, use an asterisk (*) as a wildcard character. This field is required.	hla-cw-loggroup1,hla-cw-loggroup2
Prefix	Name prefix for the Amazon CloudWatch log streams to read from. The data input reads only from log streams with this name prefix.	hla-cw

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab (continued)

Field	Description	Example
	Note: Only a single log stream prefix per data item is supported. For multiple prefixes, create multiple data inputs.	
Filter pattern	Pattern by which to filter incoming events. Various types of filter patterns are supported. For example: • A pattern for fetching log events that contain a single term. • A pattern for fetching log events that contain multiple terms. • A pattern for fetching log events that include a term and exclude another. **Note:** Filter patterns are case sensitive. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/FilterAndPatternSyntax.html	• Pattern for fetching log events that contain a single term, "STATUS_CODE": "STATUS_CODE" • Pattern for fetching log events that contain multiple terms, “STATUS_CODE” and “200”: “STATUS_CODE 200” • Pattern for fetching log events that include a term, “STATUS_CODE,” and exclude another term, “200”: “STATUS_CODE” – “200”

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon CloudWatch cluster runs, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Connection timeout	The number of milliseconds to wait before timing out the AWS connection attempt.	1000
Batch size	The maximum number of logs retrieved per query.	2500
Socket timeout	The number of milliseconds to wait before timing out a data transfer over an established connection.	10000
Default timezone	The default timezone if the log date and time doesn't include timezone information.	GMT
Sub sample drop ratio	The number of logs to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched logs.	-1
Sub sample receive ratio	The number of logs to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received logs.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no logs.	60
Polling interval	The interval, in seconds, to wait before polling for new logs.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Amazon S3 data input configuration fields

Description of the fields on the Amazon S3 data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon S3 is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Amazon S3 to stream log data to your instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sources count	The number of log sources this data input has created.
Disabled since	Time when the data input stopped or failed.
Last log time	Time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From/To	Starting and ending dates and time for reading the data. • From: Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Data newer than this date and time is not read. For live data, set this date far into the future. This field is required.	From: Now -1 week To: 2300-01-01 15:59:59
Bucket name	The Amazon S3 bucket to stream. This field is required.	my-s3-bucket
Prefix	Prefix for the objects to be fetched. The data input fetches only objects that begin with this prefix. This field is typically used to fetch only specific folders in a bucket.	/only/this/folder/
Include	File or object to include when the system performs pattern matching.	.*include-me.*

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab (continued)

Field	Description	Example
Exclude	File or object to exclude when the system performs pattern matching.	.*skip-me.*

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon S3 bucket is located, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Anonymous	Option to force accessing the Amazon S3 bucket without credentials, while ignoring default credentials if they exist.	False
Traverse	Option to access each directory in the bucket.	False
Object sorted by Last Modified Time	Option to fetch objects if the objects in the bucket are sorted by time.	False
Connection timeout	The number of milliseconds to wait before timing out the attempt to establish a connection to AWS.	100
Threadpool size	The number of concurrent threads that are downloading files from the bucket.	1
Buffer size	Size of the download buffer, in bytes.	100MB
Socket timeout	The number of milliseconds to wait before timing out data	10000

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
	transfer over an established connection.	
Max retry for file	The maximum number of times to retry file processing in case of failure.	10
Default timezone	The default timezone if the log doesn't include timezone information.	UTC
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Apache Kafka data input configuration fields

Description of the fields on the Apache Kafka data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Apache Kafka is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Apache Kafka to stream log data to your instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query Settings tab

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week

Transport tab

Field	Description	Example
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. The list does not have to include all the Apache Kafka Cluster servers.	123.4.5.6:9092,123.3.4.5:9093
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.	FirstTopic,SecondTopic,ThirdTopic
Kafka credentials	Reference to the Apache Kafka credentials. You can display the Kafka SSL credentials form by selecting the information icon ( ) and	None

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description	Example
	then selecting **Open Record**. The form enables you to choose the security protocol used for authenticating with Apache Kafka from the following options: • **SSL** - SSL channel. • **SASL_SSL** - SASL authenticated, SSL channel. • **SASL_PLAINTEXT** - SASL authenticated, non-encrypted channel. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.	
Group Id	The name of the Apache Kafka Consumer Group.	logs

Advanced configuration

Advanced configuration form

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Kafka SSL credentials fields

Description of the fields on the Kafka SSL credentials form.

SSL security protocol

Field	Description
SSL keystore	The content of an actual server.keystore.jks file, encoded as a Base64 string.
SSL keystore type	Format of the SSL keystore file. Default: Java KeyStore (JKS).
SSL keystore password	Password to the keystore, identical to the value of the ssl.keystore.password property in Apache Kafka.
SSL key password	Password, identical to the ssl.key.password property value in Apache Kafka.
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string.
SSL truststore type	Format of the truststore file. Default: Java KeyStore (JKS).
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property in Apache Kafka.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

SASL_SSL security protocol

Field	Description
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SASL_SSL security protocol (continued)

Field	Description
SSL truststore type	Format of the SSL truststore file. Default: Java KeyStore (JKS).
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property in Apache Kafka.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
User name	The user name, if any, associated with this credential. **Note:** The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.P required username=<user_name> password=<password>`
Password	The password associated with this credential. **Note:** • The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain. required username=<user_name> password=<password>` • The password you specify is invisible. It is stored in the database in encrypted form.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

SASL_PLAINTEXT security protocol

User name	The user name, if any, associated with this credential.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SASL_PLAINTEXT security protocol (continued)

	Note:
	The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server:
	`org.apache.kafka.common.security.plain.P`
	`required`
	`username=<user_name>`
	`password=<password>`

Password	The password associated with this credential.
	Note:
	• The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server:
	`org.apache.kafka.common.security.plain.`
	`required`
	`username=<user_name>`
	`password=<password>`
	• The password you specify is invisible. It is stored in the database in encrypted form.

Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

Cribl data input configuration fields

Description of the fields on the Cribl data input configuration form.

Getting Started

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID server	The MID Server to which the Cribl logs are streamed. This field is required.
Port	The port on the MID Server. Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started (continued)

Field	Description
	organization's security team opens the selected port. This field is required.

Config

Field	Description
Cribl instance URL	The URL of the Cribl instance. HLA uses this URL to establish the connection with the Cribl instance.
Cribl API token	The Cribl API token HLA uses to authenticate with Cribl and make API calls.

Process

Field	Description
Cribl route	The Cribl route that directs log data to a specific destination. This field is auto-populated with a drop-down list of all available routes, each configured with a default destination. You must select the desired route from this list. This field is required.
Cribl destination	The created Cribl destination. The Cribl destination points to the MID Server host and port configured in the data input. This field is read-only.

Edge Delta data input configuration fields

Description of the fields on the Edge Delta data input configuration form.

Edge Delta data input configuration form

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
Transport	The Edge Delta destination used for streaming log messages to the ServiceNow instance. The options are: • TCP - Frequently used for handling large volumes of log data. If you select TCP, you must provide the MID Server and port.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form (continued)

Field	Description
	When choosing the TCP transport option, create a TCP destination in Edge Delta to send log data to the instance from any source, using the same MID Server host and port you have configured for the Edge Delta data input. **Note:** For TCP, TLS/SSL is not supported. • HTTP: Frequently used for sending smaller logs via RESTful APIs, HTTP, or HTTPS for secure transmission. **Note:** For the HTTP protocol, authentication is used. If you select HTTP, you must provide the MID Web Server that is running on the MID Server. The system then populates the MID Server and port fields automatically, based on the provided MID Web Server. Depending on the MID Web Server configuration, you can send logs using either HTTP or HTTPS. If the **Secure Connection** check box on the MID Web Server extension form is clear, use HTTP. If it is selected, use HTTPS. For more information, see Event Management MID Web Server extension form. In addition, if the **Authentication Type** on the MID Web Server extension form is Basic, provide Basic authentication details in the Authorization header. If the **Authentication Type** is API Key, provide the key as “Key Api_Key". When choosing the HTTP transport option, create an HTTP destination in Edge Delta and enter the Endpoint URL in the following format: http://{MID_SERVER_IP}:{MID_WEB_SERVER_PORT}/api/mid/hla/raw. In Advanced Settings, create two headers to be attached to the HTTP request: ○ An Authorization header with the MID Web Server API key value or basic credentials as MID Web Server configured. ○ A Content-Type header named with the application/json value.
MID web server	The MID Web Server to which the log data is streamed.
MID server	The MID Server to which the Edge Delta logs are streamed. This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.
Port	The port on the MID Server used for listening to logs. Choose a port within the suggested range from the array. In the case of TCP transport, the port must not be occupied by another process. Make sure that your organization’s security team opens the selected port.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form (continued)

Field	Description
	This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.
Service instance	The service instance to which to bind the log data. This field is required. Choosing the service instance enables HLA to correlate CIs and service instances in the CMDB for root cause analysis. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

Elasticsearch data input configuration fields

Description of the fields on the Elasticsearch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to determine whether to use a specific MID Server or a MID Server cluster. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Elasticsearch indices is pulled.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when the **Execute on** field is set to Specific MID Server Cluster) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This data input uses Elastic to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Transport tab

Field	Description
Server URL	URL used to access the cluster. This field is required.
Max connections per route	Maximum number of connections to be opened per node. Default: 2.
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Authentication method	The authentication method used to authenticate the data input to Elasticsearch. The options are: Basic auth, apiKey, or client certificate. **Note:** When you select the required authentication method, the corresponding credentials fields display on the form.
Basic auth credentials	User name and password used to connect to the Elasticsearch search engine. **Note:** Fill in either this field or the **AWS credentials** field.
AWS credentials	AWS credentials to use to connect to the AWS-hosted Elasticsearch search engine.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
	Note: Fill in either this field or the **Basic auth credentials** field.
AWS region	AWS region where the Elasticsearch cluster runs.
API key credentials	The API key used to connect to the Elasticsearch search engine.
Client certificate	The client certificate used to connect to the Elasticsearch search engine.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.

Query Settings tab

Field	Description	Example
From/To	From and to dates and time for reading the data. • From: Don't read data older than this date. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Don't read data newer than this date. For live data, set this date far into the future.	From: 1970-01-01 15:59:59 To: 2300-01-01 15:59:59
Use cross-cluster search	Option for searching for data across Elasticsearch clusters. When this check box is selected, the **Clusters to search** field displays.	

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	Note: Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.	
Clusters to search	The Elasticsearch clusters to search. This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following: • Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"	east,west,south
Index prefix	Prefix for the Elasticsearch indices to read from. The data input reads only from indices with this prefix. This field is required.	only-read-these-indices-*
Use minimal privileges	Option for reading log data directly from the Elasticsearch indices with the configured prefix. • When selected, the data input reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the data input fetches all indices with the prefix, filters them, and reads the log data from the filtered

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.	
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.	
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)	yyyy-MM-dd'T'HH:mm:ss.SSSSSSS'Z'
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword.	{"severity": ["error", "warning"]}
Max documents per query	Maximum number of documents fetched in a single query.	
Sliced-scrolling tiebreaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id	
Search-after tiebreaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
Use search-after API	Option for toggling between using sliced-scrolling and search-after APIs. **Note:** Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.	
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty.	uuuu.MM.dd

Advanced configuration

Advanced configuration form

Field	Description
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The default timezone if the event date and time doesn't include timezone information.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description
	setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data. The configured number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,

GCP PubSub data input configuration fields

Description of the fields on the GCP PubSub data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which the logs are streamed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

Field	Description
Transport	Protocol used to send the log data: PubSub.
Sources count	The number of log sources this data input has created.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Transport tab

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id.
Topic Name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic.
GCP Credential Alias	The credential alias to be used. Specify one GCP credential alias by selecting the magnifying glass icon and then either selecting an existing credential alias from the **Connection & Credential Aliases** list, or selecting **New** to create a new record. The default is sn_occ.HLA_Credential_Alias. For information about creating a credential alias, see Credential aliases for Discovery.
Subscription Name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
	If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

Advanced configuration

Advanced tab

Field	Description	Default value
Subscriber Thread Pool Size	The number of concurrent threads that are downloading files from the Google Cloud Pub/Sub topic.	1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	(Read-only) The character encoding for this data input.	UTF-8
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	Clear

Microsoft Azure Event Hubs data input configuration fields

Description of the fields on the Microsoft Azure Event Hubs data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Event Hubs is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Microsoft Azure Event Hubs to stream log data to your instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Max batch size	The maximum number of events passed to a single process call.	100

Transport tab

Field	Description
Event Hubs namespace	The scoping container for the event hub or hubs. This field is required.
Event Hub name	The event hub from which to fetch log data. This field is required.
Event Hub credentials	Shared access authorization policy with which to authenticate to the event hub. This field is required.
Consumer Group name	The Consumer Group to use. This field is required.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Restore point rate	The number of events the data input can read before a restore point is saved.	100
Processor threads count	The total number of processor threads.	2
Operation timeout	The number of seconds to wait before timing out event hubs operations.	120
Receive idle timeout	The number of seconds to wait before timing out receive operations.	60
Prefetch count	The number of events received in advance of event hubs operations.	500
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Microsoft Azure Log Analytics data input configuration fields

Description of the fields on the Microsoft Azure Log Analytics data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Microsoft Azure Log Analytics to stream log data to your instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disabled since	The time when the data input stopped or failed.
Sources count	The number of log sources this data input has created.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Data source name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.	ContainerLog
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.	TimeGenerated

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

(continued)

Field	Description	Example
Max documents per query	The highest number of rows retrieved in each query.	500
Columns to select	Comma-separated list of column names to return. **Note:** This field is ignored when you provide a custom query.	LogEntry,LogEntrySource

Log query	A custom query for receiving log data from Microsoft Azure Log Analytics.
	
	The settings in this field override those in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics generates the query using the values set in the other fields.
	
	For the custom query, use the following JSON format:
	
	`{"query": "query | where TimeGenerated > %s | take 500"}`
		`{ "query":"ContainerLog`
		
		`| where LogEntry contains 'cartservice'`
		
		`| where TimeGenerated > %s`
		
		`| take 500", "workspaces": ["defaultworkspace-3ab145ff-f9cd-433f-8533-d1b1ee24aee6-eus"], "project": ["TimeGenerated", "LogEntry", "LogEntrySource"] }`

Transport tab

Field	Description
Redirect Url	The redirect URL of the access log application. The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL (GET request) section in the Microsoft Azure documentation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
	This field is required.
Azure service principal credentials	The credentials used to access Microsoft Azure resources. Choose **Client Secret** from the drop-down list. **Note:** You do not need Azure Enterprise Agreement (EA) credentials. This field is required.
Workspace Id	The Customer ID used to call the Microsoft Azure Log Analytics REST API.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.	4
Workers Queue Size	The queue size of the Event Processor workers.	5
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

MID Server data input configuration fields

Description of the fields on the MID Server data input configuration form.

Basic configuration

Field	Description
Description	Description of the data input.
MID	The name of the MID Server from which the logs are streamed.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses the MID Server to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a timezone.	GMT
Sub sample drop ratio	The ratio of events to discard.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Default value
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for discarding logs if there is a load on the MID Server.	

REST API data input configuration fields

Description of the fields on the REST API data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Web Server	MID Server to which the log data is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. When you select the MID Server, the **MID** and **Port** fields are completed automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This data input uses REST to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Rsyslog, Filebeat, or Winlogbeat data input configuration fields

Description of the fields on the Rsyslog, Filebeat, and Winlogbeat data input configuration forms.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the logs stream. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port on the MID Server. Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port. This field is required.
Content pack	(Linux using Filebeat only) The content pack to use. Content packs contain default source types and mapping script templates. Health Log Analytics activates the selected pack

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	automatically and uses its mapping script for mapping the data input sources. For more information, see Health Log Analytics content packs for quicker time to value.

Tagging and Binding tab

Field	Description
Path	The full path from which to stream logs. You can use a wildcard. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example: Tomcat. Components typically represent CIs in the CMDB. Several components are often clustered together in a single service instance.
Source Type	The source type, which defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types, based on the diversity of its log formats. Service instances and components can have any number of source types.

Advanced configuration

For Rsyslog data inputs:

Rsyslog advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option for selecting to use SSL/TLS.	
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rsyslog advanced configuration form (continued)

Field	Description	Default values
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	

For data inputs that use Beats agents:

Beats advanced configuration form

Field	Description	Default value
Client inactivity timeout (sec)	The timeout, in seconds, to close an inactive channel.	15
Worker thread count	The number of threads that handle incoming data.	4
Default time zone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Beats advanced configuration form (continued)

Field	Description	Default value
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	false

ServiceNow Log Export data input configuration fields

Description of the fields on the ServiceNow Log Export data input configuration form.

ServiceNow Log Export data input configuration fields

Field	Description
Name	Name of the new data input. This field is required.
Service instance	The service instance to which to bind the log data. **Important:** The service instance field is pre-populated with a value. Changing this value is necessary only if there is a compelling reason to do so. Consider the implications carefully before making any changes.
Certificate password alias	The credential alias you created in **Basic Auth Credentials**. This field is required. For more information, see the Before you begin section in Configure a ServiceNow Log Export data input in Health Log Analytics manually.
Description	Option to add a brief description of the data input to help identify it.
Log level	The log level indicating the severity of the log messages. The available log levels are: • INFO: Information messages representing service actions. This is the default log level. • ERROR: Non-fatal error messages. • WARN: Warning messages indicating potential issues.
Status	Status of the data input: Active or Not Active. This field is read-only.
Disabled since	The time when the data input stopped or failed. This field is read-only.

ServiceNow System Logs Retriever data input configuration fields

Description of the fields on the ServiceNow System Logs Retriever data input configuration form.

ServiceNow System Logs Retriever data input form fields

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Service instance	The service instance to which to bind the log data. The default value is ServiceNow Glide Sys Log. This field is required. **Note:** Health Log Analytics comes with the source type glide_sys_log for log traffic from the ServiceNow Glide Sys Log service instance.
From	From date and time for reading the data. The data input doesn't read data older than this date and time. This field is required.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Syslog table filter	The criteria used to filter log data from the System Log table before streaming it to the AI engine.

Splunk data input configuration fields

Description of the fields on the Splunk data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the logs stream.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port for the MID Server. Make sure that your organization's security team opens the selected port in the MID Server. This field is required.
Transport Protocol	The protocol used for streaming log messages to your ServiceNow instance. • TCP - When using the Transmission Control Protocol (TCP) protocol, all logs will reach the instance. However, the Splunk pipeline might be blocked if the MID Server is down or the connection to it is lost. TCP is the default transport protocol. • UDP - When using the User Datagram Protocol (UDP) protocol, the Splunk pipeline will never be blocked. However, some logs might be dropped before they reach the instance. For more information about streaming log data using the TCP or UCP transport protocol, see the Streaming Splunk data using Heavy Forwarder: Selecting TCP or UDP [KB0998928] article in the Now Support Knowledge Base.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	Note: If you select this option, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is relevant when using Splunk Universal Forwarders and can only be used when SSL/TLS is enabled.

Advanced configuration

Advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option for selecting to use SSL/TLS. **Note:** To send logs in a compressed format, SSL/TLS must be enabled.	
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default values
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	

Splunk Polling data input configuration fields

Description of the fields on the Splunk Polling data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster.
MID	(Only when the **Execute on** field is set to Specific MID Server.) The MID Server to which the logs are streamed. This field is required.
MID Server Cluster	(Only when **Execute on** is set to MID Server cluster.) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, create a service instance and add CIs to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance.
Sources count	The number of log sources this data input has created.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
Last log time	The time when the last log streamed in the data input.

Advanced configuration

Transport tab

Field	Description
Server URL	The URL used to access the Splunk REST API.
Query	The query Splunk uses to search your data.
Authentication Type	The authentication type. • Basic authentication: Sends a username and password with each HTTP request. Basic authentication is simpler than token-based authentication, but less secure. • Token authentication: The client obtains a token from an authentication server and uses that token to authenticate against Splunk.
Splunk Poll Credential Alias	The credential alias to be used. Specify a Splunk Poll credential alias by selecting the magnifying glass icon and then either selecting an existing credential alias from the **Connection & Credential Aliases** list, or selecting **New** to create a new record. The selected credential alias can hold one Basic Auth credential and one Token Auth credential. For information about creating a credential alias, see Credential aliases for Discovery.
From	The date and time from which Splunk searches the data.
To	The date and time until which Splunk searches the data.

Advanced tab

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced tab (continued)

Field	Description
Splunk request timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

TCP data input configuration fields

Description of the fields on the TCP data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
MID	The MID Server to which the logs are streamed. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Status of the data input.
Transport	Protocol used to send the log data. Rsyslog and Splunk send data using the TCP protocol.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Use SSL/TLS	Option for selecting to use SSL/TLS.	
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".	

UDP data input configuration fields

Description of the fields on the UDP data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
MID	The MID Server to which the logs are streamed. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Status of the data input.
Transport	Protocol used to send the log data: UDP.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	Limitation on the number of events per second that the data input processes.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	false

Vector Agent data input configuration fields

Description of the fields on the Vector Agent data input configuration form.

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
Description	Description of the data input.
MID Server	The MID Server to which the Vector Agent logs are streamed. This field is required. **Note:** If the MID Server is down or the connection is lost, the Vector pipeline may get blocked.
Port	The port on the MID Server used for listening to logs. This field is required. Choose a port within the range of 6000-6200.
Transport	The protocol used for streaming log messages to your ServiceNow instance. Currently, only TCP is available.
Status	Status of the data input.

Sections and cards on the alert Overview tab in Health Log Analytics

The **Overview** tab helps you understand component-based alerts, Log Analytics alerts, and Log Analytics alert groups.

Information on the Overview tab for a Component-based alert

The alert **Overview** tab in Health Log Analytics helps you understand Component-based alerts.

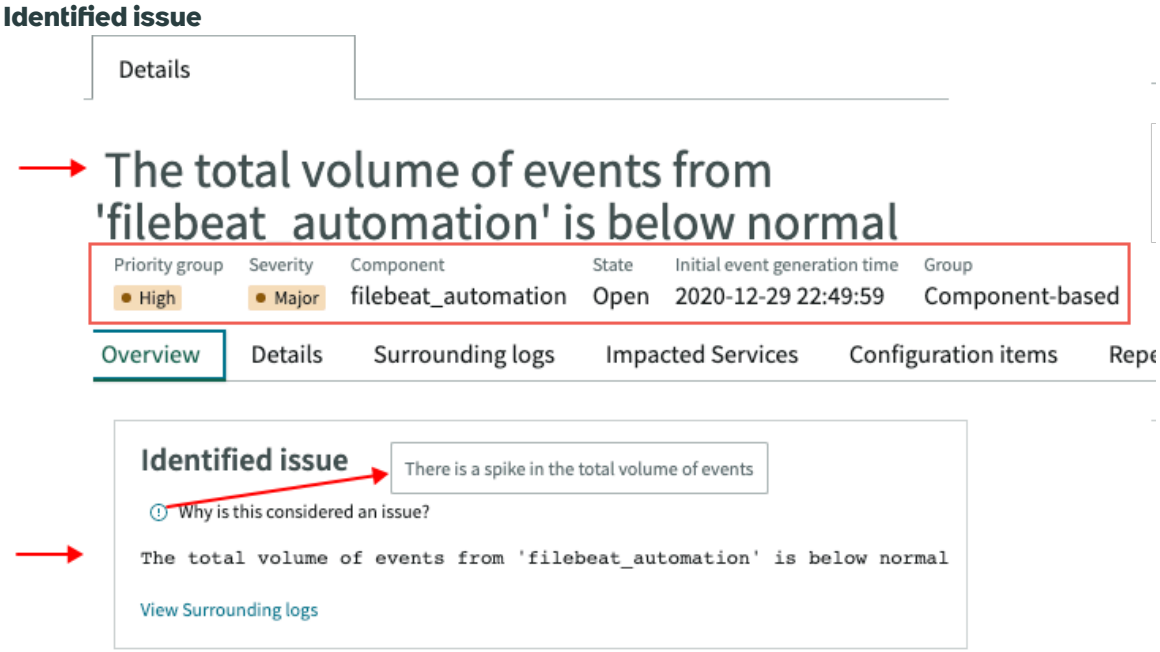
Sections on the Overview tab for a Component-based alert

For a detailed description of Component-based alerts, see Types of Health Log Analytics alerts.

Identified issue

The "identified issue" led to the alert. The issue appears in the title for the alert and on a card on the tab. Information about the alert appears in the banner.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Click the information icon (ⓘ) to see how the issue was identified.
- Click **View surrounding logs** to view the log lines that were generated one minute before and one minute after the alert. See Analyze log lines around the anomaly to help find the root cause.

Configuration Items

To view more detailed information on the CIs that are associated with the alert, click the **Configuration Items** tab or click **View more** in the Configuration Items section. See Operator phase 1: Analyze and acknowledge an alert.

Impacted services

To view detailed information on the services that are impacted by the alerts, click the **Impacted services** tab. See Operator phase 1: Analyze and acknowledge an alert.

Anomaly

The Anomaly card illustrates the anomalous activity that led to the alert.

- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

- Click the information icon to see how the anomaly was identified: ⓘ.

In this example, the peach-shaded area shows the same data for the same hour one day earlier. The spike in the metric value (events per minute) is clearly visible.

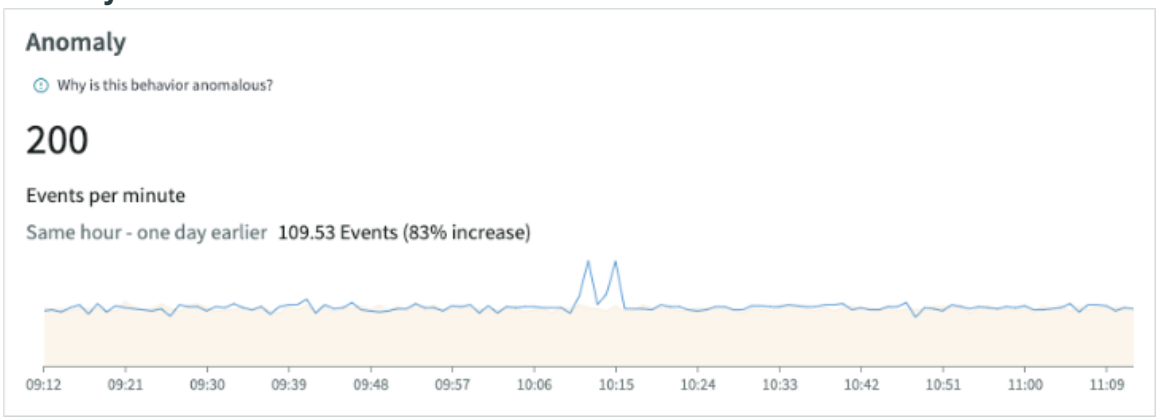
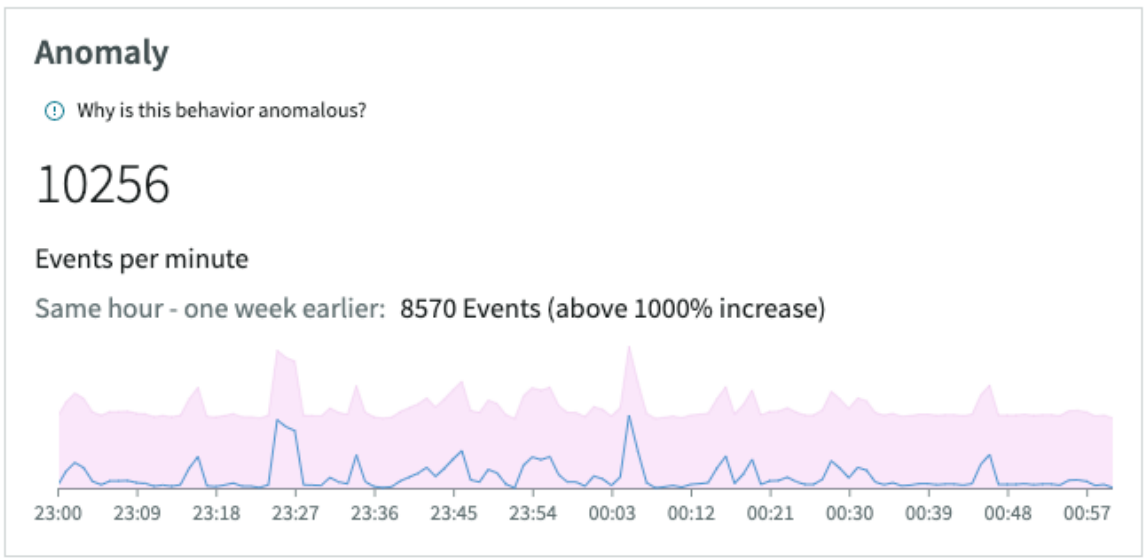
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Anomaly card



In this example, the pink-shaded area represents the baseline values for the same hour in the previous week.

Anomaly card with baseline values one week earlier



For more information on the kinds of anomalies that you might encounter, see Types of anomalous behavior in Health Log Analytics.

Meaningful log properties

On the Meaningful log properties card, each bar chart shows the distribution of values for a single log property that contributed to the anomaly. Each property value is associated with a color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property. For the *p_a5* property in the example, the value *EUR* appeared in 56.12% of log lines, *GBP* in 13.67%, and so on.

Top incidents

Information on the Overview tab for a Log Analytics group

The alert **Overview** tab in Health Log Analytics helps you understand Log Analytics groups.

Sections on the Overview tab for Log Analytics groups

For a detailed description of Log Analytics groups, see Types of Health Log Analytics alerts.

Correlations banner

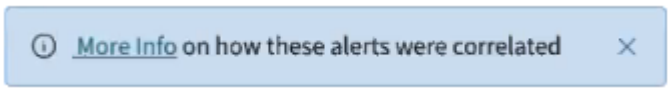
During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics alert.

The following kinds of data are considered when determining whether alerts are correlated:

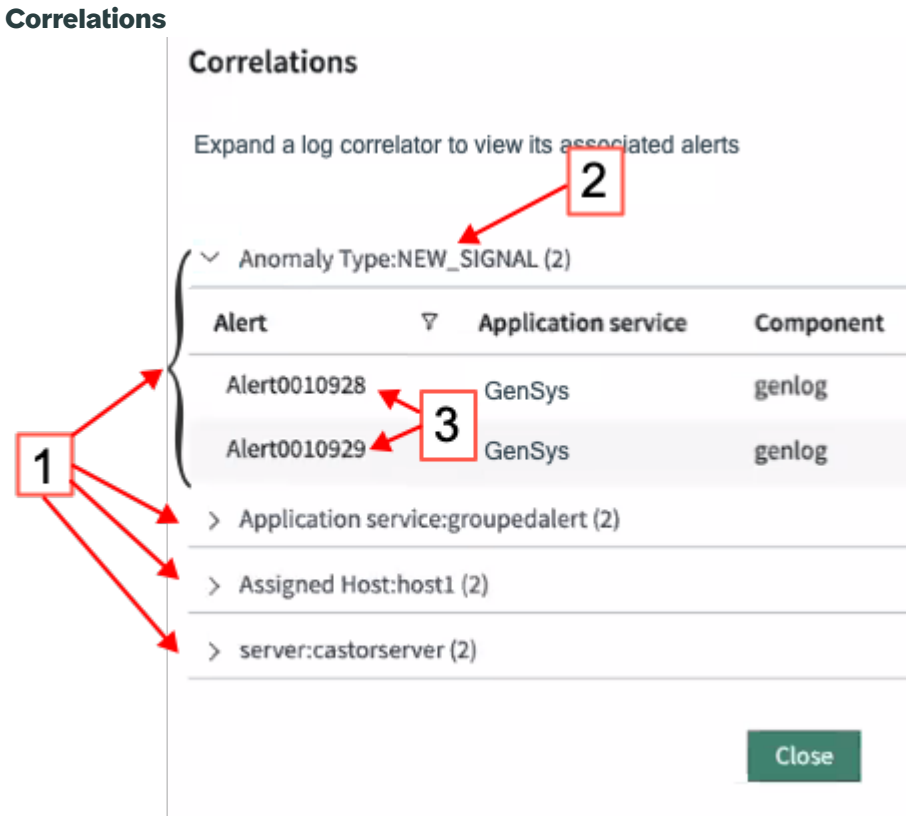
- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Click the **More info** link on the Correlations banner to view the list of correlations that relate the Log Analytics alerts.

Correlations banner



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share. The number in parentheses is the number of alerts in the correlation.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in parentheses indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

For a Log Analytics alert (Alert0010166 in the example), the Alerts in group section shows the Log Analytics alerts that are grouped under the Log Analytics alert.

Click a Log Analytics alert to view its details. To view the full list of Log Analytics alerts, click **View more** or click the **Alerts in group** tab.

© 2025 ServiceNow, Inc. All rights reserved.

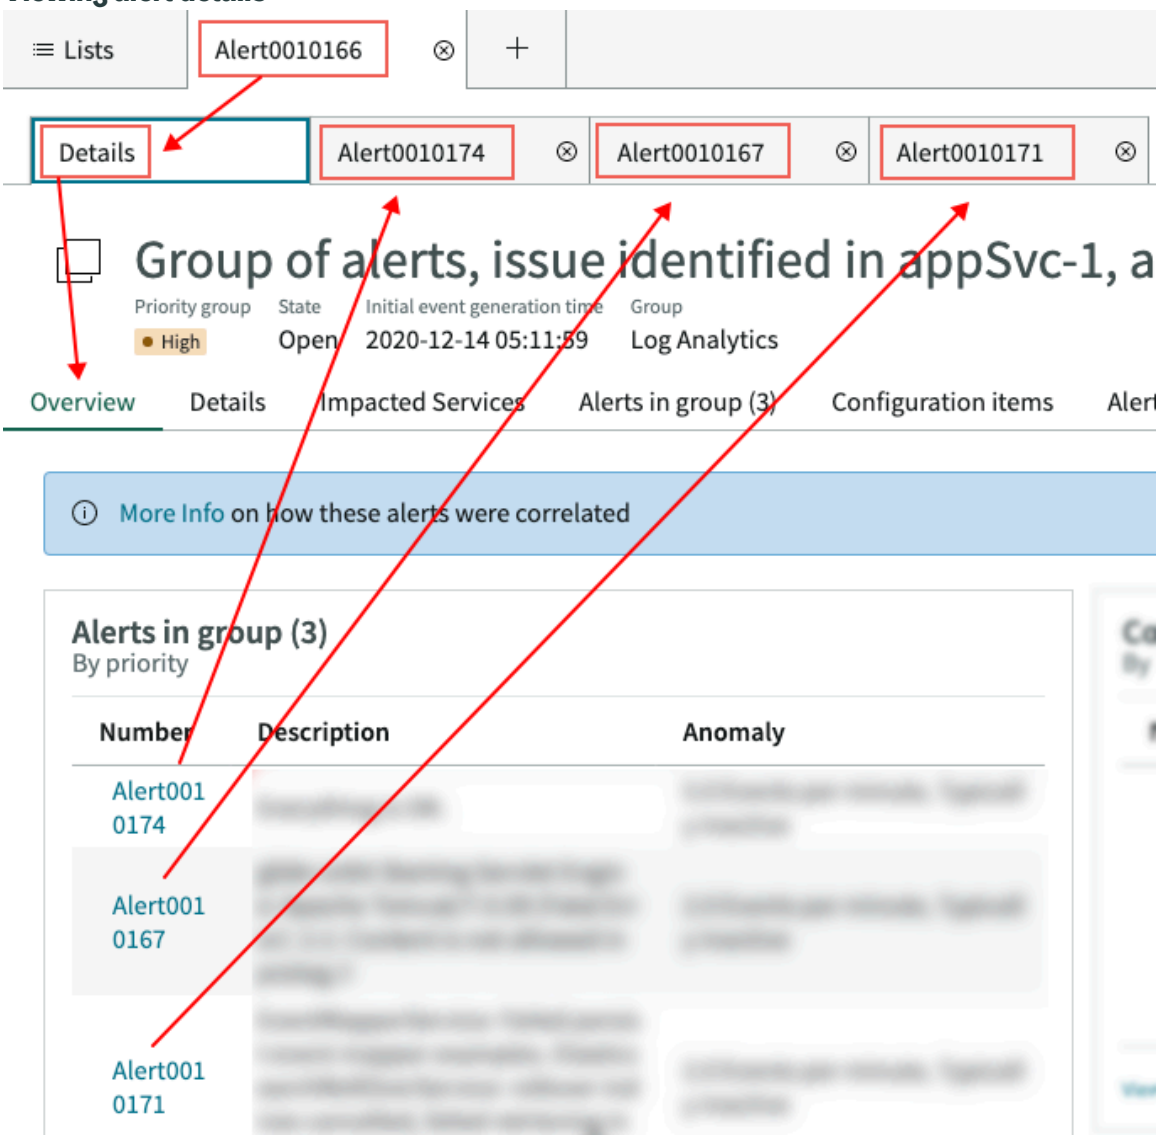
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing alert details



Configuration Items

To view more detailed information on the CIs that are associated with the alerts, click the **Configuration Items** tab or click **View more** in the Configuration Items section. See Operator phase 1: Analyze and acknowledge an alert.

Impacted services

To view detailed information on the services that are impacted by the alerts, click the **Impacted services** tab. See Operator phase 1: Analyze and acknowledge an alert.

Log Analytics alerts on the Alerts in group tab

The table describes the Log Analytics alerts in a Log Analytics group on the **Alerts in group** tab.

Alerts in group tab

Column	Description
Number	The number of the alert that appears in the list of alerts on the Operator Workspace dashboard.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group tab (continued)

Column	Description
	To view detailed information for an alert on the **Details** tab, click the alert number. This field is automatically set.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.
Description	Anomalous pattern or metric that caused the alert to be generated.
Severity	Severity value for the alert. The available values are: • **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Either performance has degraded or there is a partial, non-critical loss of functionality. • **Warning**: Attention is required even though the resource is still functional. • **Info**: An informational message. An alert is created, but the resource is still functional. • **Clear or Resolved**: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Priority group that indicates the order in which to resolve alerts. Choices are as follows: • **Urgent** • **High** • **Moderate** • **Low** The priority group value is more important than severity alone. For example, a high priority and low severity alert should be addressed before a low priority and high severity alert. For information on how priority is calculated, see Alert priority.
State	Processing state of the alert. A newly generated alert is in the **Open** state. Other states are as follows:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group tab (continued)

Column	Description
	• **Reopen**: A previously closed alert is open again, and it requires your attention. • **Flapping**: The alert is receiving identical events from the same source at high frequency. This state can cause an alert to re-open from the Closed state, resulting in a high frequency of changes between Open and Closed states. • **Closed**: The alert is closed and does not require any further action. You close an alert when it is remediated.
Configuration item	CI in the CMDB. The CI is applied to by the alert.
Node	Node field that is received in the log message. The event described in the log message occurred on this node. Often, the node is the name of the CI that is associated with the alert. For example, a computer name, IP address, FQDN, or MAC address.
Source	All Log Analytics alerts have the value **Log Analytics** in the **Source** column to indicate that Health Log Analytics generated the alert.
Metric name	Name of the metric whose anomalous behavior led to the alert. For example, the *I/O request* in the case that the I/O request took longer than 15000 ms to complete.
Updated	Most recent time when the alert information or state was updated.

Information on the Overview tab for a Log Analytics alert

The alert **Overview** tab in Health Log Analytics helps you understand Log Analytics alerts.

Sections and cards on the Overview tab for Log Analytics alerts

For a detailed description of Log Analytics alerts , see Types of Health Log Analytics alerts.

Identified issue

The "identified issue" led to the alert. The issue appears in the title for the alert and on a card on the tab. Information about the alert appears in the banner.

View the list of alerts that are provided by the Alert Insight feature on the **Alert Insight Similar Alerts** tab. The Alert Insight feature generates the information to help you resolve the alert.

Alert Insight Similar Alerts tab

The tab lists information on other alerts generated over the preceding 30 days that have the same CI type, source, resource, metric name, and so on.

Service Operations Workspace provides a context-aware alert triage based on data from IT Service Management (ITSM), such as from incidents, change requests, and problems. The Alert Insight feature helps you to determine the root cause and recommends a solution. Using smart launch in context, you can perform any of the following actions:

- Launch an application
- Open a browser at a specified URL
- Perform remediation (based on orchestration)
- Launch a subflow (workflow based on flow designer).

Surrounding logs tab fields

This section describes the information displayed on the **Surrounding logs** tab.

Surrounding logs tab

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Application service	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Surrounding logs tab (continued)

Column	Description
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

Log Viewer table fields

This section describes the information displayed in the **Log Viewer** table.

Log Viewer table fields

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Service instance	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error**

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log Viewer table fields (continued)

Column	Description
	• **Warning** • **Notice** • **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

Note:
The Raw message column does not appear in the Log Viewer table by default. You can display this column by selecting it from the **Filters** pane. For more information, see Customize the Log Viewer table in Health Log Analytics.

Log correlators form fields

This section describes the fields on the Log correlators form.

Log correlators form

Field	Description
Type	Type of log correlator. Choices are as follows. • **Free text correlator**: The log correlator analyzes text in the log message. • **Log-key correlator**: The log correlator analyzes log metadata. For example, the name of a service instance in your infrastructure. Log property correlators are specific to the business context of your environment. For more information, see Identifying related alerts in log data by using log correlators.
Free text term or Identifier	Text that the log correlator isolates when parsing log lines. The label for this field is **Free text term** for free text log correlators and **Identifier** for log property correlators. **Note:** The value of this field can be the text for either type of log correlator. As a result, the label for this column in the resulting list of log correlators is **Correlation indicator**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log correlators form (continued)

Field	Description
Active	Option to apply the log correlator. When you select this field, the system applies the log correlator to the log stream.
Range of analysis	Set of sources whose log data are analyzed by this log correlator. Choices are as follows: • **All sources**: The log correlator is applied to log lines from all sources in the data stream. • **Only new sources**: The log correlator is applied to log lines from all sources created after this log correlator is activated. • **Specified source**: The log correlator is applied only to the log lines from the source that you specify on this form.
Excluded sources	Sources that are excluded from the log correlator. The system does not analyze log lines from sources that are listed in this field. **Note:** This field applies only when the **Range of analysis** field is set **All sources** or **Only new sources**. For information about excluding a source from a log correlator, see Exclude a source from a log correlator.
Source	Source of the log correlator. The log correlator analyzes the data of this log source. This field appears only when you are adding the log correlator from the Log Sources form. The field is automatically set to the log source that you are working on.

Log-based CI candidates fields in Health Log Analytics

Field descriptions for the Log-based CI candidates table, the Log-based CI candidate form, and the Add CI candidate to CMDB form.

Log-based CI candidates table

Field	Description
Host name	The host name that Health Log Analytics discovered in the log data.
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log-based CI candidates table (continued)

Field	Description
	• Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server • Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
Last log time	(Read only) The last time this host was found in the log data.
Operation	(Read only) The suggested action to take: Add - Add the CI to the CMDB.
Status	(Read only) The status of the suggested action. • Pending - No action has been taken. • If the taken action failed, this field contains an error message.

Log-based CI candidate form

Field	Description
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type: • Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server • Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
CI name	The host name that Health Log Analytics discovered in the log data.
Operation	(Read only) The suggested action to take: Add - Add the CI to the CMDB.
Last log time	(Read only) The last time this host was found in the log data.
Status	(Read only) The status of the suggested action:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log-based CI candidate form (continued)

Field	Description
	• Pending - No action has been taken. • If the taken action failed, this field contains an error message.

Add CI candidate to CMDB form (Linux Server)

Field	Description
Name	The name of the CI.
Asset tag	Alphanumeric information to help track the asset associated with the CI.
Manufacturer	The device manufacturer.
Asset	(Read-only) The asset associated with the CI.
Class	The asset group. For example, Linux Server.
Comments	Information about the asset.
Company	The company associated with the CI. This field is required.
Serial number	The serial number associated with the CI.
Model ID	The device model ID.
Assigned to	The person using or primarily responsible for this item.
Host name	The host name of the CI.
OS Domain	The OS domain of the CI.
Operating System	The OS running on the CI.
OS Version	The version of the OS running on the CI.
OS Service Pack	The service pack installed on the OS.
DNS Domain	The DNS domain of the CI.
IP Address	The IP address of the CI.
Disk space (GB)	The amount of disk space, in GB.
Description	Textual description of the CI.
RAM (MB)	The amount of RAM on the computer, in MB.
CPU manufacturer	The CPU manufacturer.
CPU type	The CPU type.
CPU speed (MHz)	The speed of the CPU, in MHz.
CPU count	The number of CPUs.
CPU core count	The number of cores per CPU.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add CI candidate to CMDB form (Linux Server) (continued)

Field	Description
IsVirtual	Option for indicating whether the device is running on a virtual machine instance.

Service Reliability Management

Service Reliability Management (SRM) helps your organization respond, collaborate, track, and self-remediate when working on alerts and incidents. SRM is available when you have both ITSM Standard and ITOM Operator Professional subscriptions.

Overview of Service Reliability Management

Get started

Explore	Configure
Learn about SRM concepts and features.	Install and configure SRM.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use	Reference
Work with services, teams, and reliability tasks in SRM.	Get details about SRM components, such as fields, tables, and properties.

Install from the Store

Install SRM from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note:
When installing from the store, first confirm that you have all the dependencies needed by selecting the Dependencies tab. For more information, see Install Service Reliability Management from Admin Center or ServiceNow Store.

Troubleshoot and get help

- Visit our community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Exploring Service Reliability Management

Service Reliability Management (SRM) provides a self-serve, guided experience for teams to manage service health. The experience is built using the Service Operations Workspace application and combines ITOM and ITSM capabilities into a single workflow.

SRM overview

Optimize service health with site reliability engineering (SRE) practices. SRM is a single operations workspace that empowers teams to improve the reliability of digital services with SRE.

- Use on-call escalations to respond to issues in a timely manner.
- Reduce setup friction with guided self-service to onboard distributed teams with separated data, empowered access, and minimal governance from central IT.

When SRM is installed, several plugins and applications are also activated. For more information, see Plugins or applications installed with ITOM AIOps.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SRM users

Users

Users	Description	Contains Roles
admin	ServiceNow administrators manage, configure, and maintain the ServiceNow platform. In SRM, they can access and work in the Service Operations Workspace Admin Center. Only administrators can do the following: • Install SRM. • Add and manage SRM administrators. • Create and manage integration users.	All
SRM administrator [srm_admin] **Note:** This role differs from the ServiceNow admin role.	SRM administrators can manage account settings, configurations, and users. Administrators can perform the following actions: • Access, create, edit, or delete all SRM configurations. • Add or manage integrations. • Create integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget policies.	• Manager • Responder
SRM manager [srm_manager]	Managers oversee a team of SREs. Managers assign SREs to the team on-call schedule, monitor their performance, and create procedures to handle incidents and develop solutions. Managers promote resilience across all the systems and the DevOps workflows. Managers can perform the following actions within the context of their teams:	Responder

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	• Define and set up teams, on-call schedules, and services. • Add and delete users such as responders and managers for the teams they're a part of. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget policies.	
SRM responder [srm_responder]	A Service Reliability Engineer (SRE) that uses SRM to perform everyday tasks. Responders are the individuals who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams: • Set up services, teams, and integrations. • Confirm their on-call schedules. • Manage incident and alert records. • Update teams that they've created. • Add other responders. • Create integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget actions.	Inherits 17 roles including the following: • cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

For more information, see SRM roles and responsibilities.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SRM workflow

1. Product teams in IT or Lines of Business continuously deliver new service instances and technology management services. Example: New customer billing portal.
2. Along with SLO Management, teams can register services and define service level objectives (SLOs), helping them reach business outcomes. Example: 95% monthly availability for the billing portal.
3. Monitoring integrations are set up by the teams to collect the real-time health of these services. Example: Cloud Observability.
4. Monitoring creates service level indicators (SLIs) impacting alerts when services are underperforming. Automation groups and enriches. Example: Billing portal latency is exceeding 7 s.
5. When the alerts indicate an outage or customer-impacting degradation, incidents are created and on-call notifications notify appropriate team resources. Example: A Billing SRE team is notified via phone of a latency issue on the billing portal.
6. After teams collaboratively diagnose and remediate incidents, they identify action items for improving the system's resilience. Example: The Billing team decides to add additional web server capacity.
7. Management continually reviews SLO performance, helps to prevent changes when the error budget is exhausted, and prioritizes improvement initiatives for underperforming services.

SRM benefits

Benefit	Feature	Users
Team-based experience	Working with SRM teams	SRM administrators, managers, and responders
Service registration	Working with SRM services	SRM administrators, managers, and responders

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Feature	Users
Prebuilt integrations	Working with integrations in SRM	SRM administrators, managers, and responders
Measure service health	Working with reliability metrics	SRM administrators, managers, and responders
On-call coverage	Create an SRM on-call schedule	SRM administrators, managers, and responders
Remediate high severity alerts and incidents	Working with SRM reliability tasks	SRM administrators, managers, and responders

What to explore next

To learn more about configuring and using SRM, see:

- Configuring Service Reliability Management
- Using Service Reliability Management
- Service Reliability Management reference

Get started with Service Reliability Management

Service Reliability Management (SRM) accelerates your path to viewing service health in the context of service level objectives and incident resolution. Helps IT Operations and DevOps teams deliver on the promise of agility, performance, and uptime.

Get started with SRM to understand the different sections in the SRM interface.

For more information on roles, see SRM roles and responsibilities.

Basic SRM tasks

Step	Description	Reference
Set up teams and services	Setup guides for the Home, Services, and Teams pages show how to add a team or service to SRM.	Add an SRM team
Visit and learn about your Home page	The Home page is where you find the things most important to you. For example, the services with critical alerts and incidents and work assigned to you and your team.	SRM Home page
Learn how to navigate SRM	Get familiar with the different sections and elements of the SRM interface. The sections and elements are used throughout the documentation.	SRM interface

SRM helps you when you must create and administer teams, services, and integrations.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SRM tasks

Step	Description	See this
Manage a service instance or technology management service in SRM	Define the basic tasks and parameters that make up your service and how it should behave.	Add a service to SRM
Set up an SRM team	Set up a team. Teams are responsible for the issues that occur in their associated services.	Add an SRM team
Set up on-call schedules and escalation policies	Create an on-call schedule for your team to make sure they're available to resolve issues. You can set up an escalation policy to make sure at least one team member is engaged in incident response.	Create an SRM on-call schedule
Configure service relationships	Use a map canvas to add, configure, and arrange services. You can add child services that depend on parent services.	View impact of child service on parent service
Integrate services with third-party monitoring tools	Set up a third-party integration, such as Datadog or ServiceNow Cloud Observability, with SRM so that alerts are available to your teams within SRM.	Working with integrations in SRM
Establish SLOs, SLIs & error budgets for services	Establish goals for how well your service should operate. Also, specify the maximum amount of time that a technical system can fail without contractual consequences.	Service Level Objective Management
Set up alert automations **Note:** This functionality is only available if you have installed the Alert automations application.	Alert automations enable you to define alert conditions. Set up alert rules for each APM tool to define the conditions when the APM tool should send notifications to SRM.	The Alert automation application is available from the ServiceNow Store.

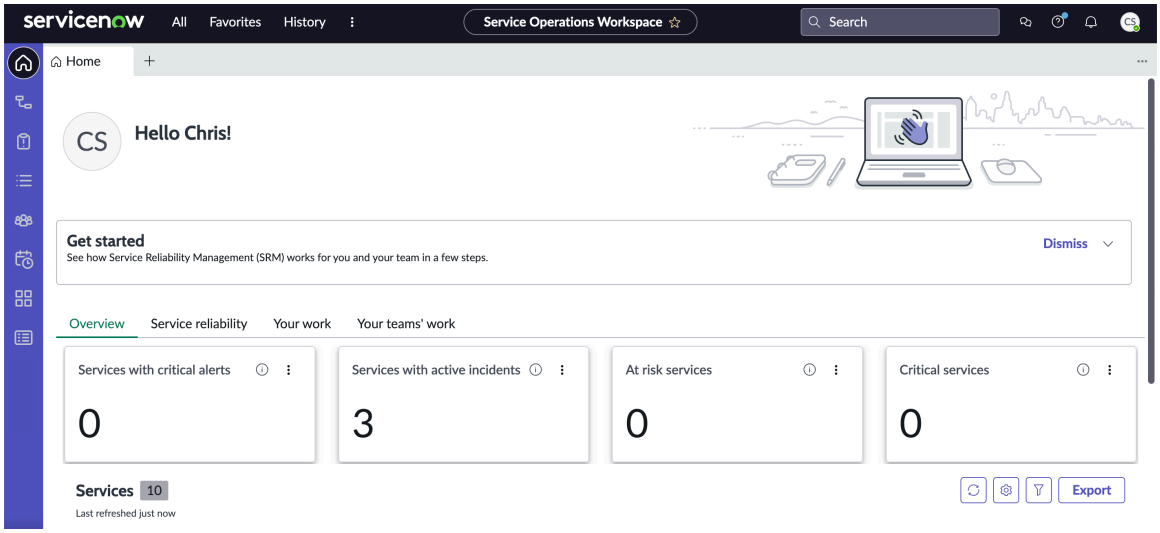
SRM Home page

The Service Reliability Management (SRM) Home page provides relevant information about your work, services, schedules, maintenance reminders, and teams. View the Home page by navigating to **Service Reliability Management**.

Service Reliability Management Home page sections

In the workspace, select **Home** ( ) to view the Home page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When you're on-call, your schedule is listed.

Home page sections

Get started	Contains setup tasks and their progress for teams and services. For more information on completing setup, see Add a service to SRM and Edit service details in SRM. **Note:** You can skip any section and come back to it later. Progress is marked in percentages by the actions that you take. As long as a step remains incomplete, the tiles are available. You can minimize them, at any point, by selecting the Up icon . Use **Dismiss** to remove it from your page. The checklist states are as follows: • **None**: No action has been taken. • **Done**: All required fields have been added. • **Pending**: Some fields or approvals still must be added or granted.
Overview	Contains an overview of all service alerts, incidents, and at-risk and critical services. **Services with critical alerts** are the default list view. Select a card to see the list view for that area.
Service reliability	Displays a dashboard for monitoring and managing service performance. The dashboard offers multiple visualizations to help you track error budgets, monitor service level objectives, and identify issues across services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Home page sections (continued)

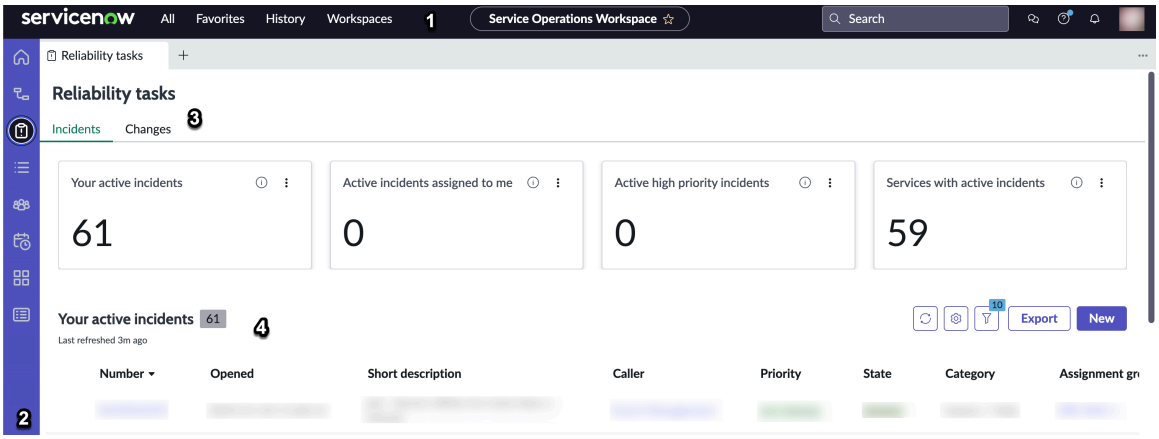
Your work	Contains incidents and alerts assigned to you. Select a card to see the list view for that area.
Your teams' work	Contains incidents and alerts assigned to your team. Select a card to see the list view for that area.

SRM interface

The different components on the Service Reliability Management (SRM) interface provide easy access to different functions. The features and functions that appear depend on your role and permissions.

The SRM interface has the following different sections:

Interface sections



Note:
If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics. Depending on your role, you may see other icons in the primary navigation.

If you see the SOW Home page, select an SRM icon to view SRM-specific information.

Sections	Description
1 - Header	A home for your organization logo and system-level utilities present everywhere in the interface. • All • Favorites • History • Workspaces • Current workspace • Search • Sidebar discussions

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sections	Description
	• Help • Notifications • Profile icon: Represents your profile
2 - Primary navigation	Easy access to specific pages in SRM. The primary navigation uses icons, including icons for Services, Reliability tasks, Teams, and Schedules. Use tooltips to identify them.
3 - Content headers	Tabs, cards, or buttons that provide the means to accomplish product-level tasks. The elements in the content header differ from one page to another.
4 - Content area	Canvas or the main area where you can gather information, read metrics, and perform tasks. **Note:** If you want to minimize the side panel on forms, by default, navigate to **Preferences** > **Workspace** and disable the **Show sidebar** option. That action disables it across the Service Operations Workspace, not just SRM.

Search, filters, lists, forms, and guides

An overview of the additional elements in the Service Reliability Management (SRM) interface that help you find items, view available forms and lists, and follow setup processes.

Table List view

View services and incidents as a list.

- Search using the header text box.
- Order items using the list columns.
- Filter list results using the list columns.

Note:

View the active filters using the filter icon in the list view header.

Each view contains its own unique items. See those pages for details.

Form view

When you open any of the table records from the list view, you see the details of the record as a form.

Each view contains its own unique items. See those pages for details.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

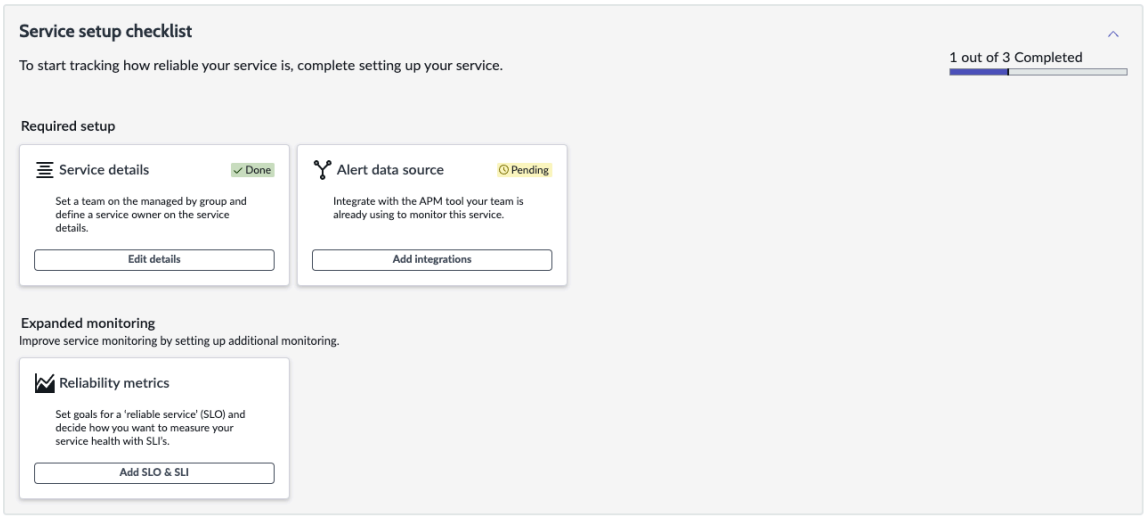
Note:
Grayed out fields can't be changed.

The Attachments panel is often visible by default, to hide it select the Attachment icon .

Setup checklists

Use the setup checklists to visualize the process that you go through to reach your goals. Each step is highlighted as you complete it.

Service setup checklist example



Export list information to a file

You can export live information to a file in Service Reliability Management (SRM).

Before you begin

Note:
Bulk selection doesn't impact exports. The export includes all records that match the current filter criteria. It doesn't consider the selections you make in the list view.

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the list view in any landing page section in SRM with an **Export button**.

3. Determine which filters you want to use and select them from the Filters or More actions menu in the list columns.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

The Export button only becomes available if there are records in the list view.

The export contains all list data that matches your filtered/grouped lists.

4. Select **Export**.
   In the pop-up window select:
   - File Type:
     - Excel
     - CSV
     - JSON
     - PDF
   - Delivery type:
     - Download
     - Email: Provide an email address

   For **Email**: Once the export is complete, a success message appears with your email address at the top of the screen. It's useful for larger files because, depending on the size of the file, exporting might take some time. Email runs in the background, so you're free to do something else while waiting.

   For **Download**: The pop-up begins exporting and the file appears in your Download directory. Depending on the size of the file, it might take some time. You can open it in any application that supports the file format.

Manually create SRM tags

Add tags to classify, categorize, and add context to data. Service Reliability Management (SRM) imports tags and attaches them to services, alerts, and incidents. You can also manually create tags.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

About this task

There are two ways that tags can enter the system and attach to an alert or incident. The first is automated but the last one is manual.

- Imported from a third-party integration such as Datadog.
- Using the tag icon in the header of a service, alert, or incident.
- Added using the **Modify field values** action in an automation rule.

This task describes how to add tags to services and incidents in SRM. For information about managing alerts, see Alerts in Service Operations Workspace.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Services** or **Reliability tasks**.
3. Open a service or incident.
4. In the header, select the **Tag** icon to add tags.
5. Enter your tag in the pop-up window.
   Your tag is saved and appears below the Add Tag box alongside any existing tags.
6. Select anywhere in the form to close the pop-up.

Note:

Tags are also shown under the description in the incident list view.

SRM incidents

Track and collaborate on incidents in the Incidents tab, helping you and your teams resolve issues efficiently.

The Incidents tab appears in the Service Reliability Management (SRM) Reliability tasks page. Its top header shows description information, tags, priority information, state, service, and assignment group.

Note:
Tags are imported from third-party integrations and attached to incidents. However, you can also create tags to categorize data and drive system logic using the Tag icon . For more information on creating and viewing tags, see Manually create SRM tags.

When selecting an incident, you're taken to an overview. This section contains three content panels: Summary, Activity, and Recommended actions.

Note:
When an editable field is updated, notifications are sent based on user notification preferences.

In the Impact Summary, you find the following information:

Affected CIs

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.

Impacted Services

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.
Managed by	Team responsible for the incident.
Owned by	Incident owner.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impacted Services (continued)

Field	Description
Approval group	Team responsible for approvals.
Location	Geographical location of the incident if defined.
Operational status	Status of the incident.
Manually added.	Whether this incident was manually added or the result of an error budget policy.

Details

Contains incident details and related alerts

Field	Description
Short description	Brief description of the incident.
Description	Detailed description of the incident.
Number	Incident identifier.
Impact	Impact is a measure of the effect of an incident on business processes. Choices are: • 1 - High • 2 - Medium • 3 - Low
Assignment group	Team assigned to the incident.
Priority	Priority is based on **Impact** and **Urgency**, and it identifies how quickly the incident should be addressed. Choices are: • High Impact = Critical Priority • Medium Impact = High Priority • Low Impact = Moderate **Note:** See Priority Data Lookup rules below.
Category	Category of the incident. Choices are: • Inquiry/Help • Software • Hardware • Network • Database

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details

Contains incident details and related alerts

(continued)

Field	Description
Urgency	Urgency is a measure of how long the resolution can be delayed until an incident has a significant business impact.
Service	Affected service associated with the incident. You can edit this field from a list menu. **Note:** When you set a service, and that service has an assigned team, the assigned team of that service is automatically assigned to the incident.
Severity	Imported severity on the incident. Values P1–P5.
Configuration item	Asset associated with the incident.
Assigned to	Individual responsible for resolving the incident.
State	State of the incident. The state moves and tracks incidents through several stages of resolution. Choices are: • New • In Progress • Ob Hold • Resolved • Canceled
Watch list	Individuals interested in the incident. Subscribes them to notifications according to their preferences.
Resolution code	Code associated with the resolution. Choices are: • None (default) • Duplicate • Known error • No resolution provided • Resolved by caller • Resolved by change • Resolved by problem • Resolved by request • Solution provided
Resolution notes	Detailed information on the resolution. Resolution notes are posted to the **Activity** timeline.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

The Related Records tab contains any alerts associated with this incident.

Note:
All field values are imported from the related records and aren't editable from SRM.

Child Incidents

Field	Description
Number	Identifier for the related incident.
Short description	Brief description of the related incident.
Priority	Priority of the related incident.
State	State of the related incident.
Assigned to	Team member assigned to the related incident.
Assignment group	Team assigned to the related incident.
Service	Service associated with the related incident.

Alerts

Field	Description
Number	Identifier for the related alert.
Severity	Severity of the related alert.
Short description	Brief description of the related alert.
Acknowledged	Whether the related alert has been acknowledged or not.
Assigned to	Team member assigned to the related alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts (continued)

Field	Description
Configuration item	Asset associated with the related alert.
Parent	Primary alert associated with the related alert.

Recent Impactful Changes

Field	Description
Number	Identifier for the related changes associated with this incident.
Short description	Brief description of the related changes associated with this incident.
Type	Type of the recent changes associated with this incident.
State	State of the recent changes associated with this incident.
Planned start date	Date and time to begin changes associated with this incident.
Planned end date	Date and time to begin changes associated with this incident.
Assigned to	Team member responsible for the change request associated with this incident.

Change Requests

Field	Description
Short description	Brief description of the change request associated with this incident.
Type	Type of the change request associated with this incident.
State	State of the change request associated with this incident.
Planned start date	Date and time to begin change request work associated with this incident.
Planned end date	Date and time change request work associated with this incident ended.
Assigned to	Team member responsible for the change request associated with this incident.

Postmortem tab

About Postmortem owner:

- If a Scribe has already been chosen in the Collaboration panel Responders list, they're automatically made the owner.
- If there's more than one scribe, the first one assigned is chosen. Otherwise, you can select an owner from the list menu.
- If a new scribe is added or an existing user persona is changed to Scribe, that user is made the owner.
- If you manually remove an owner, no new owner is automatically selected.

Use the drag-and-drop feature to edit postmortem sections. You can exclude sections from PDFs, delete sections, or reorder sections.

To add new sections, select the **Add** icon .
Compose panel

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

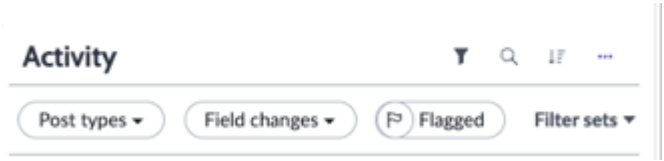
Work notes are added to the Activity timeline automatically. Visible to responders and above. Add comments using the **Compose** text box.

Comments are added to the Activity timeline automatically. Visible to everyone in SRM.

Activity section

Stream that contains all the system activity, and resolution notes. You can filter, sort, expand or collapse all posts using the header icons.

Note:
The filter option includes **Post types**, **Field changes**, and **Filter sets**. All choices are selected by default. Flagged entries are either all or none.



Actions panel

Note:

The **Notifications**, **Agent assist**, **Expert on-call**, and **Email templates** panels aren't currently supported in SRM.

Attachments section

Open the **Attachments** section using the Attachment icon .

On the **Attachments** section, you can initially **Browse** your local hard drive for files.

Once you have added attachments, you can:

- Search for an attachment based on its name or extension

Note:
You must have two or more attachments to search.

- Upload a new attachment using the ( ) icon.
- Download, remove, or rename existing attachments using the More actions icon ( ).

Template section

Open the **Template** panel using the Template icon .

Note:
Existing templates are displayed, but creating templates isn't available in SRM.

Collaboration panel

Displays the available Zoom meetings, Microsoft Teams, or Slack channels to start or join.

To start or join a Zoom meeting:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Zoom integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

1. Select **Start Zoom**.
   - A meeting pop-up appears.
   - Add participants.
   - Select **Create Meeting**.
   - The meeting is created, invitations are sent, and you join the meeting.

     Note:
     Any issues found when starting a meeting are shown in a banner message.
2. Select **Join Meeting**
   - **Sign in** to your Zoom account.
   - You join the Zoom meeting.

1. Select **Start Channel**.
   - Sign in to your Microsoft Teams account.
   - Select **Create**. You are redirected to the Microsoft Teams application.
   - Back in the Collaboration column, the **Join Channel** button is activated.

     Note:
     Any issues found when joining a channel are shown in a banner message.
2. Select **Join Channel** in the Collaboration panel in SRM.
3. Sign into your Microsoft Teams account.

   You are taken to the channel in Microsoft Teams.

Start or join a Slack channel:

Note:
The Slack integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

1. Select **Start Slack**.
   - Add participants in the Create a Slack channel pop-up.
   - Select **Create**. You are redirected to the Slack application.
   - Back in the Collaboration column, the **Join Slack** button is activated.

     Note:
     Any issues found when starting a channel are shown in a banner message.
2. Select **Join Channel** in the Slack application window.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Sign into you Slack account.

   You are taken to the Slack channel.

Service Operations Workspace setup for SRM

Install and configure Service Reliability Management (SRM) within the Service Operations Workspace Admin Center so that SRM admins, managers and responders can provide service reliability efficiently.

You can Install Service Reliability Management from Admin Center or ServiceNow Store from the Service Operations Workspace Admin Center.

Note:
The Data visualizations app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

Once installed, configuring SRM within the Service Operations Workspace Admin Center sets up the SRM workspace with options and actions.

Using the Service Reliability Management menus in the Service Operations Workspace Admin Center, you can:

- Assign an administrator to Service Reliability Management.
- Activate teams and services in SRM
- Customize service approval settings in SRM.
- Customize team approval settings in SRM
- Access and publish the request catalog item for users.
- Configure error budget actions for breached SRM SLOs.

Alert automations are conditional triggers that execute response actions automatically, based on the contents of the alert. This functionality is available to SRM upon request, from the Alert automations application in the ServiceNow Store.

Configuring Service Reliability Management

Configuring Service Reliability Management (SRM) involves installing it from the ServiceNow Store or Service Operations Workspace Admin Center. You can also assign administrators and import services and teams.

Using guided setup for SRM

The guided setup provides a sequence of tasks to help you configure SRM on your instance. To open the guided setup, navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**. Next, find the Service Reliability Management tile and select **Configure**.

SRM configuration documentation

Visit the following pages to set up and configure SRM. The content is primarily for srm_admin or admin users.

Install Service Reliability Management from Admin Center or ServiceNow Store

Install the Service Reliability Management (SRM) application from the Admin Center or ServiceNow Store.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Subscriptions required: ITSM Standard and ITOM Operator Professional subscriptions.

> **Note:**
> The data visualizations store app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

To create and manage alert automations, install the Alert automation application available on request in the ServiceNow Store.

Role required: admin

About this task

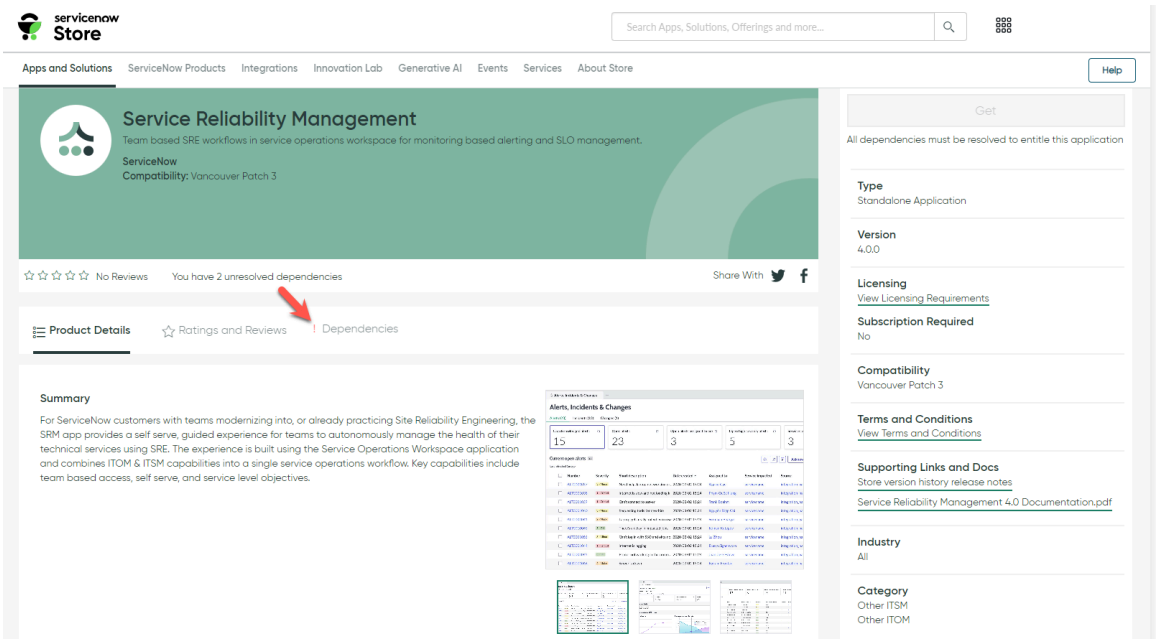
Roles and demo data are installed with SRM. The demo data includes templates that help accelerate implementation and SRM use.

Procedure

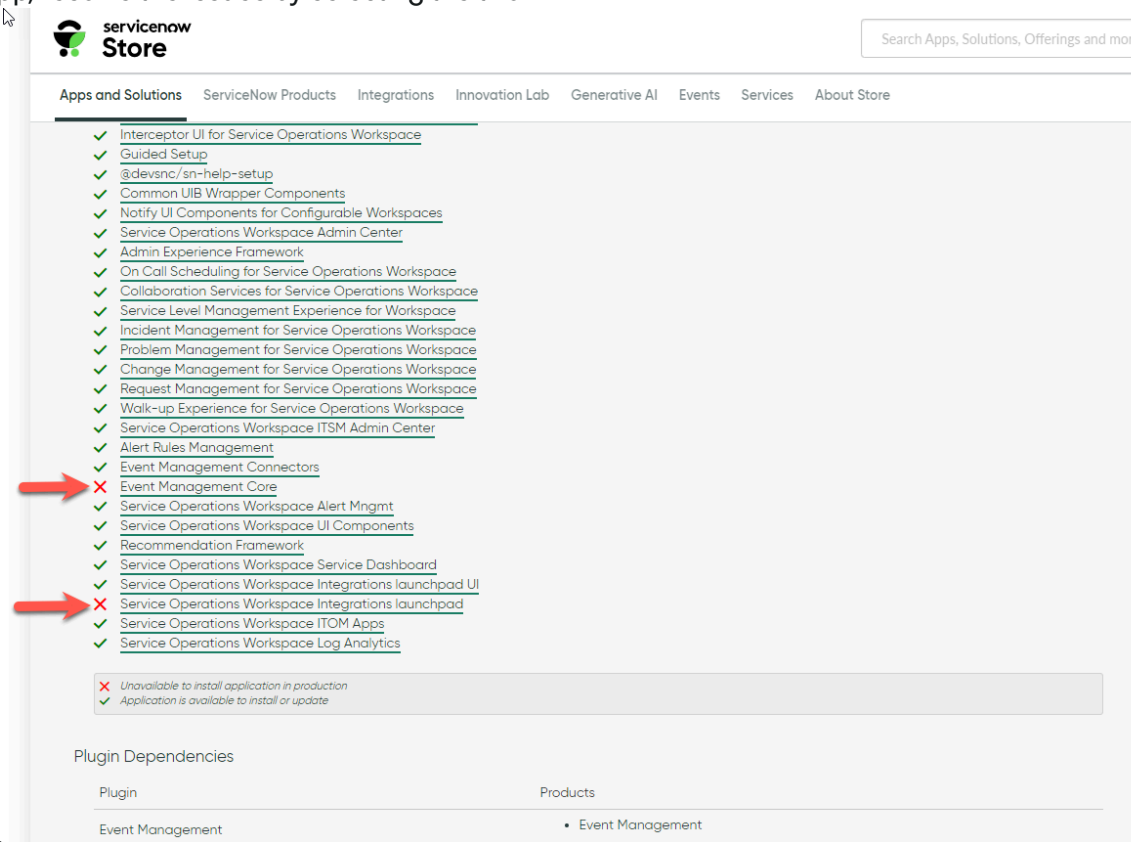
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. Locate the *Service Reliability Management* card and select **Install**.
3. In the pop-up window, select **Start Install**.
   You're taken to the ServiceNow Store portal.
4. Complete the necessary steps.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If any dependencies are red on the app store listing, select the row to open the dependent app and install it. If the dependent app is already installed but still appears in red, you can get or reopt it as needed.



The example shows two unresolved dependencies. Before installing the app, resolve the issues by selecting the two dependencies.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demo data comprises the sample records that describe application features for the common use cases. Demo data is loaded when you first install the application on a development or test instance.

Following installation, the *Service Reliability Management* card can be used to configure SRM.

Assign an administrator to Service Reliability Management

Add people from your ServiceNow instance to administer Service Reliability Management (SRM) and your service operations.

Before you begin
Role required: admin

About this task
The SRM admin can add and create teams. They can also manage data across all SRM teams.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. In the *Service Reliability Management* tile, select **Configure**.
3. Navigate to **Assign admins** > **Service reliability management admins**.
4. Enter user names in the field.
5. Select **Save**.

Activate teams and services in SRM

Activate teams and services to be managed in the Service Reliability Management (SRM) application.

Before you begin
Role required: srm_admin or admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Activate** > **Teams and services**.
3. Select **Activate teams and services** to begin importing or adding teams.
4. Use the condition builder to filter the teams shown in the Assignment groups list.

   Note:

   Filters on the same field use AND logic, and filters on different fields use OR logic. For example, filtering for multiple `Business Criticality` levels and `State = Open`, evaluates as `(Criticality = 1 OR 2 OR 3 OR 4) AND (State = Open)`.

   List view filters are saved automatically and persist when you navigate away and return.

5. In the Assignment groups list, select the teams you want to add and then select **Activate**. You reach the **Activate services** option to add services.
6. From the **Select a service class** list, select a service.
   The following service types are available:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application Services
- Mapped Application Services
- Calculated Application Services
- Dynamic CI Group
- Technical Services
- Tag-based Services

7. Use the condition builder to add new services to the list view.
8. Select the services that you want to add and then select **Activate**.
   The **Activate Services** pop-up opens.
9. From the **Support Group** drop-down, select the relevant support group and select **Confirm**.

Result

On the **Activate teams and services** page, the following options appear:

- Existing teams
- Existing services

You can select the options to view the teams or services.

Customize service approval settings in SRM

Add an approval process to your services for governance.

Before you begin

Role required: srm_admin or admin

About this task

Require approval when Service Reliability Management (SRM) admins, managers, or responders request to create or add a service in SRM.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Governance and autonomy** > **Service governance**.
3. Choose one or both processes by selecting the relevant check box.

   Approval requirement types:

   - Approval required when creating a new service:

     Requires approval when creating a service in SRM, and assigns it to the team responsible for new services.

   - Approval required when associating an existing Configuration Management Database (CMDB) service:

     Requires approval to add an existing service to SRM, and assigns it to the team responsible for existing services.

4. Enter or select the team responsible for approvals.
5. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This action initiates the approval process and assigns approval to the team responsible for approving the new service.

Note:
Approvals take two steps. First, the request is approved, which appears in the **Stage** field of the request record. Next, the request remains **Pending** until the request item is approved in the **Request** record.

Customize team approval settings in SRM

Customize how team approvals work when non-admin users create or add a team in Service Reliability Management (SRM). This feature, also known as team governance, helps you control access and align with internal policies.

Before you begin
Role required: srm_admin or admin

About this task
By default, team governance is active in SRM. When non-admin users request a team, SRM creates two records: a parent request and a requested item. The approval team is notified, and any member can approve the request from My approvals. Once approved, the team is created or added, the parent request is set to `Approved`, and the requested item is set to `Closed Complete`.

You can customize team governance by turning off approvals or changing the approval team.

Note:
Non-admin users are SRM managers and SRM responders. When team governance is active, admins and SRM admins can still create and add teams without approval.

Procedure
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Under **Service Reliability Management**, select **Governance and autonomy** and then select **Team governance**.
3. Review or update the approval options.
4. Review or update the approval team for one or both options.
   By default, the approval team is set to `SRM Team approvers`. You can view its members in `sys_user_group.list`.

   Note:
   Any member of the approval team can approve requests, but they need the `sn_request_read` role to view request details. Without that role, they only see the approval task.
5. Select **Save** to update your team governance settings.

Configure error budget actions for breached SRM SLOs

Configure the actions that the team can select when the error budget of a service level objective (SLO) is breached.

Before you begin
Role required: srm_admin or admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Governance and autonomy** > **Error budgets**.
3. Select **Configure error budget actions** to edit the Process Error Budget Policy Threshold subflow in Workflow Studio.

Note:
Working in Workflow Studio requires advanced ServiceNow expertise. For more detailed information on editing workflows or creating custom workflows, see Flow Designer.

Approve a change request for SRM

Approve a service change request in Service Reliability Management (SRM) to allow the requested action to proceed.

Before you begin

Only open change requests are available on the **Reliability tasks** page.

Role required: SRM approval team or admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

Note:
If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select a change request and then select the **Details** tab.
5. On the **State** field, select the list and select **Approved**.
6. Select **Save**.
   The change request state updates from `Assess` to `Approved`.

   On approval, the new service is created and added to the SRM team. The owner is set to the person shown in the Assigned to field. And the Managed by group is set to the SRM team associated with the assignee.

Configure fields for escalation triggers

Configure additional fields for on-call escalation triggers in Service Reliability Management (SRM).

Before you begin

Role required: admin

About this task

Configure additional fields that teams can use when setting up escalation triggers. By default, escalation triggers run only when the Assignment group field changes. Completing the following

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

procedure makes other fields available, giving teams more flexibility and helping them respond to issues quickly.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Trigger Rule Table Config**.
2. Select **em_alert** or **incident** to configure additional trigger fields for alerts or incidents.
3. In **Trigger condition fields**, add fields from the following table.

   Note:
   Selecting fields not listed in the table might cause performance issues.

4. Select **Update** to save your changes.
   The selected fields now appear as options for teams configuring escalation triggers.

What to do next

To set up an escalation trigger, see Create an escalation trigger for an SRM team.

Configure Twilio to send notifications in SRM

Connect your Service Reliability Management (SRM) instance and Twilio account to send notifications to teams.

Before you begin

Before you begin, you must have a String Identifier (SID) and an authentication token for an active Twilio account.

Note:
Performing this action requires ServiceNow expertise.

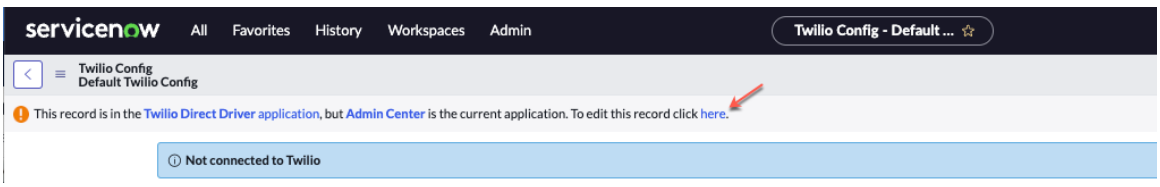
Role required: srm_admin or admin

About this task

You can adjust what gets sent from Twilio by editing the on-call workflow in the system.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Integrations** > **Twilio API Key**.
3. Select **Twilio Config**.
4. In the new window, select **here** to edit the record.



5. Enter the **Account SID** value.
6. **Optional:** Enter a **Validity Period** value.
7. Select **Connect** to activate the key or **Save** to save your changes without activating.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install the Alert Automation application

Install the **Alert Automation** application and any supporting applications.

Before you begin

Role required: admin

Subscriptions required: ITSM Professional or ITOM Operator Professional subscriptions.

About this task

Before creating management rules, you must install and configure the Service Reliability Management (SRM) application, available in the ServiceNow Store.

Procedure

1. To access the ServiceNow Store and download the application onto your SRM instance, select the link in the email you received.
2. In your ServiceNow AI Platform instance, navigate to **All** > **System Applications** > **All Available Applications** > **All**.
3. Locate the *Service Operations Workspace* **Alert Automation** application and select **Install**.
   Alert automation rules are ready to use in SRM.

Using Service Reliability Management

Service Reliability Management (SRM) enables you to register services, monitor service health, respond to service degradations with on-call shifts and escalation policies and triggers, and onboard distributed teams with minimal governance from central IT.

Basic Tasks in SRM

Working with SRM services

A service represents a functional outcome like networking, payments, or HR services, that is owned by a team. To deliver that outcome, a service can contain one or more technical components like a user authentication service, or a piece of shared infrastructure like a database.

Service Reliability Management (SRM) works with integrations to prioritize and route alerts to the relevant responders. It follows up with escalations until the alert is acknowledged and someone responds. When you create or add a service in SRM, it must reflect a service in your SRM infrastructure.

Note:
You might want multiple tool integrations to monitor each technology management service and receive events from those tools. See Working with integrations in SRM for more information.

In addition, you can create reliability metrics for the service. See Working with reliability metrics.

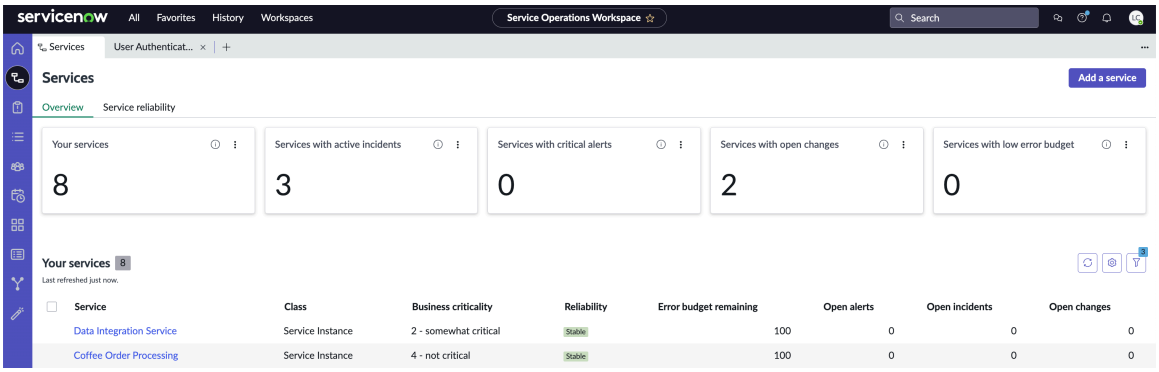
Tying a team and policies to that service makes it easier to divide responsibilities and track technical outcomes. It also makes it easier to automate response routines and focus on who you notify and when.

The state of an exiting service is inherited. The state of a created service in SRM is **None**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Services Overview

Information on the Overview tab



The cards on the Overview tab display the following metrics. By default, the list view shows information related to the Your services card. Select a different card to view different information in the list view.

- **Your services**: Count of all the services you or your team manages and monitors for reliability.
- **Services with active incidents**: Services with open incidents sorted in the following order:
  - Business criticality - most critical first.
  - Number of active incidents - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with critical alerts**: Services with open alerts sorted in the following order:
  - Business criticality - most critical first.
  - Number of alerts - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with open changes**: All the services your team manages and monitors.
- **Services with low error budget**: Services with less than 25% error budget remaining.

  The error budget metric is represented as the amount of service level objective (SLO) that you can spend over a specified time. It can be used to manage release velocity.

Note:

To refresh the card and list values, select Refresh .

You can interact with the list in the following ways:

- Group or filter columns to customize the view.
- Edit, sort, or export the list as needed. See Export list information to a file.

For more information about individual service details, see Edit service details form.

Services list view definitions

The columns include the following details:

- **Service**: Name of the service.
- **Class**: Service instance or technology management service.
- **Business criticality**: Importance of the service to the business.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Open alerts**: Number of open alerts assigned to the service.
- **Open incidents**: Number of open incidents assigned to the service.
- **Error budget remaining**: Percentage of error budget remaining for the service.

Service reliability

The Service reliability tab is a customizable dashboard showing high-level service performance. For more information about the dashboard, see Visualizations in the Service reliability dashboard.

Add a service to SRM

Add services to Service Reliability Management (SRM) to help your teams manage service health.

Before you begin

If you're adding a technology management service to SRM, make sure it doesn't have a support group. You assign the support group when you add the service to SRM.

Role required: srm_manager, srm_responder, or srm_admin

About this task

Add a service to SRM to assign it to your teams and let them access its incidents and alerts. You can either create a service or import an existing one. SRM supports both service instances and technology management services:

- Service instances - Business-facing services, such as an HR portal. Service instances often have multiple infrastructure components.
- Technology management services - IT-focused services that support a business service or service instance. For example, an authentication service or database service.

When you add a technology management service to SRM, you also add its offerings. Offerings are specific components within a parent technology management service. For example, Spam filtering is an offering within the Email technology management service. In SRM, you can assign a parent technology management service and its offerings to different teams.

Note:
When you import an existing technology management service, its offerings don't inherit its support group. Offerings either keep their existing support group or, if they don't have one, you must assign it before setting up Service Level Objectives (SLOs).

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the Services icon and then select **Add**.
3. In the Add services for your teams modal, you can either create a service or add existing services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Assign a team step, assign your service to an existing or new support group.
   In SRM, support groups are also known as teams.

5. Select **Add service**.
   If approvals aren't enabled, your service appears in the service list. If approvals are enabled, your request is sent for approval. After it's approved, the service appears in the services list.

> **Note:**
> If you added a technology management service, its offerings appear in the Offerings tab on the parent technology management service's page. Offerings also appear in the services list. To view an offering without an assigned support group, remove all filters from the services list.

What to do next

If an offering doesn't have a support group, assign it to a support group before setting up SLOs. For how to assign support groups, see Edit service details in SRM.

You can also add integrations to your service to start monitoring its health.

Edit service details in SRM

Edit an existing service owned by your team. For each service that you support in SRM provide general information about the service and the SRM team that supports it.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

> **Note:**
> If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Services** icon ( ).
3. From your services list, select the service that you want to edit or update.
   To view and select a technology management service offering without an assigned support group, remove all filters from the services list.
4. On the Overview page, select the **Details** tab.
5. Fill in or edit the fields.
   For more information on the field descriptions, see Edit service details form.
6. To save the updated service details after editing, select **Save**.

Remove a service from SRM

Remove a service from Service Reliability Management (SRM) when you no longer need to track or monitor its reliability.

Before you begin

SRM administrators can remove any service from SRM. SRM managers can remove only the services assigned to their teams.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Administrators and SRM administrators have a delete option on service pages. That option deletes the service from both SRM and the Configuration Management Database (CMDB). The remove option, described below, only removes the service from SRM.

Role required: srm_manager or srm_admin

About this task

Remove one or more services from SRM when you no longer need to track their reliability. Removing a service from SRM does the following:

- Removes the service from SRM views, including the Service page and Service reliability dashboard.
- Deletes all draft service level objectives (SLOs) associated with the service. Those SLOs aren't recoverable.
- Retires all active SLOs associated with the service. Those SLOs are no longer active but remain visible in SRM.

Removing a service from SRM doesn't affect the service reliability tasks, such as alerts, change tasks, or incidents. The service also remains in the CMDB, and you can add it back to SRM at any time.

Note:
The following procedure shows how to remove services from SRM using the Services page. You can also remove services using the Teams page by selecting a team and then the **Services managed** tab.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. In the primary navigation, select **Services**.
3. Point to a service you want to remove, and then select its check box.
   You can select one or more services.
4. Select **Remove**.
5. In the dialog, review the details about the affected SLOs and then select **Remove service**.
   The page displays `<service-name> removed from` SRM. The service no longer appears in the SRM application, but it remains in the CMDB. You can add it back to SRM at any time.

   Note:
   If you receive an error when removing a service, see Troubleshoot SRM.

What to do next

To learn how to monitor and manage services that remain in SRM, see Working with SRM services. To add a service that you want to monitor or that was removed by mistake, see Add a service to SRM.

Working with integrations in SRM

Connect your services to monitoring tools using the Integrations Launchpad . Integrations send information to Service Reliability Management (SRM), helping you track alerts, manage incidents, and maintain service health.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the Integrations Launchpad

As an SRM admin, manager, or responder, you can access the Integrations Launchpad in the following ways:

- From the primary navigation, select the ITOM Admin Experience icon, and then select either **Add integration** or **Manage installed integrations**.
- From the Services page ( ), select a service, select the **Integrations** tab, and then select **Add an integration**.
- From the Services page ( ), select a service, expand **Complete setup**, and then select **Add integrations**.

Integration details specific to SRM

Be aware of the following when using the Integrations Launchpad for SRM:

Connector type support

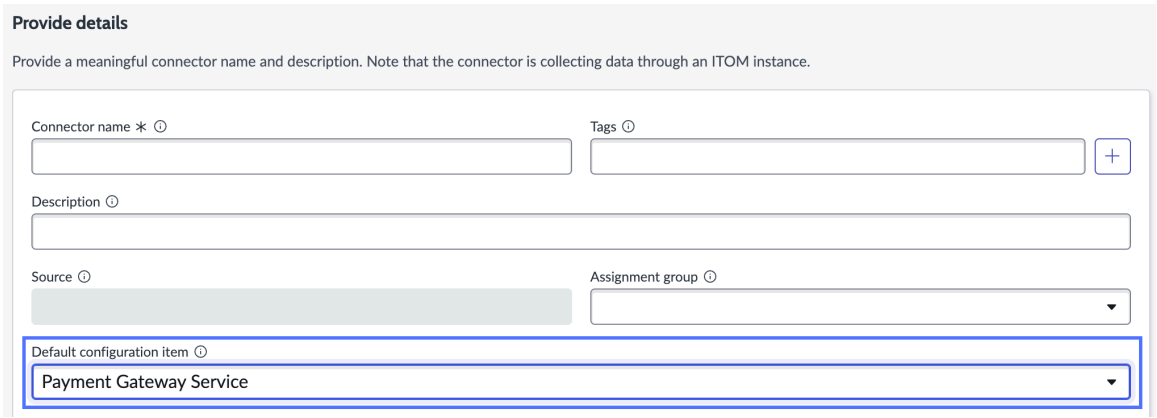
SRM supports custom, pull, and push connectors. Pull connectors retrieve data from external sources, and push connectors send data from external sources to your instance.

> **Note:**
> For information about setting up connectors, see Integrations Launchpad in Service Operations Workspace for ITOM.

Configuration item field

When you set up an integration for SRM, the Provide details step has an additional field called Default configuration item.

Set this field to the service your integration monitors. If an incoming alert doesn't include service details, SRM uses this field to connect the alert to the relevant service. This field helps make sure that your teams receive alerts for the services they support.



Learn more

Visit the following links to set up and manage integrations with the Integrations Launchpad. The pages are in a different section because the Integrations Launchpad is part of the broader Service Operations Workspace.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

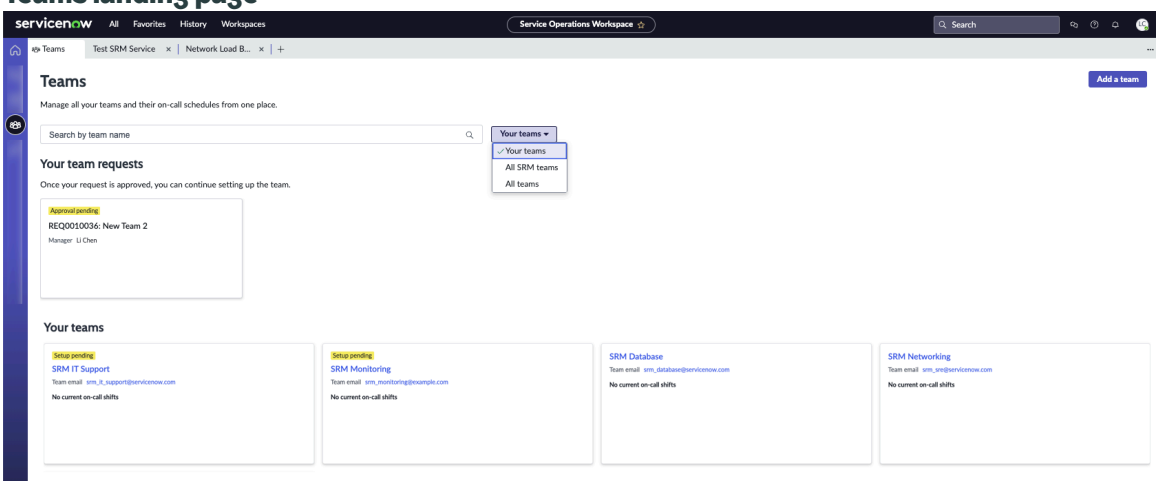
- Activate integration
- Configure an event custom connector
- Configure an event pull connector
- Configure an event push connector
- Deactivate integration
- Delete integration

Working with SRM teams

Manage schedules and define escalation policies for your team. That way, your team sees who is on call and accountable and can have the confidence that critical alerts or incidents are acknowledged in a timely manner.

On the Teams landing page, view and manage your teams and team requests.

Teams landing page



Search by team name among teams you belong to, all SRM teams, or all teams in your organization.

Your selection determines the cards that you're shown on the Teams landing page.

Choices are:

- **Your teams** (default)
- **All SRM teams**: All the SRM teams.

> **Note:**
> Your ability to take actions in each team depends on permissions for that team.

- **All teams**: All teams you have access to in your organization.

> **Note:**
> Your ability to take actions in each team depends on permissions for that team.

The Your team requests section contains team cards for any pending requests, if there are any.

The Your teams section contains cards that provide information about a specific team, such as the status of the team, name of the team, manager, team email, current shift name and duration, and primary responder. See Manage your SRM team details for more information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add an SRM team

Request to create a team to start monitoring your services. Teams are responsible for the issues that occur in the associated services.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

About this task
If you have the srm_admin or admin role, you can set up teams using a different process. See Activate teams and services in SRM for more information.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select **Teams** ( ), select **Add a team**.
3. Create a new team or add an existing one.

Result
When the request is approved, the team is created. Your team appears in the Teams landing page under **Your teams**.

What to do next
- Manage your SRM team details
- Set up escalation policies for your team in SRM
- Create an SRM on-call schedule
- Add team members to SRM
- Manage or add a service to your SRM team

Manage your SRM team details

Add or edit team members, description, contact information of you team.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card whose details you want to update.
4. On the form in the **Details** tab, update the details as required.

Field	Description
Name	Unique name of the team.
Manager	Person who manages the team.
Group email	Email contact for the team that includes all team members.
Description	Description of the team that helps others to understand its responsibilities, purpose, or location.

5. Select **Save**.

Add team members to SRM

Add new team members to your team as required to plan, manage, resolve issues, and increase the efficiency of your business operations.

Before you begin
Role required: srm_manager or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card to open.
4. Select **Teams members** tab.
5. Select **Add**.
6. In the pop-up window select members to add from the list menu.

   Note:
   Member details are imported from user records and not editable.

7. Select **Add**.

Manage or add a service to your SRM team

Add a service to an incident to increase the amount of data for the incident.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select a team card to open any team you want to view or add a service to.
4. From the team page, select the **Services managed** tab.
   You can export the list of services. See Export list information to a file for more information.
5. **Optional:** Add a service to your team by selecting **Add**.
6. Add a new service or register an existing one.
7. In the Assign a team step, fill in the fields.
   - In the **Service owner** field, select the user who will own the services.
   - In the **Support Group** field, select a team that will monitor services.

   The service record has been added.
8. Finish setting up your service or do it later.
   See Edit service details in SRM and Edit service details formfor information on the service and completion steps for setup.

Create an SRM on-call schedule

Set up an on-call schedule to make sure that someone is available to respond to incidents and critical alerts.

Before you begin
Before creating an on-call schedule, a team must exist in Service Reliability Management (SRM). The Alert table [em_alert] must also be added to the Trigger Rule Table Config list. See Add an SRM team and Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task
Shifts in SRM let you define variable time periods for your shift-based workforce. Create shifts for particular dates and times when you need coverage, and assign them to team members.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** > **Teams (** **)**.
2. On the Teams page, select your team.
3. Select the **Schedule** tab and then select **Create shift**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Create new dialog, select either **Create new** or **Use template**.
   Your system admin can create predefined templates for you to use to create shifts.
5. Fill in the fields.
   For more information on the field descriptions, see Create a shift form in Service Reliability Management.
6. Select **Create shift**.

Set on-call team preferences in SRM

Set on-call preferences for team members to increase the efficiency of your business operations.

Before you begin
Role required: srm_manager or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card to open.
4. Select the **On-call team preferences** button.
5. On the form, fill in the fields.
6. Select **Save**.

Set up escalation policies for your team in SRM

Set up an escalation policy for your team to ensure that alerts or incidents are resolved in a timely manner by the appropriate team member.

Before you begin
Before creating an escalation policy, you must create an on-call shift for your team.

Note:
Only the responder who created the team or the manager of the team can set up an escalation policy for that team.

Role required: srm_manager, srm_responder, or srm_admin

About this task
An escalation policy is a set of guidelines that outlines how and when incidents should be elevated to higher levels of authority. It delineates clear procedures and responsibilities for escalation to help responders promptly address problems. It defines the order in which notifications should be escalated if an alert or incident isn't acknowledged or resolved within a defined amount of time. If no one responds, the escalation is based on your defined policies until someone responds. After a team member responds, the escalation policy stops escalating and no further notifications are sent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Escalation workflow is triggered only if there's an active shift.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the **Escalation triggers and policies** tab.
4. Under **Escalation policies** in the left panel, select **Create policy**.
5. On the Escalation policy form, fill in the fields.
   For more information, see Set up escalation policies form in SRM
6. **Optional:** Select **Add escalation step** to define the additional steps for escalation and escalation path.
   For more information on the Add escalation step form, see Set up escalation policies form in SRM.
7. Select **Save changes**.
8. **Optional:** Add another escalation policy to the team for another category of alert or incident by selecting **Add a policy**.

Create an escalation trigger for an SRM team

To address issues promptly, define the conditions that trigger a team's escalation policy in Service Reliability Management (SRM).

Before you begin

If your team needs trigger fields other than Assignment group, confirm that an admin has already configured them. For more information, see Configure fields for escalation triggers.

Role required: srm_manager or srm_admin

About this task

This procedure shows how to create escalation triggers in SRM. If your organization manages on-call scheduling using IT Service Management (ITSM), you can also use ITSM On-Call Scheduling to define escalation triggers. See Create an escalation trigger rule for more information. While that procedure lists ITSM roles, SRM users only need the srm_manager or srm_admin role.

For a broader overview of escalation processes in ITSM, see Designing an escalation process.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
2. From the primary navigation, select **Teams** ( ).
3. Select your team, and then select the **Escalation triggers and policies** tab.
4. In the **Escalation triggers** panel, select **Create trigger**, and fill in the Escalation trigger form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Escalation trigger name	Name of the trigger. Example: `P1 incidents`.
Order	Order of execution for the trigger. When a team has multiple escalation triggers, the triggers with lower values are evaluated first.
Active	Option to activate or deactivate the trigger.
Conditions	Choose the table (**Alert** or **Incident**) and set the conditions for the trigger. When conditions are met, the system triggers an escalation for the relevant team. Example: `Priority is 1 - Critical`.
Advanced options	Define what happens when the trigger conditions are met and when the trigger runs. For **Trigger action**, select **Workflow**, **Subflow** or **Script**, then choose the specific item. Example: Select **Workflow**, and **On-Call: Assign by Acknowledgment** to auto-assign the incident to the person who acknowledges it. Select **Run trigger rule every time the selected field changes** to run the trigger when one of the chosen fields updates. If not selected, the trigger runs only when the Assignment group changes.

5. Select **Save**.
   The UI displays `The Escalation trigger has been added successfully`. The trigger is now active and runs when the defined conditions are met.

Working with SRM reliability tasks

Alerts, incidents, and change requests are reliability tasks. From creation to resolution, SRM helps you manage your alerts throughout the response life cycle.

The Reliability Tasks pane ( ) has several tabs:

- **Incidents** are created manually or based on Service Level Objectives (SLOs) and Service Level Indicators (SLIs). For more information on incidents, see Working with incidents in SRM. For more information on SLO, SLI, and error budget actions, see Create SLOs, SLIs, and error budget policies.
- **Changes** can be created within SRM. See Manually create an SRM change task.

The Express List pane ( ) provides a focused view of alerts to help you monitor, evaluate, and resolve health issues efficiently. You can create alerts from SRM service pages or by

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

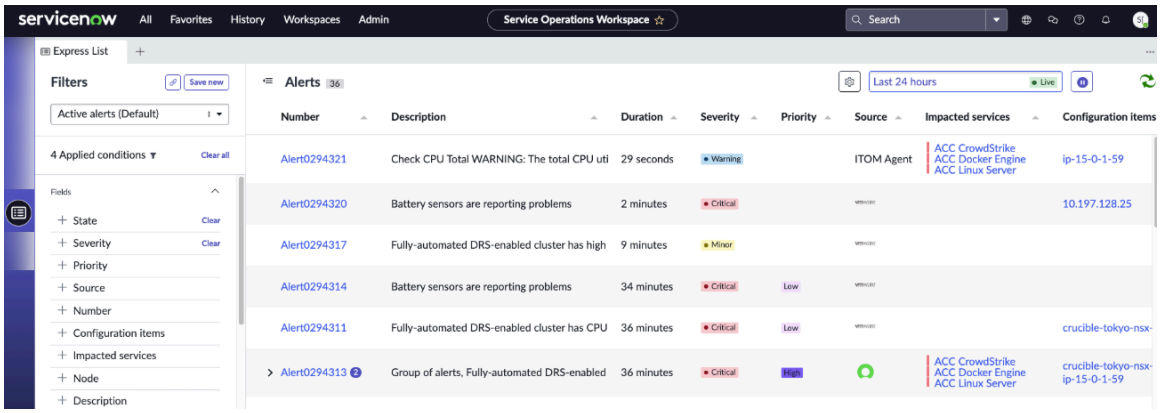
using integrations. For more information on alerts, see Express List in the Service Operations Workspace for ITOM and Manually create an SRM alert.

Responders and above are notified for updates to reliability tasks based on their notification preferences.

Working with alerts in SRM

Monitor, evaluate, and resolve health issues in the Express List.

The Event Management Express List feature provides a customizable, sortable view for accessing and managing alerts. Use the Express List feature to prioritize alerts, understand their impact, and resolve issues faster.



As a Service Reliability Management (SRM) user, you automatically have the evt_team_operator role, which lets you access the Express List feature ( ). To learn more about that role, see Roles used by Express List.

Visit the following to work with alerts in the Express List feature:

- Acknowledge viewed alerts in Express List
- Assign alerts in Express List
- Close an alert in Express List
- Create an incident from an alert in Express List
- Monitor incoming alerts
- Place an alert in the Acknowledged state
- Place an alert in the Maintenance state

In SRM, integrations create alerts or you create alerts manually. Visit the following link to learn how to create an alert from the **Services** page:

Manually create an SRM alert

Create an alert for testing purposes or if you think an issue poses a risk.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. In the navigation pane, select **Services**.
3. Select the service that you want to trigger an alert for.
4. Select the **Related alerts** tab.
5. Select **Trigger alert** and fill out the **Trigger an alert** form.

   To trigger an alert, you must first create an event to get processed. Only **Service** is required.

Trigger an alert

Field	Description
Service	Select a service for the event.
Source	Manual.
Node	Enter the name of the node (for example, FQDN, IP address, or MAC address) associated with the event.
Type	Enter a type of event.
Resource	Enter a node resource (process or service) associated with the event.
Metric Name	Enter the name of the metric associated with the event.
Source instance	Enter a data source for the event.
Message key	Enter an identifier for multiple events related to the same event.
Severity	Select the expected impact of this event. Choices are: ○ Critical: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor (default): Partial, non-critical loss of functionality or performance degradation occurred. ○ Warning: Attention is required, even though the resource is still functional. ○ OK: The resource is still functional.
Time of the event	Select the date and time that the event occurred in the source system.
Description	Enter information describing the event.
Additional information	Add more information relevant to the event.
Processing notes	Enter relevant processing information.

6. Select **Trigger**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Reliability Management (SRM) creates an event to generate the alert. Refresh the screen to see the event processing results.

Express List automatically displays your alert. If enabled, SRM triggers the applicable automations and on-call escalation workflows.

What to do next

Consider making the following optional adjustments to your alert for testing purposes or team collaboration:

- Acknowledge the alert or assign it to someone on your team.
- Add comments or work notes in the **Compose** panel.
- Add an attachment related to the alert using the attachment icon .

Working with incidents in SRM

Plan ahead of service disruptions and have SRM send notifications and create status when incidents occur. Distractions are minimized and teams stay focused on remediation.

You can manually create incidents within SRM or create an error budget action to do so. See Manually create an SRM incident or Create SLOs, SLIs, and error budget policies for more information.

- Manual creation from an alert.
- Manual creation from the incident view.
- Automatically from Alert automations, if Alert automations are installed.

The **Assigned to** field on an incident specify who should be notified. When a team is selected as a responder, team automations are checked to determine which schedule to use for the notifications.

Note:

The **Assigned to** field is cleared when the **Assigned-team** or **Service** field is updated on an incident. Escalation policies for the newly assigned teams run. The field remains cleared until a user on the new team acknowledges an escalation notification.

If the Service is changed and the new Service does not have an assigned team, no changes occur.

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

Responders and above are notified for updates to incidents based on their notification preferences. If you made the update, you won't be notified.

You can resolve incidents by selecting specific incidents or in bulk. See Resolve an SRM incident, or Close an SRM incident or Cancel an SRM incident.

Note:

Incidents in the **Resolved** state are automatically closed after 3 days.

For more information on the areas and fields available in an incident, see SRM incidents.

Export list information to a file from the list view.

Respond to an incident in the following ways:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Tag an incident.
- Update the priority of an SRM incident.
- Set the state of the incident.
- Copy an SRM incident.
- Add a service to an SRM incident.
- SRM incidents.
- Resolve an SRM incident.
- Cancel an SRM incident.
- Close an SRM incident.
- Reopen an SRM incident.

Manually create an SRM incident

Create an incident if you think an issue poses a serious risk and should be taken care of as soon as possible.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

About this task

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the Incidents tab.
4. Select **New**.
5. Fill in the fields on the Create New Incident form, as appropriate.

   Only the **Short Description** field is required.

Incident Field mapping

Field	Description
Short Description	Add brief description of the incident.
Description	Add detailed description of the incident.
Number	Identifier assigned to the incident.
Impact	Select is a measure of the effect of the incident. Impact affects **Priority**. Choices are:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ 1 - High ○ 2 - Medium ○ 3 - Low
Assignment group	Select a team to work on the incident by typing or searching.
Priority	Automatically set based on **Impact** and **Urgency**. It identifies how quickly the incident should be addressed. See **Priority Data lookup rules** table below. Values are: ○ 3 - Moderate ○ 4 - Low ○ 5 - Planning
Category	Select a category for the incident. Choices are: ○ --None-- ○ Inquiry/Help (default) ○ Software ○ Hardware ○ Network ○ Database
Urgency	Select a measure of how long the resolution can be delayed until an incident has a significant business impact. Urgency affects **Priority**.
Service	Select a service associated with the incident.
Severity	Select a severity to associate with the incident by typing or searching. Choices are: ○ 1 - High ○ 2 - Medium ○ 3 - Low
Configuration item	Select a asset to associate with the incident by typing or searching.
Assigned to	Assign team member to work on the incident by typing or searching.
State	Choose a state for the incident. Choices are: ○ New (default) ○ In Progress ○ On Hold ○ Resolved ○ Canceled See SRM incident states for more information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Watchlist	Select individuals to watch the incident by typing or searching.
Resolution code	Select a resolution code when you have one. Choices are: ○ None (default) ○ Duplicate ○ Known error ○ No resolution provided ○ Resolved by caller ○ Resolved by change ○ Resolved by problem ○ Resolved by request ○ Solution provided
Resolution notes	Enter any relevant resolution information.

Note:
Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

6. Select **Save**.
   The incident is created and the new incident form displayed.
7. Add an attachment related to the incident in the **Actions** panel using the **Attachments** icon .
8. Create an incident template using the Template icon .
9. Start or join a Zoom meeting, Microsoft Teams, or Slack channel in the **Collaboration** panel..
10. Select **Save**.
    The incident appears with comments, work notes, and incident activity captured in the **Activity** stream. For more information on incident fields, see SRM incidents.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reassign an SRM incident

Reassign an incident to a responder when the incident tasks should be addressed by a particular team member.

Before you begin

This action is available when the **Assigned to** field in the incident is populated.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

Option	Description
Option	Description
In the incident list view	Double-click the **Assigned to** field for the inci dent and replace the team member from the list menu.
In the Details tab of incident form	Delete the name in the **Assigned to** field and reassign. Select **Save**.

   The incident is now assigned to the new responder and an email notification sent. The assignee is displayed in the list view and on the form.

Update the priority of an SRM incident

If the priority of an incident should be changed, you can manually update it to reflect its new criticality.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. In the Incident list view, select a **Priority** value from the list menu.
   - 1 - Critical
   - 2 - High
   - 3 - Moderate
   - 4 - Low
   - 5 - Planning (default)
5. Select **OK**.
   The new priority is reflected in the incident list view and incident header and form field.

Add a service to an SRM incident

Add a service to an incident to increase the amount of data for the incident.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.
   For value choices see SRM incidents.
   The new service is displayed in the incident list view and incident form.

Add resolution code and notes to an SRM incident

Add a resolution code and notes to an incident when you have resolved the incident.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Open the incident.
4. In the Incident **Details** panel, select a **Resolution code** from the list menu.
5. Enter text in the **Resolution notes** text box.
   The resolution notes are displayed in the **Activity** timeline panel.
6. Select **Save**.

Copy an SRM incident

Copy an incident, if you have a similar issue.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to copy.
4. Using the list menu under the More option button, select **Copy incident**.
5. Select a team member from the list menu for the **Caller** field.
   After the incident is copied, the **Activity** timeline of the new incident is updated with the original incident as a work note.

Resolve an SRM incident

Resolve an incident, if you need it reviewed, or you think it has already been handled, but aren't ready to close it.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Result
Resolved incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you resolve an incident, the related alerts remain open until you close the incident.

Cancel an SRM incident

Close an incident, if you think it is not an issue, or if it has already been handled.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to cancel.
4. You have two options.
   For value choices, see SRM incidents.
   The new state is displayed in the incident list view, incident form, and form header.

Result
Canceled incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you cancel an incident, the related alerts are closed.

Close an SRM incident

Close an incident when it’s not an issue or has already been handled.

Before you begin
Role required: srm_responder, srm_manager, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.
   For value choices, see SRM incidents.
   The new state is displayed in the incident list view, incident form, and form header.

Result
Closed incidents remain in the incidents list view. If they don't appear, try adjusting your filters.

Note:

When you close an incident, any related alerts are closed.

Reopen an SRM incident

Reopen a closed incident if you think the issue is not yet resolved.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure
1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Find and open the incident you want to reopen.
   Check your filters if you don't see them.
4. You have two options.
   For value choices, see SRM incidents.
   The new state is displayed in the incident list view, incident form, and form header.

Manually create an SRM change task

Create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Before you begin
For general information on Change requests, see Using Change Management .

Role required: srm_manager, srm_responder, or srm_admin

Procedure
1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note:
   If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select **New** from the **Changes** list header.
5. In the **Select a change** window, search for a change record or select an SOW change creation page card to select the type of change request.
6. Select **Next**.
7. In the form Details tab, fill in the fields on the **Change request**, **Impact**, **Assignment**, **Planning**, **Schedule**, **Notes**, and **Closure information** forms.
   For more information, see Create change request forms.
8. **Optional:** Select **Assign to me**.
9. Select **Save**.

   The change request is created and a **Related Records** tab appears for the request.
10. **Optional:** You can take the following steps in **State** workflow.

    (Optional) If the change request requires approval, you'll see the **Request approval** button. Select **Request approval** and **State** moves to **Assess**. See Approve a change request for SRM for instructions on approving a change request.

    If the change request is pre-approved or doesn't require approval, you can move the **State** to **Scheduled**.

    Once approved and scheduled, you can select **Implement** to put the change request into action.

    Once implemented, you only after reviewing the details on the change request, select Review. The change request is moved to the **Review** state.

    Note:
    All open change tasks are set to **Canceled**.

    For more information on **State** in Change requests, see, SRM change request states

Service Reliability Management reference

Reference topics provide additional information about administering Service Reliability Management.

SRM roles and responsibilities

Roles grant users access to different parts of the SRM console. Roles determine the actions that users can or can't perform in Service Reliability Management.

SRM has the following predefined roles:

Note:
The SRM experience was optimized for you to having just the SRM roles. Additional roles could change the UI and have unintended consequences.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List

Role	Tasks
SRM Administrator [srm_admin]	• Update a service managed by any SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update any SRM team • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policies and triggers • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event
SRM Manager [srm_manager]	• Update a service managed by your SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update SRM teams that you manage • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policy and trigger • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event
SRM Responder [srm_responder]	• Update a service if you are in the support group tied to the service • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List (continued)

Role	Tasks
	• View on-call shifts • View escalation policies and triggers • Edit contact preferences • Schedule coverage request • Submit time off • Create event
Administrator [admin]	• Update a service managed by your SRM team • Delete services • Assign new incidents • Create and edit incidents • Create and edit changes • Delete incidents • Create teams • Update SRM teams that you manage • Delete on-call shifts • Override contact preferences • Manually create an alert • Delete alerts • Submit time off

Create team form

Request to create a team to start monitoring your services.

Create a team form

For more information, see Add an SRM team.

Field	Description
Team name	Name the team.
Team manager	Manager for the team.
Team email	Email contact for the team.
Team members	Members for your team.
Tags	Words that describe or relate to your team.
Briefly describe the team responsibilities	Description of your team. For example, team responsibilities or geographic location.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a shift form in Service Reliability Management

Set up an on-call schedule for your team to ensure that the right person is always available to quickly respond to incidents and critical alerts.

Create a shift form

For more information, see Create an SRM on-call schedule.

Create new shift

Field	Description
Shift name	Name for the shift.
All day shift	If selected, the shift is an all-day commitment.
Shift starts	Date and time the shift begins.
Shift ends	Date and time the shift ends.
Repeats	Shift repetition. Choices are: • Never • Daily • Weekly
Every	How often to repeat. Display depends on the time frame chosen.
More options	More options to customize your schedule.
Timezone	User time zone.
Holiday schedule	Schedule to use for the holiday.
Repeats until	Date and time to end repetition.

Create shift using shift template

Field	Description
Shift name	Name for the shift.
Template/Schedule	Existing templates for shifts. Choices are: • 24 x 7 • Off hours (workday 8:00 - 5:00) • Off hours (workday 9:00 - 5:00) • Workday 8:00 - 5:00 • Workday 9:00 - 5:00

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add service form

Create or add an existing service to your instance so that alerts and incidents on that service are available to your teams within SRM.

Add a service form

For more information, see Add a service to SRM.

Add services for your teams

Field	Description
Service name	Enter a name for your service. For example, Cloud storage service. Your teams see this name in SRM.
Service class	Select either service instance or technology management service .
Business criticality	Specify how important the service is to the business: • 1 - most critical • 2 - somewhat critical • 3 - less critical • 4 - not critical
Operational status	Select the status of your service: • Operational • Non-operational • Repair in Progress • DR Standby • Ready • Retired • Pipeline • Catalog
Short description	Describe your service to help your teams understand its purpose and other relevant information.

Edit service details form

Edit an existing service owned by your team.

Service Details form

For more information, see Edit service details in SRM.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the service.
Support group	SRM team managing the service.
Business criticality	How important this service is the business.
Owned by	Service owner. May not be part of an SRM team.
Operational Status	Status for the service's ability to perform operational functions.
Stakeholders	Product owners or service consumers who determine the target availability of a service.
Environment	Choices are: • None • Development • Production • Test
Managed by group	Team manager responsible for the service. Add by search or edit using the text editor.
Change group	Team responsible for changes. Add by search or edit using the text editor.
Status	Status of the service.
Life Cycle Stage	Choices are: • Deploy • Design • End of Life • Ideation • Operational
Phase	Phase of the service. Choices are: • None • Pipeline • Catalog • Retired
Location	Address where the service resides. Add by search or edit using the text editor.
Used for	Purpose for the service. Choices are:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Production (default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Short description	Additional information about the service.
Support by	SRM team managing the service. Add by search or edit using the text editor.

Set up escalation policies form in SRM

Escalation policies define the order and conditions in which members or devices receive notifications.

Escalation policy form

Field	Description
Name	Name of the escalation policy.
Active on shift	Team that receives the notifications on their shift..
Create from scratch	Option to create your own policy.
Create from template	Option to create a policy by using a template created by your admin.
Description	Text describing the policy.
Active	Option to activate or deactivate the policy.
Use as default	Option to use this team as the default
Order	Order of execution. This is the hierarchy or chain of command. When there are multiple escalation policies with the same conditions for a team, the escalation policy with the smaller order number is executed first.
Conditions	Conditions for the policy. The table and conditions that define the escalation policy These conditions are checked after the escalation is started by an escalation trigger. If the conditions are met, the policy is run.
Escalation steps	Escalation steps to add. See the Escalation steps form for more information about the fields.
Escalation notifications	Notification conditions for the policy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When user preference override is on, your escalation policy overrides any policy that the on-call agents set for their own notification preferences. When user preference override is off, the on-call agents' notification preferences take priority over this escalation policy.
Add notification step	Additional notification steps to add. You can select email, call, or SMS. You can add as many attempts as you like.

Escalation steps form

Add escalation step

Field	Description
Escalation step name	Name of the escalation step.
Order	Order of execution. This is the hierarchy or chain of command.
Responder level	Level of authority or expertise needed to respond to the incident.
Rotate through members	Option to notify all members, one by one, until one of them acknowledges the incident or until all of them are notified.
Additional audience	Specific users, teams, groups, or devices that you want to notify.
Time to next step after last notification	The maximum amount of time that will pass before the issue is escalated to the next step. For example, if a responder can't resolve the issue within 30 minutes of the notification, the issue is escalated to the manager.

Domain separation and SRM

Domain separation is supported for Service Reliability Management (SRM).

Support level: Basic*

The support level is Basic but has some exceptions or special conditions.

- Business logic: Ensure that data goes into the proper domain for the application’s service provider (SP) use cases.
- The user interface, cache keys, reporting, rollups, and aggregations all use the domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on support levels, see Application support for domain separation.

Overview of domain separation

- Domain separation is present in all metadata tables in the application. Instance level tables also have domain separation explicitly. Other internal tables, such as the internal Team Request table, are domain-separated implicitly by referencing domain-separated records.
- System properties are not domain-separated, which has implications for Team Management features. The properties are shared by multiple domains and are set at the instance level. Domain-specific setup for these is not supported.
- Where another application is being leveraged (for example the Event Management Connectors) domain separation is determined by the domain-separation capabilities of that application.

How domain separation works in the Service Reliability Management application

The specific conditions indicated by the Basic* support level rating above relate to team management:

- New teams created through a catalog item backed by an Integration Hub flow are setup by the Service Operations Workspace administrator. They can initiate it from the Service Portal. An SRM admin, manager or responder can do it through the SRM workspace. Instructions appear in the SRM documentation.
- Integration Hub subflows and actions control management of SRM teams.
- Only one catalog item and flow can be set up for each instance. The customer is responsible for setting up team properties to support domain separation as a customization of the existing flows.
- The requestor of a team catalog item is associated with the domain and is available as part of the request item. As a result, if needed, the requester can create the team in a specific domain or the catalog Item and extend it to capture the domain another way. In either case, the Service Operations Workspace must make changes to the Integration Hub flows and actions to support this.

For more information, see Domain separation and On-Call Scheduling.

Related topics

Domain separation for service providers

Create change request forms

Fill out the fields in the forms to create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Change request form

Create a new change request. For more information, see Manually create an SRM change task.

Field	Description
Short description	Brief description of the change request.
Description	Description based on Short description.
Number	Identifier for the change request.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Category	Category for the change request. Choices are: • Hardware • Software • Service • System Software • Application Software • Network • Telecom • Documentation • Other (default)
Model	Model to use for the change request. Standard (default)
Risk	Risk the issue poses. Choice are: • High • Moderate (default) • Low
Type	Type of change request. Standard (default). Read-only.
Impact	Impact the issue poses. Choices are: • 1 - High • 2 - Medium • 3 - Low (default)
State	State of the change request. Choices are: • New (default) • Assess If approval is required further states are unavailable. • Scheduled • Implement • Canceled

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Work notes list	Team members to receive notifications when work notes are added. **Note:** An administrator must have already created an email notification for the work notes list for this to be available.
Work notes	Any additional information related to the request.

Impact, Assignment, Planning, Schedule, Notes, and Closure information

Field	Description
Configuration item	Asset affected by the issue.
Service	Service affected by the issue.
Service offering	Service offering affected by the issue.
Assignment group	Team assigned to the change request
Assigned to	User assigned to the change request.
Justification	Reasoning for the change request.
Implementation plan	Imported text.
Risk and impact analysis	Analysis of risk and impact of the issue.
Backout plan	Imported text.
Test plan	Imported text.
Planned start date	Expected date to begin change.
Planned end date	Expected date to finish change.
Actual start date	Date change implementation began.
Actual end date	Date change implementation ended.
Conflict status	Not run. Read-only.
Conflict last run	Based on Conflict status. Read-only
Watch list	Interested users.
Work notes list	Team members to receive notifications when work notes are added. **Note:** An administrator must have already created an email notification for the work notes list for this to be available.
Additional comments	Additional notes for the request.
Work notes	Additional notes on the work done for the request

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Close code	Code for the change request. Choices are: • None (default) • Successful • Successful with issues • Unsuccessful
Close notes	Notes on the change request closure.

SRM incident states

Incidents can be in a few different states depending on how they are acted on.

An incident is created in SRM when a third-party monitoring tool has an event. Incidents can be manually created or assigned. Edit actions from the incident form using the state button in the form. Use the **Save** button in the form to keep any changes you've made. Changes to incidents in the list view are automatically saved.

Incident states

State	Description
New	State on incident creation. The incident is logged but not yet worked on.
In Progress	The incident is assigned being worked on.
On Hold	The responsibility for the incident shifts temporarily to another entity to provide further information, evidence, or a resolution.
Resolved	A satisfactory fix is provided for the incident to ensure that it does not occur again.
Closed	The incident is closed when it is confirmed that the incident is satisfactorily resolved.
Canceled	Incident was triaged but found to be a duplicate incident, an unnecessary incident, or not an incident at all. To reopen an incident. Select **New**.

SRM alert states

Alert can be in a few different states depending on how they are acted on.

An alert is created in SRM when a third-party monitoring tool has an event. Alerts are manually assigned. An alert is one of four states. You can edit actions from either the Alerts list or the Alert form. Use the **Save** button in the form to keep any changes you've made. Changes to Alerts in the list view are automatically saved.

Note:
You can acknowledge and assign an alert in any state.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert actions

State	Description
Open	State on alert creation. From this state you can acknowledge and set to: **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed. See Configure alert flapping for more information on event flapping. **Closed** Closes the alert.
Reopen	From this state you can acknowledge and set to: **Open** Sets the alert to the **Open** state. **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed. **Closed** Closes the alert.
Flapping	Flapping occurs when the event source continues to generate events even after its associated alert has been closed. From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Closed** Closes the alert.
Closed	From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed.

SRM change request states

Incidents can be in a few different states depending on how they are acted on.

Change requests can be manually created in SRM. Edit actions from the change request form using the state field in the form or using buttons in the change request record. Use the **Save**

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

button in the form to keep any changes you've made. Changes to change requests in the list view are automatically saved.

Change request states

State	Description
New	State on change request creation. The request is logged but not yet worked on.
Assess	The change request approval is being worked on.
Scheduled	The change request is scheduled for work.
Implement	The change request is taking action.
Review	The change request is moved to the **Review** state. **Note:** All open change tasks are set to **Canceled**.
Closed	The change request is closed.
Canceled	Change request was triaged but found to be a duplicate, or unnecessary. **Note:** You cannot reopen a canceled changed request.

CMDB service classes

Service Reliability Management (SRM) typically supports several Configuration Management Database (CMDB) service classes.

Types of CMDB service classes that SRM supports:

- Service instances (cmdb_ci_service_auto)
- Technology management services (cmdb_ci_service_technical)
- Query-based services (cmdb_ci_query_based_service)
- Mapped application services (cmdb_ci_service_discovered)
- Calculated application services (cmdb_ci_calculated)
- Tag-based application services (cmdb_ci_service_by_tags)

Troubleshoot SRM

Find answers to issues that you may encounter when using Service Reliability Management (SRM).

Condition

When trying to remove a service from SRM, you see one of the following messages:

- `<service-name> couldn't be removed from SRM. Check your permissions. Only SRM team managers can remove their team's services.`
- `<x> services couldn't be removed from SRM. Check your permissions. Only SRM team managers can remove their team's services.`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause

You're not assigned the required role to remove the selected services. As an SRM manager, you can only remove services that belong to your teams. You can still view and filter services across teams, but you can't remove services owned by another team.

Remedy

To remove the service from SRM, follow these steps to identify the manager to contact:

1. Navigate to **Workspaces** > *`Service Operations Workspace`* > **Services**.
2. Select the filter icon ( ) and remove the existing filters, letting you view services not assigned to your teams.
3. Find and select the service you want to remove.
4. Select the **Details** tab and then select the information icon ( ) in the Support group field.

The manager's name appears below the team name. Contact the manager to request the removal of the service from SRM.

ITOM Mobile Agent

Stay connected and keep services reliable with ITOM Mobile Agent, which lets you access Service Reliability Management (SRM) features on iOS and Android devices. Use it to track alerts, manage incidents, work on change and catalog tasks, and manage on-call shifts on the go.

Exploring ITOM Mobile Agent

Learn how you can use ITOM Mobile Agent to manage service reliability on the go, including its capabilities, benefits, and a sample workflow.

ITOM Mobile Agent overview

Use ITOM Mobile Agent to access Service Reliability Management (SRM) features on iOS and Android devices. With ITOM Mobile Agent, you can track alerts, manage incidents, and work on change and catalog tasks on the go. You can also manage on-call schedules by checking shifts, requesting time off, and filling scheduling gaps.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To help you manage service reliability in one place, ITOM Mobile Agent auto-integrates with existing ServiceNow mobile apps. It runs in the ServiceNow Agent app and automatically includes ITSM Mobile Agent features. With that setup, you can manage alerts, incidents, on-call schedules, and tasks in one mobile app.

Note:
If you already use ITSM Mobile Agent for incidents, on-call schedules, and tasks, install ITOM Mobile Agent to add alerts to your mobile experience. With ITOM Mobile Agent, you get and configure alert notifications and view alerts in the My work, My team, and Notifications tabs. See Install ITOM Mobile Agent for installation instructions.

ITOM Mobile Agent users

The following table lists user roles and what each user can do in ITOM Mobile Agent:

User	Description
Admin	Admins install ITOM Mobile Agent so teams can access service reliability features on the go.
SRM admin	SRM admins customize alert and incident notifications for ITOM Mobile Agent. They make sure that the relevant people are aware of critical issues.
SRM manager	SRM managers track team progress, monitor unassigned issues, and review performance metrics. They also handle on-call schedules, including shift rescheduling, time-off requests, and scheduling gaps.
SRM responder	SRM responders manage alerts, incidents, and tasks on the go. They accept, assign, and close alerts; create and collaborate on incidents; and process critical issues. They can also view upcoming shifts and request time off.

ITOM Mobile Agent workflow

This sample workflow shows how ITOM Mobile Agent helps you manage services and the teams assigned to them:

1. Monitoring tools generate critical alerts when they detect issues, and the ITOM Mobile Agent system sends mobile alert notifications to on-call responders.
2. As an on-call SRM responder, you acknowledge, reassign, or close the alerts. If needed, you create incidents from the alerts, and then the ITOM Mobile Agent system assigns them to the appropriate team.
3. You troubleshoot and collaborate on incidents, escalating them to major incidents when necessary, and then resolve and close the incidents, providing relevant details as needed.
4. As an SRM manager, you adjust shifts, approve time-off requests, and resolve scheduling gaps for the on-call responders. Use dashboards to view alert trends, incident resolution times, and team performance.

ITOM Mobile Agent benefits

Working with ITOM Mobile Agent has the following benefits:

Improve service reliability

Minimize downtime by managing alerts and incidents on the go.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Respond to issues faster

Keep on-call engineers connected, letting them accept, assign, and close alerts from anywhere.

Notify the right people

Customize push notifications to make sure that the relevant people are aware of critical issues.

Boost collaboration

Help teams work efficiently by managing on-call schedules and filling coverage gaps on mobile.

What to explore next

To learn more about configuring and using ITOM Mobile Agent, see:

- Configuring ITOM Mobile Agent
- Using ITOM Mobile Agent
- ITOM Mobile Agent reference

Configuring ITOM Mobile Agent

Set up and configure ITOM Mobile Agent.

Configuration overview

Use the pages in this section to set up and configure ITOM Mobile Agent. The information covers required and optional setup steps, including installing the app, managing alerts, and customizing alert recipients.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, so you can manage alerts, incidents, and on-call schedules from the same mobile app. Where relevant, this section links to ITSM Mobile Agent content, providing additional configuration options for your mobile experience.

Required configuration steps

If you're an admin, start by installing ITOM Mobile Agent. If you're a Service Reliability Management admin, manager, or responder, you can start by downloading the ServiceNow Agent app and then logging in.

- Install ITOM Mobile Agent
- Download the ServiceNow Agent app
- Log in to ITOM Mobile Agent

Optional configuration steps

After you log in to ITOM Mobile Agent, you can work with the core features. Visit the following links to configure and customize ITOM Mobile Agent further to meet your team's needs:

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install ITOM Mobile Agent

Install and give your teams access to ITOM Mobile Agent.

Before you begin

Service Reliability Management (SRM) services, service integrations, teams, and on-call schedules must be set up. ITOM Mobile Agent connects to your existing SRM setup, helping your teams manage alerts, incidents, tasks, and on-call schedules.

Role required: admin

About this task

ITOM Mobile Agent runs in the ServiceNow Agent app. When you install ITOM Mobile Agent, your teams can access it in the ServiceNow Agent app on their devices.

This procedure is for admins managing mobile access for their teams. If you aren't an admin and want to use ITOM Mobile Agent on your mobile device, see Download the ServiceNow Agent app.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Search for and select ITOM Mobile Agent.
   If you can't find ITOM Mobile Agent, request it from the ServiceNow Store.
3. Review the listed dependencies and, if needed, install the required plugins and applications.
4. Select **Install**.

   After the application is installed, your teams can access ITOM Mobile Agent by downloading the ServiceNow Agent app and logging in to the relevant instance.

What to do next

To start using ITOM Mobile Agent, see Download the ServiceNow Agent app and Log in to ITOM Mobile Agent.

You can also customize ITOM Mobile Agent to meet your team's needs:

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

Download the ServiceNow Agent app

Download the ServiceNow Agent app to use ITOM Mobile Agent on your device.

Before you begin

ITOM Mobile Agent must be installed. See Install ITOM Mobile Agent for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task

The ITOM Mobile Agent application runs in the ServiceNow Agent app. To access ITOM Mobile Agent, download the ServiceNow Agent app on your device.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Download the ServiceNow Agent app for your device:
   - For iOS, use the App Store.
   - For Android, use Google Play.
2. Confirm that the app is on your device.

   Look for the ServiceNow Agent app icon ( ). The app appears on your device with the name Agent.

What to do next

To start using ITOM Mobile Agent, see Log in to ITOM Mobile Agent. You must log in to receive push notifications about alerts and incidents.

Log in to ITOM Mobile Agent

Log in to your ITOM Mobile Agent instance on the ServiceNow Agent app to manage alerts, incidents, and on-call schedules on the go.

Before you begin

ITOM Mobile Agent must be installed, and the ServiceNow Agent app must be downloaded on your device. See Install ITOM Mobile Agent and Download the ServiceNow Agent app for more information.

You must also have your instance address, for example `nebula-dev.service-now.com`, or a QR code for the instance. If you don't have one, contact your admin.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Tap the ServiceNow Agent icon ( ) on your device.
2. Enter the address of your instance manually or with a QR code.

Option	Description
Manual entry	Replace `example.service-now.com` with the address of your instance. You don't need to include `service-now.com`. For example, enter `nebula-dev` for `nebula-dev.service-now.com`.
QR code	Tap the QR code icon and scan the QR code.

3. **Optional:** In the **Nickname** field, enter an alternative name for your instance.
   Alternative names can help you quickly navigate between different instances on your device.
4. Tap **Save and log in**, enter your credentials, and then tap **Log in**.
   The app displays `Logged into <instance-name> as <username>` and the ITOM Mobile Agent **My work** tab.

> **Note:**
> You must be logged in to get push notifications about alerts and incidents. If you aren't, you only get email notifications.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Visit these links to start using ITOM Mobile Agent:

- Work with alerts in ITOM mobile
- Managing incidents and major incidents on mobile
- Working with On-Call Scheduling on mobile
- Working with tasks on mobile

Configure when to send alert notifications for ITOM Mobile

Keep your teams informed by configuring when ITOM Mobile Agent sends a notification about an alert.

Before you begin

Role required: admin

About this task

By default, ITOM Mobile Agent sends a push notification and email when an alert meets these conditions:

- **Assigned to is empty** - The alert isn't assigned to anyone.
- **State is not Closed** - The alert state isn't closed. It's either empty, flapping, open, or reopen.
- **Severity is Critical** - The alert severity is critical. It isn't clear, empty, OK, major, minor, or warning.

You can update those conditions as needed. For example, the ITOM Mobile Agent app can send notifications for both critical and major alerts. However, if you customize the conditions, the conditions don't receive future release updates. That behavior is intentional to avoid overwriting your work.

> **Note:**
> To get push notifications, you must log in to ITOM Mobile Agent. If you log out, you only get email notifications.

This procedure is for admins configuring alert push notifications and emails. To manage other notification features, see Customizing other mobile settings for ITOM Mobile Agent.

Procedure

1. Navigate to **All** > *Mobile App Builder*.
2. Search for and select **ITOM Mobile Agent**.
3. Select **Mobile notifications**.
4. In the **When to send** section, update or add to the assigned to, state, and severity conditions. For example, adding the condition **OR [Severity][is][Major]** under the condition **[Severity][is][Critical]** sends a push notification and email when the **Severity** field of an alert is Critical or Major.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Implement your changes by selecting **Save**.
   The page displays `Your changes have been saved.`

What to do next

To customize who receives emails about alerts, see Customize ITOM Mobile Agent email recipients. You can also customize other notification features, such as setting custom notification tones and overriding the Do Not Disturb setting for critical issues. See Customizing other mobile settings for ITOM Mobile Agent for more information.

Customize ITOM Mobile Agent email recipients

Customize who receives emails about alerts to help reduce notification overload and efficiently delegate responsibilities.

Before you begin

Role required: srm_admin or admin

About this task

By default, ITOM Mobile Agent sends emails about alerts to everyone in a team's group email. You can customize the email recipients as follows:

- Exclude managers from alert emails, reducing notification overload.
- Include individual team members on alert emails, making sure that the right people stay informed.

Procedure

1. Navigate to **All** > **Service Reliability Management** > **Teams**.
2. In the list, find the team that you want to customize.
3. Choose one or more options to include or exclude certain recipients from email alerts.
4. Save your changes by selecting the check mark.
   Your updates appear in the **Teams** list, and ITOM Mobile Agent sends emails accordingly.

Customizing other mobile settings for ITOM Mobile Agent

Learn how to customize your mobile experience further. Configure actionable notifications, set custom notification tones, and override the Do Not Disturb setting for critical issues to help your teams stay informed.

Explore other settings

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Visit the following ITSM Mobile Agent documentation to learn about customizing mobile notifications.

- Configurable actionable notifications for ITSM Mobile Agent
- Enable Push notification categories for ITSM Mobile Agent
- ITSM Mobile email notification redirection via web
- Set custom alert tones in ITSM Mobile Agent for different incident priority
- Enable Override do not disturb to receive critical alerts

Using ITOM Mobile Agent

Work with alerts, incidents, on-call schedules, and tasks on the go.

ITOM Mobile Agent tasks

Work with alerts in ITOM mobile

Manage alerts on the go. Learn how to assign, reassign, and close alerts in ITOM Mobile Agent. You can also add work notes to alerts and create incidents from alerts.

Add work notes to an alert

Add work notes to an alert to update your team, share important information, and document your actions.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ).
4. Select **Add work notes** and enter your notes.
5. Save and add your notes to the alert by tapping **Submit**.

ITOM Mobile Agent displays `Success! Comments added`. The assigned team member also receives a push notification that the alert has had comments added.

To view an alert's work notes on mobile, navigate to the alert and select the **Activity** tab.

Assign an alert

Assign an alert to make sure the correct team member acts on it. You can assign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ) and select **Assign alert**.
4. Tap **Assigned to** and select a team member to assign the alert to.
5. Implement your changes by tapping **Submit**.

The assigned team member receives a push notification that the alert has been assigned to them. The alert also appears in their **My work** tab.

Close an alert

Close an alert to show that the issue is resolved or that no further action is needed.

Role required: srm_manager, srm_responder, or srm_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Close alert**.

ITOM Mobile Agent displays Alert closed successfully. The alert no longer appears in the assigned team member's **My work** tab.

To view closed alerts that were assigned to you, tap **My work** and then tap **See all** in the My Alerts section. The **Closed** tab shows your closed alerts.

Create an incident from an alert

Create an incident when an alert signifies a critical issue that disrupts or could disrupt your system.

When you create an incident from an alert, ITOM Mobile Agent assigns the incident to the same team but not the same responder. For example, if the alert is assigned to the Network Ops team and responder Alex, the incident is assigned to the Network Ops team.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Create incident**.

ITOM Mobile Agent displays a notification similar to `INC0013579 was created from Alert0002468`. You can view the incident in the **My team** tab. For more information about managing incidents in ITOM Mobile Agent, see Managing incidents and major incidents on mobile.

> **Note:**
> If you don't see the option to create an incident from an alert, make sure that the alert is assigned to a team. To assign the alert to a team, see Assign alerts in Express List. In the Express List, teams are also known as assignment groups.

Reassign an alert

Reassign an alert to make sure the correct team member or an available team member acts on it. You can reassign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Reassign alert**.
4. Tap **Assigned to** and select a team member to reassign the alert to.
5. Implement your changes by tapping **Submit**.

ITOM Mobile Agent displays Alert reassigned successfully. The assigned team member receives a push notification and the alert appears in their **My work** tab.

Managing incidents and major incidents on mobile

Manage and resolve incidents on the go using ITOM Mobile Agent. Learn how to create, process, and collaborate on incidents on your mobile device. You can also track and collaborate on major incidents.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Refer to the following ITSM Mobile Agent documentation to learn about managing incidents on your mobile device.

Manage an incident

- Collaboration with incidents
- Collaboration with incident tasks
- Create an incident from app landing page
- Generating task summarization for incident records
- My team dashboard
- Performance metrics
- Process a breached incident
- Process an incident at risk
- Unassigned incidents

Manage a major incident

- Active major incidents
- Collaboration with major incidents
- Major incident dashboard
- Review and work on a major incident candidate

Working with On-Call Scheduling on mobile

Manage on-call schedules on the go using ITOM Mobile Agent. As a manager, learn how to manage shifts, time-off requests, and scheduling gaps. As a responder, learn how to request time off, view who is on call, and see upcoming shifts.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Refer to the following ITSM Mobile Agent documentation to learn about managing on-call schedules on your mobile device.

On-Call Scheduling for managers

- Manage gaps and conflicts with On-Call Scheduling
- Manage time-off requests with On-Call Scheduling
- Manage upcoming shifts with On-Call Scheduling

On-Call Scheduling for responders

- Request time off with On-Call Scheduling
- View on-call group members
- View upcoming shifts with On-Call Scheduling

Learn about ITOM Mobile Agent settings. You can view the app version, give feedback, and adjust your preferences.

Explore reference documentation

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Visit the following ITSM Mobile Agent documentation to learn more about your mobile app settings.

Settings

Service Level Objective Management

Service Level Objective Management (SLO Management) helps your organization define, track, and meet agreed-upon service quality standards. It works alongside Service Level Agreements (SLAs) to help make sure that services meet customer expectations.

Overview of how SLO Management works

- SLAs set the expectations

  SLAs are formal agreements that outline the level of service a customer can expect. SLAs can include response times, resolution times, and uptime targets.

- SLOs defines how to meet expectations

  SLOs are specific, measurable objectives that an organization sets to achieve the SLAs. They translate the broad goals of the SLA into actionable metrics.

- ServiceNow SLO Management helps manage SLOs. It offers functionalities to:
  - Define SLOs based on various metrics.
  - Monitor SLO performance in real-time.
  - Generate alerts when SLOs are at risk of being breached.
  - Track historical data to identify trends and improve processes.

Exploring SLO Management

Service Level Objective Management (SLO Management) helps IT services meet customer expectations.

SLO Management overview

SLO Management is a framework for setting clear expectations and measuring the performance of IT services. It helps organizations deliver consistent services and identify areas for improvement. SLOs define the target service level for a specific service, such as incident resolution or service request fulfillment. Effective SLO management involves setting realistic objectives, monitoring performance, and continuously improving services to meet customer needs.

SLO Management users

Users

Users	Description	Contains Roles
admin	A ServiceNow administrator is responsible for the administration,	All

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Users (continued)

Users	Description	Contains Roles
	• Set up and maintain Reliability Indicators. • Set up and maintain Error Budget Policies.	
Responder [srm_responder]	An SRE that uses SRM to perform everyday tasks. Responders are the individuals who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams: • Set up services, teams, and integrations • Confirm their on-call schedules • Manage incident and alert records • Update teams that they've created • Add other responders • Create Integrations with Application Performance Monitoring (APM) tools • Set up and maintain reliability metrics • Set up and maintain error budget actions	Inherits 17 roles including the following: • cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

Note:
If you're using the SLO plugin without SRM, make sure that the required alert and cmdb_ci read access is granted to team members.

SLO Management workflow

1. Define SLOs - Identify critical services and define SLOs based on customer expectations and business requirements.
2. Establish SLIs - Develop Service Level Indicators (SLIs) to measure SLO performance.
3. Monitor and analyze - Track SLI data and analyze performance against SLO targets.
4. Identify gaps and improve - Determine areas where SLOs aren't being met and implement changes to improve service performance.
5. Review and refine - Regularly review SLO performance and refine SLOs as needed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLO Management benefits

- Improved service quality - SLOs help IT services meet customer expectations, leading to increased satisfaction and loyalty.
- Increased transparency - Clear SLOs provide a shared understanding of service expectations between IT and customers.
- Better resource allocation - SLOs help prioritize resources and focus on areas that need improvement.
- Enhanced collaboration - SLO management encourages collaboration between IT teams and customers to achieve common goals.
- Data-driven decision making - SLO performance data informs decisions and drives continuous service improvement.

Working with reliability metrics

Learn about the reliability metrics and features that can help you track service health, respond to issues, and support business goals.

Service reliability dashboard

The Service reliability dashboard displays a customizable, high-level view of service performance. It helps you monitor and manage reliability using visualizations that track service states, error budgets, and service level objectives (SLOs) over time.

The dashboard displays information about all services in Service Reliability Management (SRM). You can access the dashboard in Service Operations Workspace in the following ways:

- Navigate to **Services (** **)** > **Service reliability**.
- Navigate to **Home (** **)** > **Service reliability**

For more details, see Visualizations in the Service reliability dashboard.

Note:
You can also view SLO information for all services on the Services Overview tab. See Working with SRM services for more information.

Notification destinations

Notification destinations help keep teams informed about service reliability. Attach them to error budget policies to send notifications when a policy is breached.

To view and manage notification destinations in Service Operations Workspace, navigate to **Teams** > **[Your team]** > **SLO Notification destinations**.

Visit the following links to learn more about creating and working with notification destinations:

- Create a notification destination in SRM
- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

Reliability metrics tab

The Reliability metrics tab shows how well a specific service is meeting its reliability goals. Use it to track SLOs, service level indicators (SLIs), and error budgets for a service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view the Reliability metrics tab in Service Operations Workspace, navigate to **Services ( )** > **[Your service]** > **Reliability Metrics**.

See these links to learn more about what you can do in the Reliability metrics tab:

- Create SLOs, SLIs, and error budget policies
- Edit a reliability metric
- View SRM reliability metrics

Service level objectives table

On the Reliability metrics tab, the Service level objectives table includes the following details about the service SLOs:

- **Name** - Name of the SLO. You can select the name to view the SLO record.
- **Reliability** - Current state of the SLO. For example, stable, at risk, or critical.
- **% Error budget remaining** - Percentage of the error budget still available in the current compliance period.
- **Compliance period** - Time window used to calculate performance:
  - Month - Current month, for example, if the current date is January 26, the month is January 1 through January 31.
  - Rolling 7, 30, or 90 days - Number of days from the current date. For example, for rolling 7 days, the duration is 7 days back from the current date.
- **SLI type** - Performance category being measured:
  - Availability - Percentage of time your service or configuration item is available, also known as uptime.
  - Errors - Frequency of your service errors.
  - Latency - Time that it takes to service a request.
  - Saturation - Fullness of your system, focusing on resource usage.
- **Source type** - Origin of the data used to calculate the SLIs for this SLO:
  - Alert - Uses alerts from integrated monitoring tools.
  - Outage - Uses outages detected by monitoring tools and reported by users. An outage indicates when the service was unavailable. This source type excludes planned outages, such as scheduled maintenance.
- **Updated** - The date and time the SLO was last edited.
- **Updated by** - The user name of the person who last edited the SLO.
- **State** - Status of the SLO. For example, running or retired.

Note:
For performance purposes, SLO and SLI records ([sn_sow_srm_slo_history] and [sn_sow_srm_sli_metric]) are archived after one year and deleted five years later. Archived data is omitted from tables and visualizations.

Using SLO Management

Using SLO Management ensures IT services meet customer expectations, improves service quality and transparency, and enables data-driven decision making.

Activate SLO-based change approval decisions

Activate Service Level Objective (SLO) change approval decisions to evaluate change requests based on SLO performance.

Before you begin

Review change approval policies and their terminology, including policy inputs, decisions, and approval definitions. For more information, see Change approval policies.

Role required: admin

About this task

Activate the Service Level Objective Change policy's decisions to include SLO performance in your change management process. The policy is active by default, however, its decisions are inactive.

When you activate the policy's decisions, the policy evaluates SLOs as inputs and implements the following:

- Require group manager approval if these conditions are true:
  - The lowest SLO error budget is less than 25%.
  - The highest SLO burn rate is greater than 1%.
- Auto-approve change requests if these conditions are true:
  - The lowest SLO error budget is greater than 25%.
  - The highest SLO burn rate is less than 1%.

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Change Approval Policies**.
2. Select the **Service Level Objective Change policy**.
3. In the **Decisions** tab, set **Active** to true for these decisions:
   - **Budget < 25% and Burn Rate > 1**
   - **Budget > 25% and Burn rate < 1**
4. Select **Update** to save your changes.
   The decisions are active and part of your change management process.

What to do next

Use a test change request to verify that change requests are either auto-approved or routed to a manager as expected.

You can also customize the Service Level Objective Change policy, including its name and conditions, as needed.

For more advanced setups, use Flow Designer to customize the SLOs and services included as policy inputs:

> **Important:**
> Customizing the flow prevents it from receiving future release updates. That behavior is intentional to avoid overwriting your customizations.

1. Navigate to **Process Automation** > **Flow Designer**.
2. In the list of flows, select **Change - SLO – Authorize** and then select **SLO - Get worst performing SLOs**.

3. Customize the **Action Inputs** section.
4. Select **Done** to implement your changes.

Create a notification destination in SRM

Set up notification destinations to help keep teams informed about service reliability.

Before you begin

Before creating notification destinations, set up the Microsoft Teams Graph spoke. When registering an application in the Microsoft Azure portal, grant the following Microsoft Teams Graph API permissions:

- `ChannelMessage.Send`
- `Group.ReadWrite.All**`

For setup instructions, see Set up the Microsoft Teams Graph spoke.

Role required: srm_manager, srm_admin, or admin

About this task

Create a notification destination to deliver messages to a specific Microsoft Teams channel. After you set up a notification destination, team members can attach it to error budget policies to receive messages about policy breaches.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. From the primary navigation, select **Teams** ( ).
3. On the Teams page, select the team you want to use the notification destination.
4. Select the **SLO Notification destinations** tab, select **Create a destination**, and then fill out the form.
5. **Optional:** Select **Send test notification** to verify your setup.
   When successful, a message appears in the relevant Microsoft Teams channel. The message is titled `Test Notification` and includes the following text:

   ```
   This is a test notification from the Service Reliability
    Management (SRM) Team '<team-name>'.
   ```

6. Select **Save**.
   The notification destination appears in the SLO Notification destinations tab. The table includes details about the Microsoft Teams channel and when the notification destination was last updated.

What to do next

To use and learn more about notification destinations, visit the following pages:

- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

You can also edit and delete notification destinations from the SLO Notification destinations tab. Deleting a notification destination removes it from all error budget policies where it was previously used.

Create SLOs, SLIs, and error budget policies

Define service level objectives (SLOs), service level indicators (SLIs), and error budget policies to monitor service health. These tools help you and your teams track performance and respond when needed.

Before you begin

To send notifications when an error budget policy is breached, your team must have a notification destination configured. You can check by navigating to **Teams** > **[Your team]** > **SLO Notification destinations** in Service Operations Workspace. For more information, see Create a notification destination in SRM.

> **Note:**
> By default, the outage data source for SLIs includes unplanned and degradation outages. Administrators can include planned outages by adding `planned` to the `sn_sow_slo.outage_supported_types` system property value.

Role required: srm_admin, srm_manager, or srm_responder

About this task

Create SLOs, SLIs, and error budget policies to monitor service health and help make sure that your services support business goals.

- SLOs are specific targets that you set for SLIs. They define the expected performance level.
- SLIs are metrics that measure performance based on a data source, such as alerts or outages.
- Error budget policies define the acceptable margin of error and what happens if that threshold is breached.

In Service Reliability Management (SRM), an SLO must have at least one SLI. SLIs can be filtered to a service or configuration item (CI) within the parent service's hierarchy. Filtering an SLI to a CI can help you more accurately track service health and identify root causes faster.

> **Note:**
> In SRM, each SLI can be associated with only one SLO to prevent conflicting performance expectations.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace* > **Services (** **)**.
2. On the **Services** page, select the service you want to monitor, then select the **Reliability metrics** tab and select **Add SLO & SLI**.
3. In the Service Level Objective (SLO) form, fill in the fields for your SLO and select **Next**.
   For information about the SLO fields, see Create SLO form.
4. In the Service Level Indicators (SLI) form, select the data source for your SLI.

   > **Note:**
   > If you create multiple SLIs for an SLO, they must use the same data source.

5. In the same form, select **Add indicators for <data source>**, fill in the fields for your SLI, and then select **Next**.
   For more information about the SLI fields, see Create SLI form.
6. **Optional:** In the Error budget policies form, select **Add policy**, and fill in the fields for your error budget policy.
   For more information, see Add an error budget policy form.
