If you don't add an error budget policy, the SLO objective percentage is only informational. Adding a policy helps you take corrective actions based on the performance data. If you're not ready to add a policy, you can add one later.

7. Review your SLO, SLI, and error budget policy, and then select **Activate**.

   Your SLO, SLI, and error budget policy are now active. The SLO record opens, displaying its reliability state and error budget information.

What to do next
See the following to learn how to monitor and manage your SLOs:

- Working with reliability metrics - Learn where and how to view SLO performance.
- Edit a reliability metric - Update your SLOs to keep them aligned with your reliability goals.

Edit a reliability metric

Update a reliability metric to keep it relevant and aligned with your team's goals.

Before you begin
Updating reliability metrics, such as Service Level Objectives (SLOs) or Service Level Indicators (SLIs), during active measurement periods can result in graph inconsistencies.

Role required: srm_admin, srm_manager, or srm_responder

About this task
To help you manage reliability-metric history, Service Reliability Management (SRM) follows specific naming conventions. When you edit a reliability metric, SRM does the following:

- Retires the existing SLO.
- Creates a copy of the SLO with your edits in a draft state, which you can either save as a draft or activate.
- Appends a number to the copy name, for example, Uptime (2) or Uptime (3).

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. Follow these steps to access the **Reliability metrics** tab:
   a. Select the **Services** page icon ( ).
   b. Select the service that uses the reliability metric you want to edit.
   c. Select the **Reliability metrics** tab.
3. To edit a reliability metric, select the relevant reliability metric, and then select **Edit** and **Continue to edit**.
4. Make your changes in the Details, Service level indicators, or Error budget policies tabs.

Note:
If you change the SLI data source, all existing SLIs for the SLO are removed and you must create new ones. An SLO can use only one data source type, and each data source has unique settings that can’t be preserved or automatically converted.

While you can’t recover the removed SLIs while editing the SLO, you can view the earlier versions in the Reliability metrics tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To save and implement your changes, select **Activate**.
   Your edited reliability metric appears in the Reliability metrics tab. SRM sets the state to running and includes a version number in its name, for example, Uptime (3).

What to do next

Managing SLOs requires ongoing updates to make sure that they reflect your reliability goals. You can edit or retire existing SLOs and, if needed, reactivate retired SLOs.

Note:
If you reactivate a retired SLO, SRM creates and activates a new copy of it. For example: If there are two versions of an SLO, Uptime (1) and Uptime (2), and you reactivate Uptime (1), SRM creates an active version called Uptime (3).

View SRM reliability metrics

Learn about an existing service level objective (SLO) and service level indicator (SLI).

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Note:
Administrators can view any Service Reliability Management (SRM) SLO.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. From the primary navigation, select the **Services** icon ( ).
3. Select a service, select the **Reliability metrics** tab, and then open an SLO.
4. View the SLO header to get key information about the SLO, SLI, and state.

Header element	Description
SLI type	○ **Availability**: Percentage of time the service is available. ○ **Errors**: Frequency of service errors. ○ **Latency**: Time taken to service a request. ○ **Saturation**: Fullness of the system, focusing on resource use.
SLO type	○ **Duration**: Measures the time that the service spends without breaching. The associated metrics are: ▪ **Objective (percentage)**: The target percentage of the SLI that the service is expected to meet. ▪ **Error budget**: The remaining error budget, shown in days and time, before the objective is breached. ○ **Count**: Measures the number of occurrences during a compliance period. The associated metrics are:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header element	Description
	▪ **Limit (occurrences)**: The number of occurrences that triggers a breach. ▪ **Remaining breach occurrences**: The number of occurrences left before a breach occurs.
State	○ **Draft**: The SLO isn't active yet. You can add new SLIs, update existing ones, or delete the SLO. ○ **Running**: The SLO is active. You can edit, retire, or delete the SLO. Editing a running SLO automatically retires it and creates a new copy. See Edit a reliability metric for more information. ○ **Retired**: The SLO is no longer active. You can reactivate it if needed.
Service	The service associated with the SLO.
Reliability	○ **Stable**: All SLOs have more than 25% of their error budget remaining. ○ **At risk**: All SLOs have some error budget remaining, but at least one SLO has less than 25% left. ○ **Critical**: At least one SLO has fully used its error budget.

Note:
From the header, you can delete, retire, or edit the SLO. Deleting an SLO also deletes the associated SLIs. Retiring an SLO changes its state, but you can reactivate it later from the SLO page or the Reliability metrics tab.

5. Select the **Overview** tab to view summary metrics and performance charts for the SLO.
   - Historic periods: Select a time range. The available periods span from the SLO creation date to the present in defined increments.
   - Summary metrics: View details about SLO performance depending on the configured SLIs and error budget policy thresholds.
   - Service level indicators: View the SLIs associated with the SLO.
   - Service level objective (SLO) history:
     - For duration SLOs, view charts for error budget used, error budget remaining, and burn rate.
     - For count SLOs, view charts for cumulative breach occurrences, burn rate, and alerts, incidents & changes impacting this service.

     You can point to the charts to view daily values.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the **Details**, **Service level indicators**, and **Error budget policy** tabs to view key configuration details.
   For information about the details shown, see Create SLO form, Create SLI form, and Add an error budget policy form. On the Error budget policies tab, you can select **Add policy** to define actions based on performance data.

What to do next

To learn how to create or edit SLOs, see Create SLOs, SLIs, and error budget policies and Edit a reliability metric.

SLO Management reference

Reference topics provide additional information about Service Level Objective Management.

Add an error budget policy form

Learn about the available fields for setting up error budget policies.

Fields in the Add an error budget policy form

The following table describes the available options in the Add an error budget policy form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Field	Description
Policy name	Display name of the error budget policy.
Threshold type	Select how you want to track your error budget. • **Burn rate (count)**: Tracks how quickly the error budget is being consumed. A higher burn rate means faster consumption. • **Error budget remaining (%)**: Tracks the percentage of the error budget that's still available during the specified period. **Note:** You can add multiple thresholds to a policy, but each must be unique. If you try to add a duplicate threshold, an error message appears.
Threshold value	The point at which you get notified based on the selected SLO indicator. • Burn rate: Set a value that indicates the burn rate is too high. For example, to be notified when your service or configuration item is burning through its error budget twice as fast as expected, set the threshold to 2.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Error budget remaining: Set a value that indicates the remaining error budget is too low. For example, to be notified when only 25% or less of the error budget remains, set the threshold to 25%. **Note:** The threshold values support up to 4 decimal places and then round up.
Policy action	[Optional] If a breach occurs, select the action that you want to take: • Create incident. • Send an email. • Notify Microsoft Teams. If you select this option, you must also select a relevant notification destination. To set up a notification destination for your team, see Create a notification destination in SRM. **Note:** To learn about the notifications that teams receive for breached error budget policies, see Notifications for breached error budgets.

Create SLO form

Learn about the available fields for adding a service level objective (SLO) to Service Reliability Management.

Service level objective form

The following table describes the available options in the Service level objective form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Service Level Objective form

Field	Description
Name	Name of the SLO.
SLI type	• **Availability**: Percentage of time the service is available. • **Errors**: Frequency of service errors.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields in the Service Level Objective form (continued)

Field	Description
	• **Latency**: Time taken to service a request. • **Saturation**: Fullness of the system, focusing on resource use.
How do you want to measure this objective?	You can measure this objective by: • **Duration**: The amount of time the service spends without breaching. It's the only value available. • **Count**: The number of periods or occurrences in a given compliance period.

Measuring by Duration

Field	Description
Objective (%)	The percentage of how available (uptime) you want the service to be over a length of time. If measuring by duration, an objective percentage of Five Nines (99.999%) means that the service wasn't available for 26 seconds per month, or about 5 minutes and 35 seconds per year. This is used to calculate your error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January. • **Rolling 7 days**: The duration is considered to be 7 days from the current date. • **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.
Error budget	Auto-populated. The maximum level of errors (downtime) allowed over a certain period. A percentage

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Duration (continued)

Field	Description
	of total service availability. Once you set your objective (%), your error budget is automatically calculated using this formula: 1 – (Desired) Availability. The error budget of a service will be calculated in days, hours, minutes, and seconds for a desired availability of 99.99% (Four Nines) of the year by: **1.** Calculating the total time in seconds in a year: 31536000 seconds. **2.** Determining the error budget as 1 – (Desired) Availability: 1 - 0.9999 = 0.0001. **3.** Converting the error budget to time units. For example, if the error budget is 0.0001: • Error Budget in Seconds = 0.0001 * 31,536,000 seconds = 3,153.6 seconds. • Error Budget in Minutes = 3,153.6 seconds / 60 = 52.56 minutes. • Error Budget in Hours = 52.56/60 = 0.875 hours. • Error Budget in Days = 52.56 minutes / (24 * 60) ≈ 0.0364 days. **Note:** Your error budget appears in units of days, hours, minutes, and seconds only when you measure your SLO by duration.

Measuring by Count

SLO type	Count by periods or Count by occurrences
Limit occurrences	The number of occurrences after which a breach occurs. Limit occurrences act as an error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Count (continued)

SLO type	Count by periods or Count by occurrences
	• **Rolling 7 days**: The duration is considered to be 7 days from the current date. • **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.

Note:
The **Assignment group** is auto-populated.

Create SLI form

Learn about the available fields for adding a service level indicator (SLI) to a service level objective (SLO).

Add SLI form

The following table describes the available options in the Add SLI form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Add SLI form

Field	Description
SLI name	Enter a name for your SLI. For example, Critical router issue.
Data source	This field is auto-populated. The alerts or outages are used to calculate the error budget.
Service or configuration item	• <Service-name> - Select this option to filter your SLI to the entire service. This option helps you measure overall service health. • Related configuration item - If your service includes one or more configuration items (CIs) in its hierarchy, select this option to filter your SLI to specific CIs. This option provides a more granular view of service health.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields in the Add SLI form (continued)

Field	Description
	Note: By default, only level-one CIs appear in the CI list. Administrators can change the number of levels displayed by updating the `sn_sow_slo.slo_rollup_depth` system property value.
Set conditions (optional) Customize your SLI by filtering it to specific alerts or outages. The fields in this section are optional.	
Add condition set	Select this option to specify the alerts or outages included in the error budget. For example, for alerts, if you set the condition to **Status is Critical**, only alerts with a critical status count toward the error budget.

Notifications for breached error budgets

Details about the notifications that teams receive for breached error budget policies.

When notifications are sent

When a service or configuration item breaches its error budget policy and a notification destination is set, Service Reliability Management (SRM) sends a notification to the configured Microsoft Teams channel.

Notification content

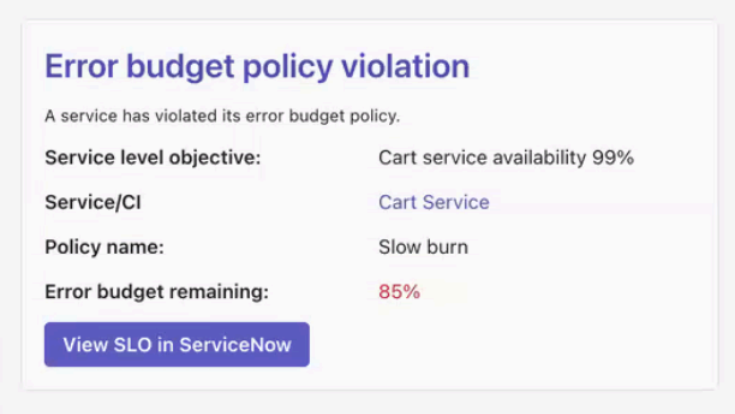
The message contains details about the breach to help team members learn about the issue and act. In Microsoft Teams, the message is titled `Error budget policy violation` and lists the following information:

- Service level objective - Name of the service level objective (SLO), for example, `Navigation service availability 99.95`.
- Service/CI - Name of the associated service or configuration time. Select the name to open the relevant service in SRM.
- Policy name - Name of the error budget policy that was breached.
- Error budget remaining - Percentage of error budget left at the time of the breach.
- View SLO in ServiceNow - Link to view the SLO details in SRM.

Sample notification

The following image is a sample notification in Microsoft Teams. It shows an error budget policy violation for the Cart service and details about the SLO and error budget remaining.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Related documentation

See Create a notification destination in SRM and Create SLOs, SLIs, and error budget policies.

Visualizations in the Service reliability dashboard

List of visualizations and options on the Service reliability dashboard in Service Reliability Management (SRM).

Service state charts

Top-level charts show the number of services in critical, at-risk, and stable states. Their states are based on the error budget remaining on their service level objectives (SLOs). You can select the charts to view service names, adjust the time range, and access additional chart options.

Note:
An error budget is the amount of failure a service can experience before breaching its SLO.

Each visualization also includes a trend line showing changes in service count over the past 12 months. Smaller figures indicate how the count has changed compared to a week ago, for example, ↓25 (22%) since Jun 11.

Chart	What it is	How to use it
Critical	Displays the number of services in a critical state. Critical services have 0% error budget remaining on their SLOs.	View how many services have consumed their error budgets and identify the services needing immediate attention.
At risk	Displays the number of services at risk. At-risk services have <= 25% error budget remaining on their SLOs.	Monitor how many services are approaching critical thresholds and find issues early.
Stable	Displays the number of stable services. Stable services have more than 25% error budget remaining on their SLOs.	Get insights into overall service health and identify if services are staying reliable over time.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk trends over time

Line charts track the number of SLOs with high burn rates and low error budget remaining over the past 12 months. You can use them to find recurring patterns and potential reliability risks.

Chart	What it is	How to use it
High burn rate (>=1)	Shows the number of SLOs with a burn rate >= 1 over time. A high burn rate indicates that the service linked to the SLO is likely to breach its error budget before the compliance period ends. For example, if a service has 30 days to meet its SLO but is using up its error budget in 15 days, the burn rate is 2.	• Find risks early by seeing when services begin consuming error budgets too quickly. • Identify emerging or recurring reliability issues by tracking burn rates over time. • Point to the chart to see the number and percentage of SLOs with a high burn rate at that time. • Select the chart to view SLO details, adjust the time range, and access additional chart options.
Low budget remaining (<=25%)	Shows the number of SLOs with low or no error budget remaining over time.	• Monitor how many services are nearing or have breached their SLOs. • Track rising trends, which might indicate declining reliability or recurring issues that need investigation. • Point to the chart to see the number and percentage of SLOs with little or no error budget remaining at that time. • Select the chart to view SLO details, adjust the time range, and access additional chart options.

Service level objectives (SLOs) table

The SLOs table lists the SLOs defined in Service Reliability Management (SRM), and it's sorted by SLO name by default. Use the table to monitor overall reliability, identify services at risk, and find the assigned teams.

The SLO table includes the following columns by default. To customize the columns shown, select the gear icon.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Name - Name of the SLO. You can select the arrow to sort the table by SLO name, and you can select the name to view the SLO record.
- Reliability - Current state of the SLO. For example, stable, at risk, or critical.
- Measured reliability - Percentage showing the actual performance of the service. For example, if your SLO is 99.9% success, and the actual performance for the month is 99.7%, the measured reliability is 99.7%.
- Objective (percentage) - Target SLO value.
- Burn rate - Numeric value showing how quickly the service is consuming its error budget.
- % Error budget remaining - Percentage of the error budget still available in the current compliance period.
- Service - Name of the service associated with the SLO. You can select the service name to view the service record.
- Assigned - Team responsible for the service.

Dashboard filters and actions

The Service reliability dashboard is built with Platform Analytics and includes standard dashboard features. For details on customizing, duplicating, or sharing dashboards, see the Dashboards in Platform Analytics documentation.

Note:
Changes to the Service reliability dashboard affect all SRM users on your instance. To create a personalized version, either build a new dashboard or duplicate the existing dashboard and edit it. Learn more in Create a dashboard with the in-line editor and Duplicate a Platform Analytics dashboard.

Service Observability

The ServiceNow® Service Observability application enables operators to triage and manage incidents in a complex and distributed system. Application and platform telemetry insights from multiple observability tools are combined into a centralized workflow.

Exploring Service Observability

Service Observability helps operations teams triage and manage incidents in a complex and distributed production system. It combines external application performance monitoring (APM) systems' telemetry with related data from the Configuration Management Database (CMDB) and displays both in a single workflow in the Service Operations Workspace (SOW).

Service Observability overview

Service Observability displays health metrics in the SOW related to a given service. Metrics can be ingested from an external APM system and displayed alongside information for related configuration items in the CMDB.

Service Observability supports the following APM vendors:

- Amazon CloudWatch
- AppDynamics
- Datadog
- Dynatrace
- Microsoft Azure Monitor
- New Relic
- Prometheus (on-premise)
- SolarWinds on-premise
- Splunk Observability

Service Observability supports the following databases:

- MySQL
- PostgreSQL (not supported with Splunk)
- RDS (Relational Database Service) (Amazon CloudWatch)

After connecting an APM instance to Service Observability, map services in the CMDB to APM metrics using existing tags.

With this data mapping, Service Observability displays APM metrics for entities such as host or database along with details about related CI information. Operators use these metrics and contextual information, including current incidents and alerts, to assess service health.

For example, say you use Dynatrace to monitor your `checkout` service, and metrics from your database and host use the tag `checkout-service` to denote requests coming from that service. By mapping the `checkout` service CI to the APM data tagged with `checkout-service`, Service Observability retrieves metrics for those databases and hosts and CIs related

© 2025 ServiceNow, Inc. All rights reserved.

to the service, then displays them together. Operators can pinpoint issues on entities related to the service and narrow down the mitigation process without having to leave the SOW.

Service Observability users

Users

User	Description
System admin	Version 1.5 only. System admins configure users and teams, register services to be monitored, connect Service Observability to APMs, and then map those services to that data. They can also view the data in the SOW
Service Observability admin	Version 1.6.x and later. Service Observability admins can configure users and teams, connect Service Observability to APMs, and then map services to that data. They can also view the data in the SOW. Admins can also customize dashboard templates used to display metrics and related information.
Operator/ operations manager **Note:** These users must belong to an `srm` group type to see all data.	Operators use Service Observability when triaging incidents in the SOW. They can view basic health metrics for a service, along with related incidents, alerts, and changes. They can get more detailed information by navigating to the **Observability** tab to view additional service metrics, along with metrics from related entities, such as a host or database.

Service Observability workflow

Admins configure Service Observability by registering services, connecting APM metrics, and then mapping the services to that data. Operators use Service Observability to determine if another related entity is causing issues surfaced by the service's performance.

As an admin, you:

1. Determine the services to be monitored by Service Observability based on business criticality.
2. Connect existing APM instances to Service Observability.
3. Map services with APM metric data based on APM-based tags used on that data.
4. Customize the templates used to display metric charts.

As an operator or manager, you:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Spot an issue with a service while working in the SOW, for example, from an alert, the Service dashboard, or Express List, then navigate to the Service Details page.
2. View overall health metrics for the service, along with related incidents, alerts, and changes. If one of the metrics seems unhealthy, navigate to the Observability tab.
3. View more detailed service metrics, as well as information from related entities, to start root cause investigation. When finding that the issue is further down the system's stack, identify the ownership for that entity to start remediation.

Service Observability benefits

Benefit	Feature	Users
Centralize critical signals and bridge workflows to increase agility and reliability: • Connect data from external APMs • Map that data to CMDB services • View combined data in the SOW	• Connect a Service Observability data source • Create and manage data mappings .	Admins
Increase efficiency and reduce mean time to resolution (MTTR). View combined metrics from entities associated with a service to begin to determine blast radius and ownership of an incident.	View service health metrics	Operators
See related changes to the system and alerts associated with a service in one place.	View overall service health.	Operators
Customize dashboard templates.	Customize Service Observability dashboard templates	Admins

What to explore next

To learn more about configuring and using Service Observability, see:

- Configuring Service Observability
- View overall service health
- View service health metrics
- Service Observability reference

Configuring Service Observability

After you install Service Observability, you must register services, connect external application performance management (APM) instances, and map that APM data to those services.

Configuration overview

Install Service Observability

If you have the system admin role, you can install the Service Observability application (`sn_sow_svcobs`). The application installs related ServiceNow® Store applications and plug-ins if they aren't already installed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Service Observability application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: system admin [admin]

About this task

The following items are installed with Service Observability:

- Plugins
- Store applications
- Roles
- Tables

For more information, see Components installed with Service Observability.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Service Observability application (`sn_sow_svcobs`) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box that is displayed, any dependencies that are installed along with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Activate teams and services

Follow this step only if you are on version 1.5.0 of Service Observability. Assign existing teams to Service Observability so they can view the data returned by the Configuration Management Database (CMDB) on those pages. Activate the services in the CMDB for use in Service Observability.

Before you begin

- Users assigned to a group that manage the activated services.
- Services that you want to monitor in Service Observability should be configured in the CMDB.

Role required: system admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:
Follow this step only if you are on version 1.5.0 of Service Observability.

Teams are used in both Service Reliability Management and Service Observability to give existing roles and groups the ability to view CMDB data on the **Overview** and **Observability** tabs.

The services that you want to monitor in Service Observability must be activated. Activation enables you to map data from an application performance management (APM) instance to that service and then view that service's related data on the **Overview** and **Observability** tabs.

Note:
Teams and services activated for Service Observability are also activated for Service Reliability Management (SRM). Service Observability admins can create a single service. For more information, see Add a service to SRM. When Service Observability admins create a single service, it's automatically activated for Service Observability and SRM. For more information, see Service Reliability Management.

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations** and choose the **Service Operations Management** card.
2. Navigate to **Service Operations Management** > **Assign and activate** > **Activate teams and services**.
3. Choose **Activate teams and services**.
4. Select the assignment groups that you want as teams in Service Observability and then select **Activate**.
   Only teams that haven't already been assigned are displayed.
5. In the modal, select **Confirm**.
6. In the Service class drop-down menu, select a CMDB service type.
7. From the list of services, select which services to activate for Service Observability and select **Activate**.
8. In the modal, select a support team for the services and choose **Confirm**.
   You now have services that can be monitored in Service Observability

What to do next

1. Connect a Service Observability data source
2. Create and manage data mappings

Connect a Service Observability data source

Connect Service Observability to an external application performance management (APM) instance. Service Observability displays metrics in the Service Operations Workspace (SOW) from that APM instance.

Before you begin

You must enter a connection URL and credentials for your APM vendor. You can either use an existing connection or create one. Note the following for specific vendors:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific connection information

APM Vendor	Connection information
AWS	The connection URL must be specific to the region to be monitored, for example, `https://monitoring.us-east-2.amazonaws.com`.
Azure	The connection URL should be `https://management.azure.com`.
Splunk Observability	The connection URL must include the Realm, for example, https://stream.[REALM].signalfx.com

If you're using existing credentials, you need the credential name. If you're creating credentials, collect the following information.

Vendor-specific credential requirements

APM vendor	Credential type	Information needed
AppDynamics	OAuth 2.0	• OAuth Client ID • OAuth Client secret • OAuth token URL • AppDynamics account name
Azure	OAuth 2.0	• OAuth Client ID • OAuth Client secret • OAuth token URL • Subscription ID
AWS	AWS credentials	• Access key • Secret key If the user associated with this key is restricted to specific permissions, they must include the following, scoped to all resources: • `cloudwatch:Describe` scoped to all resources • `cloudwatch:Get` scoped to all resources

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

APM vendor	Credential type	Information needed
		• `cloudwatch:List` scoped to all resources • `cloudtrail:LookupEvents` • `tag:GetResources` • `tag:GetTagKeys` • `tag:GetTagValues` • `apigateway:Get`
Datadog	API	• API key • Application key If an application key is restricted to a specific scope, those scopes are required for the following endpoints: • https://api.datadoghq.com/api/v2/catalog/entity • https://api.datadoghq.com/api/v1/hosts • https://api.datadoghq.com/api/v1/query • https://api.datadoghq.com/api/v2/query/timeseries
Dynatrace	API	API key The API key must have `Read entities` and `Read metrics` scope permissions.
New Relic	API	• Account ID • API key

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

APM vendor	Credential type	Information needed
Prometheus (on-premise)	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your Prometheus instance is hosted on
SolarWinds	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your SolarWinds instance is hosted on
Splunk Observability	API	Access token

Role required: sn_sow_svcobs.admin

About this task

The first step to ingesting APM data is to create a connection to the APM instance.

Service Observability supports the following APM vendors:

- Amazon CloudWatch
- AppDynamics
- Datadog
- Dynatrace
- Microsoft Azure Monitor
- New Relic
- Prometheus (on-premise)
- SolarWinds on-premise
- Splunk Observability

Procedure

1. Navigate based on your version of Service Observability.
   - Version 1.5.0: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability Management** > **Manage Observability** > **Data sources**
   - Version 1.6 or later: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability** > **Data sources**.
2. Select your APM vendor.
3. On the **Add connection** form, fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use an existing HTTP or HTTPs connection and an existing API key credential or create one.

4. Select **Save**.

Result

A new connection appears in the list of observability data sources. You use this connection when you create a data mapping.

What to do next

Map your connection to the services that you want to monitor in Service Observability. See Create and manage data mappings.

Create and manage data mappings

Map your services to the data from a connected external application performance management (APM) instance, and view it in charts for the service.

Before you begin

- If you are on version 1.5.0, activate the services that have data from an external APM instance. For instructions on how to activate the services, see Activate teams and services. For later versions, you don't need to activate services. You can map any of the following service types:
  - Application
  - Mapped application
  - Calculated application
  - Dynamic CI group
  - Technical
  - Tag-based
  - Service offerings
  - Business services
- Connect a Service Observability data source

Role required: sn_sow_svcobs.admin

About this task

When a service CI is mapped to specific APM metric tag key/value pairs, Service Observability displays metrics containing those tags for that service. These metrics are grouped by the following entity types:

- Application metrics: Metrics associated with the selected service
- Compute metrics: Metrics associated with the hosts the service is run on
- Databases: Metrics associated with databases used by the service

For example, say you have metrics from New Relic that are used to monitor services, databases, and hosts. On those metrics, you have used the tag `service_name`. Say you have also mapped the `checkout` service CI to the APM metadata key/value pair `service_name = checkout`. Service Observability shows you all the database and host metrics tagged with `service_name = checkout` in the context of the `checkout` service CI.

If some of your metrics on different entities use a different key name or a different key value, you can create exceptions. For example, if your host metrics use `service` instead of `service_name`, you can create an exception to include those metrics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each entity type has its own dashboard and each metric or related CI has its own default chart. You can customize the templates used for the dashboards and charts. See Customize Service Observability dashboard templates for more information.

Note:
To understand how Service Observability creates these mappings, see APM vendor entity mappings for Service Observability.

For a description of the field values, see Service Observability data mapping form.

Procedure

1. Navigate to the Data mappings page, following the procedures for your version of Service Observability.
   - Version 1.5.0: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability Management** > **Manage Observability** > **Data mappings**
   - Version 1.6.x or later: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability** > **Data mappings**.
2. Select **Create your first mapping** or **Create mapping**.
3. On the Observability data mapping page, enter a name for the mapping.
4. Choose the services that should use this mapping.
   - For version 1.5.0: Enter the names of the activated services that you want to map. For information about activating services, see Activate teams and services
   - For version 1.6.x and later:
     a. Choose **Select services**.
     b. Use the navigation to narrow down the list to the type of service you're searching for.
     c. Select the services to add to the mapping. You can add services from any combination of service type.

        Note:
        Use the filter to narrow down the service list.

     d. Select **Add services** to add them to the mapping.

   The Mapping preview pane updates to show the selected service, or the first service in a list of services.
5. Create a rule to determine how Service Observability should map internal services to the APM entities using tag keys and values.

   a. Select the data source for this map.

   b. Enter the tag key that you want to use to map the APM data to the service.
   The key can be any tag you use on your APM metadata, for example `service`. The entered key must match the tag you use in the APM metadata and is case-sensitive.

      Note:
      If you use more than one tag to represent a service, you can create an exception. For example, if most tags use `service` except for database metrics, which use `service_name`, you can create an exception for the database metrics.

   c. Manually enter a tag value or choose one from the drop-down menu.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Values are case-sensitive.

Values can be strings that are from your APM metadata, like a service name, or they can be a variable used to represent multiple instances, for example `$(service)`. When your key represents a service, a drop-down menu shows fields from the corresponding CI that can be used as a variable. If you choose to use a variable, be sure that the values resolve to values sent in the APM data.

Note:
If you selected more than one service to map, the drop-down displays only the fields that are common to all selected services.

You can now test your mapping or add exceptions.

6. **Optional:** If some of your entities use different key names or values, create exceptions to the default policy by configuring them in the Exceptions card.
7. Test the mapping.
   The **Mapping preview** panel shows the test results for the first service mapped. Service Observability sends a request through the connection and returns the entities found using the provided mapping. If you created an exception using a different source, the panel shows the results from each source separately. If the results don't seem correct, try reconfiguring the mapping by changing the tag key or value.

   If you have more than one service mapped, use the **Service** drop-down menu to select and test a different service.
8. Select **Save mapping**.

Result

On the **Observability** tab of the Service details page, dashboards and charts appear for the entities found from the mapping.

Customize Service Observability dashboard templates

You can customize the Service Observability dashboards on both the Overview and Observability tabs of the Service Details page. You can change or add metrics and related data to fit your business needs.

Service Observability dashboards are built using templates specific for each Application Performance Monitor (APM) vendor and entity tab. They're built using Platform Analytics, letting you customize templates to meet your business needs. For example, you might want to display metrics from your APM vendor that aren't available by default.

The Service Observability dashboards use APM-specific templates. You can see what each template displays by default from its respective reference topic.

- Amazon CloudWatch templates for Service Observability
- AppDynamics templates for Service Observability
- Azure Monitor templates for Service Observability
- Datadog templates for Service Observability
- Dynatrace templates for Service Observability
- New Relic templates for Service Observability
- Prometheus templates for Service Observability

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SolarWinds templates for Service Observability
- Splunk templates for Service Observability

Note:
When you make a customization, you're changing the template and not the individual service's dashboard. This means that dashboards for any services that also use the same data source are also changed.

Along with APM data, you can also add charts for data from ServiceNow tables and also from data stored in the MetricBase and Health Log Analytics applications.

When you customize a template, a copy of the original is saved so that you can reimplement it if needed. Default dashboards display a `Certified` tag.

Creating APM queries for a chart

When you edit or add a chart on a dashboard, you use the Edit data source page of Platform Analytics to create a query. You use the built-in query editor for simple metric queries and the Advanced mode to paste a query copied from a chart in your APM vendor instance.

Service Observability dashboards are scoped to the service currently displayed in the Service Details page. If you want to use a single query for multiple services and entities and any time range, you can replace hard-coded values with Service Observability template variables.

Add ServiceNow Tables

You can include data from ServiceNow problem records and business application records to dashboards and the data is scoped to the selected service.

Add MetricBase data charts

You can add charts based on data stored in the MetricBase application. The data is scoped to the selected service.

Add Health Log Analytics data charts

You can add charts based on data stored in the Health Log Analytics application. The data is scoped to the selected service.

Edit APM data charts on Service Observability dashboard templates

Edit Service Observability dashboard templates to view different APM vendor metrics on the Overview or Observability tabs' charts.

About this task

When creating an APM chart, you can use the query builder to create simple queries or use the advanced mode to create more substantial queries.

Use simple queries to return metrics associated with services, hosts, and databases. The returned metrics are aggregated across the time window set by the user.

Use advanced query mode to cut and paste queries from existing APM charts into Service Observability. For most APM vendors, you can simply copy a query from an existing chart in your APM instance.

Both query types support template variables that let you use the same query to return metrics for multiple entity instances.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note:
   Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add an APM query for a new chart, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization** > **New visualization**.

   b. In the **Configuration panel**, select `Line` for **Visualization type** and choose **Add data source**.

   c. In the **Add data source** page, open **Service Observability** in the navigation panel and select your APM vendor.
   Be sure to select the same APM vendor used on the template you're editing.

   d. Enter a query in the **Metric** card.

   Use the query builder to edit a simple APM-specific query.

   To copy a full query from your APM vendor chart, activate the **Advanced** switch and paste in a query from your APM vendor chart.

   For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

   Use template variables to replace any hard-coded entities or time periods to have the query return results that match both the service and time period selected in the UI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:**
> Use the **Docs** link to refer to the APM-specific documentation for help with creating the query.

e. To preview your query, select **Run** and then choose a service and entity.

f. When satisfied with your query, select **Add this source** to add the chart to the template.

5. To edit an existing query, follow these steps.

a. In Edit mode, select the chart to edit.

b. In the **Data sources** section of the Configuration panel, use the **More actions** menu to select **Edit**.

c. In the **Edit data source** page, edit the query in the **Metric** card.

Use the query builder to create a simple APM-specific query.

To copy a full query from your APM vendor chart, activate the **Advanced** switch and paste in a query from your APM vendor chart.

For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

Use template variables to replace any hard-coded entities or time periods.

> **Note:**
> Use the **Docs** link to refer to the APM-specific documentation for help with creating the query.

d. To preview your query, select a service and an entity and select **Run**.

e. When satisfied with your query, select **Apply** to add the chart to the template.

6. When done customizing, select **Save** and then **Exit editing mode.**
7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Edit ServiceNow data on Service Observability dashboard templates

Edit Service Observability dashboard templates to view data from problem and business app records on the Overview or Observability dashboards.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Services** list: Choose a service from the list.
- **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
- **List**: Navigate to **Application Services** > **Services** and select a service.
- **Express list** alert: Select a service from the **Impacted services** column.

The Service Details page opens and the Overview tab is displayed.

Trouble?
If charts are displaying error messages, see Chart error states.

2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note:
   Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new ServiceNow table, follow these steps:
   a. In Edit mode, select **Add new element** and choose **List**.
   b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.
   c. In the **Add data source** page, find the **Table** whose data you want to display and choose **Add this source**.
   d. In the **Columns and rows** section, add and arrange the columns to display.
5. To edit an existing chart, follow these steps.
   a. In Edit mode, select the chart to edit.
   b. In the **Data** section of the Configuration panel, verify that the correct table is selected in **Table** field.
   c. In the **Columns and rows** section, add and arrange the columns to display.
6. When done customizing, select **Save** and then **Exit editing mode.**
7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add MetricBase charts to Service Observability dashboard templates

Add MetricBase data to charts on Service Observability dashboard templates when you want to view those metrics in context of Service Observability.

About this task

You can add metrics that are stored in the MetricBase application to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note:
   Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new chart with MetricBase data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

   c. In the **Add data source** page, navigate to **MetricBase** > **Monitorable Item** and select the data to display, and then choose **Add this source**.
   The data is added to the dashboard.

   d. Use the controls in the **Data** section of the Configuration panel to select the metric and configure the query.
5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add Health Log Analytics data

Add a graph showing logs from Health Log Analytics (HLA) in a Service Observability dashboard.

About this task

You can add logs from HLA to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note:
   Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new chart with HLA data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

   c. In the **Add data source** page, navigate to **Health Log Analytics** > **Log components**.

   d. Enter a saved search or select a component and then optionally add conditions or a Lucene query, as described in Step 5 of Create log data dashboards and visualizations in Health Log Analytics.

   e. Once the filter is correct, choose **Add this source**.
   The data is added to the dashboard.

   f. Use the controls in the **Data** section of the Configuration panel to further configure the chart.
5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Use synthetic monitoring with Service Observability

Create a synthetic monitor to test your service's endpoints. Then display the results by customizing a Service Observability dashboard.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of using synthetic monitoring with Service Observability

Synthetic monitoring simulates user transactions on a service's HTTP endpoints, enabling you to identify performance bottlenecks, help confirm up-time, and optimize user experiences. It continually calls a service's endpoint to test availability, response times, or the presence of a defined string in the response body. When a test fails the configured criteria, it can send an alert. For more information about synthetic monitoring, see Exploring synthetic monitoring.

The results of the monitor's test can be added to the Service Observability Overview dashboard and to the Observability Service dashboard. To view synthetic data related to a service on a dashboard, you first create a monitor that tests the endpoints of your service. Then you customize a dashboard template to add the monitor's test results.

Note:
When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

1. Create a synthetic monitor to test a service.

   Install and configure synthetic monitoring and then create a monitor to continually test your service's endpoints using status code, response time, or response body as criteria.

2. Add synthetic monitor results to a Service Observability dashboard

   Customize a Service Observability dashboard template to add synthetic monitoring test results.

Create a synthetic monitor to test a service

Install and configure synthetic monitoring and then create a monitor for your service.

Before you begin
Your service must have an HTTP-reachable endpoint, configured as a CI in the HTTP(S) Endpoints [cmdb_ci_endpoint_http] table of the Configuration Management Database (CMDB).

Role required: n_sow_svcobs.admin, sn_sow_synthetics.synthetics_admin

Procedure

1. Install synthetic monitoring.
   See Install synthetic monitoring for more information.
2. If needed, create a location to run the monitor from.
   Monitors can be run locally from a ServiceNow Glide instance or from your environment using either a cluster of Agent Client Collector (ACC) agents or from a MID Server. If you choose to run them from your environment, you must create a location. See Create synthetic monitoring locations for more information.
3. Create the monitor.
   Follow the steps in Create and edit a synthetic monitor. Be sure to select the service you want to monitor as the **Related service CI**.

What to do next
Once you create the monitor, it begins running tests. View the results of those tests to verify the results before embedding synthetic monitoring into a Service Observability dashboard. For more information about viewing monitor test results, see Identifying system issues with synthetic monitoring.

© 2025 ServiceNow, Inc. All rights reserved.

Once you have expected results, move on to Add synthetic monitor results to a Service Observability dashboard.

Add synthetic monitor results to a Service Observability dashboard

Add a synthetic monitor to a dashboard in Service Observability by customizing an existing dashboard template.

About this task

Once you have created monitors for your services, you can display those results on your Service Observability dashboards by customizing the template to include a chart that queries synthetic monitoring. You can add synthetic monitoring to either the Overview dashboard or the Observability > Service dashboard.

Note:
When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note:
   Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To add a new ServiceNow table, follow these steps:
   a. In Edit mode, select **Add new element** and choose **List**.
   b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.
   c. In the **Add data source** page, search for and select the synthetic monitoring data source, depending on the data you want to display.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you want to display the status of all tests associated with a service, select the `Single API` [sn_synthetics_check_single_api] table.
- If you want to display the results of a single synthetic test for a service, select the `Single API Result` [sn_synthetics_check_single_api_result] table.

Note:
Leave the **Follow filters** check box selected. This control enables the chart to display information for the selected service.

4. In the **Default display** section, choose **Add** to begin adding columns from the table to the new list.
5. Choose **Save** and then **Exit editing mode** to return to the dashboard.
The synthetic monitoring data now appears on the dashboard.

What to do next

For detailed instructions about editing dashboards, see Edit in-line Platform Analytics dashboard elements.

Monitoring services and investigating issues

Operators use Service Observability to monitor the health of their services and to triage and manage incidents. They can view performance metrics from external application performance management (APM) systems in the context of an application service and its related CIs (Configuration Item).

Overview of using Service Observability

Service Observability can display metrics from an APM instance in context of a service. Along with metrics for the service and information about related CIs, Service Observability can infer entities related to the service, like a host or database, and display their metrics. This functionality gives an operator a more holistic view of what might be affecting performance.

The **Overview** tab on the Service Details page shows high-level performance metrics for the service and other contextual information such as open alerts or incidents affecting the service. The **Observability** tab displays more detailed metrics from the APM for the service, along with metrics for inferred entities that are found through data mappings configured during setup. It also shows information about CIs related to those inferred entities. Instead of having to switch to an external tool, an operator can view those external metrics in the context of the Service Operations Workspace (SOW).

- View overall service health

  In the **Overview** tab of the Service Details page in the SOW, view overall service health and related information, like alerts and changes.

- View service health metrics

  In the **Observability** tab, view more detailed service metrics, as well as metrics from related APM-monitored entities such as databases and hosts.

View overall service health

View overall service health and related events, like alerts and changes, with the **Overview** tab on the Service Details page in the SOW.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- For version 1.5, a service must be activated. For more information, see Activate teams and services.
- A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

About this task

When you have been notified that a service is experiencing performance issues, you can begin your investigation with the **Overview** tab on the Service Details page.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Use the charts in the Overview section to help determine where there might be performance issues.
   The Overview section shows the basic rate, error, and duration (RED) metrics along with metrics for key transactions found on the service. Hover over a metric to view more details.

   Note:
   If more than one service is found with the same name, select an individual service using the **All services** drop-down menu.
3. Change the time period using the time picker.
4. Use the other charts on the page to view related information about the service, such as recent changes, open incidents, and trends for incidents and alerts.
   These charts help explain whether recurring incidents or alerts might be caused by performance issues on the service. For detailed information about using this page, refer to the corresponding Overview templates for your Application Performance Management (APM) vendor described in Service Observability templates.

What to do next

To view more detailed metrics and metrics for related entities, select the **Observability** tab. For more information, see View service health metrics.

View service health metrics

View detailed metrics for a service, as well as metrics from related entities, such as databases and hosts, on the **Observability** tab in SOW.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The **Observability** tab on the Service details page displays metrics for related entities inferred from external application performance management (APM) instances, enabling you to view related metrics without having to leave the ServiceNow platform.

The metrics are grouped by the following entity types:

- Application metrics: Metrics associated with the application services
- Computer metrics: Metrics associated with the hosts of the service
- Databases: Metrics associated with databases used by the service

For example, say you have metrics from New Relic used to monitor services, databases, and hosts. Say that you also have an issue with the `checkout` service and want to view performance information and metrics related to that service. Service Observability can show you the service, database, and host metrics related to that service that are coming from New Relic, along with related CI information from the ServiceNow platform. Each entity type has its own dashboard and each metric and related CI information has its own chart.

Before you begin

- For version 1.5.0, a service must be activated. For more information, see Activate teams and services.
- A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Select the **Observability** tab.
   The **Observability** tab shows the related metrics and CI information available for the service. Use the navigation pane to view the entity dashboards.

   Note:
   If you don't see navigation options for an entity, then the metrics for that entity haven't been discovered or mapped.

3. Select an entity to view its dashboard.
   You can do the following with the charts:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Display metrics for a single entity by electing the **All [entity type]** drop-down list and choosing an entity.

  Note:
  If more than one entity returned metrics, charts display multiple lines with one line for each entity.

- Display metrics from a different time period using the time picker. The default time period is the last hour.
- Refresh the charts to the current time period of the last hour by selecting the **Refresh** button.
- Hover over a point to view detailed information.

For detailed information about using this page, refer to the corresponding Observability templates for your APM vendor described in Service Observability templates.

Service Observability reference

Reference topics provide additional information about administering and using Service Observability.

Components installed with Service Observability

Several types of components are installed with activation of the Service Observability plugin, including tables and user roles.

Roles installed

Role title [name]	Description	Contains roles
Operator/ Operations manager [snc_sow_svcobs.manager]	Triages incidents in the SOW. Views basic health metrics for a service and more detailed service metrics from related entities.	• sn_sow_srm.srm_responder • connection_admin • evt_mgmt_connector_instance_write
Service Observability admin [sn_sow_svcobs.admin]	Configures data sources and adds data mappings. Customizes dashboard templates.	• sn_sow_srm.srm_admin • connection_admin • evt_mgmt_connector_instance_write • sn_sow_itsm_admin.sow_admin_user

Store applications installed

The following are installed when you install Service Observability.

Store application [plugin]	Description
Service Observability UI [sn_service_obs_ui]	The Overview and Observability tabs in the Service Details page of the SOW.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Store application [plugin]	Description
Service Reliability Management	Service Reliability Management and Service Observability display service performance metrics together to give a holistic view into service health.
Platform Analytics	Enables customizing the dashboards.

Tables installed

Table	Description
Dashboard fragments [sn_sow_svcobs_dashboard_fragments]	Contains the definitions of dashboards in JSON format.
Service to data mapping configuration map [sn_sow_svcobs_svc_to_config_map]	Associates data mapping configurations with a registered service using the CMDB Group Contains Configuration Item [cmdb_group_contains_ci] table.
Data mapping configurations [sn_sow_svcobs_mapping_config]	Defines a data mapping configuration for a service.
Data mapping configuration rules [sn_sow_svcobs_mapping_config_rules]	Defines a single tag-based mapping rule.
Observability data source [sn_sow_svcobs_data_source]	Defines a third-party APM vendor data source (an `http_connections`) that can be used to get telemetry for services.
Service Observability entity records [sn_sow_svcobs_entity_records]	Records configuration items and unknown monitored objects for entities that appear in dashboards.
Service Observability PA Dashboards sn_sow_svcobs_pa_dashboards	Contains reference information for customized dashboards.

Domain separation and Service Observability

Domain separation is supported for Service Observability. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Service Observability overview

Domain separation is present in all aspects of the synthetic monitoring application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Service Observability

When data is separated by domains in Service Observability, users can only configure and see the observability data in their own domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

You define the domain-separated environment when you configure your data inputs. All relevant records and data processing in the Service Observability program flow reside in the same domain as the data input. The domain name of a data input appears in the Domain column that is displayed in the tables in your instance.

Service Observability manages all aspects of the data, such as the data mappings and the data displayed on dashboards. When a property is changed, the new value affects new sources only in the specific domain.

Domain separation for service providers

APM vendor entity mappings for Service Observability

Understand how Service Observability maps service, host, and database entities to your Application Performance Management (APM) vendor resources.

Service Observability displays metrics from your APM vendor for services, hosts, and databases on the Observability dashboards based on the key:value pairs in the mapping rules you create during configuration. Service Observability sends a request to the APM vendor using that mapping as a filter to find related entities. Any additional filtering needed to find the entities is noted in the following sections.

Amazon CloudWatch entity mapping

Resources are returned using the AWS `GetResources` API.

Service Observability entity category	Service Observability entity dashboard	AWS resource
Application	API Gateway - HTTP	API Gateway HTTP APIs
	API Gateway - REST	API Gateway REST APIs

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	AWS resource
	ELB	ELB application load balancers
	Lambda	Lambda functions
Compute	Host	EC2 instances
Databases	RDS	RDS database instances

AppDynamics entity mapping

Resources are returned using the value of the `entityName` property.

Service Observability entity category	Service Observability entity dashboard	AppDynamics resource
Application	Service	AppDynamics applications returned by the `/controller/rest/applications/` API
Compute	Host	Server nodes for applications returned by the `/controller/sim/v2/user/machines/keys/` API
Databases	MySQL	MySQL database instances returned by the `/controller/rest/databases/collectors/`
	PostgreSQL	MySQL database instances returned by the `/controller/rest/databases/collectors/`

Azure entity mapping

Resources are returned using the Azure `ResourceGraph` API.

Service Observability entity category	Service Observability entity dashboard	Azure resource
Application	Service	• `Microsoft.Compute/cloudServices` • `Microsoft.Web/sites`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Azure resource
Compute	Host	`Microsoft.Compute/virtualMachines`
Databases	MySQL	• `Microsoft.DBforMySQL/servers` • `Microsoft.DBforMySQL/flexibleServers`
	PostgreSQL	• Microsoft.DBforPostgreSQL/servers • `Microsoft.DBforPostgreSQL/flexibleServers`

Datadog entity mapping

Service Observability entity category	Service Observability entity dashboard	Datadog resource
Application	Service	Entities returned from the Software Catalog: List Entities API
Compute	Host	Hosts returned from the Hosts: List Hosts API
Databases	MySQL	Databases returned by filtering the `mysql.net.max_connections` metric, filtered by the provided key:value pair in the data mapping. **Note:** If your databases don't emit this metric, they aren't mapped.
	PostgreSQL	Databases returned by filtering the `postgresql.connections` metric, filtered by the provided key:value pair in the data mapping.

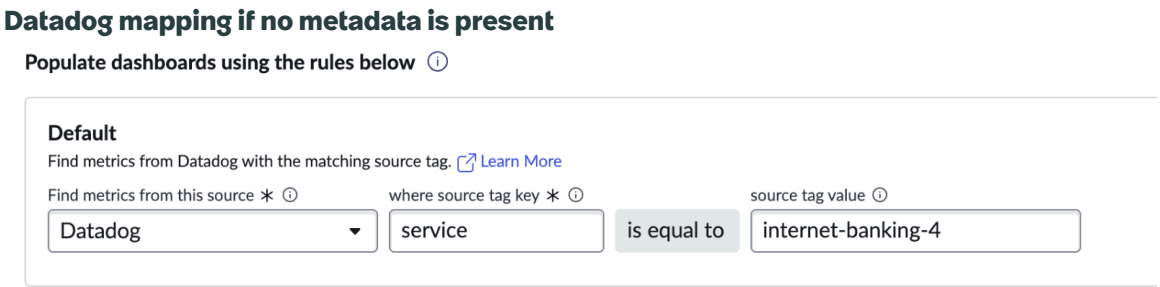
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Datadog resource
		Note: If your databases don't emit this metric, they aren't mapped.

Items of note:

- Service entities: The `Software Catalog list entities` API only returns data for services that include metadata. If you want to map services that don't include metadata, you must create a mapping using `service` as the tag and the name of the service as the value.

  For example, say you have a service named `internet-banking-4` that you want to use in a mapping and it doesn't contain metadata. You set up the mapping as shown in this screenshot.

- Default dashboard templates: The Requests, Errors, and Latency charts on the Overview and Observability dashboard templates are created using the Datadog `trace.http.request` trace metric. If a service isn't emitting that metric, no data is found. You can customize the template to use a different trace metric query. See Customize Service Observability dashboard templates for more information.

Dynatrace entity mapping

Service Observability entity category	Service Observability entity dashboard	Dynatrace resource
Application	Service	Services
Compute	Host	Hosts
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

New Relic entity mapping

Service Observability entity category	Service Observability entity dashboard	New Relic resource
Application	Service	APM application services
Compute	Host	Hosts

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	New Relic resource
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

Prometheus entity mapping

Service Observability entity category	Service Observability entity dashboard	Prometheus resource
Application	Service	Applications
Compute	Host	Server nodes for applications
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

SolarWinds entity mapping

Service Observability entity category	Service Observability entity dashboard	SolarWinds resource
Application	Service	APM application services
Compute	Host	Hosts

Splunk entity mapping

Resources are returned using the Splunk Metric time series Metadata API. Service Observability searches for matching key:value pairs in custom properties and then falls back to searching dimensions.

The returned payload is then filtered by the presence of a specific metric in the metadata that corresponds with an entity type.

Service Observability entity category	Service Observability entity dashboard	Splunk Property or dimension	Splunk metric used for filtering
Application	Service	• Property: `sf_service` • Dimension fallback: `service.name`	`sf_metric:service.request`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Splunk Property or dimension	Splunk metric used for filtering
Compute	Host	• Property: `host.name` • Dimension fallback: `host.id`	`sf_metric:disk.summary_util`
Databases	MySQL	• Property: `mysql.instance.name` • Dimension fallback: `mysql.instance.endpoint`	`sf_metric:mysql.threads`
	PostgreSQL	Not supported	

Advanced query support for AWS and Azure

Understand how to create advanced queries for Service Observability dashboard charts.

Advanced queries in Service Observability support most vendor-specific query languages. Simply copy a query from the APM chart and paste it into the Advanced query field in Service Observability. However, queries to AWS and Azure must be JSON-formatted and follow the guidelines outlined in this topic.

Note:
As of version 1.10, you can import charts directly from AWS and Azure. See Edit APM data charts on Service Observability dashboard templates for more information.

AWS advanced queries

Data from AWS is accessed using the `GetMetricData` API. Queries can be either a direct request in JSON format to that API or they can be in the form of a `DashboardBody` metric widget. For example, you can use the widget representation for a chart that exists on an AWS CloudWatch dashboard.

Example: Direct GetMetricData request

The following example shows a `GetMetricData` JSON query for a chart that displays the average CPU Utilization for an ELB instance.

```
{

    "StartTime": 1637061900, // can be replaced with “${START}”
    "EndTime": 1637074500, // can be replaced with “${END}”
    "MetricDataQueries": [
        {
            "Expression": "SELECT AVG(CPUUtilization) FROM
SCHEMA(\"AWS/EC2\", InstanceId)",
            "Id": "q1",
            "Period": 300,
            "Label": "Cluster CpuUtilization"
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        },
        {
            "Id": "m1",
            "Label": "Unhealthy Behind Load Balancer",
            "MetricStat": {
                "Metric": {
                    "Namespace": "AWS/ApplicationELB",
                    "MetricName": "UnHealthyHostCount",
                    "Dimensions": [
                        {
                            "Name": "LoadBalancer",
                            "Value":
 "app/EC2Co-EcsEl-EXAMPLE69Q/fdd2210e799e4376" // can be
 replaced with “${ENTITIES}” or “${ENTITIES_ELB}”
                        }
                    ]
                },
                "Period": 300,
                "Stat": "Average"
            }
        }
    ]
}
```

Example: Copied source for a single object in an AWS CloudWatch dashboard

This example shows the JSON copied directly from a single object in the widgets list of the Source view for a CloudWatch dashboard.

```
{
  "type": "metric",
  "x": 9,
  "y": 0,
  "width": 15,
  "height": 5,
  "properties": {
    "view": "timeseries",
    "metrics": [
      [ "AWS/ApplicationELB", "RequestCountPerTarget",
 "TargetGroup", "targetgroup/api-tg/1e3dc9z72fe21ca2",
 "AvailabilityZone", "us-west-1a" ],
      ["...", "targetgroup/api-tg-cs/82a1db5f950073e1", ".",
 "." ]
    ],
    "region": "us-west-1"
  }
}
```

Both types of queries can use template variables to represent a set of entities or the start and end time selected in the UI. For example, instead of querying for a single ELB instance, you can replace the `Value` field for the `LoadBalancer` dimension with `${ENTITY_ELB}`. The query is run against each ELB instance associated with the selected service in the Service Observability UI. The chart displays a time series for each one.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
JSON objects copied from the source of a CloudWatch dashboard don't include explicit time fields. The values from the time picker in the Service Observability UI are used automatically.

Template variables

AWS field	Template variable
`Dimensions[n].Value`	• `ENTITIES` • `ENTITIES_HOST` • `ENTITIES_LAMBDA` • `ENTITIES_API_GATEWAY_HTTP` • `ENTITIES_API_GATEWAY_REST` • `ENTITIES_ELB` • `ENTITIES_RDS` The `Dimensions[n].Value` field must be a resource identifier key.
`StartTime`	`START`
`EndTime`	`END`

Azure advanced queries

You run an advanced query for an Azure-based chart by copying the source from the Azure UI and pasting it in the **Advanced query** field.

To copy the source:

1. In the Azure UI, export and download the dashboard.
2. Copy the JSON for a single chart. Charts are located at `properties.lenses[i].parts[j].metadata.settings.content.options.chart`.
3. Paste the JSON into the query field. The JSON must include at least the following:

```
```
{
“metrics”: [
  “name”: string,
  “resourceMetadata”: {
    “id”: string
    }
  ]
}
```
```

The `id` field must be either an Azure resource ID or a template variable.

Service Observability template variables

Understand the template variables that you can use in your queries when editing Service Observability dashboards and charts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the following template variables in your query. Variables enable the query to be used for multiple services, hosts, and database instances, as well as for the time period currently selected for the dashboard.

Note:
Amazon CloudWatch uses slightly different template variables. See Advanced query support for AWS and Azure for more information.

Aside from the variables listed below, you can also use any tag key used in the chart's data mapping as a template variable.

Template variables

Variable	Description
`{$ENTITIES_HOST}`	Returns metrics for the selected host
`{$ENTITIES_MYSQL}`	Returns metrics for the selected MySQL instance
`{$ENTITIES_POSTGRESQL}`	Returns metrics for the selected PostgreSQL instance
`{$ENTITIES_SERVICE}`	Returns metrics for the selected service.
`{$ENTITIES}`	Returns metrics for the selected entity; either service, host or database.
`{$START_TIME}`	Returns metric time series using the selected start time.
`{$END_TIME}`	Returns metric time series using the selected end time.

Example query

Let's say you're using NewRelic and you create a data mapping that maps the key `service` to the value `checkout-service`.

A simple query built using the query builder might look like this:

```
rate(count(apm.service.transaction.duration), 1 minute
```

It would return the rate of transactions for the `checkout-service` service.

Instead you might use a full vendor query like this:

```
SELECT rate(count(apm.service.transaction.duration), 1
 minute) as 'Web throughput' FROM Metric WHERE (entity.guid
 = 'NDc2NDMyNXxBUE18QVBQTElDQVRJT058MTA3NjIyODQwMw') AND
 (transactionType = 'Web') LIMIT MAX SINCE 30 minutes ago
 TIMESERIES UNTIL now
```

It would return the duration for the hard-coded `NDc2NDMyNXxBUE18QVBQTElDQVRJT058MTA3NjIyODQwMw` entity from the last 30 minutes.

To create a query that would return the time series for any selected service at any time period, you can replace the entity and times with template variables:

```
SELECT average(convert(apm.service.transaction.duration, unit,
 'ms')) as metricValue,
```

Service Observability templates

View the templates for your Application Performance Management (APM) vendor to understand the default dashboards provided by Service Observability.

See Customize Service Observability dashboard templates for information about customizing these templates.

Amazon CloudWatch templates for Service Observability

Templates used to create Amazon CloudWatch dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Amazon CloudWatch Overview tab for Service Observability

Information that is displayed on the Amazon CloudWatch **Overview** tab of the Service Details page in the SOW.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Invocations	Aggregate rate of transactions through the service.	AWS
Errors	Number of transactions that have an error.	AWS
Duration	Aggregate duration of transactions through the service, in milliseconds.	AWS

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related Configuration Items (CIs) that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All active alerts	Listing of active alerts that affect this service.	CMDB

Amazon CloudWatch Observability tab for Service Observability

Dashboard and charts on the Amazon CloudWatch tab of the Service Details page in the SOW.

Application dashboards

This dashboard displays performance metrics for the selected service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

API Gateway - HTTP

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

API Gateway - REST

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Gateway - REST (continued)

Chart	Description	Data source
5xx Errors	Number of errors returned with a status of 5xx.	AWS

ELB

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

Lambda

Chart	Description	Data source
Errors	Number of errors reported by the Lambda function.	AWS
Duration	Aggregate duration of transactions through the service, in milliseconds.	AWS
Invocations	Number of Lambda invocations executed by this service.	AWS

Compute dashboards

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed by this service.	AWS
Disk Write Bytes	Number of bytes written to the database by this service.	AWS
Disk Read Bytes	Number of bytes read from the database by this service.	AWS

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
Network In Bytes	Amount of incoming network traffic in bytes for this service.	AWS
Network Out Bytes	Amount of outgoing network traffic in bytes for this service.	AWS
All EC2 VM Instances	Information for all EC2 VM instances the service is actively using. Select a link to view more detailed information.	CMDB
All Active Servers	Information for all servers the service is actively using. Select a Server link to view more detailed information.	CMDB

Database dashboards

This dashboard displays metrics for RDS databases related to the service.

RDS

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed by this service.	AWS
Free Memory	Amount of memory in bytes available on this database.	AWS
Free Storage	Amount of storage in bytes available on this database.	AWS
Current Connections	Number of connections from this service to the database.	AWS
Read Latency	Time taken in milliseconds for read operation from the database to complete.	AWS
Write Latency	Time taken in milliseconds for write operation from the database to complete.	AWS
All RDS Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

AppDynamics templates for Service Observability

Templates used to create AppDynamics dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

AppDynamics Overview tab for Service Observability

Information that is displayed on the AppDynamics **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Average Response Time	Average rate of transactions through the service.	AppDynamics
Errors per Minute	Rate of errors per minute on transactions for the service.	AppDynamics

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

AppDynamics Observability tab for Service Observability

Dashboard and charts on the AppDynamics Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service

Chart name	Description	Data source
Average Response Time	Average rate of transactions through the service.	AppDynamics
Errors per Minute	Rate of errors per minute on transactions for the service.	AppDynamics
Calls per Minute	Number of calls to the server, per minute.	AppDynamics
Number of slow calls	Number of calls to the server that have a response time slower than the set slow threshold.	AppDynamics
Number of Very Slow Calls	Number of calls to the server that have a response time slower than the set very slow threshold.	AppDynamics

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU %Busy	Percent of the host processing power being consumed.	AppDynamics
Memory Used %	Percent of memory the host is using.	AppDynamics
Disk Reads/sec	Percent of disk space being used, per second.	AppDynamics
Disk Writes/sec	Percent of disk space being written to, per second.	AppDynamics
Network Incoming KB/sec	Number of kilobytes coming into the service, per second.	AppDynamics
Network Outgoing KB/sec	Number of kilobytes being sent by the service, per second.	AppDynamics
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Calls Per Minute	Number of database calls made by the service, per minute	AppDynamics
Time Spent in Executions	Number of seconds spent executing database calls by the service.	AppDynamics

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MySQL (continued)

Chart	Description	Data source
DB Inserts	Number of database inserts by the service.	AppDynamics
DB Reads	Number of database reads by the service.	AppDynamics
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Calls Per Minute	Number of database calls made by the service, per minute	AppDynamics
Time Spent in Execution(s)	Time in seconds the database in execution mode for this service.	AppDynamics
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Azure Monitor templates for Service Observability

Templates used to create Azure Monitor dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Azure Monitor Overview tab for Service Observability

Information that is displayed on the Azure Monitor **Overview** tab of the Service Details page in the SOW.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Requests	Aggregate rate of transactions through the service.	Azure
Response Time	Aggregate duration of transactions through the service, in milliseconds.	Azure
Http 5xx	Number of errors returned with a status of 5xx.	Azure

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related Configuration Items (CIs) that might be affecting the service.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All Active alerts	Listing of active alerts that affect this service.	CMDB

Azure Monitor Observability tab for Service Observability

Dashboard and charts on the Azure Monitor Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Service

Chart	Description	Data source
Requests	Aggregate rate of requests through the service.	Azure
Http 4xx	Number of transactions that have an HTTP 4xx response.	Azure
Response time	Aggregate duration of transactions through the service, in milliseconds.	Azure
Data Out	Volume in bytes of outgoing network traffic from this service.	Azure
Http 2xx	Number of transactions that have an HTTP 2xx response.	Azure

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service (continued)

Chart	Description	Data source
Data In	Volume in bytes of incoming network traffic to this service.	Azure

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
Available Memory Percentage	Percent of the memory available to the service.	Azure
CPU %	Percent of the host processing power being consumed.	Azure
VM Cached Bandwidth Consumed Percentage	Percent of the virtual machine's cached bandwidth that the service is consuming.	Azure
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Storage %	Percentage of storage currently being consumed by the service.	Azure
CPU %	Percentage of CPU currently being consumed by the service.	Azure
Memory %	Percentage of memory currently being consumed by the service.	Azure
Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
MySQL Uptime	Total time in seconds that this MySQL instance has been running since its last restart.	Azure
Slow Queries	Number of queries that take longer than the specified threshold to execute. This threshold is typically defined by the `long_query_time` parameter in MySQL.	Azure

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL

Chart	Description	Data source
Storage %	Percentage of storage currently being consumed by the service.	Azure
CPU %	Percentage of CPU currently being consumed by the service.	Azure
Memory %	Percentage of memory currently being consumed by the service.	Azure
Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
Succeeded Connections	Number of successful connections from the service to the database.	Azure
Deadlocks	Number of deadlocks encountered by the service.	Azure
Is Database Alive	`1` if database is up, `0` if it is down.	Azure
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Datadog templates for Service Observability

Templates used to create Datadog dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Datadog Overview tab for Service Observability

Information that is displayed on the Datadog**Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request	Aggregate rate of transactions through the service.	Datadog
Errors	Percent of transactions that have an error.	Datadog
Latency	Aggregate duration of transactions through the service, in milliseconds.	Datadog

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your Application Performance Management (APM) system configuration.

Chart name	Description	Data source
Requests	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Datadog
Errors	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Datadog
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Datadog

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Datadog Observability tab for Service Observability

Dashboard and charts on the Datadog Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Host (continued)

Chart	Description	Data source
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Max Connections	Maximum number of concurrent connections that can be established with the MySQL database server.	Datadog
Failed Connections	Number of failed attempts to connect to the MySQL server.	Datadog
Slow Queries Rate	Number of database queries that have been categorized as slow by the APM.	Datadog
Data Reads	Number of read operations performed on the MySQL database.	Datadog
Data Writes	Number of write operations performed on the MySQL database.	Datadog
Cache Utilization	Percentage of the cache memory being used by the MySQL database.	Datadog
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Connections	Total number of connections to the database server, including all connection states such as active, idle, and others.	Datadog
Connections Used	Number of connections to the database used by this service.	Datadog
Active Waiting Queries	Number of queries in the queue waiting to be executed.	Datadog
Deadlocks	Number of deadlocks encountered by the service.	Datadog
Rollbacks	Number of transactions rolled back by the service.	Datadog
Buffer Hits	Number of times disk blocks were found in the buffer cache, so that a read wasn't necessary.	Datadog

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Dynatrace Observability tab for Service Observability

Dashboard and charts on the Dynatrace Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Service Basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service.	Dynatrace
Error %	Percent of transactions that have an error.	Dynatrace

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Basic metrics (continued)

Chart	Description	Data source
Latency	Aggregate duration of transactions through the service, in milliseconds.	Dynatrace
Client error rate	Rate of errors the service clients experienced.	Dynatrace
Client throughput	Rate of client requests for this service.	Dynatrace
Client response time	Response time for client requests on this service, in milliseconds.	Dynatrace
Total DB connections	Number of databases that this client has connections to.	Dynatrace
DB connection errors	Number of errors received by the client when trying to access databases.	Dynatrace
Time spent in database calls	Duration of requests to databases, in milliseconds.	Dynatrace

Service Transactions

Chart	Description	Data source
Key Request Count	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Response Time	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Dynatrace

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	Dynatrace
Memory utilization	Percent of memory the host is using.	Dynatrace
Disk utilization	Percent of disk space being used.	Dynatrace
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB

Process

Chart	Description	Data source
CPU Usage	Percent of the host processing power being consumed.	Dynatrace
Memory Usage	Percent of memory the host is using.	Dynatrace
Requests	Rate of requests per second	Dynatrace
Throughput	Size of requests, in megabytes per second.	Dynatrace
Latency	Aggregate duration of transactions, in milliseconds.	Dynatrace

Process Group

Chart	Description	Data source
CPU Usage	Percent of the host processing power being consumed.	Dynatrace
Memory Usage	Percent of memory the host is using.	Dynatrace
Requests	Rate of requests per second	Dynatrace
Throughput	Size of requests, in megabytes per second	Dynatrace
Latency	Aggregate duration of transactions, in milliseconds.	Dynatrace
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

MySQL

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed.	Dynatrace
Memory utilization	Percent of memory the database is using.	Dynatrace
Availability	Percent of time the database is available.	Dynatrace
Connections	Number of connections to the database.	Dynatrace
Slow queries	Number of database queries that have been categorized as slow by the APM.	Dynatrace
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Scheduled Checkpoints	Average number of scheduled checkpoints that were performed.	Dynatrace
Buffers Written for Checkpoint	Average number of buffers written during checkpoints.	Dynatrace
Buffers Written by Background Writer	Average number of buffers written by the background writer.	Dynatrace
Buffers Allocated	Average number of buffers allocated.	Dynatrace
Checkpoint Write Time	Time in milliseconds spent writing files to disk.	Dynatrace
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

New Relic templates for Service Observability

Templates used to create New Relic dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

New Relic Overview tab for Service Observability

Information that is displayed on the New Relic **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Current open alerts	Listing of active alerts that affect this service.	CMDB

New Relic Observability tab for Service Observability

Dashboard and charts on the New Relic Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Service basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service, per minute.	New Relic
Error %	Percent of transactions that have an error.	New Relic
Latency	Aggregate duration of transactions through the service, in milliseconds.	New Relic
Time spent in database calls	Duration of requests to databases, in milliseconds.	New Relic
Database throughput	Rate of database requests for this service, per minute.	New Relic
Time spent in database queries	Time spent querying the database, in milliseconds.	New Relic

Service transactions

Chart	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	New Relic
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	New Relic

Service transactions (continued)

Chart	Description	Data source
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	New Relic

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	New Relic
Memory utilization	Percent of memory the host is using.	New Relic
Disk utilization	Percent of disk space being used.	New Relic
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed.	New Relic
Memory utilization	Percent of memory the database is using.	New Relic
Availability	Percent of time the database is available.	New Relic
Connections	Number of connections to the database.	New Relic
Slow queries	Number of database queries that have been categorized as slow by the APM.	New Relic
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL

Chart	Description	Data source
Scheduled Checkpoints	Average number of scheduled checkpoints that were performed.	New Relic
Buffers Written for Checkpoint	Average number of buffers written during checkpoints.	New Relic
Buffers Written by Background Writer	Average number of buffers written by the background writer.	New Relic
Buffers Allocated	Average number of buffers allocated.	New Relic
Checkpoint Write Time	Time in milliseconds spent writing files to disk.	New Relic
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Prometheus templates for Service Observability

Templates used to create Prometheus dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Prometheus Overview tab for Service Observability

Information that is displayed on the Prometheus **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request Rate	Aggregate rate of transactions through the service, per second.	Prometheus
Error %	Percent of transactions that have an error.	Prometheus
Average Response Time	Average duration of transactions through the service, in seconds.	Prometheus

Contextual information section

MySQL (continued)

Chart	Description	Data source
Inbound Network Traffic	Number of bytes per second of inbound traffic to the database.	Prometheus
Outbound Network Traffic	Number of bytes per second of outbound traffic to the database.	Prometheus
Slow Queries	Rate of slow queries detected by MySQL, per second.	Prometheus
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Active Sessions	Count of sessions currently active.	Prometheus
Idle Sessions	Count of idle sessions.	Prometheus
Committed Transactions	Total committed transactions since server start.	Prometheus
Failed Transactions	Total rolled back transactions since server start.	Prometheus
Deadlocks	Total deadlocks detected since server start.	Prometheus
Locks Count	Current count of locks given out by the database.	Prometheus
Cache Hit Ratio	Percentage of database requests that can be served by the cache.	Prometheus
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

SolarWinds templates for Service Observability

Templates used to create SolarWinds dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

SolarWinds Overview tab for Service Observability

Information that is displayed on the SolarWinds **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note:
If the dashboards have been customized, they might not reflect the information shown on this page.

Database Dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Queries Per Second	Number of queries per second the service is sending to the database.	Splunk
Row Locks Rate	Frequency at which row locks are encountered by transactions from this service.	Splunk
Buffer Pool Usage	Usage of the buffer pool to access cached data by this service.	Splunk
Table I/O Wait Time	Time in milliseconds that the database is waiting on Input/Output operations on tables sent by this service to complete.	Splunk
Threads	Number of threads used by this service	Splunk
Uptime	Amount of time in (?) that the database has been running since its last restart.	CMDB

Service Observability data mapping form

Field descriptions for the Observability data mapping form. Use this form to map activated services in Service Observability to metrics from your application performance monitoring (APM) instance. Each service can be mapped only once, but can contain exceptions to include all related entities.

Field	Description
Mapping name	Name for the mapping. The name should be descriptive so that users understand where the data is coming from.
Services	Service to use for this mapping. Each service can be mapped only once. For version 1.5.0 of Service Observability, services must be activated to be mapped. To activate a service, see Activate teams and services.
Default	
Find metrics from this source	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
where source tag key	Tag key that you want to map to the activated service. If you use more than one tag to represent a service, you can create an exception. For example, most tags use `service_name` except for database metrics, which use `service`.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service. You can use variables on your APM data as the value to map multiple entities at once. For example, if your APM data uses the `$service_name` variable and you enter that as the **source tag value**, all services using that value are mapped.
Exceptions	
For entity type	Entity that uses a different key or value than the default.
Find metrics from this source	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.
where source tag key	Tag key that you want to map to the activated service for this entity.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service.

Chart error states

Understand the different error states that the charts in Service Observability might display and how to fix them.

Error message	Fix
Set up this service's observability data mapping	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.
Data mapping is not configured	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.
Authentication failed	Service Observability can't connect to the data source. See Connect a Service Observability data source.
No results found	No metrics were found for the chart.
Something went wrong	Connection to the data source was successful, but the application performance management (APM) instance didn't respond. This error might be due to a connection timeout on the APM side.
No impacted systems found (Impacted systems chart on the Overview page)	Only services found on your service map can be displayed. Update your service map to

© 2025 ServiceNow, Inc. All rights reserved.

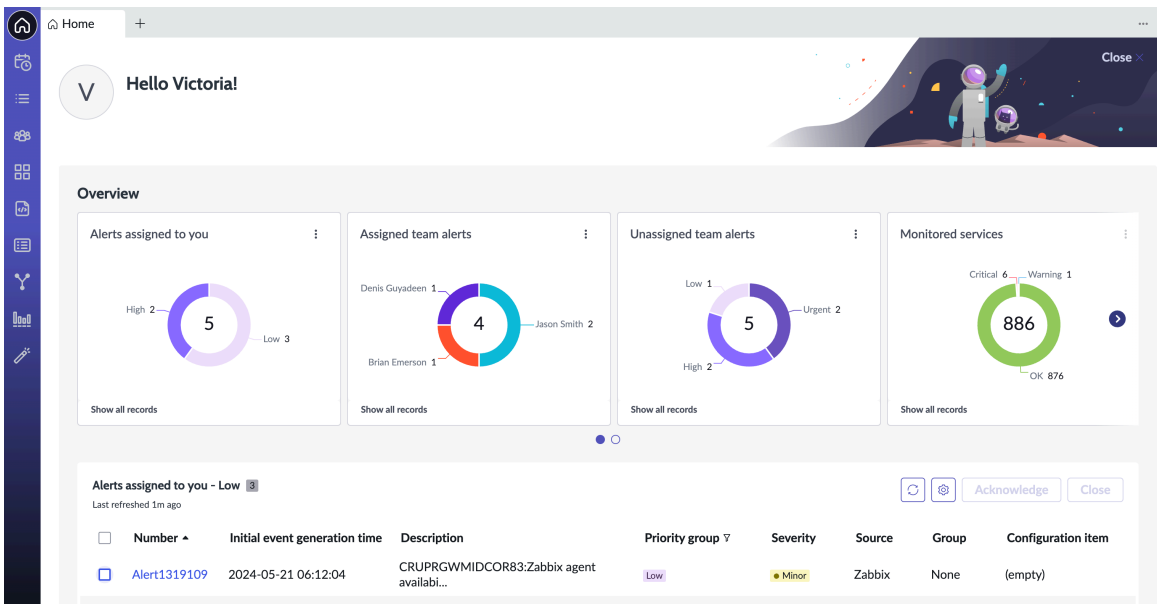
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error message	Fix
	include all services that should be included in the chart. See Service Mapping.
Set up objectives (SLO Error Budget chart on the Overview page)	SLOs haven't been configured for Service Reliability Management. See Create SLOs, SLIs, and error budget policies.

Service Operations Workspace for ITOM

ServiceNow® Service Operations Workspace (SOW) is a configurable workspace designed to streamline IT Operations Management (ITOM) workflows, offering a unified experience for multiple IT operational processes. Configurable and user-friendly, it consolidates various tasks into a single interface, allowing seamless navigation and easy access to tools and information.

By centralizing workflows, it enhances collaboration, facilitates efficient task management, and provides real-time insights through different metrics. Highly customizable, it enables you to tailor the workspace to your specific needs, optimizing productivity and workflow efficiency. With its comprehensive set of features, including automation and collaboration tools, Service Operations Workspace empowers users to work more effectively across different workflows, boosting productivity organization-wide. Scalable to accommodate evolving business needs, it ensures continued support for IT environments of all sizes, delivering superior services and driving operational excellence.



For information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription for ITOM Health.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM features, see Service Operations Workspace for ITSM.

Exploring Service Operations Workspace for ITOM

Discover how Service Operations Workspace for ITOM streamlines the entire life cycle of alerts, including alert generation, notification, grouping, analysis, investigation, resolution, and closure.

Overview of Service Operations Workspace

Service Operations Workspace for ITOM provides powerful AIOps Experience capabilities, namely the Express List, Integrations Launchpad, Alert Automation, and AIOps Dashboards, each delivering unique value.

Express List

Express List revolutionizes alert management by providing a consolidated platform for efficient triage, root cause analysis (RCA), and alert remediation. With real-time updates, dynamic filtering, and an intuitive preview pane, users can effortlessly manage their alert workflows and take immediate action with unparalleled ease and speed.

Integrations Launchpad

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrations Launchpad offers a hub of seamless connections to various external tools and services, simplifying the onboarding of new data sources. This streamlines the integration process, allowing users to effortlessly leverage their existing ITOM ecosystem within the ServiceNow platform. The Integrations Launchpad enhances data exchange and cross-platform collaboration, boosting efficiency and productivity.

Alert Automation

Alert automation provides crucial support as organizations navigate complex IT infrastructures and rising data volumes. Manual alert handling is error-prone and inefficient, underscoring the need for automated systems. By disregarding irrelevant or false-positive alerts through ignore alert automation, and by using alert enrichment, grouping, and response, these systems streamline alert response, reduce human error, and ensure consistent, timely actions.

AIOps Dashboards

AIOps Dashboards provide comprehensive visualizations of critical operational data and insights. Users can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. These customizable dashboards empower users with actionable insights, facilitating data-driven decision-making and ensuring proactive responses to potential issues.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

For more information, see Exploring Service Operations Workspace for ITSM.

Operator experience in Service Operations Workspace

1. Start of day: The operator begins by reviewing an overview of alerts and metrics in the Service Operations Workspace to prioritize work.
2. Alert prioritization: The operator prioritizes alerts based on SLAs, priority level, and urgency.
3. Alert investigation: The operator investigates alerts in detail, leveraging historical data and trends.
4. Access alert information: The operator accesses all related information from the alert record page for a comprehensive view.
5. Resolve alerts: Using tailored recommendations, the operator resolves alerts efficiently.
6. Subject matter expert (SME) consultation: For complex or high-priority tasks, the operator reaches out to SMEs or uses automated tools.
7. Collaboration: The operator collaborates with team members and stakeholders directly from the alert, sharing insights and coordinating responses.
8. Initiate change requests or maintenance: To prevent future occurrences, the operator initiates change requests or maintenance activities, addressing root causes and implementing long-term solutions.

Users

Role title [name]	Description
Admin [evt_mgmt_admin]	Configures and sets up Event Management properties and rules.
Operator [evt_mgmt_operator]	Manages alerts, including closing and acknowledging them.
User [evt_mgmt_user]	Manages the lifecycle of alerts, including performing basic operations such as viewing and acknowledging them.

Benefits

Unify experience for multiple workflows

Consolidate various IT operations workflows into a single, intuitive interface, allowing seamless task management across different areas of IT operations, thus enhancing efficiency and reducing complexity.

Provide automated recommendations

Enhance efficiency and decision-making with automated recommendations tailored to operator actions.

Deliver real-time insights

Provide real-time analytics and reporting capabilities for each integrated workflow, enabling informed decision-making and proactive problem-solving by monitoring key performance metrics and tracking operational status in real-time.

Targeted experience

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Offer dynamic and minimal content based on the current task, with the next task accessible with minimal clicks. Provide access to related alerts to support faster response times.

Customize configurability

Enable organizations to tailor the workspace to specific requirements and preferences, optimizing productivity by displaying relevant data and tools for each workflow.

Enhance productivity

Empower users to work more efficiently across multiple workflows by automating routine tasks, providing access to relevant information, and facilitating collaboration, thus boosting productivity organization-wide.

Scale seamlessly

Accommodate changes in workload, requirements, and operational complexity for all integrated workflows, ensuring continued support for evolving IT environments, regardless of organizational size.

Service Operations Workspace for ITOM user interface

Explore the interface to understand how an operator can prioritize tasks and offer solutions.

Access Service Operations Workspace

Open the workspace by navigating to **Workspaces** > **Service Operations Workspace**.

Home page

To access information on the Home page, select the home icon ( ).

The home page provides operators with a comprehensive snapshot of the current operational landscape. The Overview section presents vital insights, including alerts assigned to the operator, team-based alerts, unassigned team alerts, monitored services, and open alerts. This Alerts Assigned to You section furnishes operators with specific details regarding alerts tailored to their responsibilities. Information includes the alert number, initial event generation time, description, priority group, severity, source, group, configuration item, state, node, metric name, and last updated timestamp. Both sections streamline operations by offering operators a concise overview and personalized insights into alerts relevant to their responsibilities, facilitating swift prioritization and proactive resolution of critical issues.

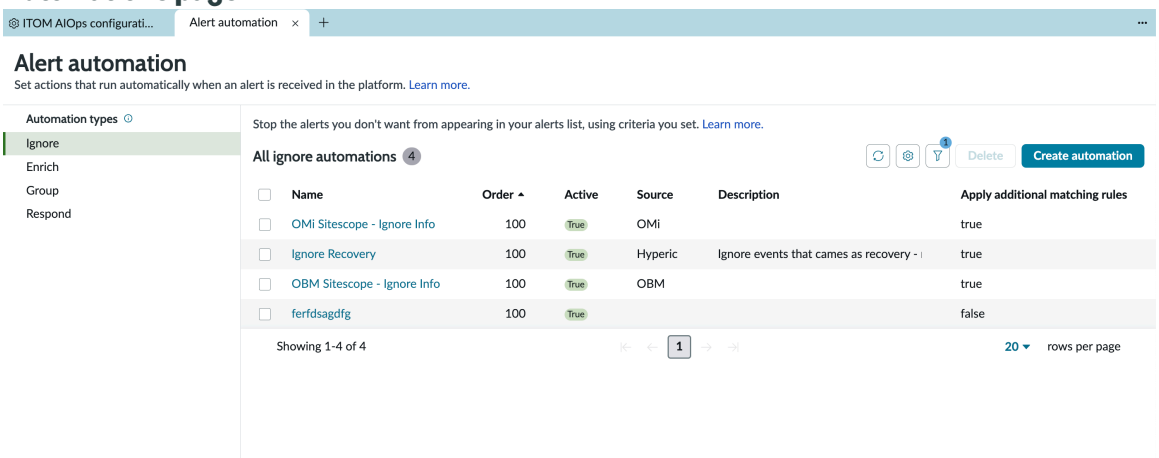
Alert automation

Automations streamline processes, enabling timely responses to potential issues by ignoring, enriching, grouping, and responding to alerts. They reduce manual intervention, lower the risk of errors, and free up IT teams to focus on strategic tasks, boosting system reliability and customer satisfaction.

To access information on automations, select the alert automations icon ( ).

Automations page



AIOps Dashboards

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor KPIs, track service health, and gain valuable context on the IT environment, enabling proactive responses to issues.

To access information on dashboards, select the AIOps Dashboards icon ( )

Configuring Service Operations Workspace for ITOM

Configure Service Operations Workspace for ITOM so that you can manage IT alert volumes efficiently and customize the workspace to enhance service delivery and operational visibility.

The Service Operations Workspace for ITOM is a centralized hub designed to optimize IT Operations Management by focusing on the handling and resolution of alerts. By leveraging this workspace, administrators can streamline the process of monitoring, triaging, and resolving alerts, thus enhancing service delivery and operational efficiency.

Note:
Installing the AIOps Experience application [sn_sow_aiops] provides you with Service Operations Workspace for ITOM.

If you want information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription for ITOM Health.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM configurations, see Configuring Service Operations Workspace for ITSM.

Install Service Operations Workspace for ITOM application

You can install the AIOps Experience [sn_sow_aiops] application to get Service Operations Workspace for ITOM if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the AIOps Experience application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Service Operations Workspace supports domain separation. For details, see Domain separation and Event Management.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The following items are installed with AIOps Experience [sn_sow_aiops] plugin.

- Roles
- Plugins

For more information, see Components installed with AIOps Experience.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AIOps Experience [sn_sow_aiops] using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box that is displayed, any dependencies that are installed along with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

ITOM AIOps configuration center

The ITOM AIOps configuration center is a centralized hub to manage AIOps settings. It helps you integrate monitoring tools, optimize alerts, metrics, and logs, manage services, dashboards, teams, and authorization—streamlining event-to-response workflows for better visibility, noise reduction, and operational efficiency.

You can access ITOM AIOps configuration center by navigating to **Workspaces** > **Service Operations Workspace** and then selecting the ITOM AIOps configuration center icon that is available at the bottom of the left navigation pane.

Note:
The ITOM AIops configuration center is accessible only to aiops_admin.

The AIOps configuration center provides a single interface to configure and administer AIOps capabilities in Service Operations Workspace (SOW). You can:

- Integrate monitoring tools to bring in events, logs, and metrics.
- Optimize how alerts are enriched, grouped, ignored, and responded to.
- Fine-tune metrics and log rules for accurate anomaly detection and alerting.
- Set up synthetic monitoring for app uptime.
- Manage services (service monitoring dashboards, SLIs/SLOs, error budgets) for Service Observability and Service Reliability Management.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Access AIOps dashboards to track performance, operations, and business value.
- Configure authorization for admins, integrations, APIs, and notifications.
- Govern teams and approvals for service creation and on-call schedules.

The AIOps configuration center consolidates all administrative tasks needed to set up and operate ITOM AIOps effectively—making it easier to streamline monitoring, improve incident response, and maintain service reliability.

Customize the Service Operations Workspace for ITOM home page

You can customize the data displayed in sub pages of the home page that is available in the base system. For any visual styling changes, you need to create a copy of that landing page and edit it.

Modify the greeting text on the landing page

Customize the header message that is a part of the greeting text on the home page. This will create a more personalized user experience, making visitors feel welcomed and valued, and can also help in setting the right tone and context for the information presented.

Before you begin

Role required: evt_mgmt_admin or admin

About this task

The Get service desk agent shift data broker server script calls the `SOWServiceDeskAgentShift` script includes to display the shift information in the greeting text.

While the display text can be customized for the default landing page, the visual styling changes to the text can be done only by creating a copy of the landing page.

Suppose you are on call until Monday, March 21. You can update your greetings to reflect your on-call status.

Header

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, select **Configure** next to **Greetings**.
   The Script Includes form is displayed for SOWServiceDeskAgentShift, which internally calls the SOWServiceDeskAgentShiftSNC
4. Copy the **Script** value of SOWServiceDeskAgentShiftSNC.

   a. Navigate to **All** > **System Definition** > **Script Includes**.

   b. From the list of Script Includes, open SOWServiceDeskAgentShiftSNC.

© 2025 ServiceNow, Inc. All rights reserved.

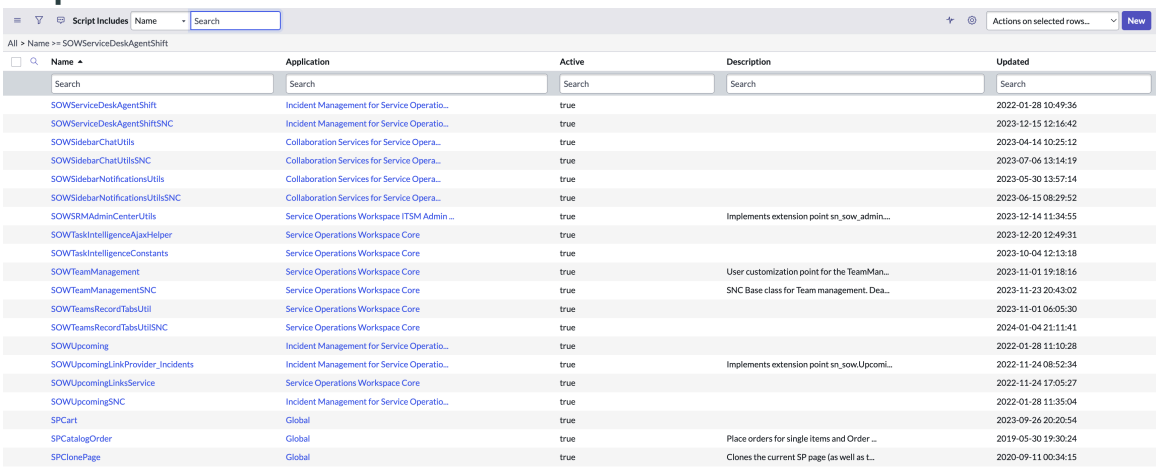
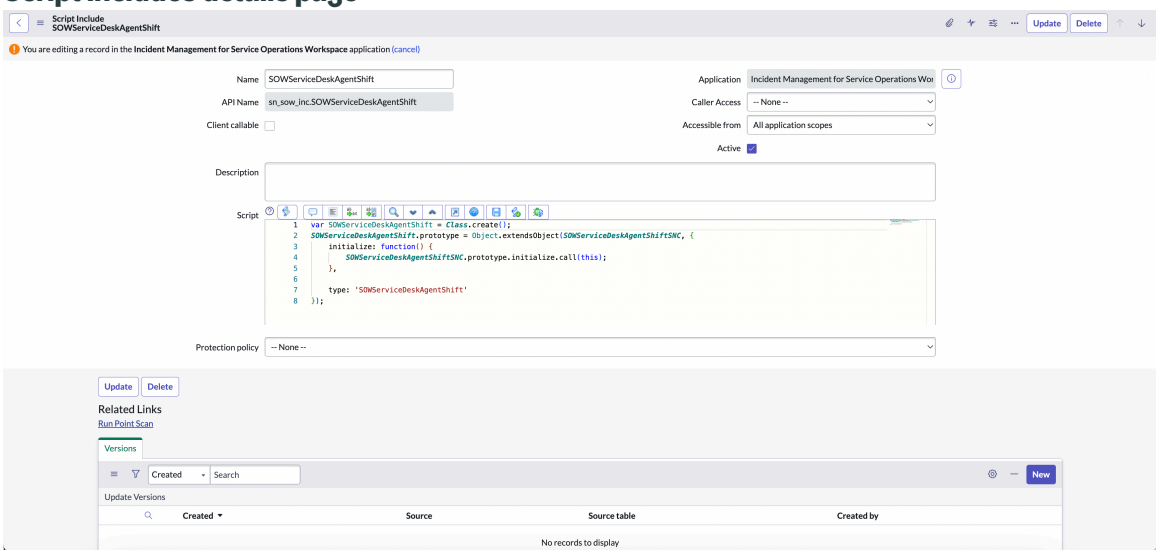
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script Includes list



c. Copy the **Script** field value.

Script includes details page



5. Edit the SOWServiceDeskAgentShift script.

a. Navigate to **All** > **System Definition** > **Script Includes**.

b. From the list of Script Includes, open SOWServiceDeskAgentShift.

c. Paste the **Script** field value that you copied from SOWServiceDeskAgentShiftSNC.

```

6. Select **Update**.

Modify the first-level cards in the Service Operations Workspace for ITOM Overview section

Customize the data displayed in the first-level cards in the Overview section by configuring various parameters such as the header label, data source, metric, group by field, and viewAllQuery. This allows for a more tailored and relevant display of information.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **sys_ux_client_script_include.list**.
2. From the UX Client Script Includes list, select `SowEMLandingPageUtilsSNC` client script include definition.
3. On the UX Client Script Include form, edit the **Script** field.
   For example:

```
  }
    };
   const labelMap = {
       'em_alert': {
           'alerts_assigned_to_you': {
               '1': 'Alerts assigned to you - Urgent',
               '2': 'Alerts assigned to you - High',
               '3': 'Alerts assigned to you - Moderate',
               '4': 'Alerts assigned to you - Low'
           },
           'open_alerts': {
               '1': 'Open alerts - Urgent',
               '2': 'Open alerts - High',
               '3': 'Open alerts - Moderate',
               '4': 'Open alerts - Low'
           },
           'team_alerts_assigned': 'Assigned team alerts - to
',
           'team_alerts_unassigned': {
               '1': 'Unassigned team alerts - Urgent',
               '2': 'Unassigned team alerts - High',
               '3': 'Unassigned team alerts - Moderate',
               '4': 'Unassigned team alerts - Low'
           }
       }
```

4. Click **Update**.

Create a copy of the Service Operations Workspace for ITOM landing page

Make visual styling changes to the sub-pages in the home page. This will enhance the overall user experience by providing a consistent and visually appealing interface, improving navigation, and ensuring that key information is easily accessible and engaging.

Before you begin

Role required: evt_mgmt_admin or ui_builder_admin

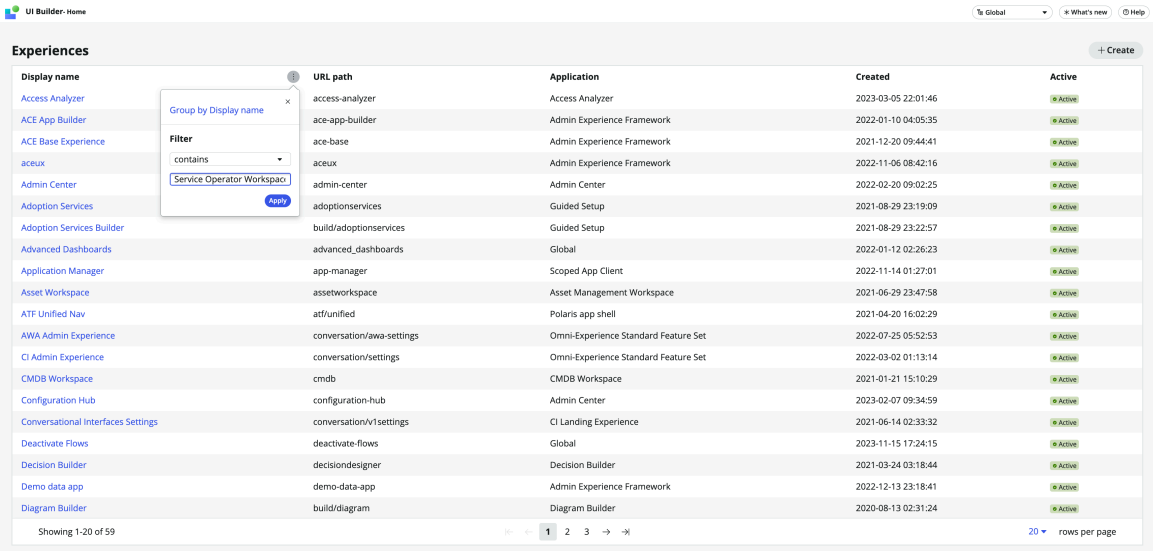
About this task

A page is content that lives at a specific URL. When a user opens the URL, they will see a different variant of this page based on the audience, conditions, and order that you set.

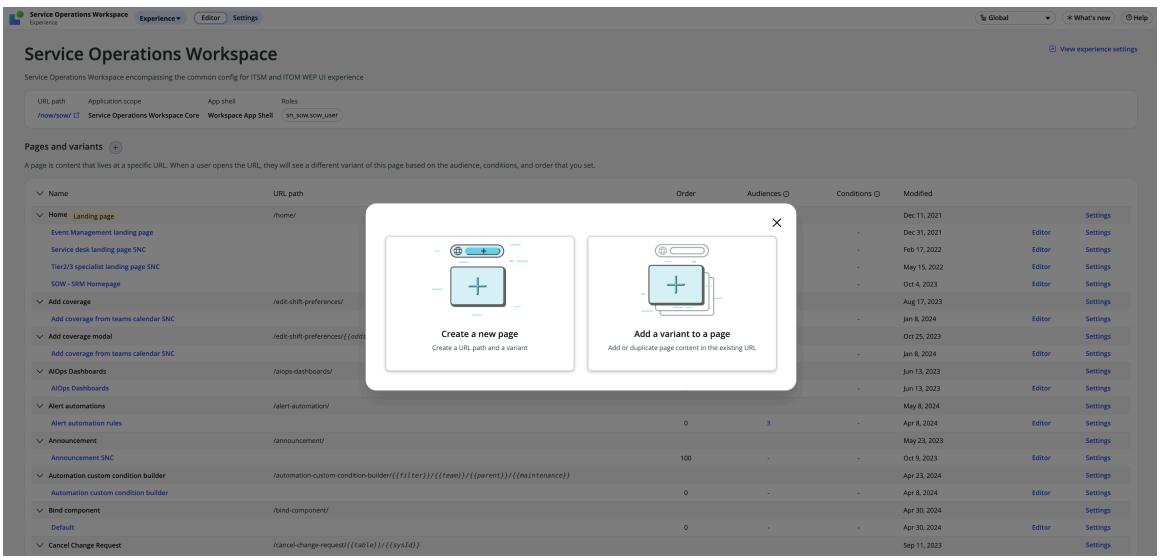
Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the **Display name** field, filter and search for **Service Operations Workspace**.

   The Experiences page opens.



3. Open **Service Operations Workspace** by selecting it.
4. Next to **Pages and variants**, select the plus icon (⊕).



5. Select **Add a variant to a page**.

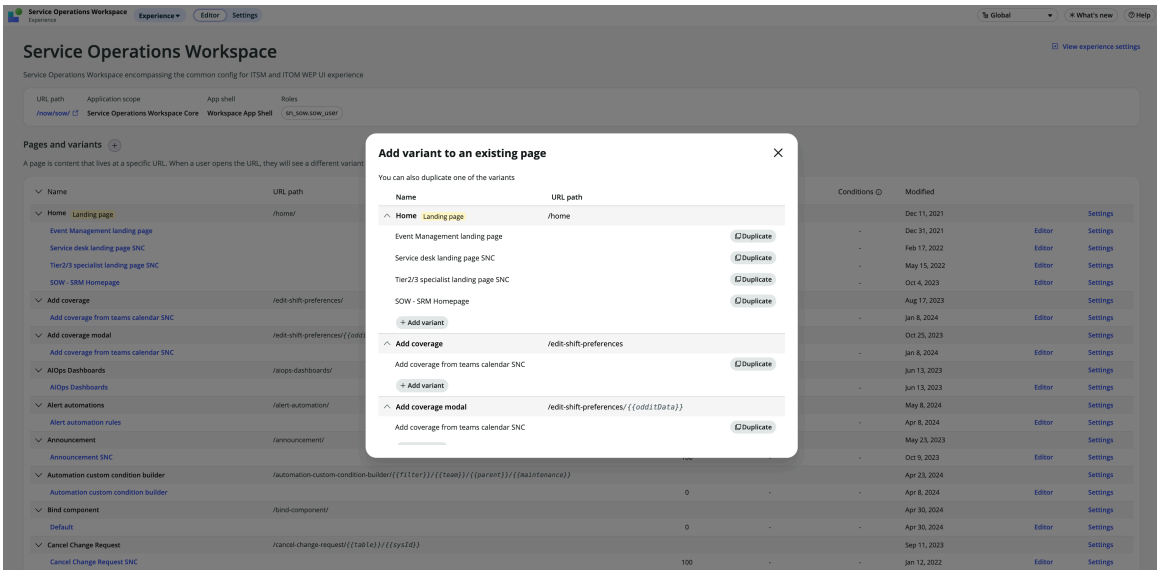
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Add variant to an existing page window opens.



6. To create a duplicate page content in the existing URL path, select **Duplicate** and follow the steps.

Open your configurable workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin

Role required: ui_builder_admin or admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result

Your Configurable Workspace experience opens in UI Builder.

Redirect to the Service Operations Workspace home page

Enable quick task prioritization by directing agents to the homepage immediately upon logging into the ServiceNow instance. This improves workflow efficiency by granting agents immediate access to essential tools and information, facilitating the timely resolution of critical tasks and issues.

Before you begin

Ensure that the value of the *glide.login.home property* is set to `/now/nav/ui/home`. This property specifies the default homepage that is displayed upon logging in.

Role required: evt_mgmt_admin

Procedure

1. Select **All** and then search for `sys_properties.list`.
2. Add the *sn_sow.service_desk_groups* property.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Value** field, enter the sys_id of the user group to which the operator belongs.

> **Note:**
> If you want to specify multiple service desk groups, add a comma-separated list of group sys_ids in the value field.

4. Select **Update**.

Open your Configurable Workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin
Role required: ui_builder_admin or admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result
Your Configurable Workspace experience opens in UI Builder.

Service Operations Workspace

The Service Operations Workspace monitors services within your Event Management environment, enabling you to review their status and identify those at risk of suboptimal performance. This empowers you to promptly address any issues.

> **Note:**
> The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

You can configure the Service Operations Workspace to remain logged in for up to 24 hours. For more information, see Manage user sessions.

View application service health information in Service Operations Workspace

Monitor the health of services and filter the information that you want to view, allowing you to focus on the most relevant data and make informed decisions quickly.

Before you begin
Role required: evt_mgmt_user or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

> **Note:**
> The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Perform the following actions as required.

Features and actions

Features	Actions
Make the tile size larger or smaller.	**a.** Select the Display settings icon ( ). **b.** From the **Display settings** pop-up window, select the size. Group services by selected criteria	Select the arrow next to **Group By** and then select the criteria by which you want to group services. Group order	Select the arrow next to **Group order** and then select the criteria by which you want to group services. Segment each group by	Segment each group by severity, business criticality, and cost to categorize and organize them into distinct groups based on these attributes. Filter information	Filter the information displayed on the dashboard ensuring you focus on relevant data for effective monitoring.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features	Actions
	○ To set a global filter, select the Filter icon ( ) and set the global filter condition, add filter conditions, and then select **Apply**.  ○ To exclude a severity from the display, select it in the **Severity Breakdown** ribbon. Filtered-out severities will appear dimmed. To restore a dimmed severity to the display, simply select it again. 
Create a user view in Service Operations Workspace

Create and customize a user view in the Service Operations Workspace to enable viewing information in the format you want.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

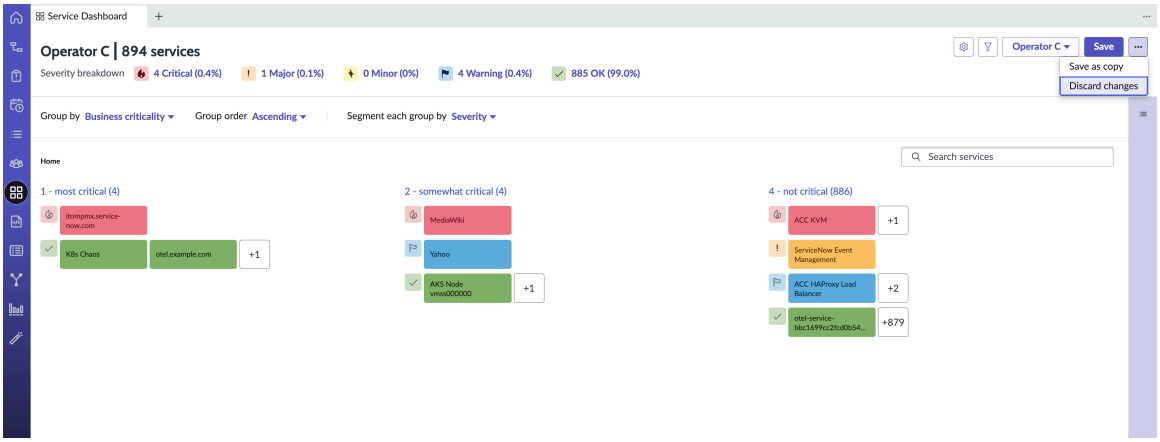
   Note:
   The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Customize the dashboard appearance by selecting output criteria from the **Group by**, **Group order**, or **Segment each group by** filters, or by selecting the relevant **Severity breakdown**. Selecting **Service group** > **All** in the **Group by** filter displays all service groups.
4. Configure the information for the view to display by clicking the filter services icon ( ) and setting a global filter.

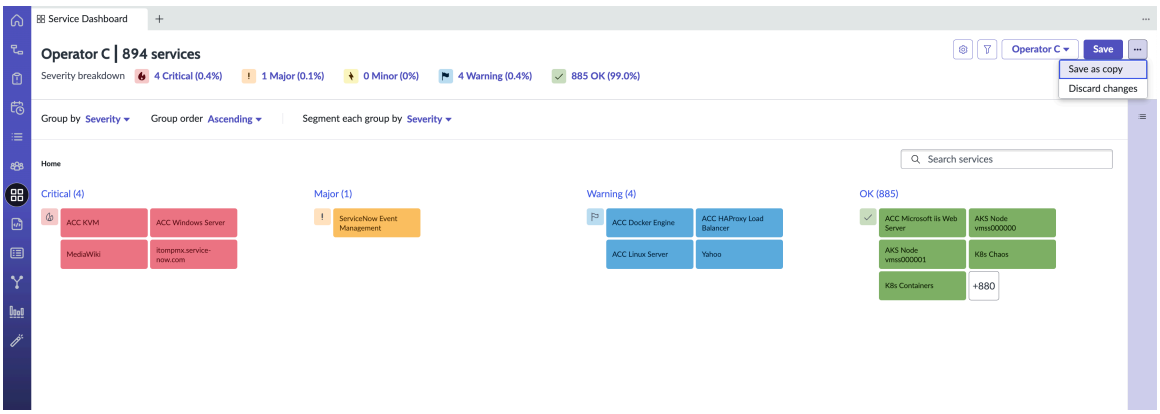
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you can configure a filter to display only those services assigned to a specific user.

Note:
To discard your changes and revert to the view's most recently saved state, select the More actions icon ( ) and select **Discard changes**.



5. Save your new view by clicking the More actions icon ( ) next to the **Save** button and select **Save as copy**.



6. In the Save as copy dialog box, enter the name of your view in the **View name** field.

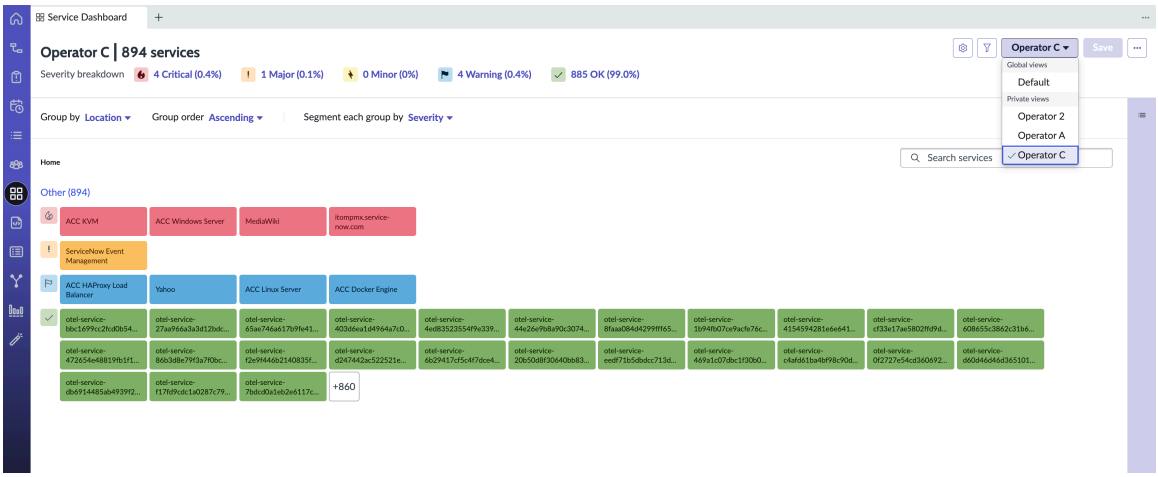
   The view is saved as a **Private view** (visible only to the logged-in user) and is available for use.

   Views are grouped in the following categories:

   - **Global views**: Visible to all users. Only an Event Management administrator can create a global view.
   - **Private views**: Visible only to the logged-in user.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can switch between different views by selecting a view from the list next to the **Save** button.



Delete a user view in Service Operations Workspace

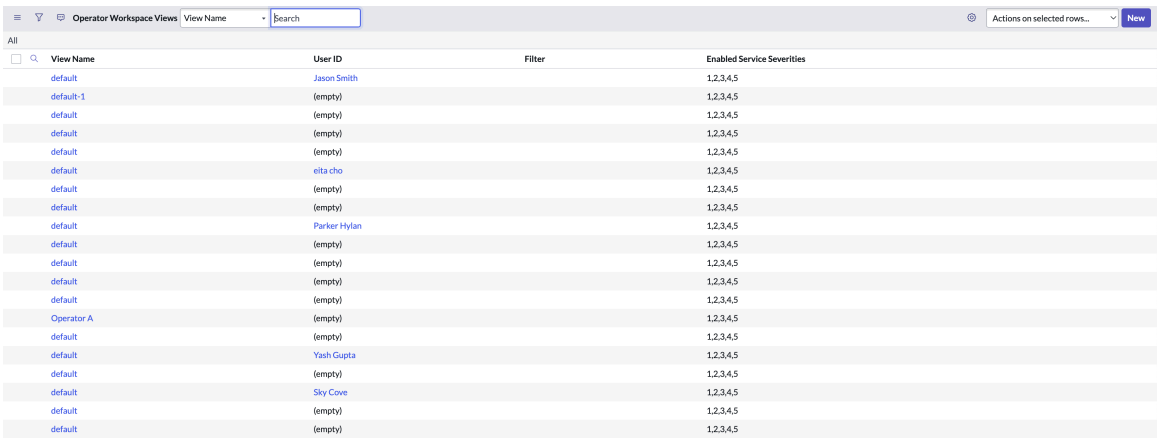
Delete a Service Operations Workspace user view you no longer need. You perform this action from the Event Management menu, outside of Service Operations Workspace.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. In your Event Management instance, in the navigation pane, search for *`noc_user_view.list`*.
   The Operator Workspace Views page opens.



View Name	User ID	Filter	Enabled Service Severities
default	Jason Smith		1,2,3,4,5
default-1	(empty)		1,2,3,4,5
default	(empty)		1,2,3,4,5

default	(empty)		1,2,3,4,5
default	(empty)		1,2,3,4,5

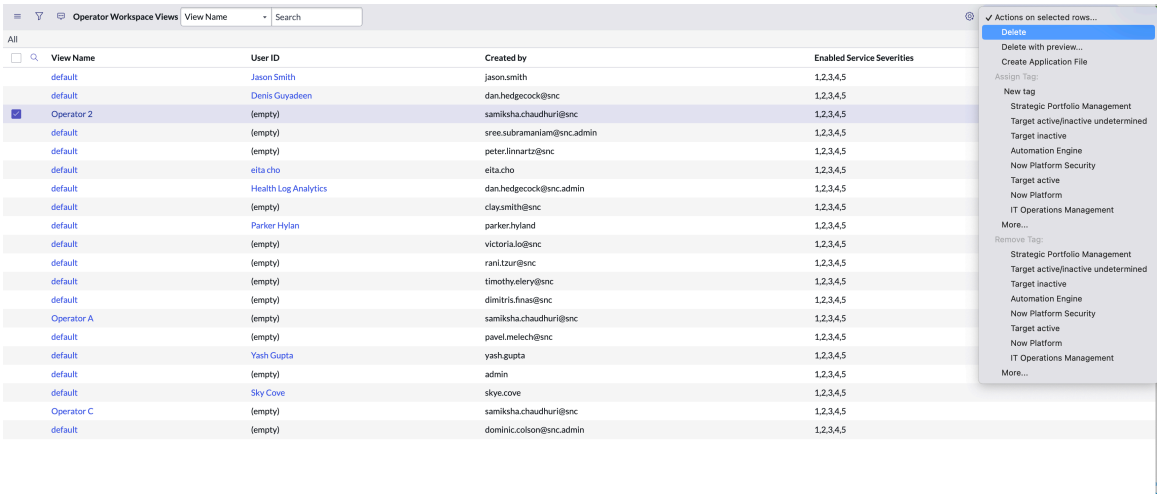
2. Select the check box next to the view you want to delete.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Actions on selected rows** list, select **Delete**.



View application service details in Service Operations Workspace

View comprehensive information about an application service, including its name, business criticality, ownership, process and operational status, traffic-based discovery details, discovery status, and relevant comments. This enables thorough analysis of the application service's current state and usage, provides clarity on ownership and criticality, and facilitates effective prioritization of resources and actions.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note:
   The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

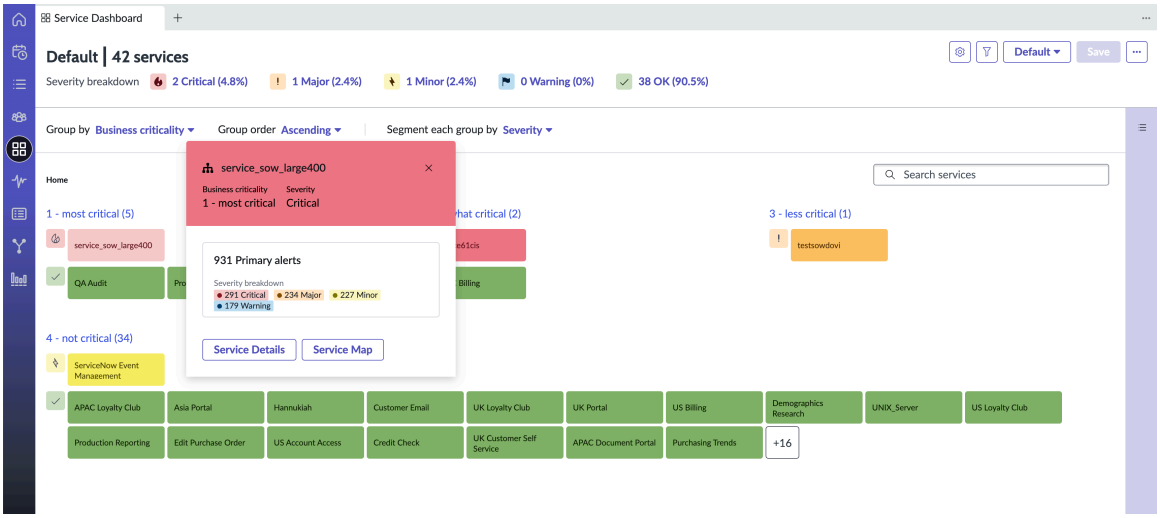
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Service Details**.
   By default, the **Details** tab is selected.

   The details page provides comprehensive information about an application service.

   For information on the fields, see Application service details page.

View primary alerts associated with a service

View the primary alerts associated with a service to help troubleshoot issues with the service.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

> **Note:**
> The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

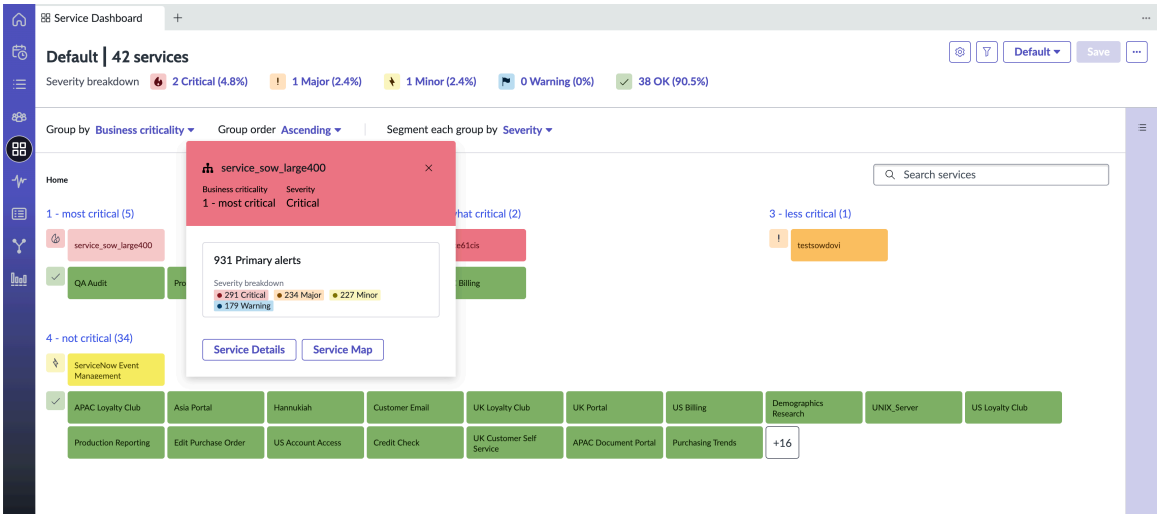
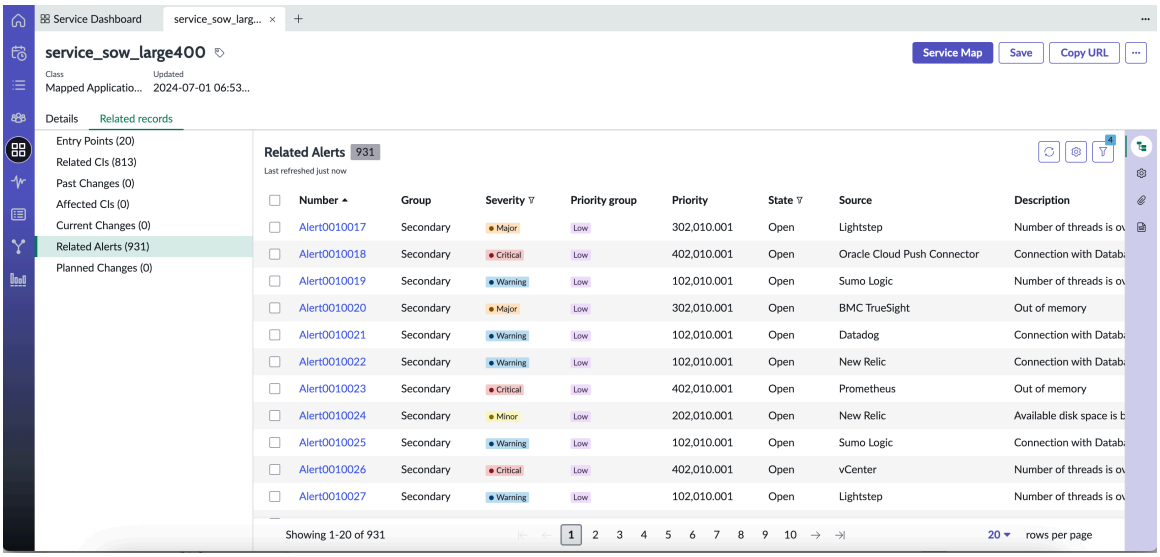
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.



4. Select **Service Details**.
   By default, the **Details** tab is selected.
5. Select the **Related records** tab.
6. From the left pane, select **Related Alerts**.



View details about an alert by selecting its number in the **Number** column.

Create a list in Service Operations Workspace for ITOM

Customize lists in Service Operations Workspace by creating new lists, changing their order, modifying their content, or deleting lists as needed. This flexibility allows operators to organize information according to their specific requirements, facilitating easier navigation, quicker access to relevant data, and streamlined workflow management.

Before you begin

Role required: itil

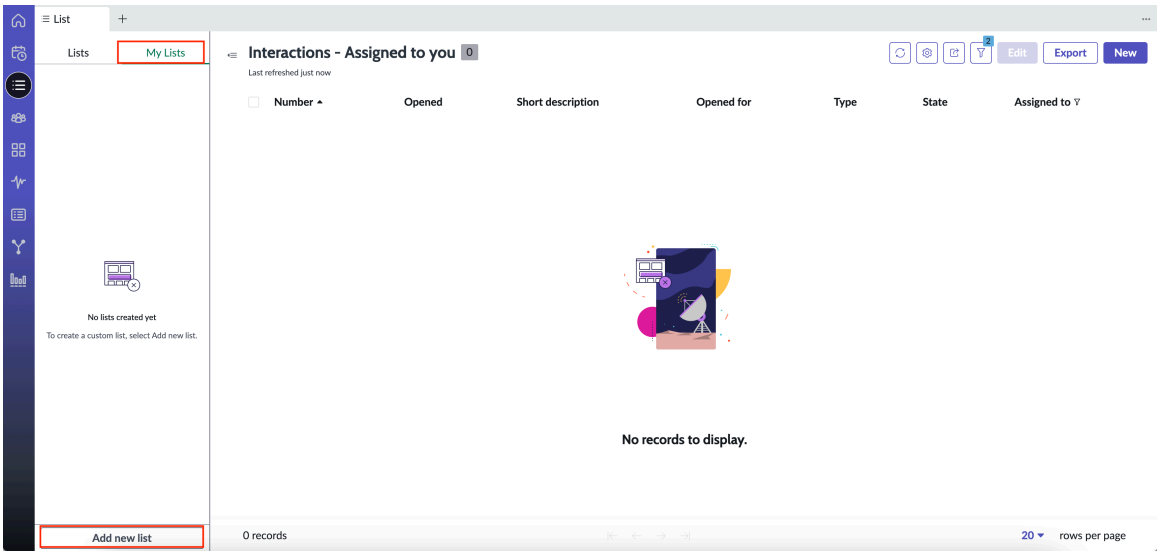
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Create custom groupings of records listed under the **Lists** tab, such as incidents tied to a specific company. Customize existing lists or create new ones exclusively visible under the **My Lists** tab for personalized organization.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select **Add new list**.



5. Create a list by either basing it on an existing list or creating a new one.
   - To base your list on an existing list, select **Start from existing**.
   - To begin a new list, select **Create your own.**
6. On the form, fill in the fields.
   For more information on the fields, see Create list fields.
7. Select **Create**.
   The list appears in the **My Lists** tab.

Rename a list in Service Operations Workspace for ITOM

Rename a list to better reflect its content or purpose. This customization allows operators to align list names with their workflow terminology, improving clarity and usability.

Before you begin

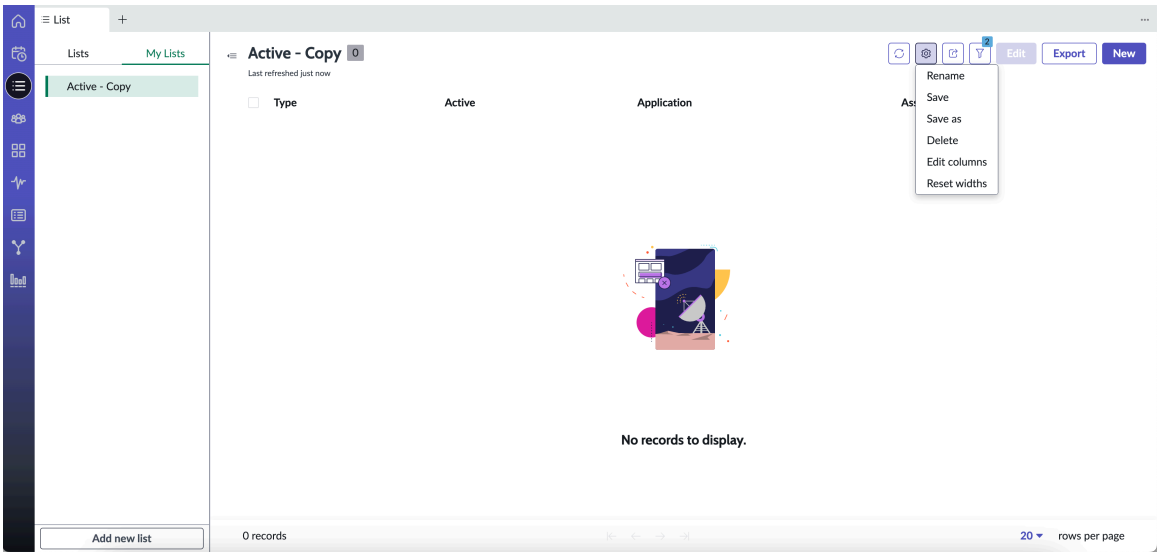
Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to rename.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the settings icon ( ) and then select **Rename**.



6. In the **Rename** pop-up window, in the **Title** field, rename the name of the list and select **Save**. The list is renamed.

Reorder list in Service Operations Workspace for ITOM

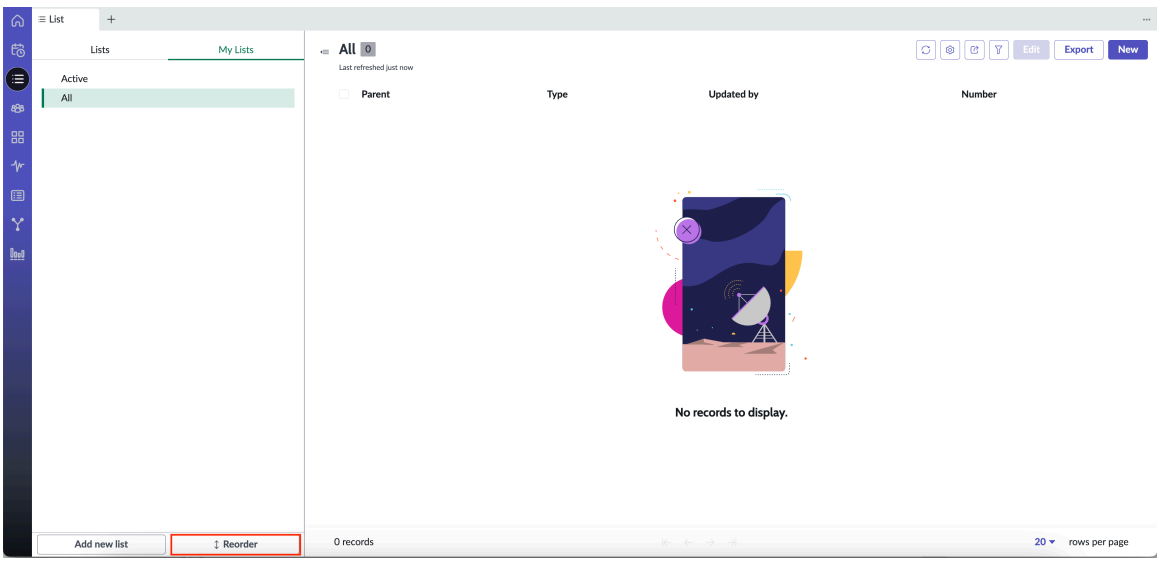
Reorder lists to prioritize information and enhance workflow organization.

Before you begin

Role required: itil

Procedure

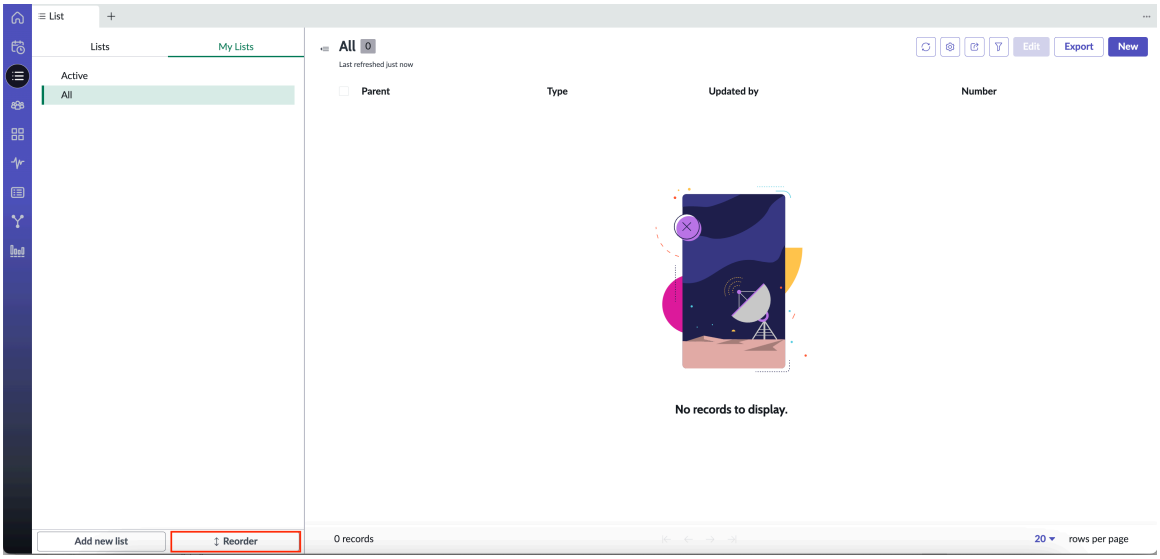
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.



4. Select the list you want to reorder.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Reorder** to adjust the position of the list.



Delete a list in Service Operations Workspace for ITOM

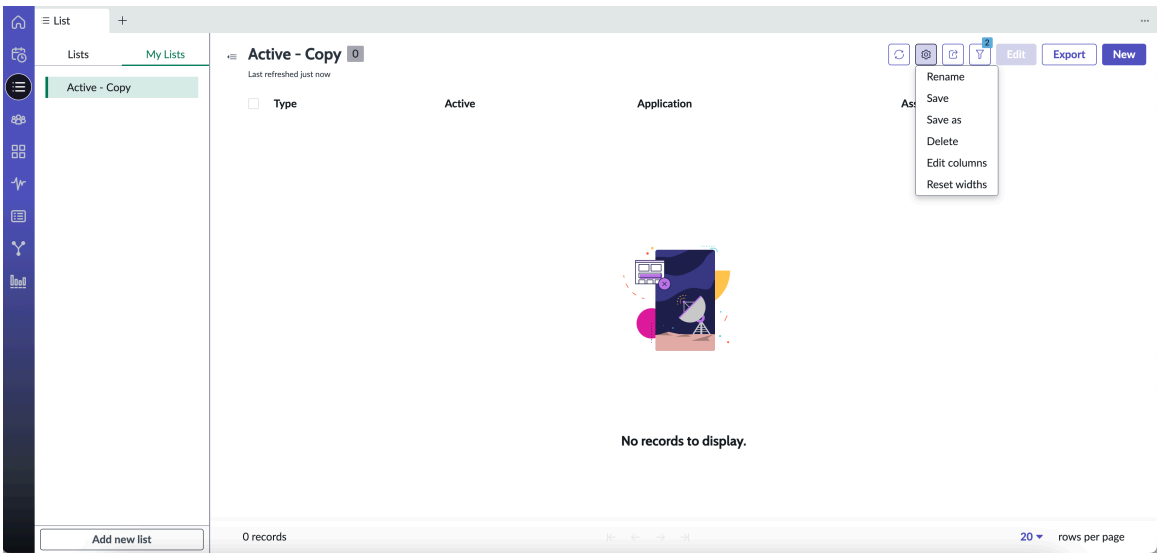
Delete a list to efficiently manage data sets, declutter your workspace, and maintain organized information.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to delete.
5. Select the settings icon ( ) and then select **Delete**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the confirmation pop-up window, select **Delete**.
   The list is delete.

View unified service map and the impact paths in Service Operations Workspace

Visualize relationships between Configuration Items (CIs) and alerts with real-time updates and detailed impact paths. Enhance troubleshooting and proactive management by quickly identifying root causes and dependencies for both discovered services and application services.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

The enhanced service map in Service Operations Workspace displays the impacted path of an alert to enable you to quickly assess its impact on a service. You can access the enhanced service map directly from the Service Dashboard, or from the preview panel or from an impacted service in the Express List.The service map has several modes of display:

- For a service with up to 60 CIs, regardless of alert status, the map shows all CIs.
- For a service with more than 60 CIs without alerts, the map shows up to 60 CIs.
- For a service with more than 60 CIs with alerts, the map shows the impacted path of the most recent alert with the highest severity.

You can also investigate a wider view of the service topology on the service map for up to 250 CIs regardless of alerts. For a broader view, select **Clear** and choose a mode of either up to 60 or up to 250 nodes.

Note:
Admins can continue using the legacy service map to manage the propagation of severity. Access the map by navigating to **Services** > **Application Services**.

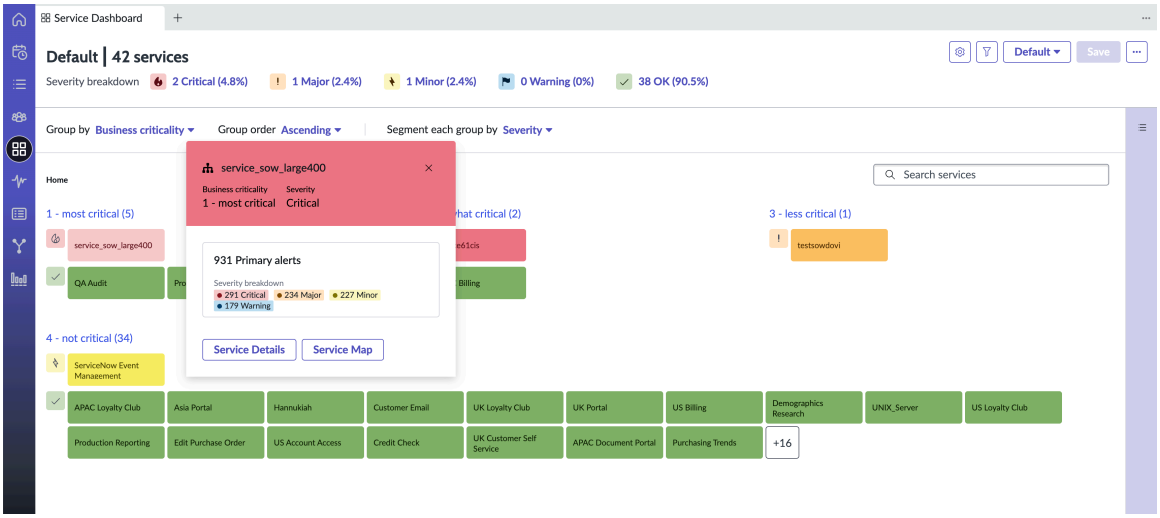
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note:
   The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

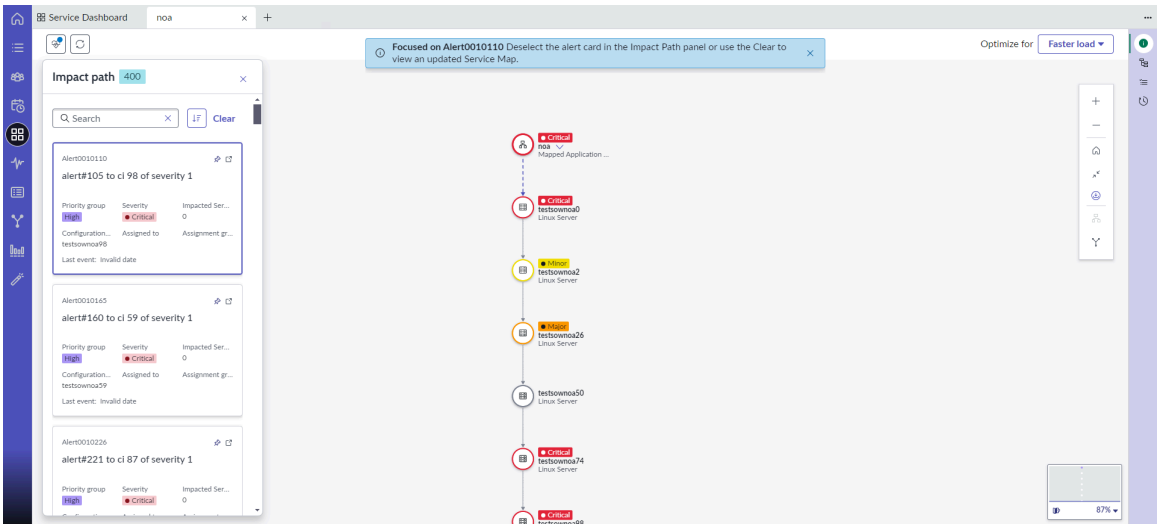
3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



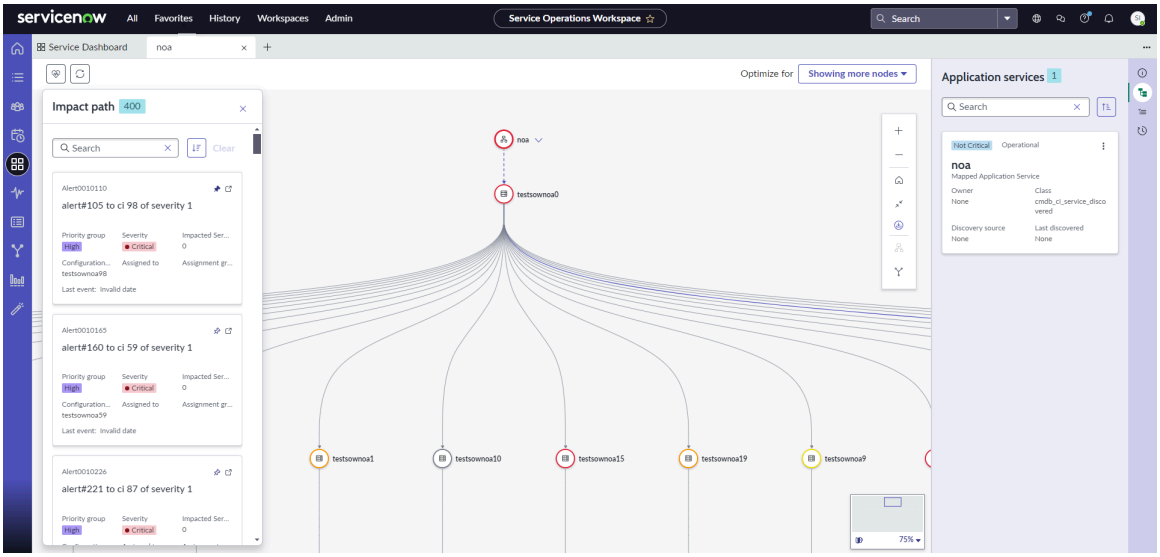
4. Select **Service Map**.

The application map along with the CI relationships appears.



Note:
Depending on the size of the service, the unified map either shows the full map (if it contains up to 60 CIs) or an Impact Path leading to the most critical alert (for maps with over 60 CIs). For large maps, you can reveal more CIs by clearing the existing selecting and navigating to the **Showing more nodes** optimization option.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

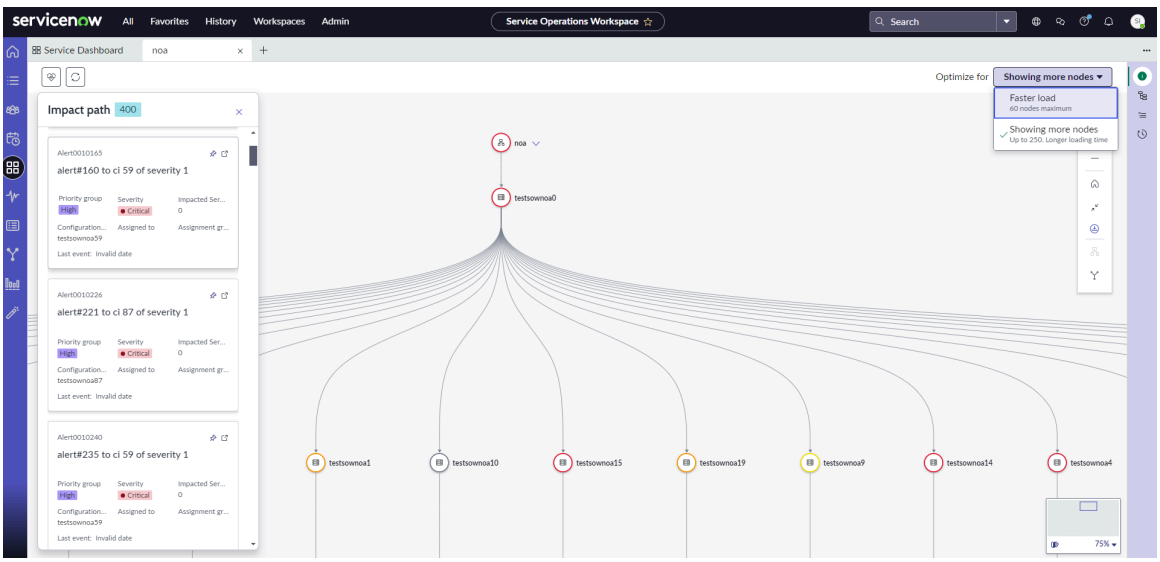


If the impact path panel is closed, you can open it by selecting the Impact path icon ( ).

5. Navigate between alerts by selecting an alert card.

Alternatively, use the search function to find an alert by description, CI, or alert number and focus on its impact path.

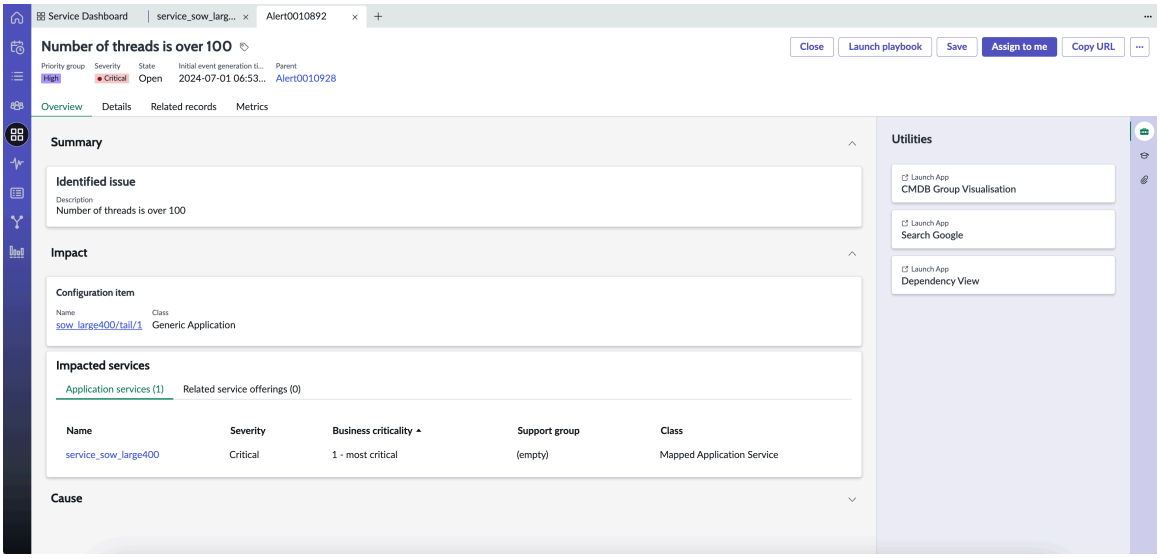
Selecting any alert tile displays the unified map for that alert. To return to the full map for the service, select **Clear**.



6. To view alert details, select the Open Record Form icon ( ) on the alert card.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert details page opens.



Enable and disable live updates for alert lists

Choose live updates for alert lists to receive real-time updates, or disable live updates and refresh the alert list manually.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

By default, the toggle for live updates is off, and you must enable it to receive live alert updates. Once enabled, the alert list automatically updates whenever an action is performed on an alert. Live updates enhance the accuracy and timeliness of the information displayed, enabling quicker response times, and improving overall system reliability and performance.

To update the alert list manually, you can switch the live updates toggle to off. Manual updates are useful when many alerts are being processed continuously, to avoid excessive refreshing.

Note:
Set Read Role permissions to the Event Management user (evt_mgmt_user). Otherwise, the property won't be available.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **Default lists** tab.
4. Under **Alerts**, select the list where you want to enable or disable live updates.

   Note:
   Live updates aren't available for the **All Alert** list.

5. At the top of the alert list, select the toggle switch to turn live updates on or off.
   - When live updates are turned on, the setting is saved for future logins by the same user.
   - When live updates are off, the refresh button displays a counter to show the number of changes since the last refresh. You can select the refresh button anytime to update the list manually.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure alert metrics

Configure the metrics you want to be visible for Service Operations Workspace alerts or use the metrics configured with the base system to focus on relevant data for faster troubleshooting.

Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Metrics View Configuration**.

2. On the Metrics View Configuration page, select **New**.
3. On the form, fill in the fields.
   For information on the fields, see Metrics View Configuration form fields.
4. Select **Submit**.

View CI health in Metric Explorer

View the health and performance of an alert's CI using Metric Explorer, to help troubleshoot problematic areas in the CI.

Before you begin

All plugins related to Event Management, Metric Intelligence, and Metric Explorer, are required.

Roles required:

- To access Metric Intelligence metrics in Metric Explorer, the workspace_agent and itil roles are required.
- To configure the set of metrics that appears in Metric Explorer for a class, the admin or evt_mgmt_admin role is required.

About this task

Metric Explorer displays the following Metric Intelligence data:

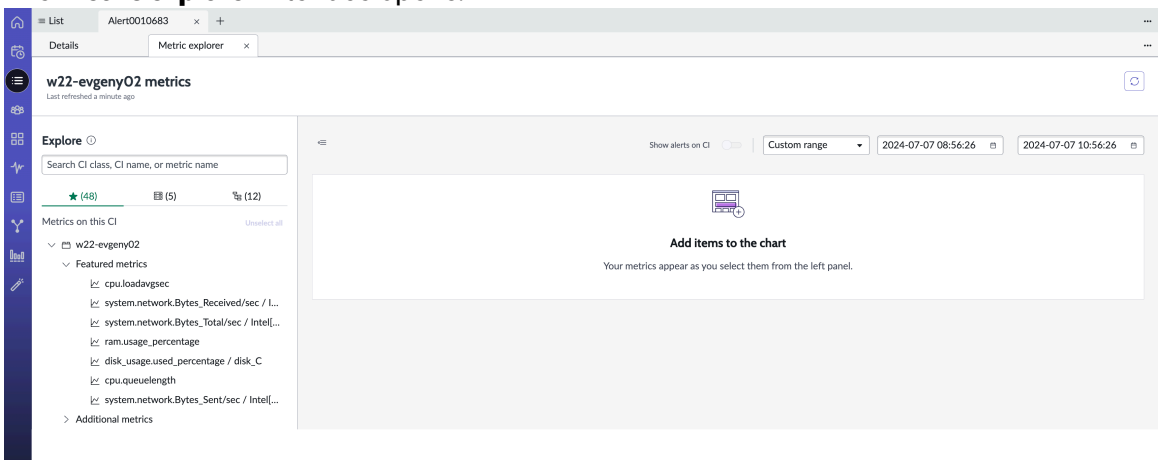
- Charts, control bounds, and aggregations for key metrics for Configuration Items (CIs), in a single location.
- Aggregation of metrics for CIs with resources, in a single consolidated time series.
- Ability for administrators to configure which metric types appear for each CI class.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics are displayed only for alerts containing a CI.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
5. Select the **Metrics** tab.
6. Select the **Metric explorer** button.
   The **Metric explorer** interface opens.



> **Note:**
> You can also access the **Metrics** subtab and **Metric Explorer** button when selecting a CI.

7. Select metrics in the Explore section to display the metrics in graph format in the **Custom chart** section.
   Metrics are divided according to the following subtabs:

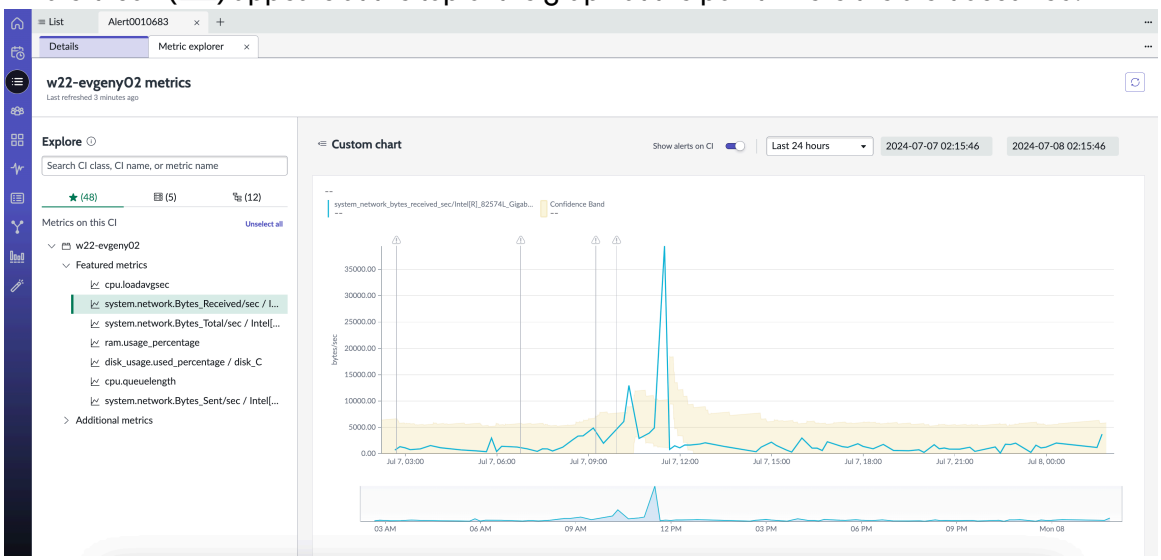
Explore section subtabs

Subtab	Description
★	Displays metrics on the current CI.
	Displays metrics on other CIs on the same host.
	Displays metrics on entry points that relate to the service that the CI is impacting.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subtab	Description
	Note: When working with large quantities of entry points (100K or more), collecting entry point metrics may cause system degradation. To prevent this, create the *sn_disable_selection_entry_point* property (**All** > **System Properties** > **All Properties**) and set it to **true** to turn off metric collection for entry points.

8. In the **Custom chart** section, configure a time range for which you want to view the displayed metrics.
9. Label alerts on the Custom chart by turning on the **Show alerts on CI** option.
   An alert icon ( ) appears at the top of the graph at the point where the alert occurred.



View alert metric trends in Service Operations Workspace

View the metrics for an alert and adjust the time range to see the trends for either the alert or its associated Configuration Item (CI), enabling more accurate analysis and timely decision-making.

Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

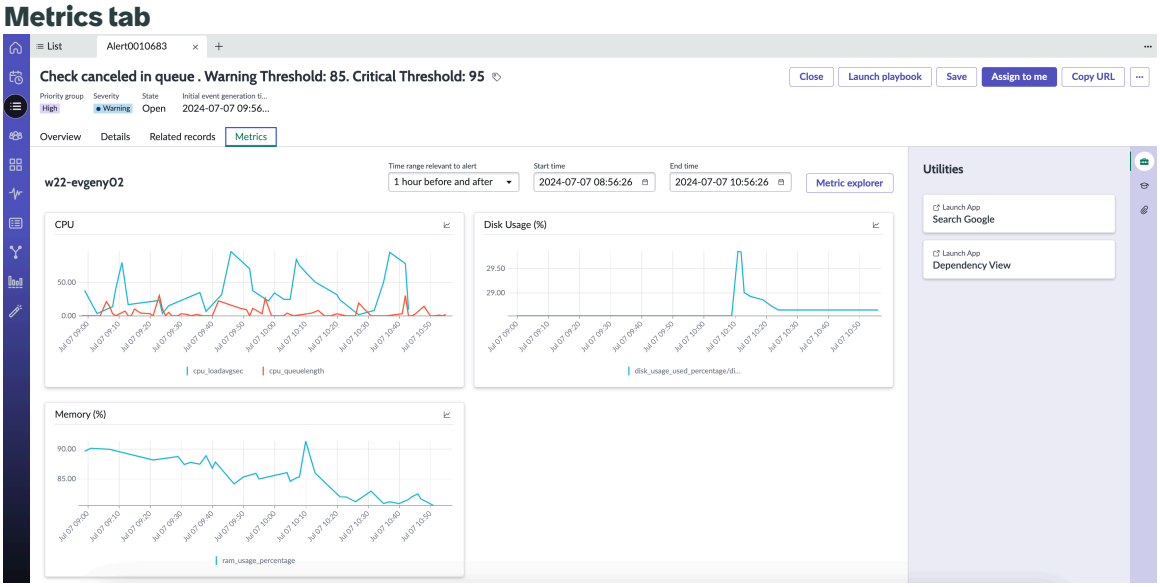
Role required: evt_mgmt_admin

Procedure

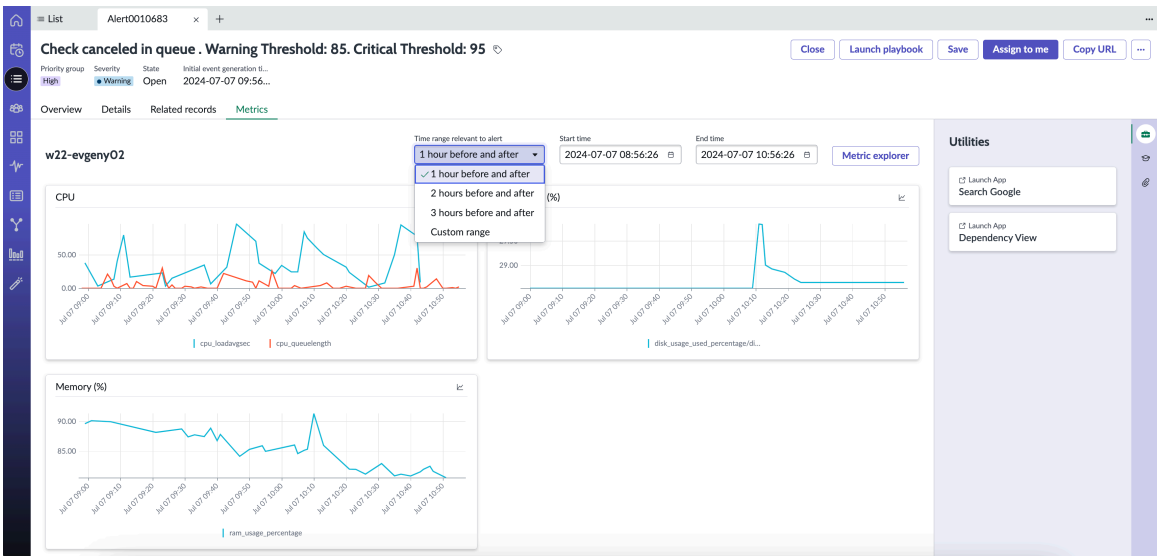
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the **Metrics** tab.



6. In the fields above the metric charts, configure the time range for the alert's metrics.



To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

- *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
- *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

Field name	Description
Time range relevant to alert	Duration for calculating metrics around the alert.
Start time	Start date and time for metric calculations.
End time	End date and time for metric calculations.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select a parameter below a chart to hide the specified parameter's data on the chart.
8. **Optional:** Select the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.
9. Select **Save**.
10. **Optional:** View a time range for an alert's CI.

    a. Select the **Overview** tab.

    b. Under the Impact section, on the **Configuration item** card, select the link to the CI that appears under the **Name** field.

    c. Select the **Metrics** tab.

    d. Select **Save**.

On-call scheduling in Service Operations Workspace for ITOM

ITOM Service Operations Workspace supports creating and managing your on-call shifts and schedules. On-call schedule determines who is on-call at a given time. Learn how to configure on-call calendars and escalation policies to ensure timely responses to critical issues, reducing downtime and maintaining service continuity. Streamlining these processes enhances team readiness, minimizes disruptions, and improves service reliability.

Getting started with on-call scheduling

To enable on-call scheduling for alerts, first incorporate the Alert table [em_alert] into the Trigger Rule Table Config list. For more information, see Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM.

Teams in Service Operations Workspace

Use the Teams menu ( ) in Service Operations Workspace to view all teams. Select a team card to view and manage a team's schedule, define escalation policies, and team preferences for the selected shift. This feature verifies that your team knows who is on call, is accountable, and is confident that critical alerts or incidents are acknowledged. For information on creating a shift, see Create on-call shift for your team .

Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM

Enable on-call scheduling by incorporating the Alert table [em_alert] into the Trigger Rule Table Config list. This allows for creating shifts and implementing escalation triggers and policies, ensuring teams can promptly respond to alerts and maintain operational continuity.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** and in the search field, type `trigger_rule_table_cfg.list`.
   The Trigger Rule Table Configs page opens.
2. On the form, fill in the fields with the following values.

   - In the **Table** field, select **Alert [em_alert]**.
   - In the **Trigger group** field, select **Assignment group**.
   - In the **Trigger user** field, select **Assigned to**.
   - In the **Journal** field, select **Work notes**.
3. Select **Submit**.

What to do next

Create on-call shift for your team.

Using Service Operations Workspace for ITOM

Service Operations Workspace for ITOM delivers a unified platform integrating various applications, specializing in streamlined alert management. Seamlessly manage IT Operations workflows while efficiently handling alerts, ensuring optimal performance and productivity.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

For more information on the tasks within ITSM, see Service Operations Workspace for ITSM.

Integrations Launchpad in Service Operations Workspace for ITOM

The Integrations Launchpad showcases all Event Management connector integrations, allowing users to pull or push events from external or internal devices. This centralized hub simplifies Event Management by consolidating integration options in one place.

The Integrations Launchpad streamlines the process of managing and utilizing event connectors, enhancing operational efficiency and ensuring seamless integration of event data from various external sources. This centralization helps users maintain better control and visibility over their Event Management ecosystem.

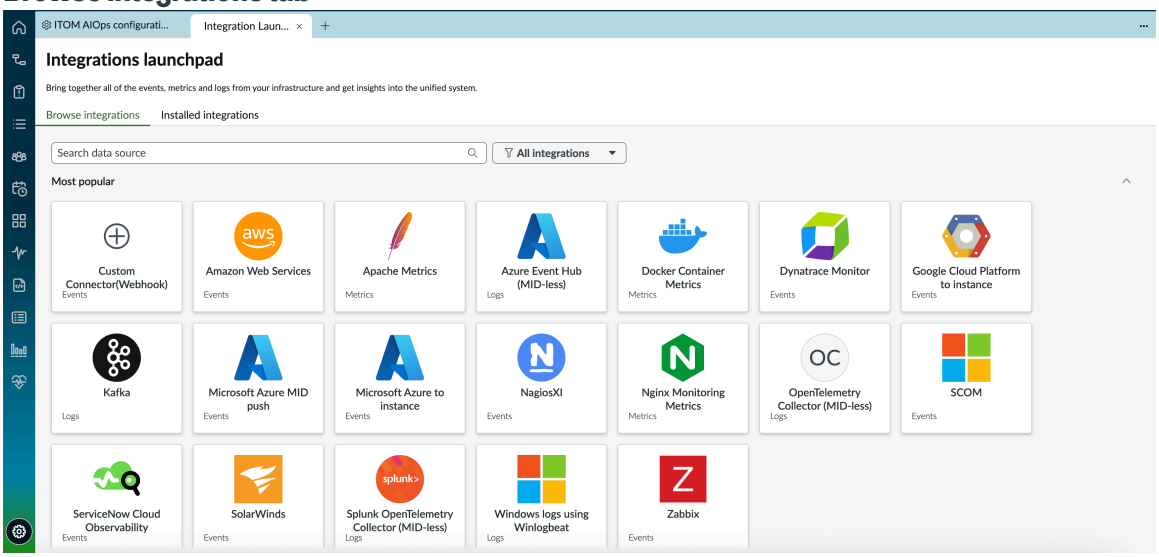
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Browse Integrations tab

Displays all pull, push, and custom connector integrations, including connectors available from the ServiceNow store and third parties. This tab features:

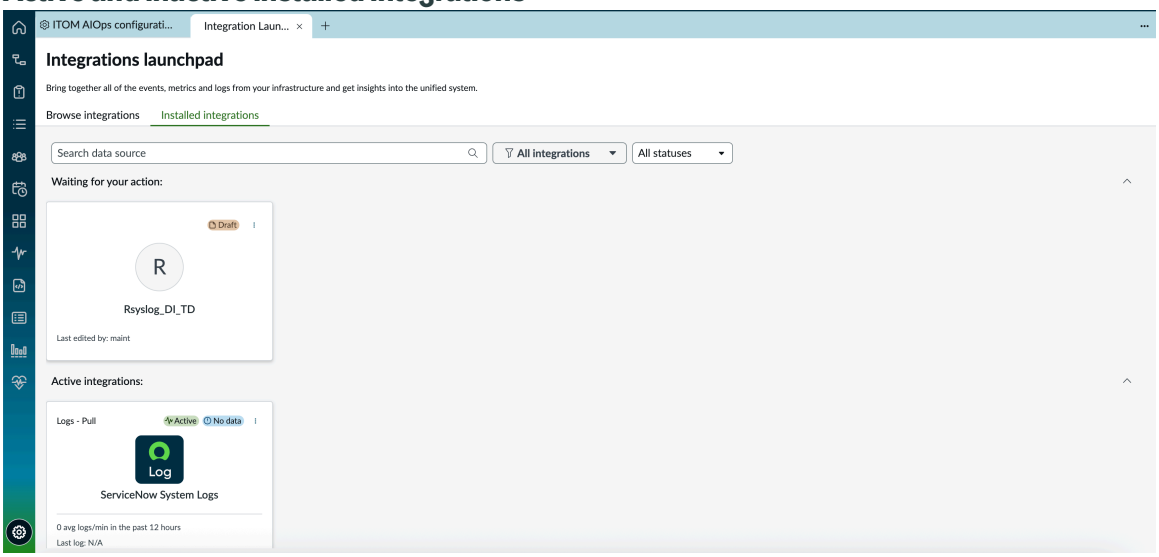
- Search Box: Helps you quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.

Browse integrations tab



Installed Integrations tab

Active and inactive installed integrations



Lists all user-configured integrations, both active and inactive. This tab features:

- Search Box: Helps users quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All statuses list: Allows you to filter integrations by their status—All Statuses, Active, Inactive, Draft, or No Data. This helps users quickly identify and manage integrations based on their current state.

Integration status and description

Status	Description
All statuses	All integration statuses
Active	Active integrations that were successfully installed
Inactive	Inactive integrations that were successfully installed
Draft	In-progress integrations with a configuration that was started but not completed
No data	Integrations that were successfully installed with no data

Configure an event pull connector

Configure event pull connectors that require a script, connector definition, and connector instance to pull events from external devices. These connectors automate the data retrieval process, ensuring the seamless integration of external events into your system for efficient monitoring and management.

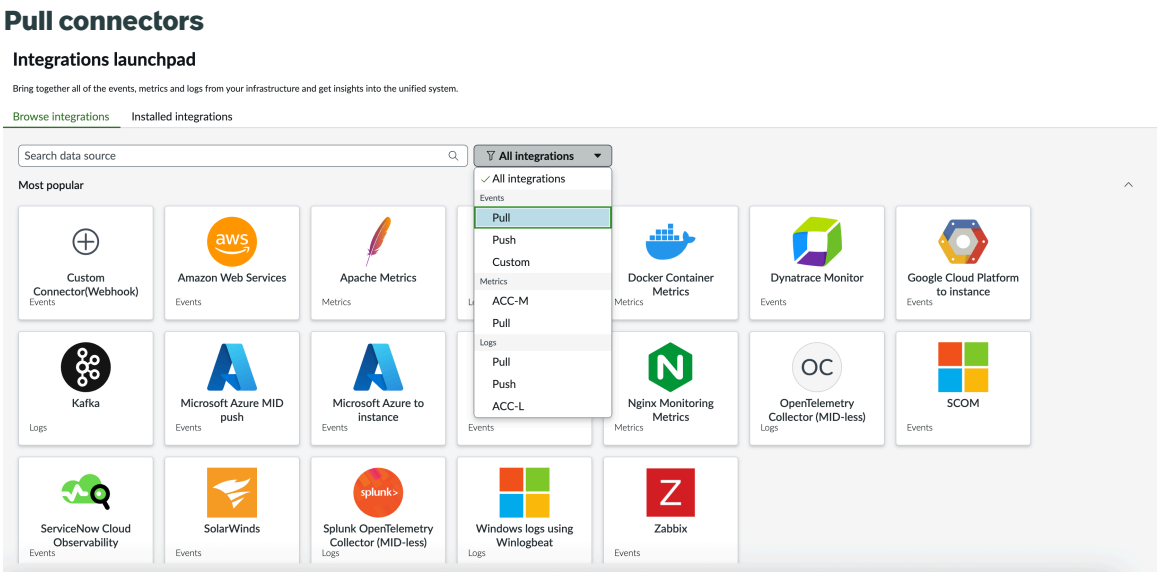
Before you begin

Role required: evt_mgmt_admin

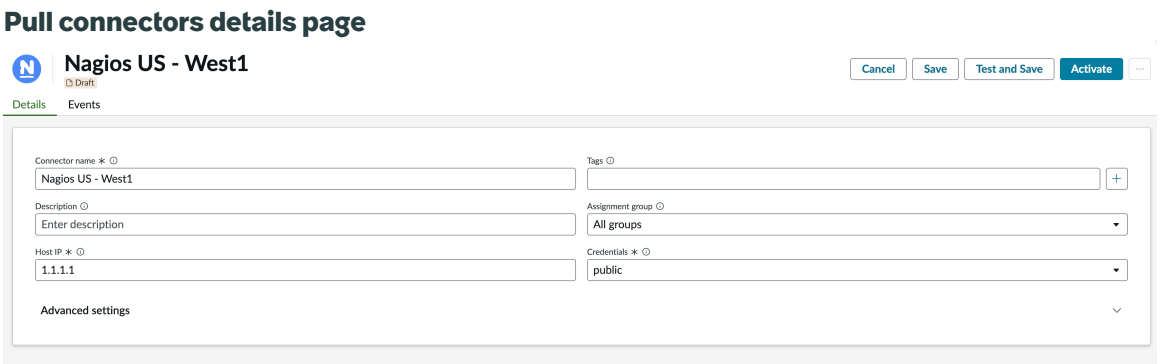
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull**. Only pull connector tiles are displayed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select a pull connector tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.



6. In the **Details** tab, in the **Connector name** field, enter a unique name for the connector type.
7. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

   To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

   a. In the **Key** field, enter a tag key.

   b. In the **Value** field, enter a tag value.

   c. Select **Add**.
8. **Optional:** In the **Description** field, enter brief information about this connector.
9. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.
10. In the **Host IP** field, enter the IP address that is used to select the appropriate MID Server for communicating with the event source host.
    You can use the host name instead of the host IP.
11. From the **Credentials** drop-down list, select the valid credentials to access the event source host.
    To create a new credential, select **Create new credentials** and continue with the process.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.

Field	Description
Connected MID Server	Determine whether you want to have the system choose the optimal MID Server or choose a specific MID Server yourself. Perform only if you must make modifications to the MID Server otherwise leave it empty and let the system choose the optimal MID Server.
Event collection schedule (seconds)	Enter the frequency in seconds that indicates how often the system should check for new events from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Protocol	Defines the communication protocol used for retrieving events from external devices.
severity_by_state_type	Determines the severity level assigned to events based on their state type.
time_zone	Specifies the time zone used for recording and displaying event timestamps.
offset_min	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in. Specifies the port number used for communication with external devices.
max_fetch_interval_min	Limits the maximum interval between event fetch operations.
initial_sync_in_days	Sets the duration for the initial synchronization process when retrieving historical data.

13. **Optional:** Test the connector before activating it by selecting **Test and Save**.
14. To save the connector, select **Save**.
15. To activate the pull connector, select **Activate**.
    The pull connector is activated and its tile is displayed in the **Installed Integrations** tab.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, select the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure an event push connector

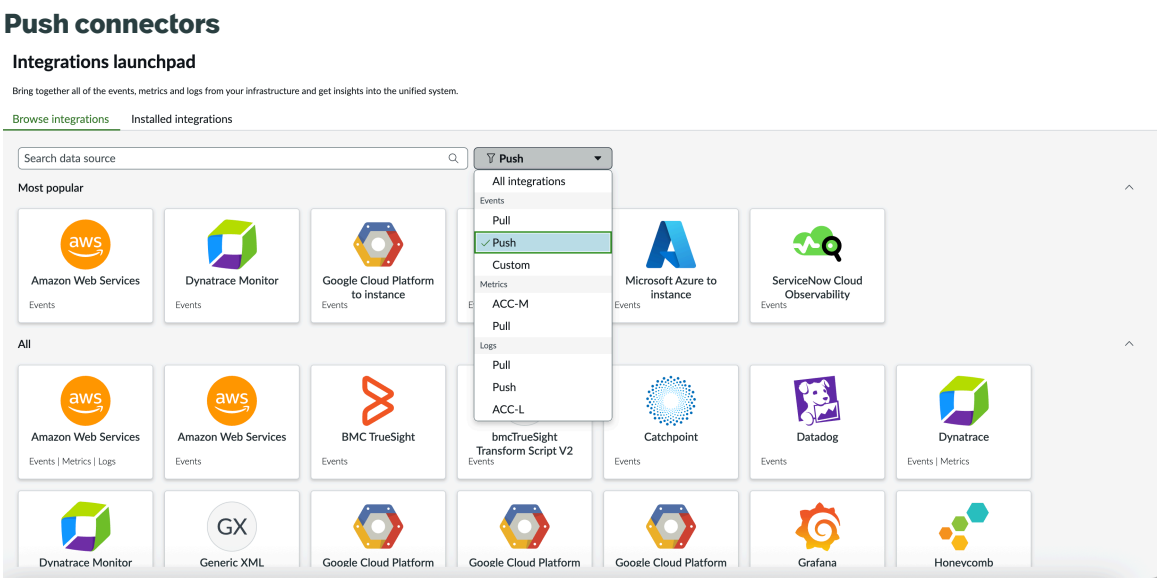
Integrate with an event push connector to connect to an external event source and push event information to your ServiceNow instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

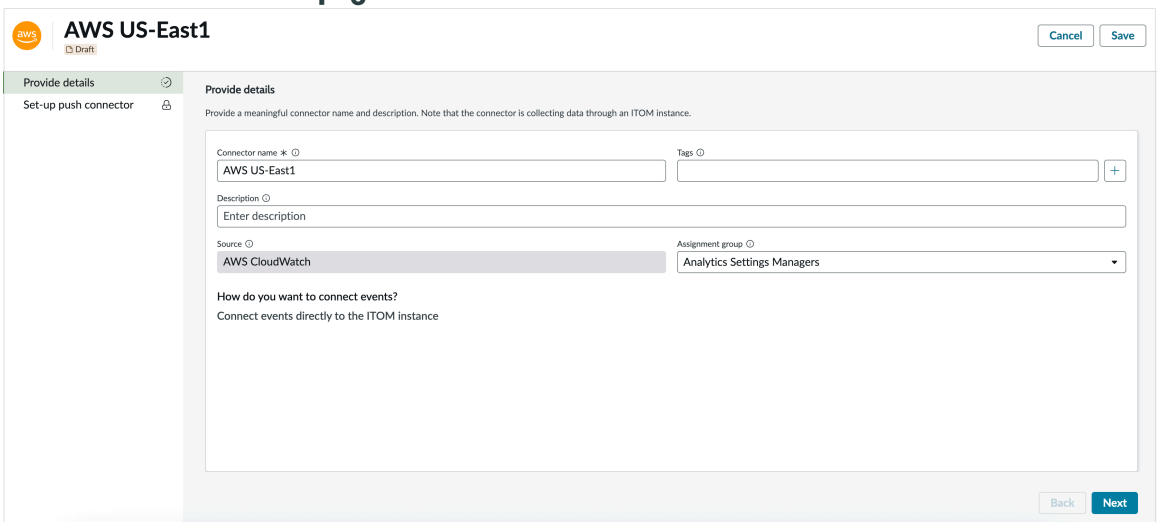
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Push**. Only push connector tiles are displayed.



5. Select a push connector type tile.
6. Provide details about the connector type on the **Provide details** screen.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push connectors details page



a. In the **Connector name** field, enter a unique name for the connector type.

b. Optional: In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.
To add additional tags, select the plus sign next to the **Tags** field. The Add tags window opens.

i. In the **Key** field, enter a tag key.

ii. In the **Value** field, enter a tag value.

iii. Select **Add**.

c. Optional: In the **Description** field, enter information to help identify this connector type.

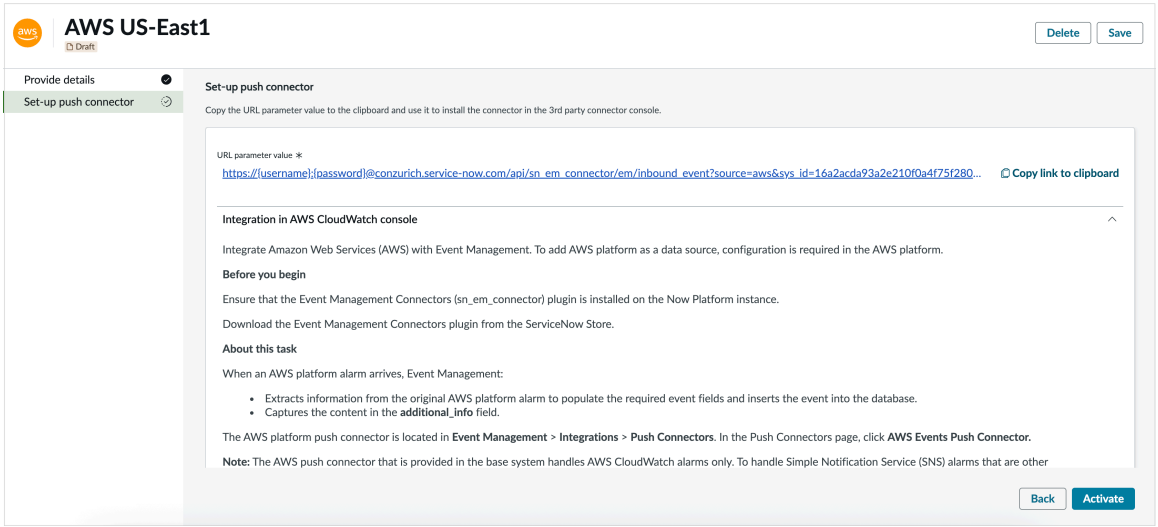
d. Verify that the vendor name in the **Source** field is correct.

e. Optional: From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the Push connector.

f. Select **Next**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector is saved in draft mode, and the process advances to the Set-up push connector section.



7. In the **URL parameter value** field, select **Copy to clipboard** to copy the auto-generated URL parameter value to the clipboard.

   This URL is generated by the code that depends on the ServiceNow instance and connector type to receive events from the third-party connector. Pasting the URL in your third-party connector configuration creates a webhook that enables it to send events to the ServiceNow instance.

8. Select **Activate** and then select **OK**.
9. In the **Details** tab, view the connector details and the URL link and follow the step-by-step instructions to integrate your third-party connector with Event Management.
   The connector is saved and a notification is sent after the connector is active.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, go to the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure an event custom connector

Authenticate your event custom connector as a data source to enable the pushing of event information to your ServiceNow instance. Define the custom connector by providing its details and mapping fields. This allows the extracted information from your custom connector's event messages to populate the required event fields. Finally, create and supply a URL for the custom connector webhook.

Before you begin

- Ensure the Event Management connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance. For more information, see Configure Event Management connectors.
- Ensure that the configuration items for the hosts managed by your custom connector exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery. For more information, see Access to cloud environments for ITOM products.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

About this task

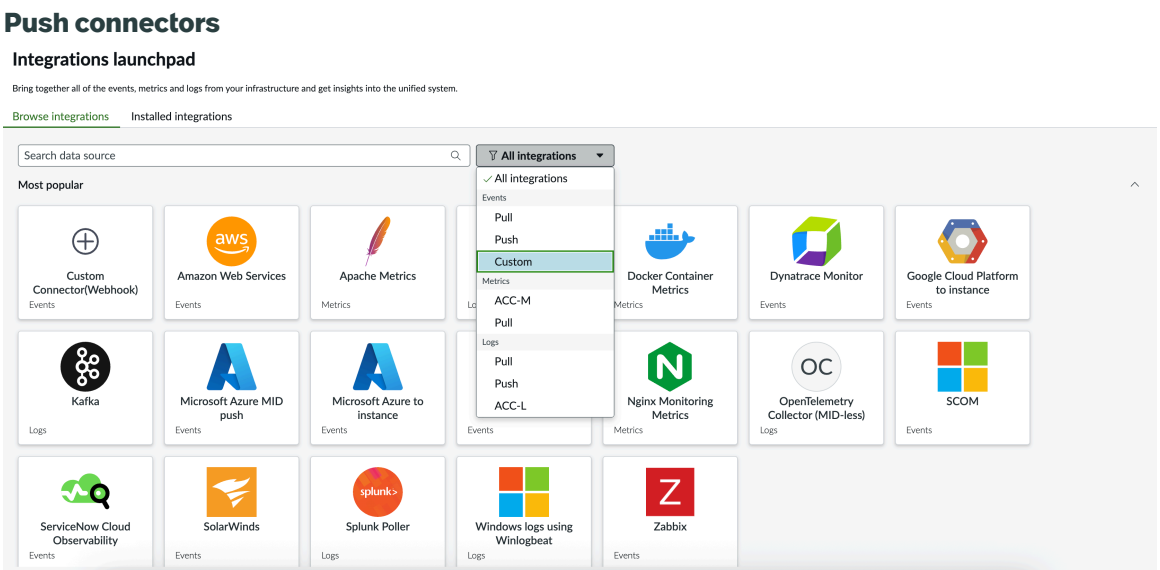
To start pushing event information to your ServiceNow instance, you must set your ServiceNow AI Platform instance as the REST endpoint using a standard webhook on your custom connector.

By providing connector details and mapping fields, you define the custom connector. The extracted information from the custom connector's event messages then populates the required event fields and inserts the event into the database.

The URL is generated by the code based on the ServiceNow instance and the custom connector. Use this URL to create a webhook that enables your custom connector to send events to the ServiceNow instance.

Procedure

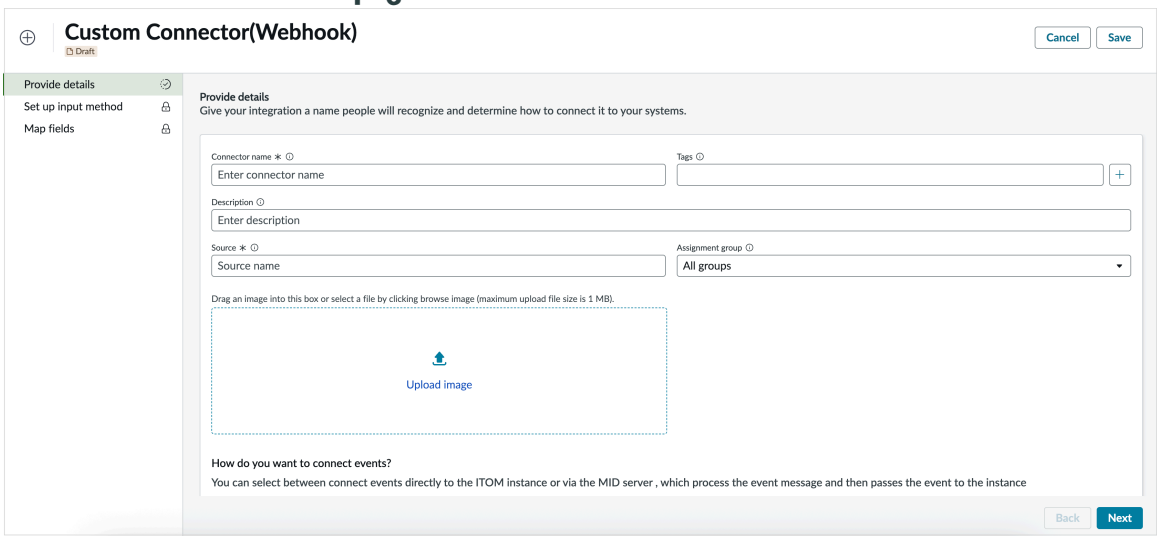
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Custom**. Only custom connector tiles are displayed.



5. Select a custom connector type tile.
6. On the **Provide details** page, provide the details for the connector.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom connectors details page



a. In the **Connector name** field, enter a unique integration name for the connector.

b. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

   To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

   i. In the **Key** field, enter a tag key.

   ii. In the **Value** field, enter a tag value.

   iii. Select **Add**.

c. **Optional:** In the **Description** field, enter brief information about this connector.

d. In the **Source** field, enter the vendor used to gather events from the external event source.

   The **Source** field identifies the connector and serves as an identifier to recognize the source of events and alerts once the connector is active.

e. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.

7. **Optional:** Drag or upload an image to display in your connector tile.
   - Drag an image into the box.
   - Browse to the image file by selecting **Upload image** and then choose the file.

   The maximum upload file size is 1 MB.

8. Determine whether you want to connect events directly to the ITOM instance or through a MID Server.
   - To send events directly to the ITOM instance, select **Directly to the ITOM instance**.
   - To send events through a MID Server, which processes and then passes the event to the instance, select **Via the MID server**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

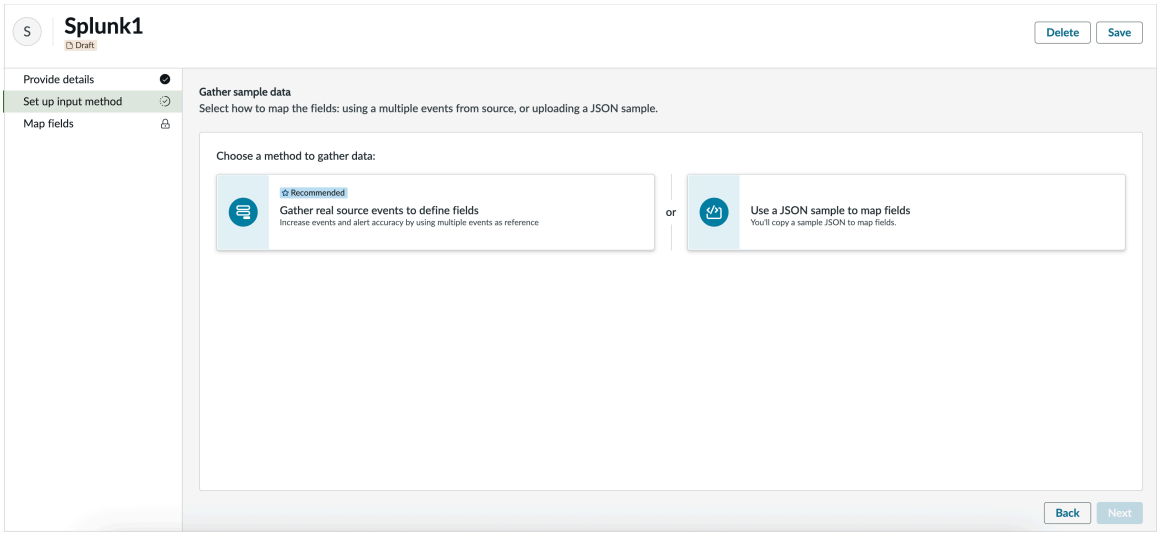
If a MID Server exists, from the **Select MID server** field, select an available MID Server connected to an events listener.

If you must create a MID Server, then select one of the following.

- **Configure MID web server extension**
- **Configure MID web service event collector context**

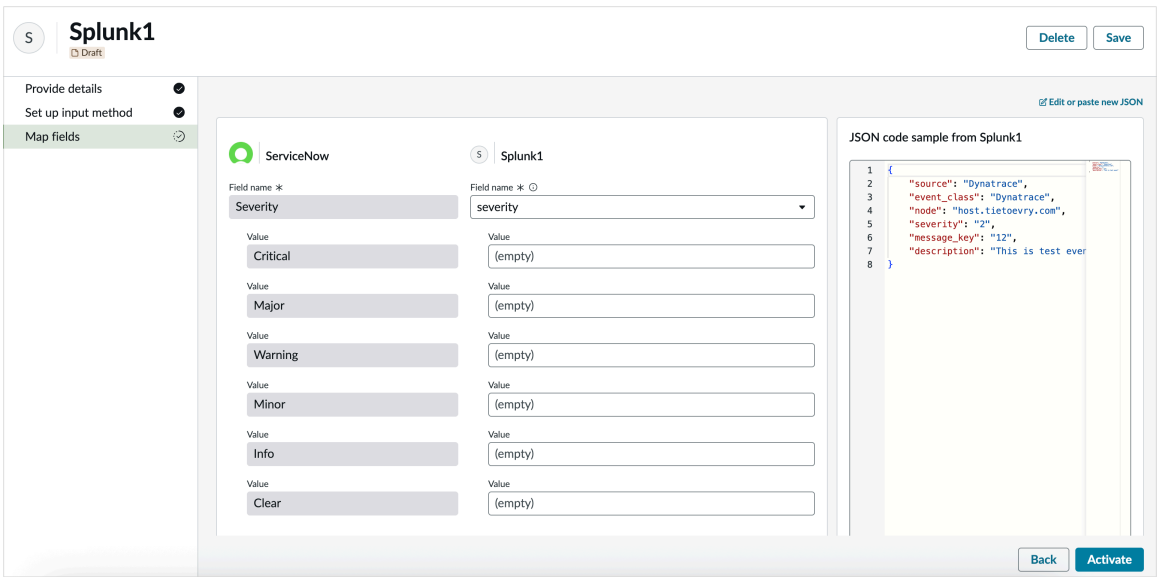
For more information, see Configure the MID Web Server extension and Configure the MID WebService Event Collector Context.

9. Select **Next**.



10. On the **Set up input method** page, select a method to gather event data.

11. Select **Next**.
The page opens where you can map fields.



12. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.

    You can enter the severity value from the JSON code sample. To set a severity value, you must be familiar with your custom connector's payload and the types of severity it supports. The severity values of the received events must match the generated events in your system.

    Enable the system to create events correctly from incoming data by mapping the fields in your JSON code sample to the ServiceNow fields. The **Severity** and **Message key** information are automatically filled in to save you time and effort. The **Message key** provides the correct identifier for the events, ensuring de-duplication works correctly and redundant alerts are not generated.

14. **Optional:** To view multiple JSON files, select the arrow above the JSON sample.
15. **Optional:** In the Other fields section, in your connector column, specify custom event parameters that are optional but provide additional information about the event.
    If you choose not to provide the optional information, leave the field empty.

    a. In the **Description** field, enter a meaningful alert description.

    b. In the **Metric name** field, enter a metric name that allows you to associate events with the performance metrics or KPIs that triggered the alert.

    c. In the **Node** field, enter a node value to be used for CI binding.

    d. In the **Event time** field, enter the creation time of the custom connector event.
    If the event time isn't mapped, the system will use the default event time.

    e. In the **Event time settings** field, select the time format and the event time zone.

    - **Time format**: A GlideDateTime field in UTC or GMT format, with a maximum length of 40 characters.
    - **Time zone**: Times are stored in Coordinated Universal Time (UTC) and are displayed globally based on the system time zone.

16. Activate and save the connector by selecting **Activate** and then select **OK** on the confirmation pop-up window.
    You can view the connector details on the **Details** tab and your field mappings on the **Fields mapping** tab.

    Note:
    You cannot modify connector details when it is active. Deactivate the connector to make any changes.

Result

After the connector is activated, events start flowing from your custom connector console into the ServiceNow instance. The plug-in extracts information from the original custom connector event message to populate the required event fields and inserts the event into the database. To see the events in your ServiceNow AI Platform instance, navigate to All Events. For more information, see View events.

What to do next

To verify that the process was successfully completed and events are flowing into the system, view the related events on the **Related events** tab. If the setup is successful, proceed to **Add**

automation to establish an alert automation. For information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure Solarwinds metric pull connector

Configure a metric pull connectors that require a script, connector definition, and connector instance to pull metrics from external sources. These connectors automate the data retrieval process, ensuring the seamless integration of external metrics into your system for efficient monitoring and performance analysis.

Before you begin

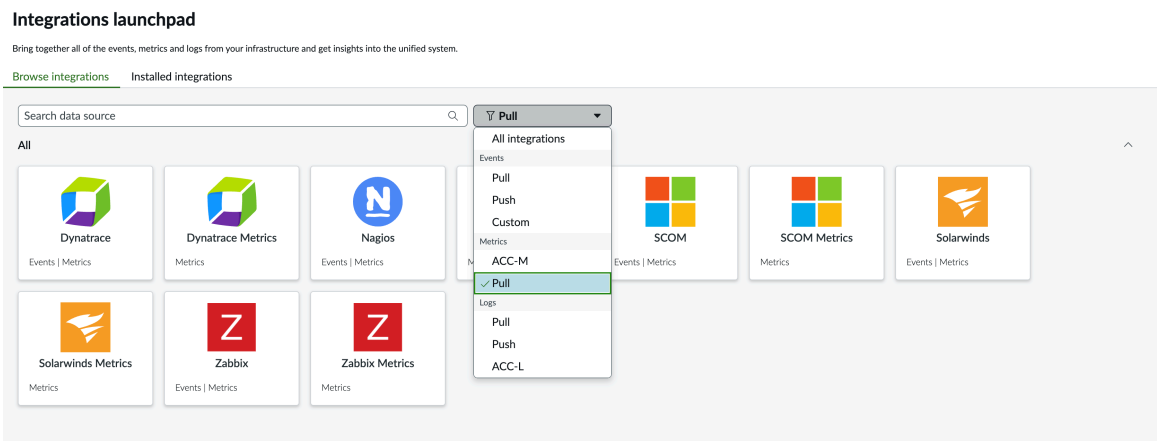
Role required: evt_mgmt_admin

About this task

Note:
The new UI for configuring metric pull connector is currently available only for the SolarWinds Metric Connector. For all other metric connectors, the configuration continues to use the Platform Table UI.

Procedure

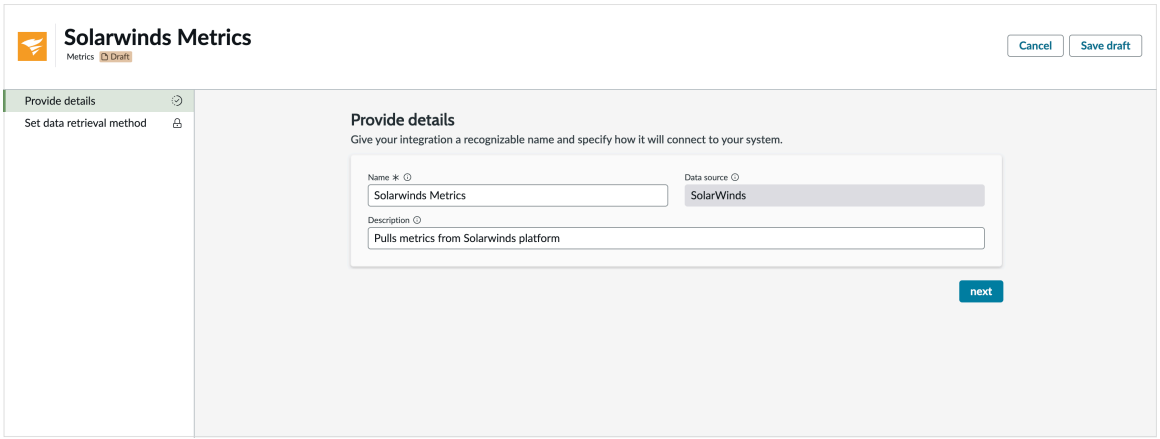
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.



Only metric pull connector tiles are displayed.

5. Select a pull connector tile.
If a pop-up menu opens, select the data to track from that connector and select **Continue**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Solarwinds server.
   - From the **Credentials** drop-down list, select the valid credentials to access the event source host.
   - In the **Metrics collection schedule (seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.
   - In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

     If none are available, ensure one is installed, running, and has the required capabilities.

     Note:
     You can select multiple MID Servers. The system randomly assigns one as the primary and uses the others as backups.
8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.

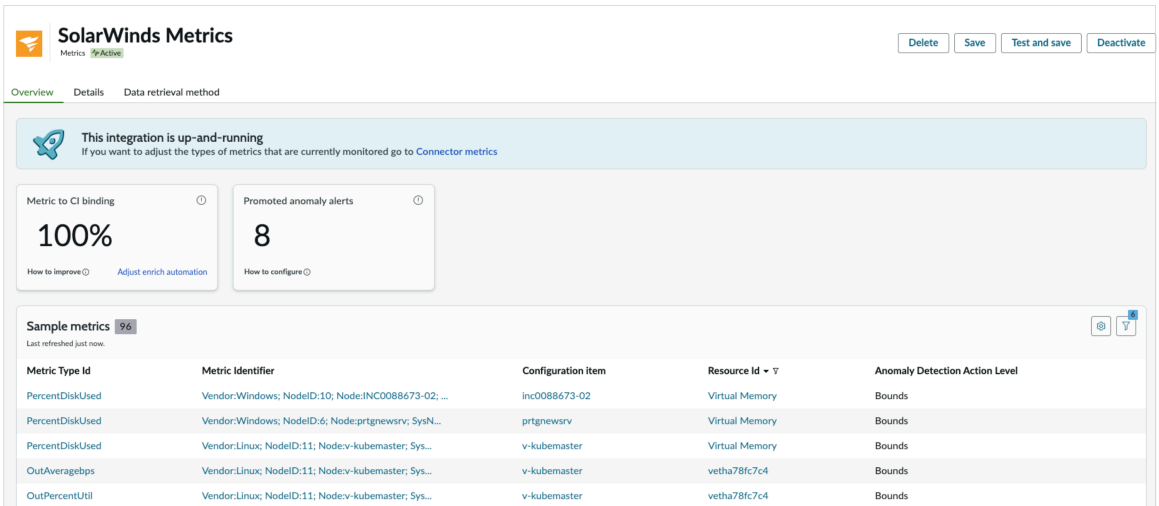
Field	Description
Max rows per query	Frequency in seconds that indicates how often the system should check for new metrics from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Max fetch interval (in minutes)	Limits the maximum interval between event fetch operations.
Offset (in minutes)	Sets the time offset for event retrieval to ensure accurate synchronization.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Port	Specifies the port number used for communication with external devices. (Optional) Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in.
Protocol	Defines the communication protocol used for retrieving events from external devices.
Debugging	○ Debug: Provides detailed logs for troubleshooting. ○ Log payload: Displays raw log data. Use only for debugging, as it can quickly fill the MID Server logs.

9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.
11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.



The **Details** tab allows you to update the connector's general information (such as name or description) and displays any errors encountered during its operation.

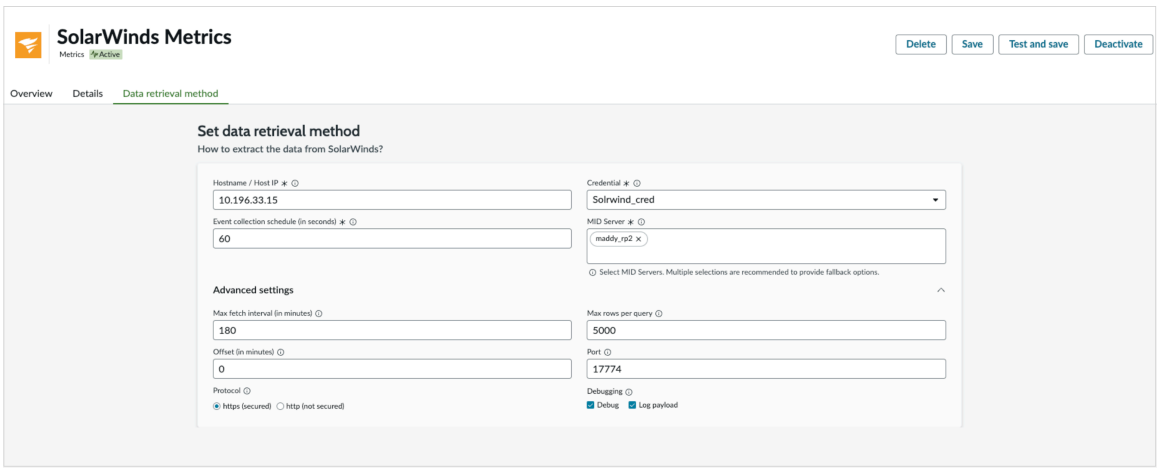
The **Data Retrieval Method** tab contains the connector settings (such as host, port, and credentials) and may provide additional details for issues like MID Server errors.



Configure Dynatrace metric pull connector

Configure metric pull connectors that require a script, connector definition, and connector instance to pull metrics from external sources. These connectors automate the data retrieval process, ensuring the seamless integration of external metrics into your system for efficient monitoring and performance analysis.

Before you begin

Role required: evt_mgmt_admin

Configure the Dynatrace API Key credential from **All** > **Connections and Credentials** > **Credentials**. For more information on how to configure Dynatrace API Key credential, see API key credentials.

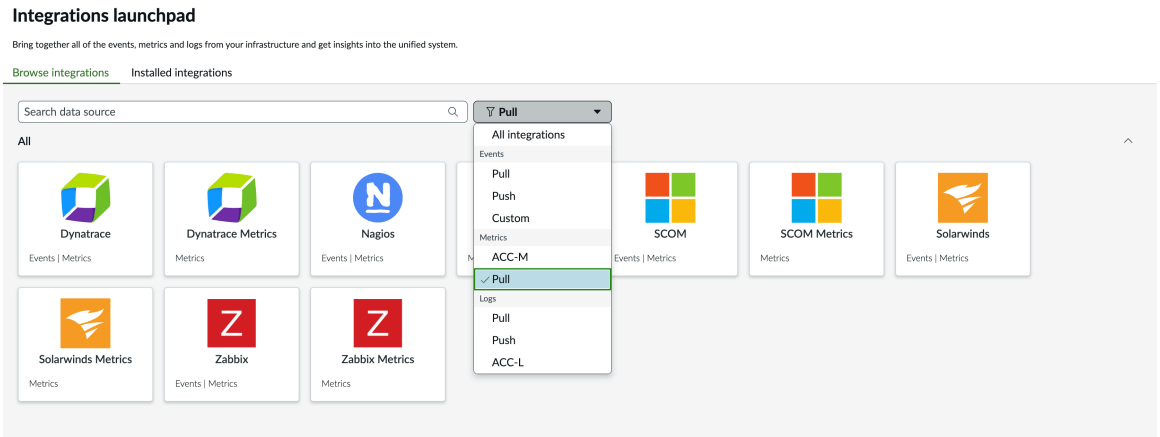
About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.



Only metric pull connector tiles are displayed.

5. Select the **Dynatrace Metrics** connector tile.
6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.

     In this case, select **Dynatrace**.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Dynatrace server.
   - From the **Credentials** drop-down list, select the valid credentials to access the metrics source host.

     Select the credential.
   - In the **Metric collection schedule (in seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.

     The default value is 60 seconds.
   - In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

     If none are available, ensure one is installed, running, and has the required capabilities. If none are available, ensure one is installed, running, and has the required capabilities. For example, the **Metric Intelligence Context** must be running on the same MID Server that you are configuring.

     Note:
     You can select multiple MID Server. The system randomly assigns one as the primary and uses the others as backups.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.
   For more information on fields, see Dynatrace advanced settings fields.
9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.
11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.

    The **Details** tab allows you to update the connector's general information (such as name or description) and displays any errors encountered during its operation.

    The **Data Retrieval Method** tab contains the connector settings (such as host, port, and credentials) and may provide additional details for issues like MID Server errors.

Review integration and configuration health

Review your events to ensure alerts are created as intended. Start this process by checking the health status of your integration. This provides useful statistics to highlight where you can make improvements to enrich alerts with relevant business context, group them for better noise reduction, escalate critical alerts promptly, and notify your team for swift response and resolution.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Health state metrics indicate how effectively alert automations add context and reduce noise, helping operators lower the Mean Time to Repair (MTTR). When adding a new integration, review these metrics, assess the rates, and develop new rules to further enhance noise reduction and improve overall system performance.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull** or **Push** as required.
5. Select a pull, push, or a custom connector type tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.
6. Select the **Events** tab.

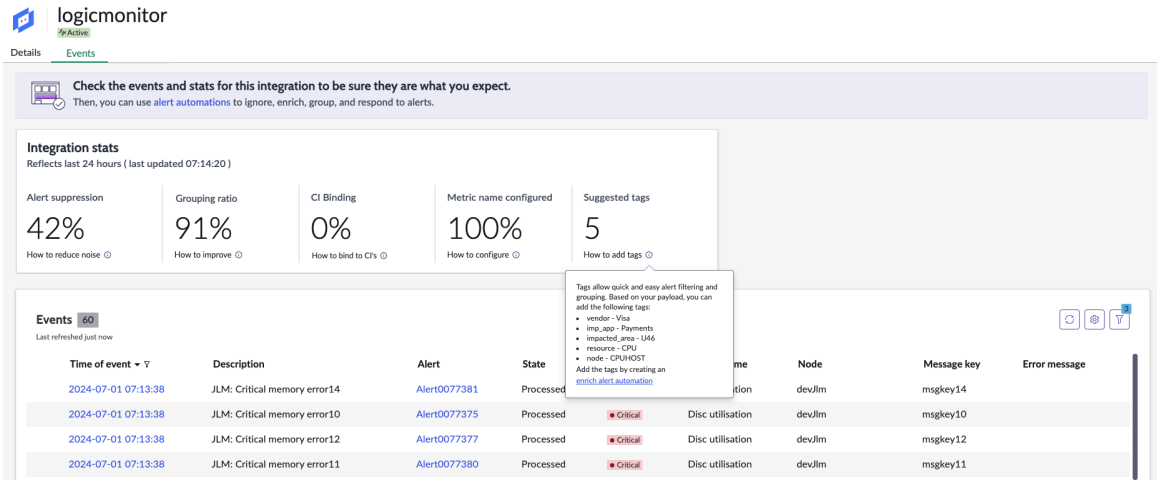
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. In the Health state section, view the data for alerts and their associated attributes.

Alert attributes

Alert attribute	Description
Alert Suppression	The suppression ratio indicates the proportion of alerts created to events received. Reducing unwanted alerts can be achieved by de-duplicating or ignoring them. ○ De-duplication: The **message_key** field is a unique identifier for an alert in the source monitoring system. It is used for de-duplication and alert flapping detection purposes. If the source event does not provide reliable unique values, you can use the default value or create your own. If the message key is not defined, the default message key will be <Source + Node + Type + Resource + Metric Name>. The guideline is for the event source to automatically populate the <Source + Node + Type + Resource + Metric Name> fields and generate the message key. This practice facilitates better distribution of event processing across instance workers and nodes. If the source event does not provide values for these fields, ensure they are populated using transform rules. This action, which does not impact event processing, is essential for de-duplication. Populate as many of these fields as possible before sending the event to the instance. Doing so enhances the distribution of events across processor workers, resulting in improved throughput and scalability. To learn more about de-duplication, see Event Management configuration preferences. To set the message key in your custom connector integration, see Configure an event custom connector. ○ Ignore alert event rules: Filter out low-quality alerts by creating an ignore automation.
Alert compression rate	When you group alerts, a high compression rate is desirable because it means fewer alerts remain for your operations team to review and

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert attribute	Description
	act on. This can lead to improved team efficiency. The compression rate is calculated as 1 – (the number of alert groups + the number of ungrouped alerts) / total alerts. To learn about alert aggregation, see Alert grouping. One way to improve your alert compression rate is by defining a new grouping automation.
CI Binding	The percentage of alerts successfully bound to a Configuration Item (CI) in your CMDB is crucial. Aim for this number to be at or near 100% to enhance alert grouping, root cause analysis, assignment, and more. To bind a host, machine, or any device with an IP, populate the **Node** field with a unique hostname, FQDN, IP, or MAC address. This can be done within the integration itself or by creating an enrich automation. For more complex scenarios, you can override node-based binding using event rules. For more information on CI binding, see Binding alerts to CIs.
Metric name configured	Shows the percentage of alerts that have a metric name defined. It's crucial to aim for near 100% because it's used by default in our automated correlation algorithm. This can be achieved within the integration itself or by creating an enrich automation.
Suggested tags	Provides suggested alert tags based on the integration payload. Alert tags are structured fields that you can define to facilitate easier filtering and grouping of alerts. The tags are stored in *sn_itom_integ_app_recommendation_tags_suggestion*, and only the top 5 most popular tags are displayed. In case you prefer to refine the results of suggestion mechanism, you can use property *sn_itom_integ_app.evt_mgmt_tag_suggestion_ignore_keys*, which displays a list of lowercase field names or keywords, separated by commas, to be ignored when scanning additional alert info for tag suggestions. Default value is time.

8. In the Events section, ensure that your events are generating alerts as expected.

   Verify that alert fields and tags are populated correctly to make the alerts easier to read and filter in Express List. Confirm that severity values align with your operations team's expectations and that fields and tags follow a standardized format across sources for easier grouping.

   By verifying alert generation, you can be confident that your system is properly configured to detect and notify you of noteworthy occurrences. For information on the fields in the Events section, see Integration and configuration health event fields.

What to do next

Now that you've confirmed alerts from the events, you can initiate the alert automation process by selecting **Add automation**. This takes you to the ignore automation step, where you can disregard irrelevant or false-positive alerts. Following that, proceed to enrich, group, and

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

automate responses. This process involves transforming raw alerts into a format understandable by ServiceNow, grouping the alerts, and escalating an alert to ensure an immediate response from the appropriate team or individual. For more information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Activate integration

Activate integration allows you to enable a previously deactivated connector integration, restoring its functionality. This feature helps you seamlessly resume data flow and integration activities, ensuring continuity and efficient event management without the need to reconfigure the integration.

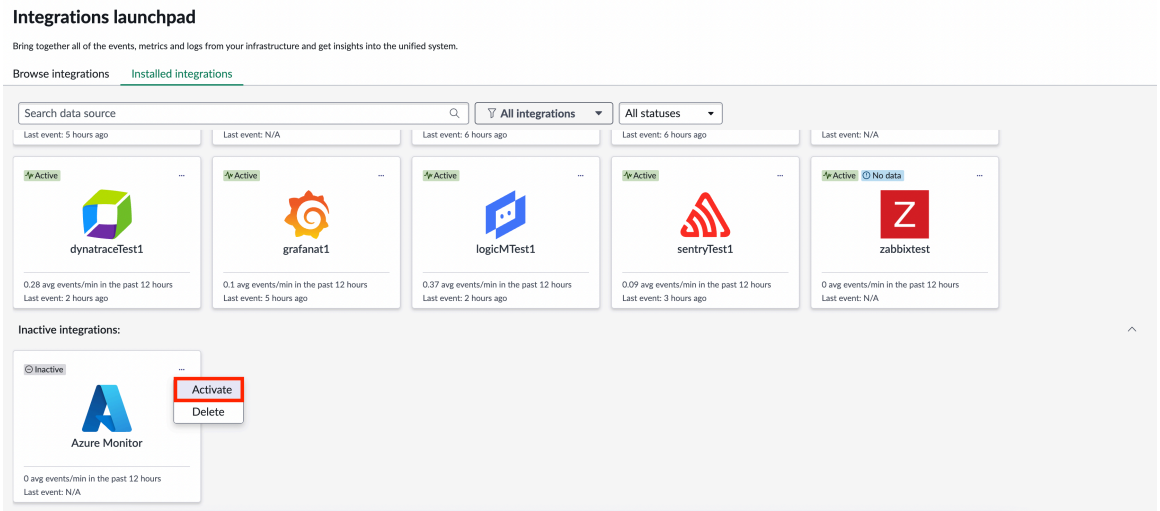
Before you begin

Ensure the integration is deactivated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to activate, select the Ellipses icon (•••) and then select **Activate**.



The selected integration is activated, and its status is shown as **Active** on the installation tile.

Deactivate integration

Deactivate integration allows you to temporarily disable an active connector integration without deleting it. This feature helps you manage integrations more effectively by pausing data flow when needed, reducing unnecessary event processing and improving system performance.

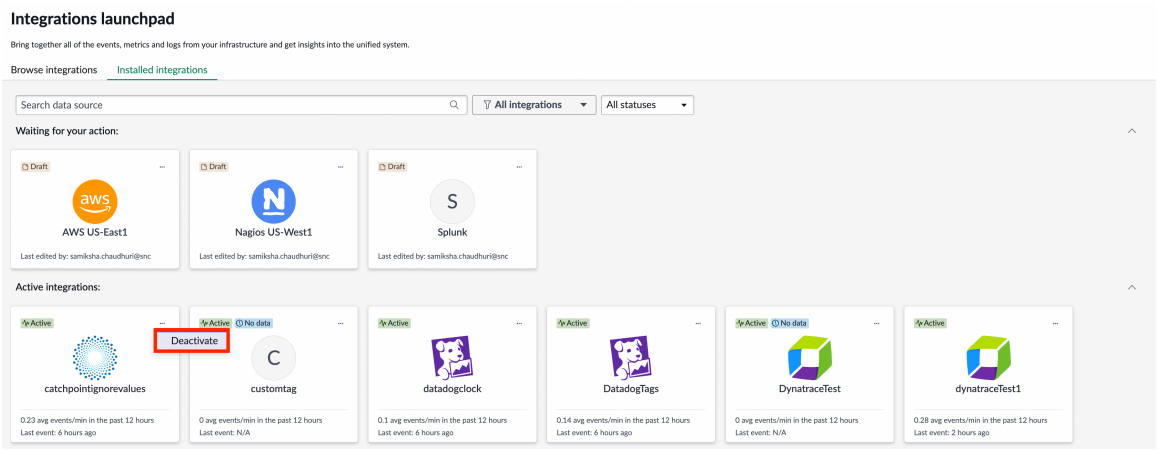
Before you begin

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to deactivate, select the Ellipses icon (•••) and then select **Deactivate**.



The selected integration is deactivated, and its status is shown as **Inactive** on the installation tile.

Delete integration

Delete integration allows you to permanently remove a connector integration from your system. This feature helps you maintain a clean and organized system by eliminating unused or obsolete integrations, freeing up resources and reducing potential clutter.

Before you begin

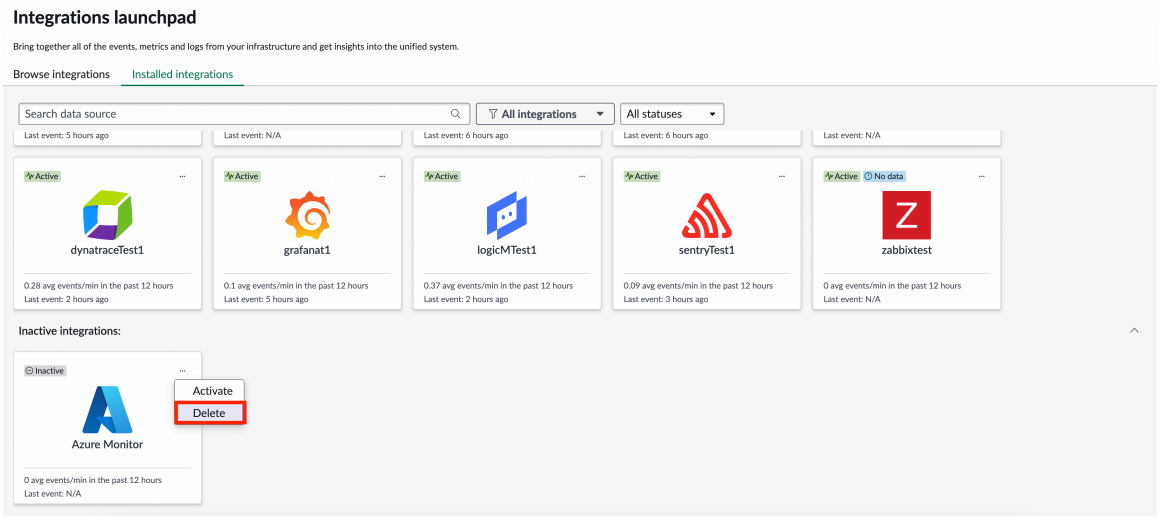
Ensure the integration is deactivated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon. The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to delete, select the Ellipses icon (•••) and then select **Delete**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. On the confirmation window, select **Delete**.
   The integration is deleted.

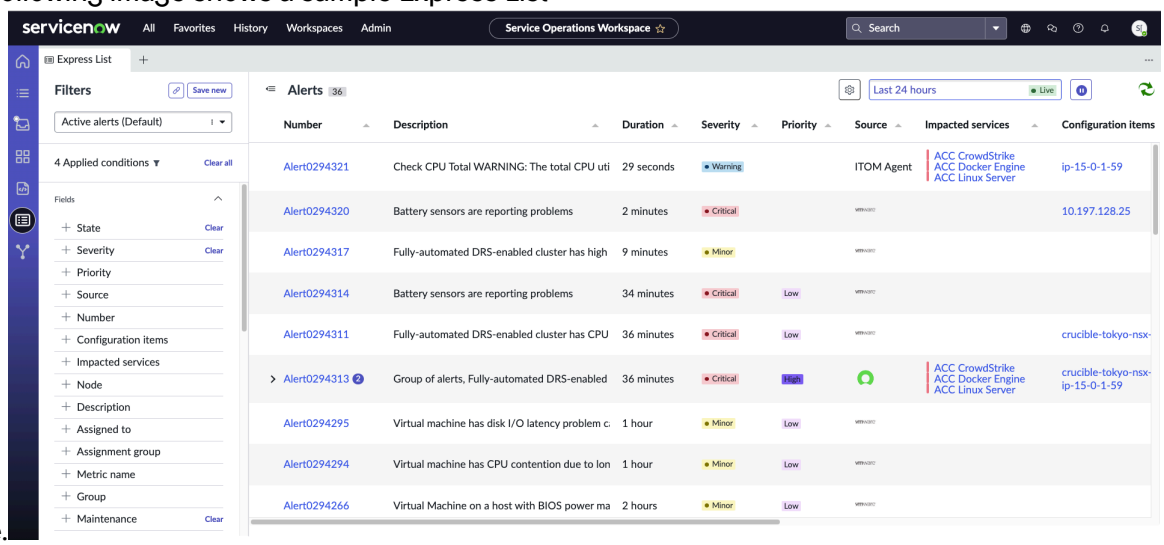
Express List in the Service Operations Workspace for ITOM

The ServiceNow Event Management Express List feature helps you identify health issues across the datacenter on the Service Operations Workspace. It provides a list of quick information on alerts so you can more efficiently monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents.

Introduction to the Event Management Express List

The Express List pane sortable alert list reduces the number of clicks necessary to access alert information. Selecting the check box of an alert opens a preview panel where you can view data that helps for prioritization, impact realization, and root cause analysis. You can easily modify the Express List pane to narrow down the display by using a provided fields list, displaying additional alert information, and filtering out or showing matching alerts. You can also modify the displayed time range.

The following image shows a sample Express List pane.



Express List benefits

The Express List pane enables operators to more efficiently perform the following actions:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Monitoring systems or application services**. Monitoring the performance and capability of computer systems to see any discrepancies.
- **Resolving alerts**. Working on discrepancies to troubleshoot issues and promote the efficient functioning of IT infrastructure.
- **Tracking issues**. Tracking and documenting defects and resolutions in detail and reporting incidents.
- **Reporting incidents**. Escalating complex issues to management, other IT resources, third parties or vendors.

Alert information displayed in the Express List preview panel

The Express List preview panel displays additional alert information on the Express List pane. This information enables you to conduct an assessment that helps in resolving incidents without having to open multiple alert forms.

The **Info** tab on the preview panel displays the following information for a selected alert:

- Alert number (link)
- Status
- Duration
- Configuration items (with links)
- Metric name
- Node
- Resource
- Source
- Assigned to
- Assignment group
- Last Updated
- Impacted services

  For more information, see View data on impacted services on the preview panel in Express List.

- Additional info
- Custom field

You can view additional alert information by selecting any of the linked items.

The **Alerts in group** tab on the preview panel displays alert information for a selected alert group. Information for each alert is displayed in a tile with additional options for each alert in the group.

Each tile displays the following alert information:

- Alert number (link)
- Status
- Severity
- Configuration items
- Duration
- Metric name

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customizing the alert display time range

You can determine the time range of the displayed alerts. The default time range is the last 24 hours. The list continues to update with new alerts until you select the pause icon ( ). Selecting the current range setting in the upper right displays a dialog box with date and time range options:

- All time - The last 90 days
- Last 24 hours
- Last week
- Last 12 hours
- Last hour
- Last 15 minutes
- Custom - Enables you to select a date and time range from the pop-up calendar.

Default time ranges can be defined by your administrator using the system property sn_sow_em.evt_mgmt.express_list.all_time_days.

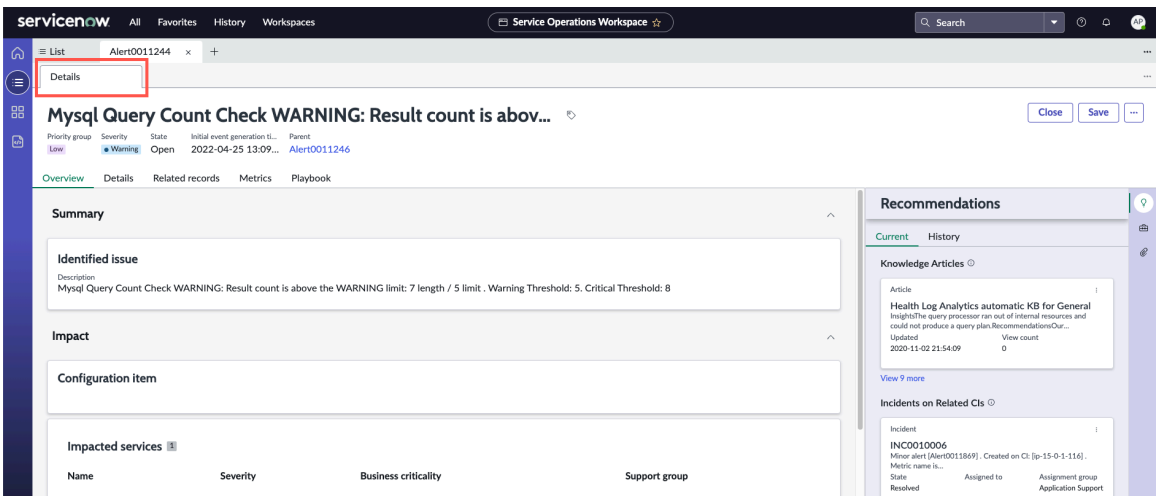
Roles used by Express List

Alerts in Service Operations Workspace

The Service Operations Workspace interface displays an alerts list and details on specific alerts.

When clicking an alert in the alerts list, the **Details** tab of the selected alert appears and the issue that caused the alert (the identified issue) appears in the alert title. Only the subtabs relevant to the alert appear on the resulting page. For example, the **Alerts in Group** option appears in the **Related records** tab only for alert groups.

Details tab



The following table describes areas on the alert form.

Alert form areas

Feature	Description
Header	The header includes these details:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert form areas (continued)

Feature	Description
	• Description: The text from the **Description** field of the alert is displayed. • Priority group: Priority group to which the alert belongs. • Severity: Severity of the alert. • State: The state of the alert. • Initial event generation time: Date and time when the initial event was generated. • Parent: The primary alert in the group (relevant only for child alerts in a group). • Group: Group type to which the alert belongs (relevant only for alerts in a group). • Task: Number of the incident with which the alert is associated. The displayed information varies according to the alert type.
Overview tab	When viewing an alert with an assigned CI, this tab opens when selecting the alert. The information displayed varies depending on the type of alert (grouped, secondary, or primary). If you have installed the Health Log Analytics app, alert types include Health Log Analytics alerts and component-based alerts.

Assign alerts in Express List

Assign alerts in Express List to yourself, to someone else, or to an assignment group to balance your organization's work load.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

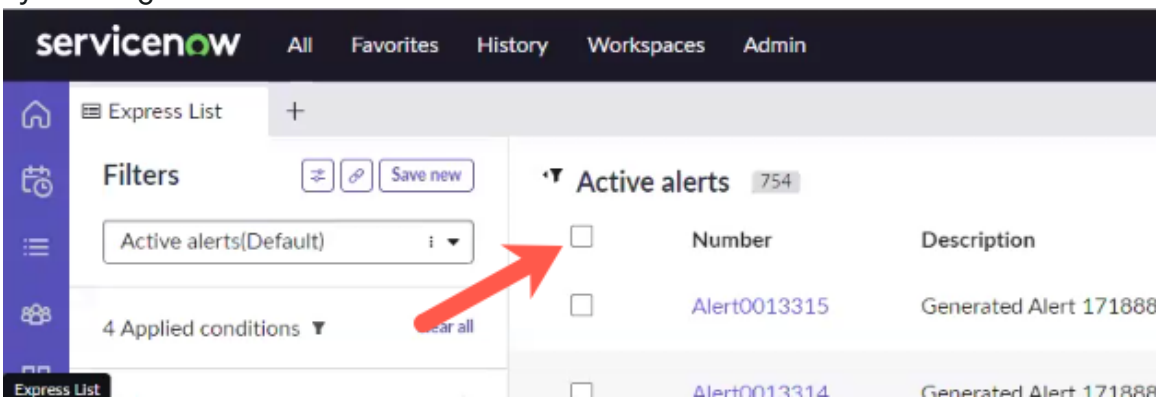
Note:
The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

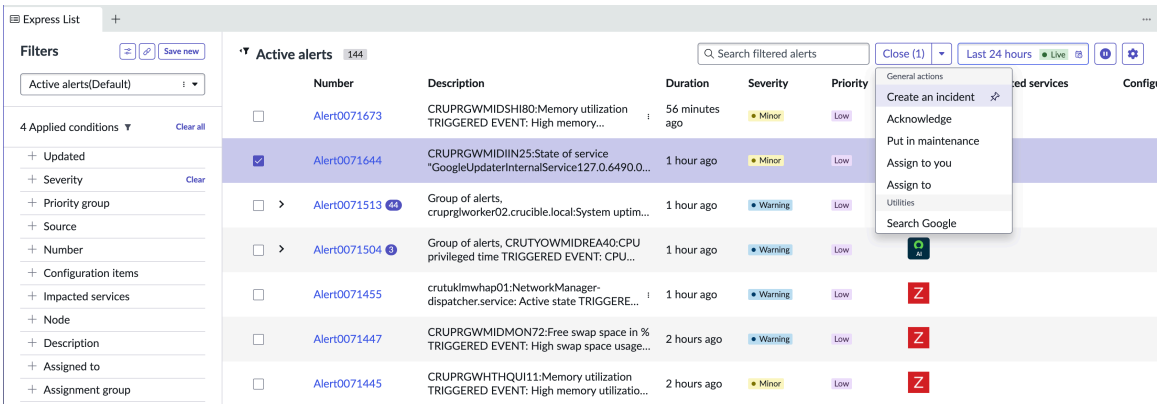
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Select the check box next to the alert number that you want to assign.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. Select the **Close** drop-down list.



5. Perform one of the following actions.

Result

The assigned person appears in the **Assigned to** column and the assignment group appears in the **Assignment group** column in the Express List pane.

Express List keyboard shortcuts

Use keyboard shortcuts to quickly perform common actions in the Express List.

Navigation shortcuts

Action	Keyboard shortcut
Go to the previous/next row	Arrow up/down
Move focus forward between clickable elements	Tab
Move focus backward between clickable elements	Shift + Tab

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action shortcuts

Action	Keyboard shortcut
Open an alert record	Option/Alt + R
Acknowledge an alert	Option/Alt + K
Assign an alert to yourself	Option/Alt + Y
Close an alert	Option/Alt + X
Create an incident	Option/Alt + I
Search free text	Option/Alt + S
Pause/Restart live updates	Option/Alt + L
Open/close the preview panel	Enter

Selection shortcuts

Action	Keyboard shortcut
Expand/collapse a selected group of alerts	Space
Select multiple neighboring alert rows	Shift + arrow up/down
Select multiple separate alert rows	Command/Control + arrow up/down
Activate a selected link or button	Enter

Note:
The information presented in this section is also available as in-product help in the Help Center panel for the Express List.

Use an assigned Express List view

Work with an Express List view assigned to you by your Event Management admin to make sure that you focus on specific services, priorities, or alerts.

Before you begin

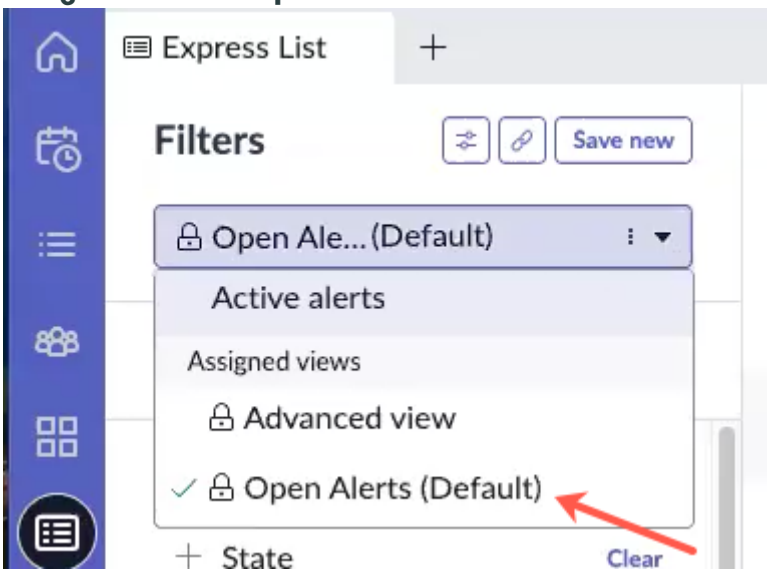
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. From the drop-down list in the Filters pane, select an Express List view that was assigned to you.
   Your default view is marked as Default.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assigned views in Express List



Note:
The Event Management admin may have assigned more than one view to you. You can switch between your views and modify and save views that aren't your default view. You can't change or share your default view or override settings in any of your assigned views.

The Filters pane lists the predefined filters. The Express List table displays the columns that were configured for the selected view.

Related topics

Configuring Express List views for users and user groups

Add or modify Express List columns

Add columns to the Event Management Express List display to focus the list of alerts that is displayed or modify the existing columns that are displayed.

Before you begin

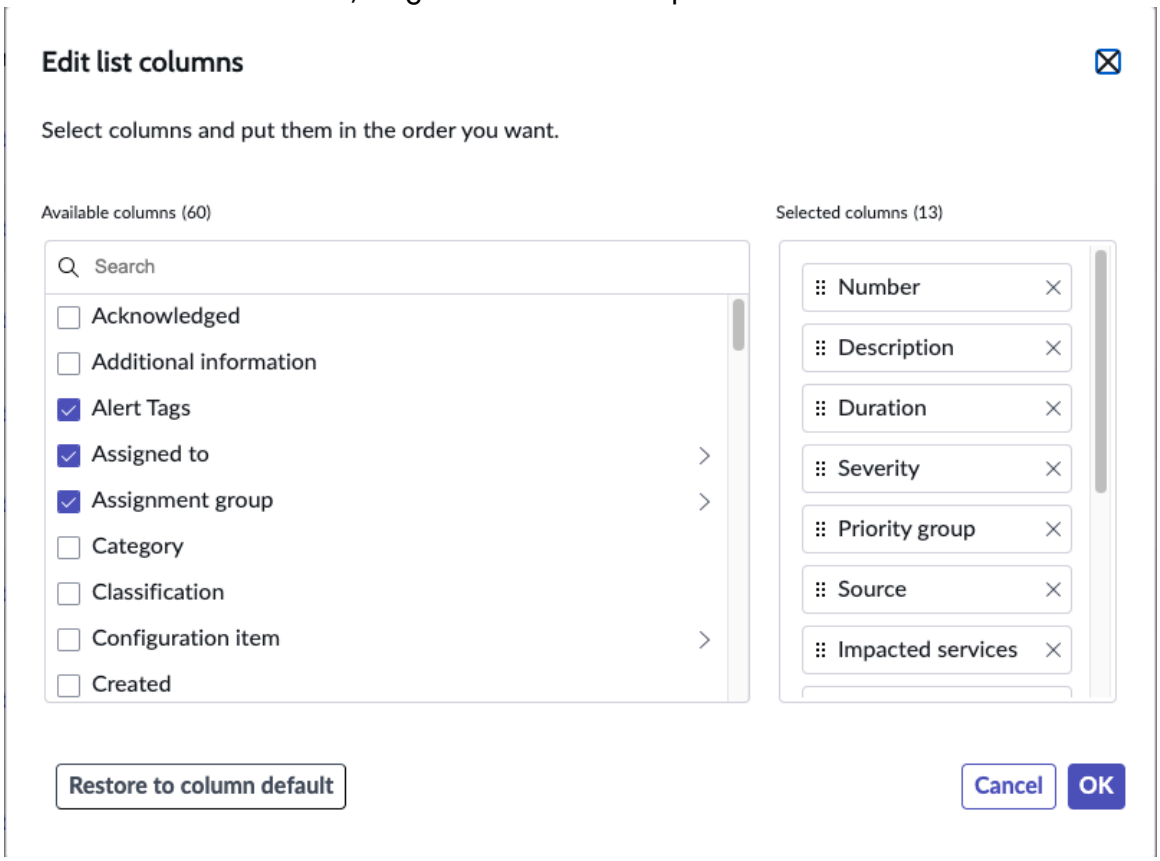
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Edit the default columns in the pane.
   a. Select the gear icon ( ).
   b. In the **Available columns** list, select the desired columns.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Selected columns** list, drag selected columns up or down to reorder the fields.



d. **Optional:** Select **Restore to column default** to return the columns to the default state.

e. Select **OK**.

4. **Optional:** Modify the column width, order, and sort direction directly in the Express List pane.

Result

The layout is automatically saved in the User preference [sys_user_preference] table. When you reopen the list, the same columns and order are displayed.

Add custom fields to the Express List preview panel

Add custom fields from the Alert [em_alert] table to the Express List Info preview panel to track alert information.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **System Properties** > **All Properties**.
2. In the **System Properties** list, select **evt_mgmt.express_list.custom_fields**.

   If a message appears about the application scope, select **here** to be able to edit the record.
3. In the **Value** field, enter the custom name from the Alert [em_alert] table.
   If you want to provide more than one field, use commas to separate the field names.
4. Select **Update**.
5. **Optional:** View the custom fields on the preview panel:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the primary navigation, select the Express List icon ( ).

b. Select a row or the information icon at the beginning of a row.

Result
The Info tab on the preview panel displays the custom fields at the bottom of the fields list.

Acknowledge viewed alerts in Express List

Acknowledge alerts that you've viewed to remove clutter in the Express List pane.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Note:
The evt_mgmt_user role is view-only and does not have permission to perform this action.

About this task
Use Acknowledge to denote that the alert is known, and can temporarily be ignored. Do not use Acknowledge to mark an alert as needing attention.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Acknowledge selected alerts.
   You can acknowledge alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Result
The alert is acknowledged and its status is displayed at the top of the preview panel.

Monitor incoming alerts

You can monitor incoming alerts in Service Operations Workspace. You can also monitor and manage alerts in the Event Management interface.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator

Note:
The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. View the alert information.

Alerts column headings

Column heading	Description
Number	Unique ID generated by Event Management to identify the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Group	An entry in this column indicates that the associated alert is a member of an alert group. Alerts that do not have an entry in this column are ungrouped alerts. ○ **Automated**: Aggregated automatically by alert aggregation. A virtual alert is added to the group as the primary alert of the group. ○ **Rules-based**: Alert group created as a result of a user-configured correlation rule. ○ **Manual**: This alert is a member of an alert group that is formed when right-clicking an alert and setting it as secondary to the selected primary alert. ○ **CMDB**: CIs without historical data that were aggregated by alert aggregation based on CI relationships in the CMDB. ○ **Secondary**: This alert is a component of an alert group. The alert at the head of the group is known as the primary alert. When **Correlated Alerts** is selected, the secondary alerts that are under the primary alert do not display, making the Alerts list less cluttered and easier to review. ○ **None**: This alert is an ungrouped alert. To make an ungrouped alert become a member of a group, right-click it and select in the topic **Add to Groups**. Select the alert and click **Add Selected**. ○ **Text**: This alert is a member of an alert group that was created based on the similarity of their text or description. ○ **Log Analytics**: This alert is a member of a Log Analytics alert group. ○ **Component-based**: This alert is a member of a Log Analytics group that was created based on the affected IT components or services. ○ **Tag Cluster**: This alert is a member of an alert group that was created based on common tags or labels assigned to them. ○ **Network Traffic**: This alert is a member of an alert group that was created based on network traffic connections between processes of host CIs. ○ **Mixed**: This alert is a member of a grouping method that combines alerts using multiple grouping strategies, such as CMBD-based grouping and tag-based grouping, into a single, cohesive group.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Priority group	Indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.
Priority	Value providing a guide as to the priority of the alert, based on a number of accumulated categories. For example, alert state and business criticality.
Source	Event monitoring software that generated the event, for example, SolarWinds or SCOM. Optionally, you can enter a description, for example, `Group Alert`. This field has a maximum length of 100.
Description	The alert description.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. This field has a maximum length of 100.
Configuration item	JSON string that represents a configuration item. For example, {"name":"SAP ORA01","type":"Oracle"}. The CI identifier that generated the event appears in the **Additional information** field. This field has a maximum length of 1000. Click to open the alert in dependency view.
Impacted Services	Lists the services affected by this alert group. Select an impacted service to view its record. **Note:** You can access the Service Map in Service Operations Workspace directly from the impacted service form by selecting **Service Map**. The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the service. For more information, see View unified service map and the impact paths in Service Operations Workspace.  el-imp-service-open-map.png
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.
Maintenance	Shows whether the resource affected by the alert is in maintenance, Valid values are `true` or `false`.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Parent	Reference to a parent alert.
Initial event generation time	Time that the initial event occurred in the remote system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

If Operational Intelligence is activated, you can right-click an alert and click **View Metrics** to open the integrated Insights Explorer and Dependency Views map for the CI that is associated with the alert.

- Metric Intelligence
- View alert information
- Alert grouping types and creation methods

Close an alert in Express List

Manually close alerts directly from the Express List pane or from the preview panel without waiting for them to be automatically closed if you already know the root cause or have fixed the problem.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note:
The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Close selected alerts.
   You can close alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Result

The alert is closed and its status is displayed at the top of the preview panel.

Create an incident from an alert in Express List

Create an incident from an alert directly from the Express List pane, saving you the time and effort of navigating to the incident record.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note:
The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Create an incident from a selected alert.

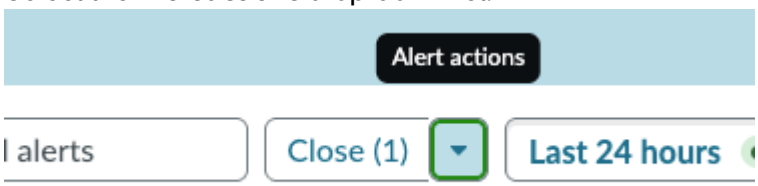
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Express List pane, select the check box for the desired alert.

Note:

To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row.

b. Select the **Alert actions** drop-down list.



c. Under **Response actions**, select **Create Incident**.

An incident is created from the selected alert and a confirmation message is displayed.

Create an incident with Now Assist in Express List

Create an incident with a human-readable, AI-generated description using Now Assist.

Before you begin

Currently, this feature is available for CMDB, Log Analytics, tag-based, and component-based alerts.

Role required: evt_mgmt_operator, evt_mgmt_admin

Note:
The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Create an incident from a selected alert.

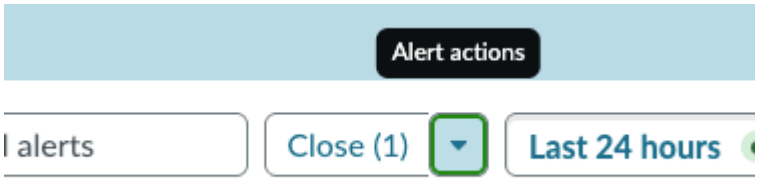
a. In the Express List pane, select the check box for the desired alert.

Note:

To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row.

b. Select the **Alert actions** drop-down list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Under **Response actions**, select **Create Incident with Now Assist**.

An incident with a human-readable, AI-generated description is created from the selected alert and a confirmation message is displayed.

Mute a CI's alerts in Express List

Mute a CI's alerts in Express List to avoid alerts being issued when replacing or upgrading the CI.

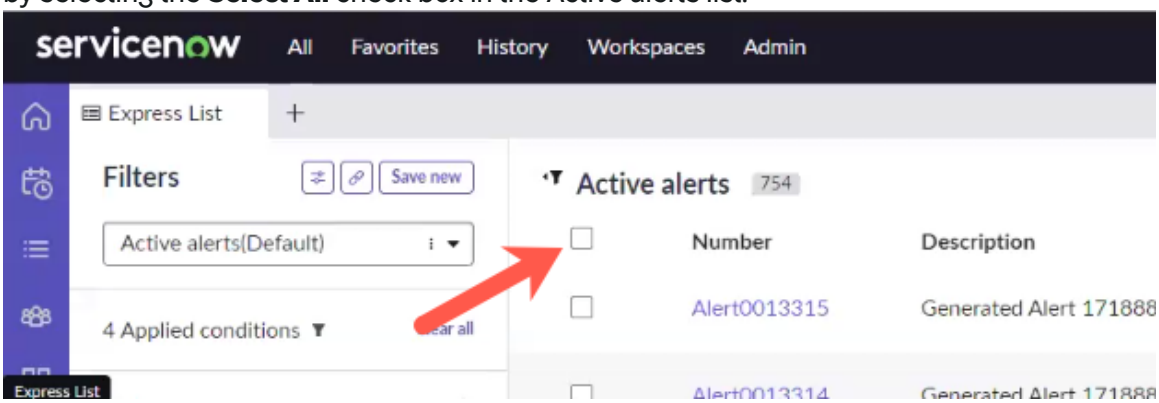
Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Note:
The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Select the alert row check box.

Note:
You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. From the **Close** drop-down list, select **Put in Maintenance**.

Result
Alerts are muted for the configuration items of that alert.

Place an alert in the Maintenance state

Placing an alert into the Maintenance state indicates that there are issues with the alert's CIs that are being addressed.

Before you begin
Role required: evt_mgmt_admin or evt_mgmt_operator

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Filter with **Active alerts**.
4. Select an alert.

5. On the **Details** subtab, select the **Maintenance** check box to place the alert into the Maintenance state.
6. Click **Save**.

Place an alert in the Acknowledged state

Placing an alert into the Acknowledged state indicates that the alert has issues that need to be addressed.

Before you begin

Role required: evt_mgmt_admin

Note:
The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Filter with **Active alerts**.
4. Select an alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Details** subtab, select the **Acknowledged** check box to place the alert into the Acknowledged state.
6. Click **Save**.

Respond to an alert in Express List

Run a response action to remediate an alert issue manually from the Express List pane.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note:
The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Select the alert number to open it.
4. Select the response action for the alert from the **Close** drop-down list.

Note:
If the list is empty, no response actions are available.

Run response actions on multiple alerts in Express List

Run response actions to efficiently remediate and respond to issues on multiple alerts directly from the Express List pane.

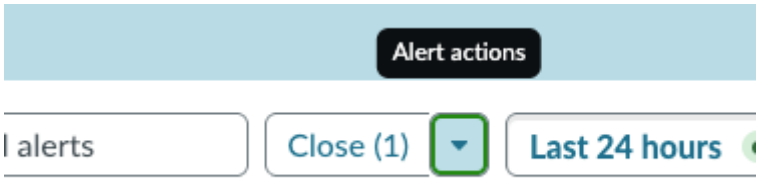
Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

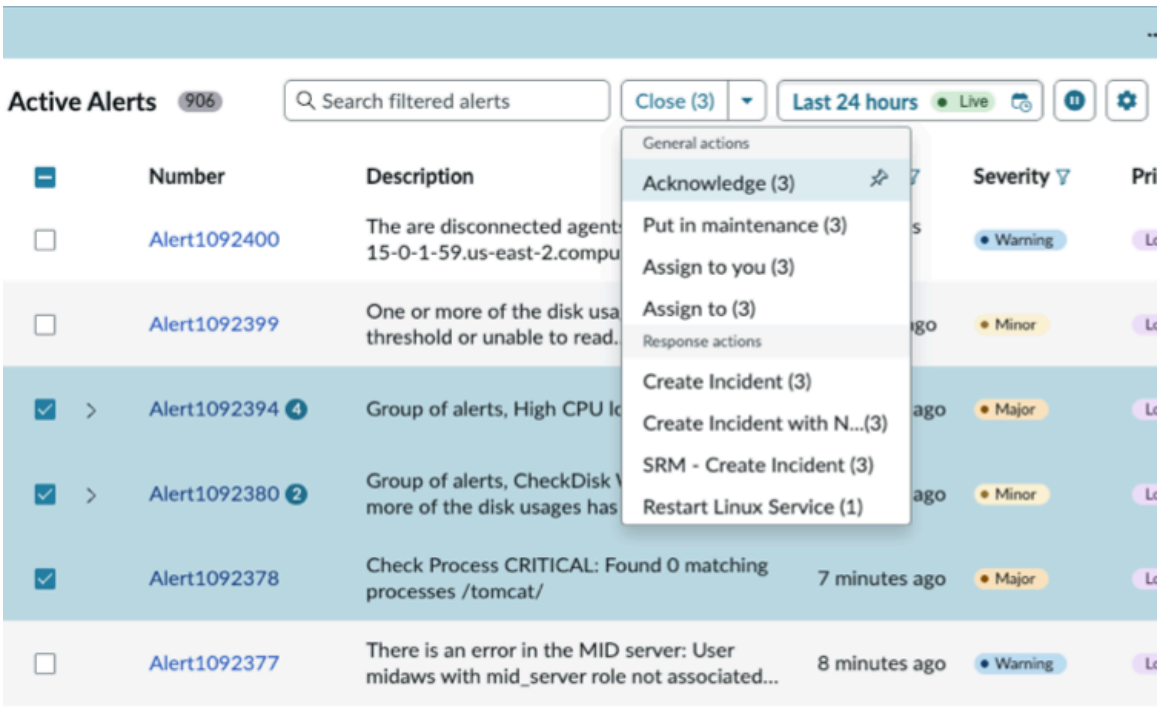
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. In the **Active Alerts** list, select the check boxes for desired alerts.
4. Select the **Alert actions** drop-down arrow to view **Response actions**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select a response action.



Note:
Numbers next to actions represent the number of alerts that can be addressed with that action. If the list is empty, no response actions are available.

The **Run response action** modal appears. The modal describes the number of alerts addressed with the selected action, and lists the selected alerts that aren't addressed.

View metrics for an alert

Viewing metrics enables you to understand historical data related to an alert's CI.

Before you begin

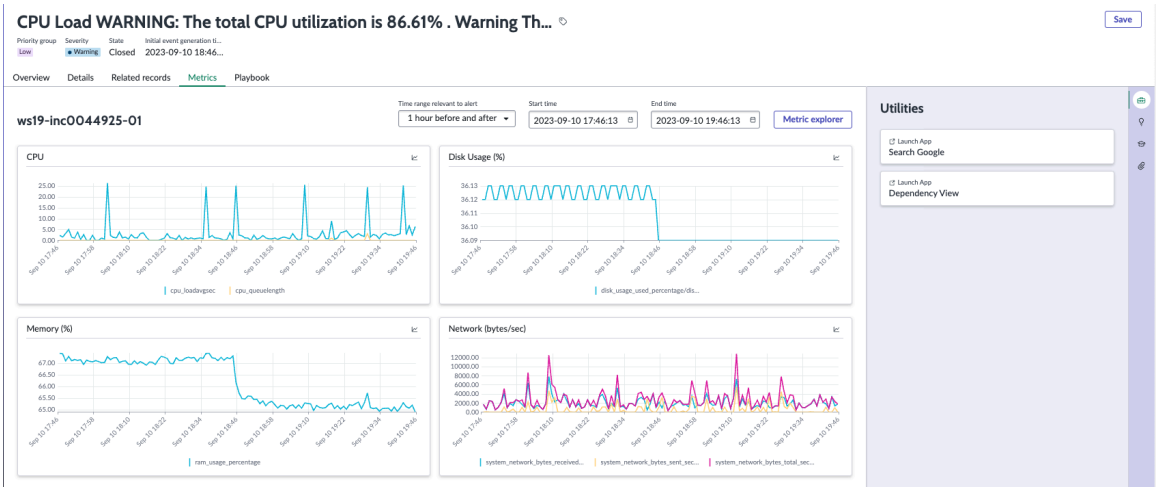
- Ensure that you install the Operational Intelligence (com.snc.sa.metric) plugin.
- Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Select an alert to open it.
4. Click the **Metrics** subtab.
   The configured metrics appear on the page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

- *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
- *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

5. In the **Time range relative to alert** list, select the time range for which you want the metrics to be displayed for the alert:
   - 1 hour before and after (default setting)
   - 3 hours before and after
   - 5 hours before and after
   - Custom range (to configure a customized time range for the metrics to measure)
6. Click a parameter below a chart to hide the specified parameter's data on the chart.
7. **Optional:** Click the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.

Related topics

View metric values in the Insights Explorer

View details about the impact and cause of an alert in Express List

View information about an alert on the alert's Overview tab in the Express List.

Before you begin

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. View alert information on the **Overview** tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview tab

Section	Description
Summary	Contains a description of the selected alert, describing why it is considered an issue.
Impact	Lists the Configuration item and any services impacted by the alert. The **Impacted Services** tile includes the following subtabs: ○ **Application services:** The application services affected by the alert. For details on application services, see Application services. ○ **Related service offerings:** The service offerings connected to the application services affected by the alert. Application services and their related service offerings display on a many-to-many basis. That is, several service offerings can relate to one or more application services, and several application services can relate to one or more service offerings.
Cause	Lists the log properties with information contributing the alert issue, as well as probable root causes for the alert.

View anomaly alert metric data on the preview panel in Express List

View visualizations for anomaly alerts to investigate anomalies using metric data without navigating away from the Express List preview panel.

Before you begin

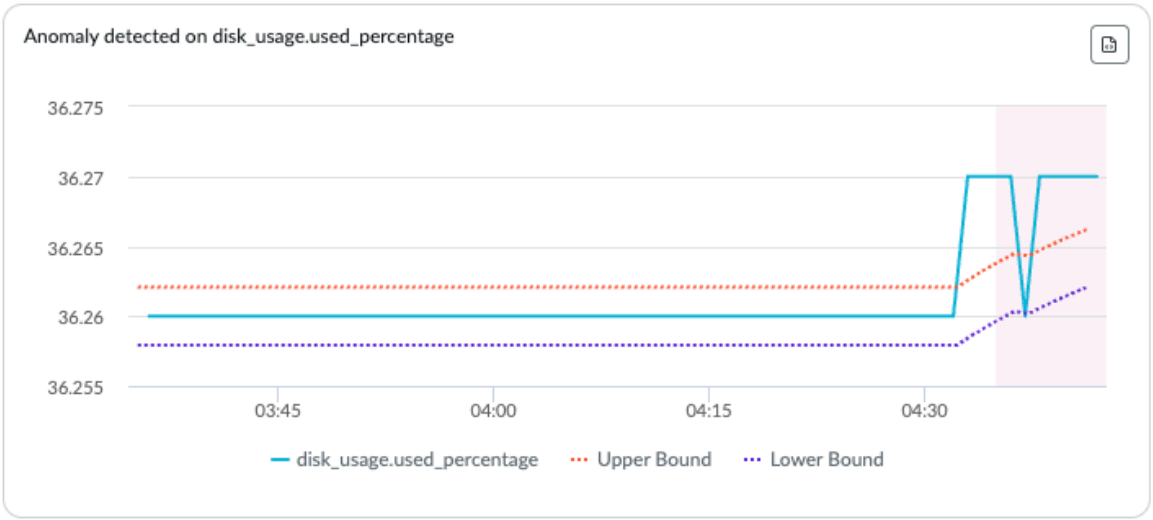
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon.
3. In the Active alerts list, select the check box for an anomaly alert.
   Information in the **Description** column can help you determine which alerts are anomaly alerts. For example, an alert description might warn about values nearing or exceeding configured thresholds, or metrics above or below a defined boundary.
4. On the preview panel, select the Info tab.
   Depending on how the metric anomaly is configured, one of two charts is displayed.

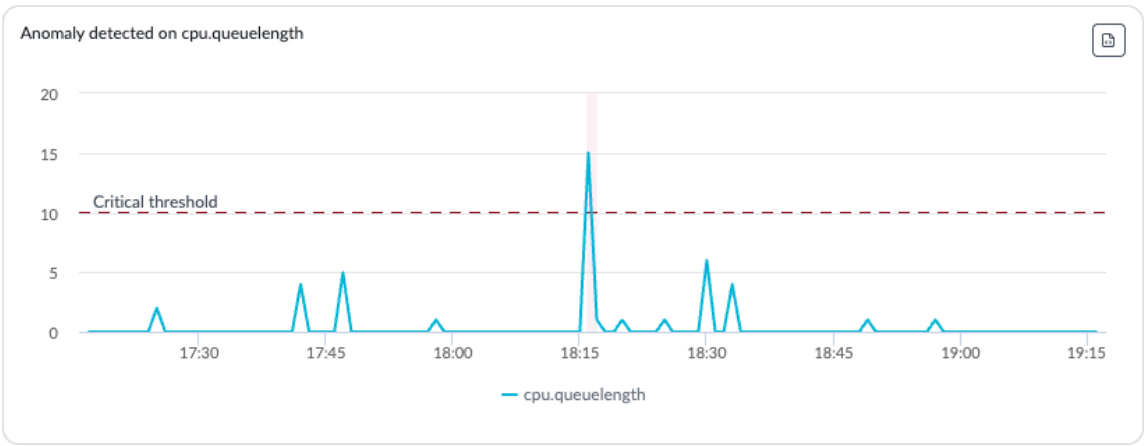
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the Metric Intelligence statistical model is used to detect anomalies, the anomaly alert chart is displayed with upper and lower bounds based on machine learning models.



For more information, see Understanding Metric Intelligence.

- When thresholds are configured by administrators, the static threshold metric anomaly alert chart shows anomalies defined using the configured thresholds.



Note:

The raw data used for the metric chart in the preview panel is available only for seven days. If older alerts are selected and the raw data is no longer available, a chart isn't shown.

For more information, see Create metric rules.

5. **Optional:** Review surrounding metric data by selecting the **Open in Metric explorer** icon ( ) in the information panel.

   (Optional) The **Metric** tab displays the Metric explorer at the time frame of the anomaly. For an open alert, the chart shows on hour before and after the last time of event generation. For a closed alert, the chart shows one hour before and after the first event that created an alert. If there's no data, the chart isn't displayed.

   For more information, see Metric Explorer.

View Log Analytics anomaly alert charts on the preview panel in Express List

View visualizations for Health Log Analytics anomaly alerts on the Express List preview panel, to identify periods of behavior that deviate from expected ranges.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. In the Active alerts list, select the check box for a Log Analytics based alert.
   This option is available only for individual alerts or the underlying individual alerts within a group.
4. On the preview panel, select the Info tab.
   A chart with a visual representation of the anomaly appears.
5. **Optional:** Select the parameter to visualize anomaly data within that time period:
   - **Events per minute** - The default setting, which shows the detected anomaly.
   - **Day ago**
   - **Week ago**
6. **Optional:** Review relevant logs in context by selecting the Open in Surrounding logs icon ( ) in the information panel.
   The **Surrounding logs** tab displays the list of log lines that were generated one minute before and one second after the Log Analytics alert. For more information, see How Health Log Analytics generates alerts.

View data on impacted services on the preview panel in Express List

View extra information on the preview panel about impacted services that are bound to alerts.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. In the **Active Alerts** list, select an alert check box.
4. On the preview panel, open the Info tab.
5. Hover over the Impacted services section to display information icons.

6. Select the relevant icon to display extra information on an impacted service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impacted service information icons

Icon	Name	Description
ⓘ	Info	Displays the severity, the business criticality, and a short description of the impacted service. From this pop-up, you can open the service map in Service Operations Workspace by selecting **View service map**.  The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the service. For more information, see View unified service map and the impact paths in Service Operations Workspace. If metrics data exists for this service, you can open the Metric Explorer from the pop-up by selecting **View related metrics**.
👤	Contact person/group	Displays the name of the owner of the impacted service and the support group assigned to it.

Hide closed alerts in Express List

Choose whether to display the closed alerts in an alert group as well as the open alerts on the preview panel and in Link View.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. In the Active alerts list, select an alert group.

   The preview panel shows the default display:

   - The Alerts tab and Timeline view show only the open alerts. The closed alerts are hidden.
   - Link View shows the attributes of both open and closed alerts.
4. On the relevant tab, change the display.

   On the preview panel, Alerts tab:

   a. Show both the open and the closed alerts by switching the **Hide closed alerts** toggle to the closed position.

   b. (Optional) Sort the displayed alerts by time or by severity by selecting the sort icon ( ) and then choosing the relevant menu item.

Note:
If you switch the toggle or sort the alerts in the Timeline view, the Alerts tab adjusts to reflect your selection.

In Link View: Show only the attributes of open alerts while hiding those of closed alerts by switching the **Hide attributes of closed alerts** toggle to the open position.

View an alert analysis by Now Assist in Express List

View an alert analysis created by Now Assist using generative AI. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note:
Currently, Now Assist for ITOM only analyzes tag-based, CMDB, Log Analytics, Mixed and Network Traffic-based alert groups. For all other alert group types, Now Assist for ITOM only analyzes the parent alert.

Role required: evt_mgmt_operator

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. In the Active alerts list, select the information icon ( ) next to the alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.

> **Note:**
> Alert analyses are provided in English, irrespective of the language used in the alert description.

6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Generating case from an alert

Enable swift resolution by generating cases from alerts, either manually or automatically.

Customer Service Management provides integration with ITOM Event Management. This integration enables you to improve the customer experience by breaking down the silos that exist between the processes and systems used by front line customer service and back-office operations teams. By monitoring issues and creating cases proactively, you can better correlate customer issues and provide faster responses.

If you are using the integration between the Customer Service Management and Event Management applications, you can create a case for the customer install base affected by an alert. For more details, see Manually create a proactive case from an alert. You can also activate an alert rule to automatically create a proactive case from an alert when an incident is created. For more details, see Activate an alert rule to automatically create a proactive case from an alert.

Remove alerts from an alert group in Express List

Remove secondary alerts from an alert group directly from the Express List pane or from the preview panel.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

> **Note:**
> The evt_mgmt_user role is view-only and does not have permission to perform this action.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Remove a secondary alert from an alert group.
   You can remove alerts from a group regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Viewing links between alerts in alert groups in Express List

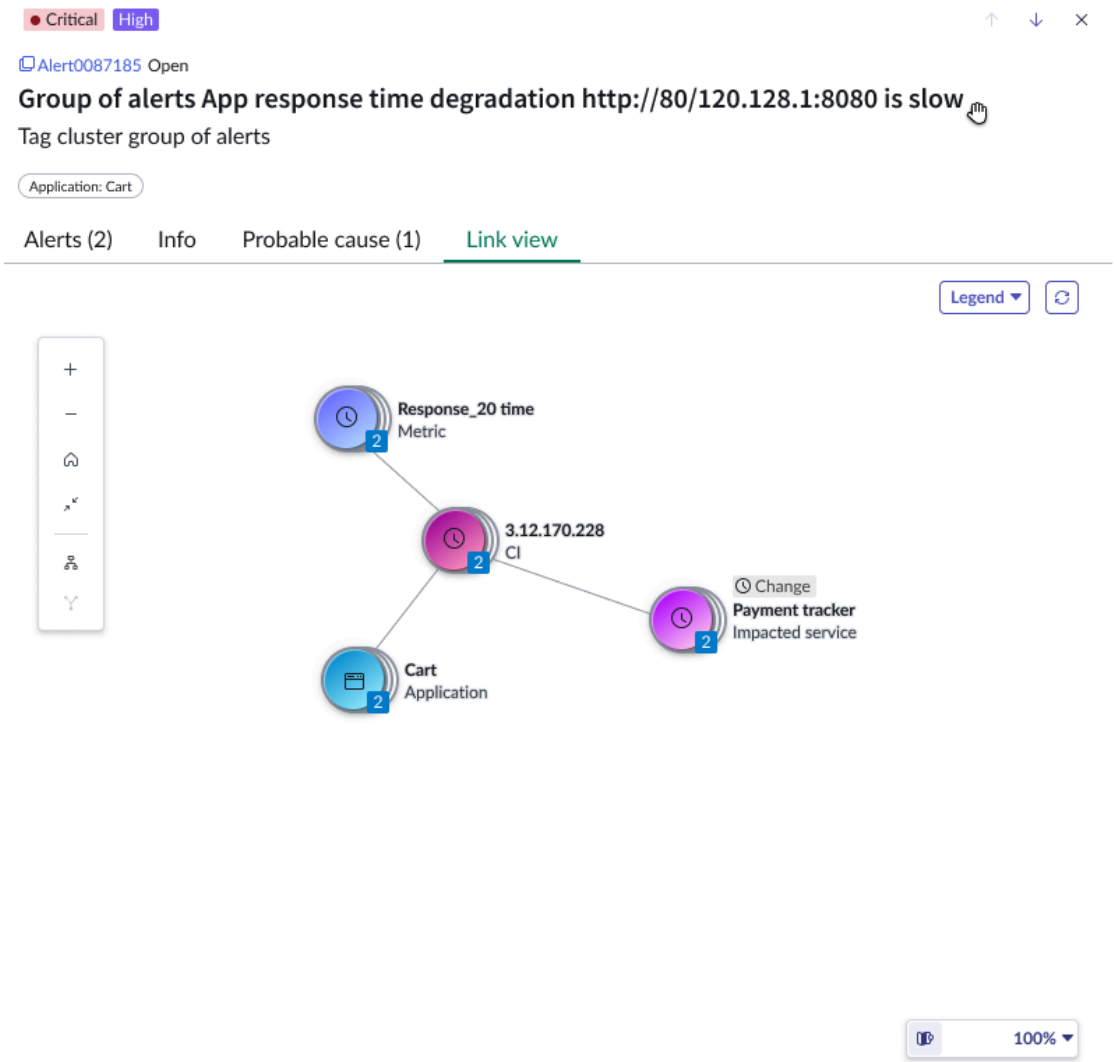
Gain a better understanding of the relationships between alerts in alert groups in the Express List by using Link View. Link View offers a visual representation of the relationships between the alerts in a group.

When Event Management generates an alert group, Link View shows how the attributes of the alerts in the group are linked. The colored tags represent configuration items (CIs) and other environment items in relation to the alerts.

The information shown in Link View is available without the need for a populated Configuration Management Database (CMDB). However, when the CMDB is populated, Link View offers additional value by providing the probable cause of the alerts and the service that the alert group impacts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample alert group in Link View



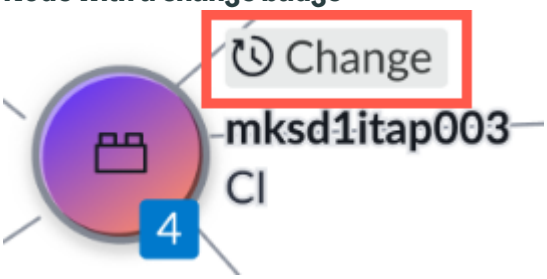
You can focus on your areas of interest by dragging the nodes in Link View to different positions. When you refresh an alert group, rearranged nodes appear in their original position again. Therefore, Link View is not refreshed automatically, but waits for you to do so manually.

If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service, enabling you to view it at a glance for quick triage.

A stacked node indicates that multiple nodes were mapped for the same tag. When the same key-value pair appears in more than one alert, the corresponding node is shown with a badge. For example, when the same key-value pair appears in two alerts, the badge on the node shows the number 2, as seen on the Payment tracker node in the sample alert group figure. When a node has no badge, the key-value pair appears in only one alert. An active change request, a probable cause of the alert, is marked by a Change badge.

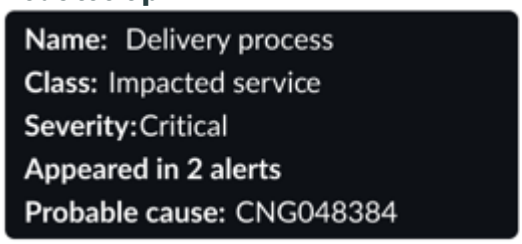
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node with a change badge



The Link View legend lists the meaning of the symbols and colors used and enables you to toggle between hiding and showing types of tags to reduce noise. In addition, the legend describes the meaning of the various lines linking the alert attributes. Attributes linked by a solid line share one or more alerts, whereas attributes linked by a dotted line are correlated by grouping criteria. For a description of each tag, see Attributes in Express List Link View. Hovering over a node displays a tooltip that includes the name of the tag, its class, its severity, the number of alerts in which it appeared, and whether the alert is primary or secondary or the probable cause of the alert, if applicable.

Node tooltip



Currently, Link View is supported for several alert groups. For more information, see the following topics:

- Viewing links between alerts in tag-based alert groups
- Viewing links between alerts in rules-based alert groups
- Viewing links between alerts in CMDB-based alert groups
- Viewing links between alerts in network traffic-based alert groups
- Viewing links between alerts in log analytics-based alert groups
- Viewing links between alerts in mixed alert groups

Related topics

View links between alerts in a group in Express List

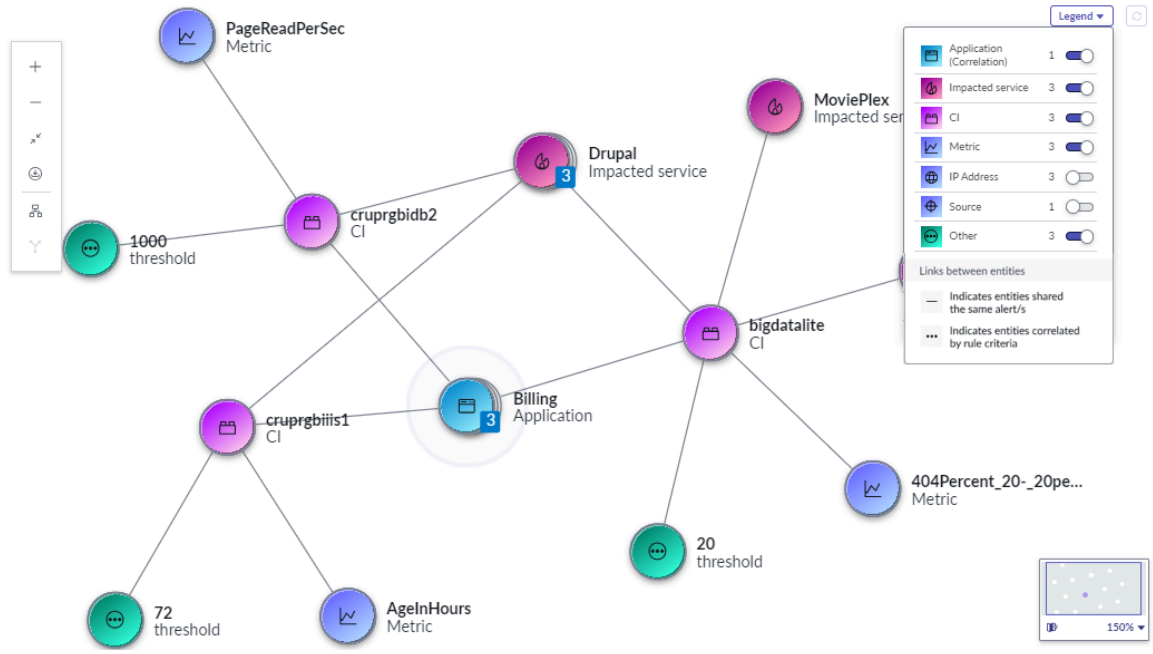
Viewing links between alerts in tag-based alert groups

View the connections between alerts in a tag-based alert group in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

When you've set alert tags and Event Management has generated an alert group based on tag-based rules, Link View offers a visual representation of the relationships between the alerts in the group. The colored tags in the view represent Configuration Items (CIs) and other environment items in relation to the alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample tag-based alert group in Link View



In this example, the defining tag for the correlation, Application, is linked to the tags of the relevant CIs. However, a correlation can be defined by any tag or combination of two tags, such as Resource and Metric name. When the defining tag is missing from Link View, the correlation was based on information that is not represented in the view, such as the description. Each CI node is further linked to the tags that appeared on the same alert as that CI.

In an alert group that was generated from tag rules, nodes connected by a dashed line signify an approximate, "fuzzy" match. This means that the nodes were correlated when the match on the tag rule was not exact, but close enough to be significant. For example, this could happen when a location, email address, or IP pattern was similar enough to qualify as a match.

The Link View legend lists the meaning of the symbols and colors used to represent the tags and their number of unique nodes. In the legend, defining tags are marked as Correlation. You can toggle between hiding and showing tag types to reduce noise. For a description of each tag, see Attributes in Express List Link View.

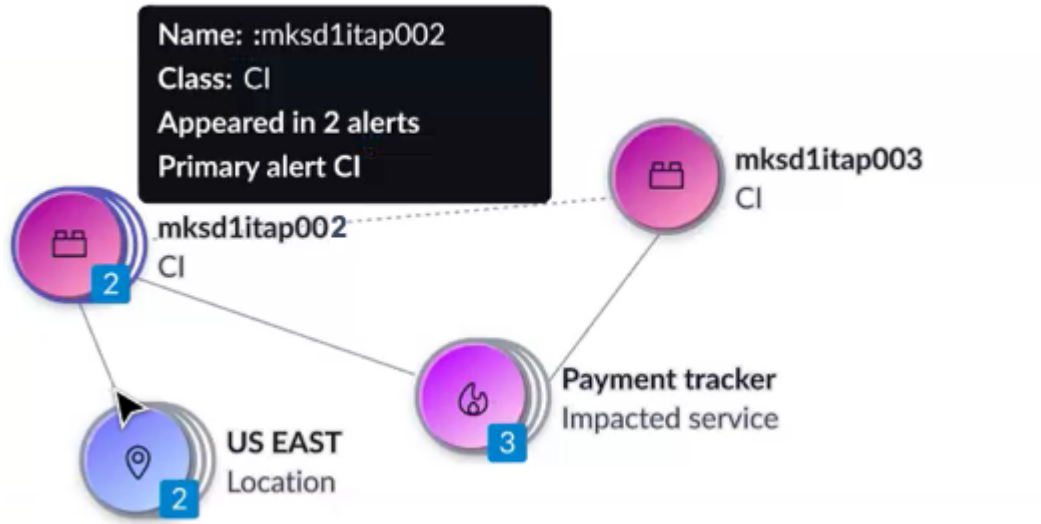
Viewing links between alerts in rules-based alert groups

View the connections between alerts in a rules-based alert group in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

When you've set alert rules and Event Management has generated an alert group based on these rules, Link View offers a visual representation of the relationships between the alerts in the group. The colored tags in the view represent Configuration Items (CIs) and other environment items in relation to the alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample rules-based alert group in Link View



Rules-based alert groups are comprised of a primary alert and one or more secondary alerts. The primary alert is generated directly and is represented in Link View as the Home node. Secondary alert nodes are connected to the Home node by a dashed line, indicating that they don't share the same alert, but are correlated using rule criteria. A solid line between nodes indicates that the connected nodes share the same alert or multiple alerts.

If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service, enabling you to view it at a glance for quick triage. Hovering over a node displays a tooltip that includes the name of the tag, its type, the number of alerts in which it appeared, and whether it is a primary or secondary alert.

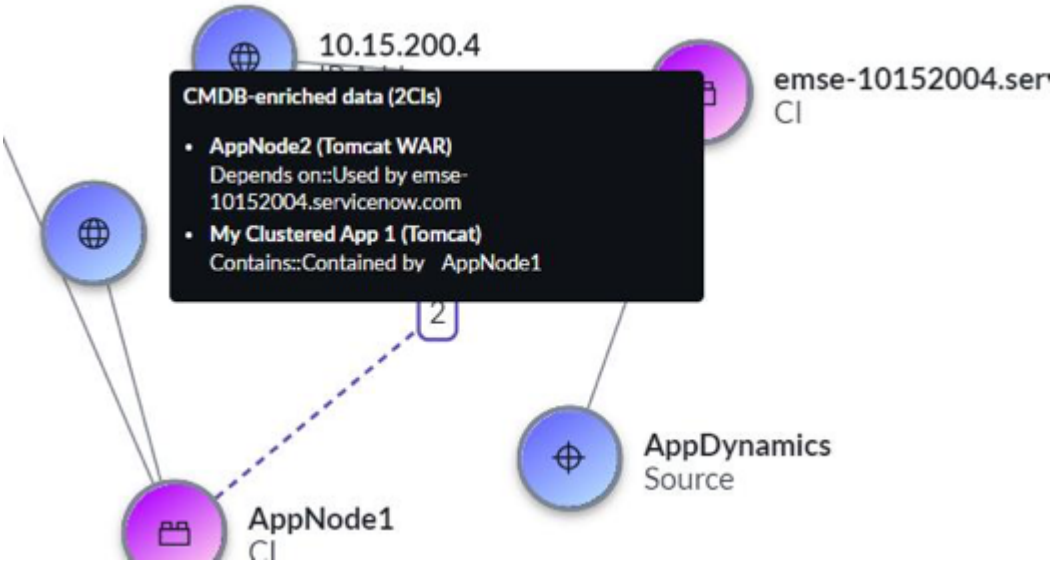
Viewing links between alerts in CMDB-based alert groups

View the connections between alerts in alert groups in Express List that were created based on the proximity of Configuration Items (CIs) in the Configuration Management Database (CMDB). Link View shows how the attributes of the alerts in the group are linked with each other.

When alerts on CIs that are located near each other in the CMDB topology occur within a certain time-frame, Event Management generates a CMDB-based alert group. Event Management correlates CIs in a service map when they are separated by a maximum of three other CIs. The colored tags in Link View offer a visual representation of the CIs and other environment items in relation to the alerts in the group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample CMDB-based alert group in Link View



In this sample Link View of a CMDB-based alert group, the dashed line with the number 2 between the CIs indicates that the CIs are not connected directly, but are separated by two CIs in the service map in the CMDB topology. The sample CMDB service map also shows correlated CIs separated by two CIs.

Sample service map with correlated CIs

Viewing links between alerts in log analytics-based alert groups

Use Link View in Express List to see why alerts in a log analytics-based alert group are correlated together through the visualization of shared attributes.

Link View for log analytics-based alert groups shows the connections between component-based alerts. Each component-based alert may involve multiple host configuration items (CIs). A component represents a logical part of a service instance where the alert was detected. Components can consist of multiple CIs that perform the same function, such as multiple redundant hosts. For more information, see Types of Health Log Analytics alerts.

The colored tags in the link view represent attributes of the alerts such as hosts, users, or correlation indicators extracted from the logs. The lines connect attributes that share the same alert. This visualization helps you understand the relationships between different alerts in the group using their shared attributes.

Log analytics-based groups often contain multiple correlation attributes within a single group. Link View enables you to explore why anomalies detected on different components were correlated into one group. By manipulating the attribute display, you can better understand the relationships between alerts that share common attributes.

- **Tag Cluster**
- **Rules-based**
- **CMDB**
- **Network Traffic**

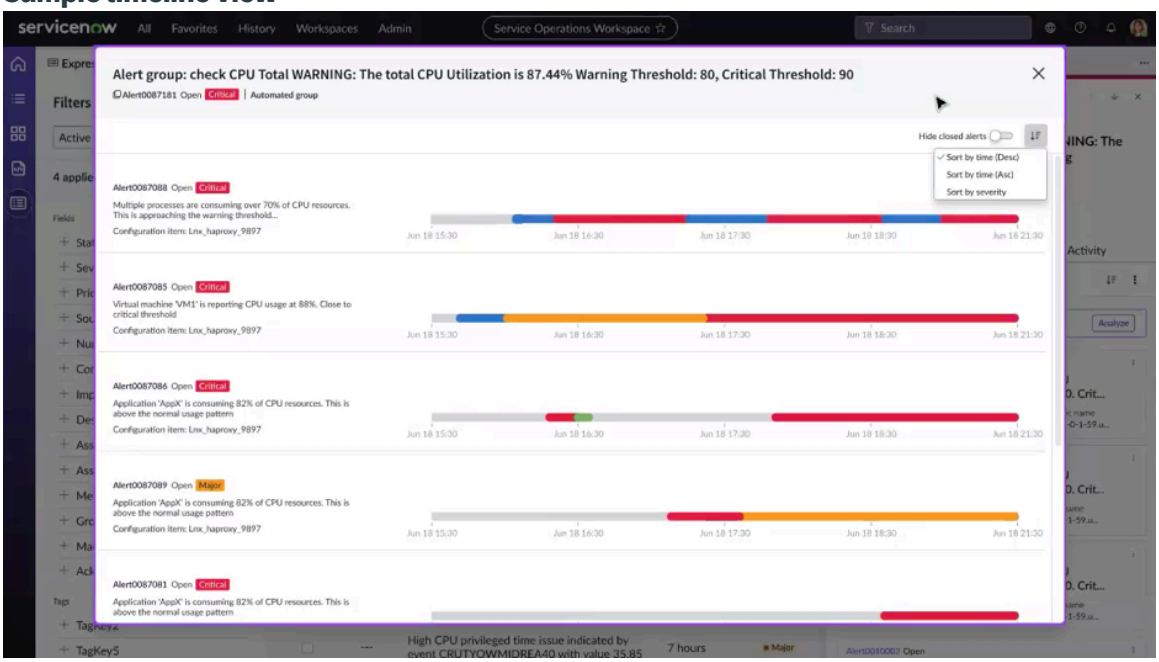
4. In the **Active alerts** list, select the description of an alert group.
   The preview panel opens to the **Alerts in group** tab, which lists all the correlated alerts in the selected group.
5. Navigate to **Link View**.
6. View the relationships between all the alerts in the selected group.
7. **Optional:** Perform the following optional tasks.

Exploring chronological data on the alerts in an alert group in Express List

Visualize the chronological sequence of events within an alert group in Express List using the Timeline view. This feature provides a comprehensive overview of when the alerts occurred, their severity changes, and other pertinent data for efficient triage and Mean Time to Resolution (MTTR).

In Timeline view, each alert is represented by a bar, enabling you to quickly discern the order of occurrence, severity transitions, and closure status. The timeline begins with the creation of the first alert and extends to the present moment.

Sample timeline view



Standard severity colors are used in the bars, with gray segments indicating periods before alert creation or after its closure. Hovering over a severity bar reveals a tooltip with key alert details.

Severity range by color in Timeline view

Color	Severity
	Critical

Severity range by color in Timeline view (continued)

Color	Severity
	Major
	Minor
	Warning
	OK

The title of the Timeline view for an alert group summarizes the group's description, number, state, severity, and grouping type, derived from the primary alert. Detailed information including alert number, state, severity, a brief description, and associated Configuration Item (CI) or node, when available, is displayed for each alert within the group.

Related topics

View a timeline of the alerts in an alert group

View a timeline of the alerts in an alert group

Gain insight into the sequence of events relating to an issue by viewing chronological information of the alerts in an alert group in Express List.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the Active alerts list, select the information icon (for an alert.
4. On the preview panel Alerts tab, select **Timeline view**.
5. Analyze the information provided in the Timeline view.
6. **Optional:** Sort the displayed alerts by ascending or descending time or by severity.
   a. Select the sorting icon ( ).
   b. Select the preferred sorting option from the pop-up menu.
7. **Optional:** Show or hide closed alerts by toggling the **Hide closed alerts** slider.

Exploring chronological data on the alerts in an alert group in Express List

Find alert records in Express List using free-text search

Perform a free-text search for alert records in a filtered list of alerts.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Event Management searches through the alerts that you're currently seeing in the Express List based on the filters and time range you have set. It searches in the following predefined fields, even if they aren't visible: Metric name, Node, Alert number, Alert Tags, and Description. It treats the text that you enter as a single string, not individual words.

The results match both the filters that you have applied and the string you have entered in the search field. In the resulting alert records, the entire string you searched by appears highlighted, and the available filters show the number of records that match the string. Recent searches are saved and accessible from the search field.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. In the Search field, enter the free text to search by.
   The free-text string must be from 3 through 50 characters long. The search isn't case-sensitive.
4. Select the check icon or press **Enter** to perform the search.

Run actions to resolve alert issues in Service Operations Workspace for ITOM

Resolve the underlying issue of an alert by running predefined remediation tasks, ensuring faster issue resolution and ensuring consistent resolution.

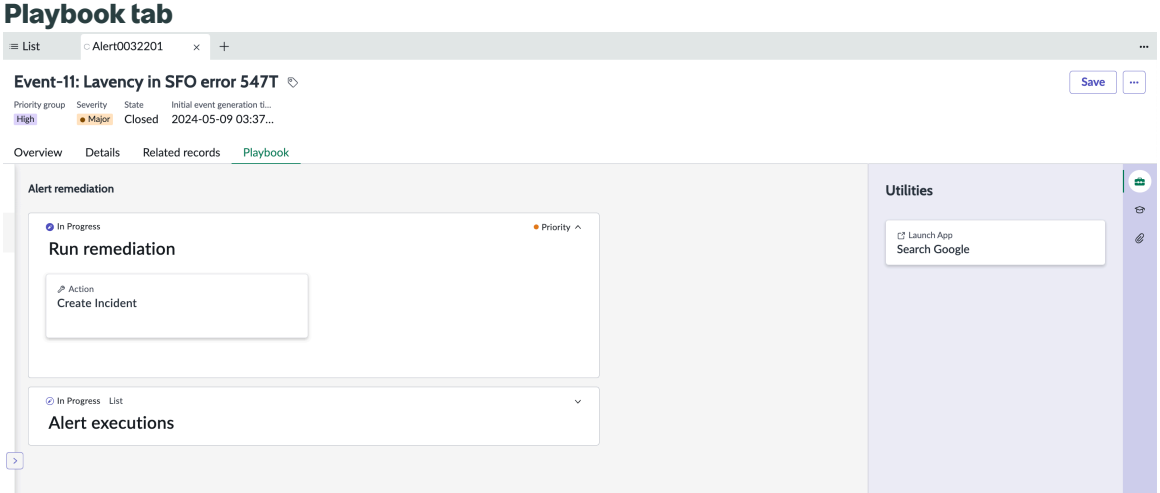
Before you begin

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. Select **Launch playbook**.
5. Select the **Playbook** tab.
   The **Run remediation** card displays the available remediation actions.

Playbook tab



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the tile corresponding to the action you want to run.
   The selected action appears on the **Alert executions** card.

Result

When the action is complete, it appears in the **Completed** card underneath the Alert remediation section.

Launch a web application for an alert in Service Operations Workspace for ITOM

Launch a web application that was configured in an alert management rule to quickly access necessary tools, improving response times and efficiency.

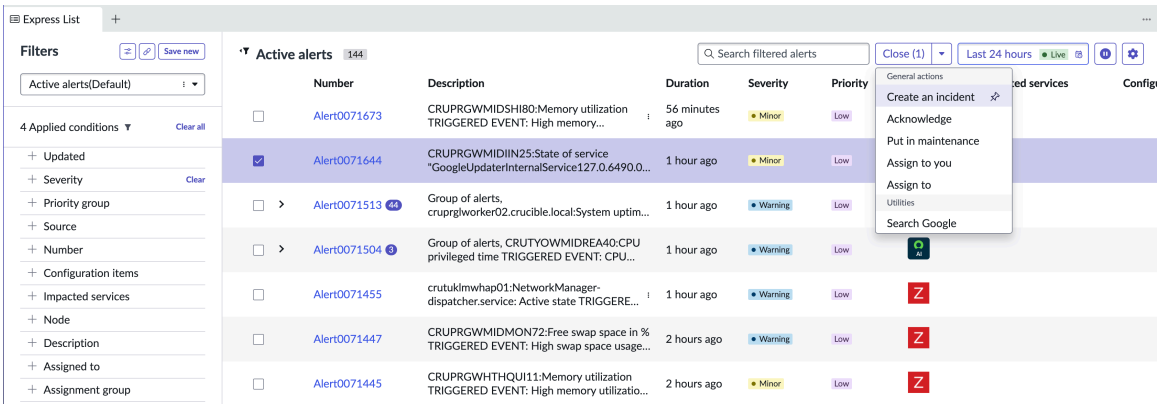
Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Select the alert number to open it.

   The alert opens in a separate tab, displaying the **Overview** subtab. In the right panel, the **Utilities** tab is selected by default.



4. In the Utilities section, select the web application to launch the app.

Filtering the alert display in the Express List pane

Filters help you create different views of categorized alerts, creating a targeted list of alerts to prioritize and focus on, saving time and minimizing distractions.

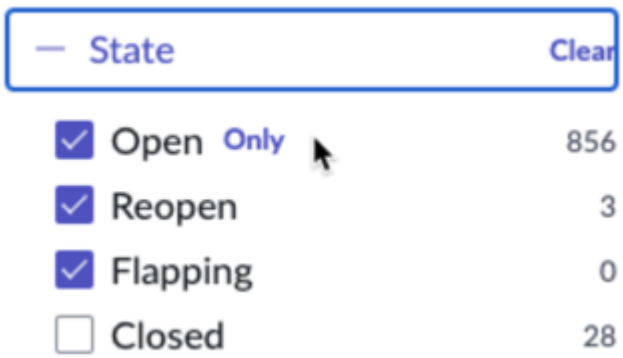
The fields in the interactive filter panel on the left side enable you to create different views on the Express List pane. The default filters are:

- State
- Severity
- Priority
- Source
- Number
- Configuration item
- Number of impacted services

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Node
- Description
- Assigned to
- Assignment group
- Metric name
- Group
- Maintenance

You can interactively view what happens if you add or remove any of the fields. The numbers next to each attribute indicate the number of alerts that are returned.



In the Express List filter panel, you can perform the following actions:

- Add filters to or remove filters from the default filter list to focus on the applied filters. The most common filters are State, Priority, CI, and Impacted services.
- Add or remove alert tags. Tags enable you to easily identify and group alerts without the need for discovery or accessing the CMDB.
- Filter by string, number, or date attributes.
- Save, delete, assign as the default, or share the filter layout.
- Filter out or show alerts that match a selected alert.

Filter the Express List display using attributes

Filter the Express List display by text, number, and date attributes using the interactive Express List filter panel. Create a targeted list of alerts to prioritize and focus on.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. From the Filters panel on the left side, select whether to filter to text, number, or date attributes depending on your filter type.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter the Express List display by adding or removing fields

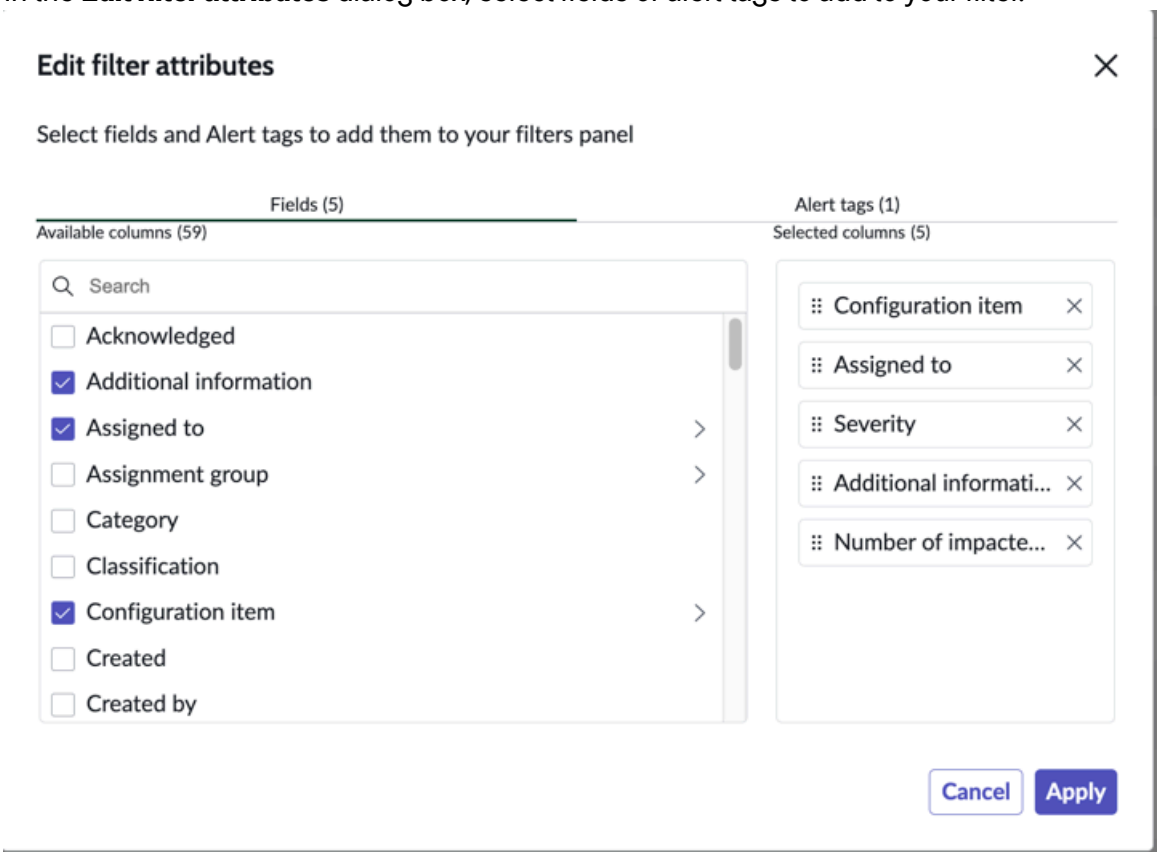
Add fields to or remove fields from the Express List pane filter using the interactive filter panel. Use filtering to create different views of categorized alerts.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the Edit filter attributes icon ( ).
4. In the **Edit filter attributes** dialog box, select fields or alert tags to add to your filter.



The **Fields** tab is displayed by default and displays the number of selected fields.

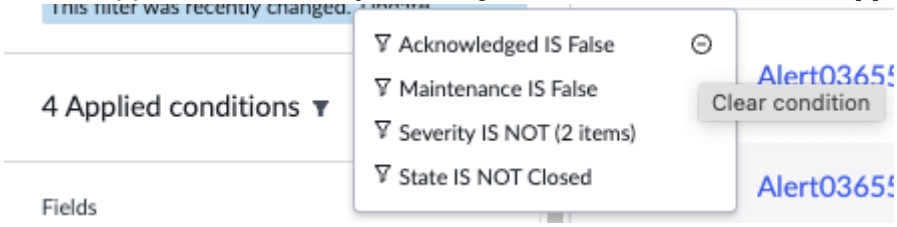
The number of available fields is displayed at the top of the column next to **Available columns**.

The selected fields are displayed in the right column. The number of selected columns are displayed at the top of the column next to **Selected columns**.

5. **Optional:** Find a specific field by entering its name in the **Search** field.
6. **Optional:** Rearrange the order of the selected columns by dragging them up or down in the right column.
7. **Optional:** Remove a column by selecting the **X** next to its name.
8. Select **Apply**.
9. **Optional:** Clear a filter by selecting **Clear** next to that filter name.
   Clear appears only if you selected or cleared any of the attribute check boxes of the selected filter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Optional:** View the applied conditions by selecting the Filter icon ( ) next to **Applied conditions**.



11. **Optional:** Remove a condition by selecting the **Clear condition**( ) icon.

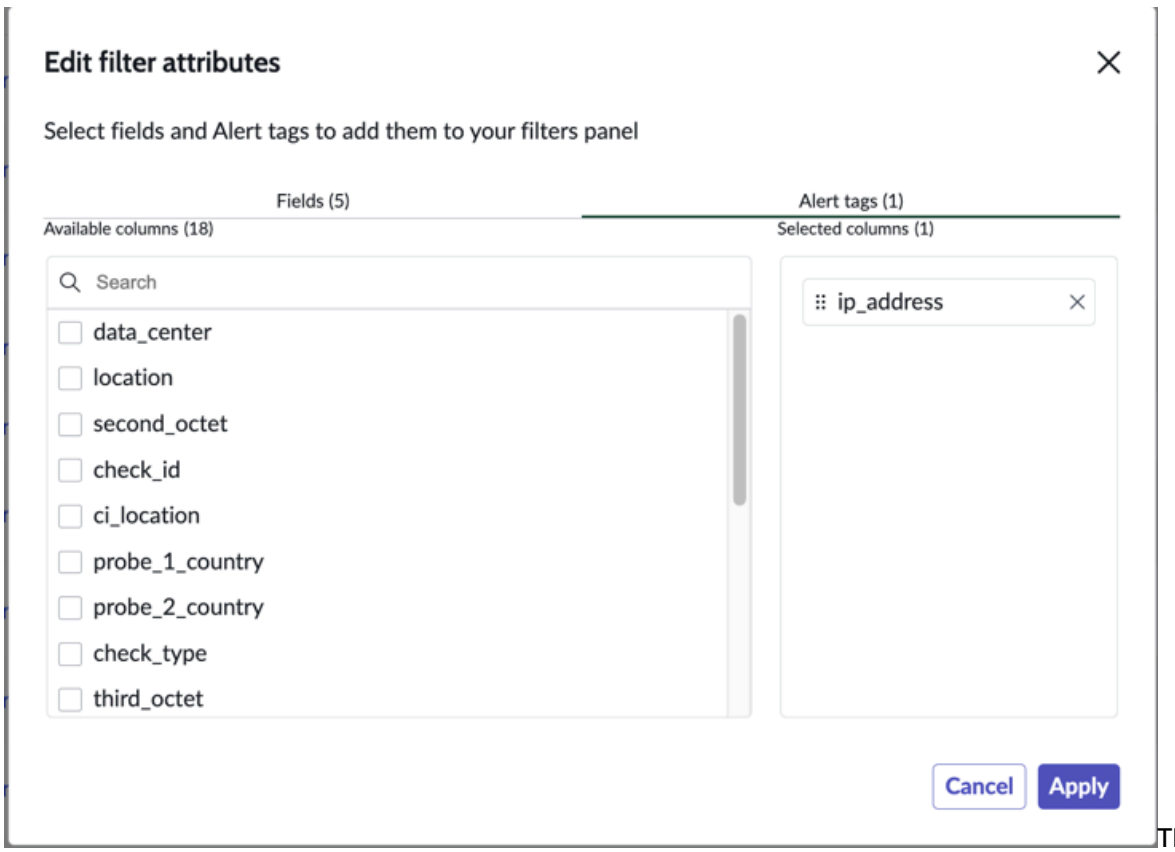
Result
All the selected fields are displayed in the **Filters** panel in the **Fields** column.

Categorize alerts displayed in Express List

Create different views of alerts by adding tags in Express List to enable you to easily identify and group alerts without the need for discovery or accessing the CMDB.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the **Edit filter attributes** icon ( ).
4. In the **Edit filter attributes** dialog box, select the **Alert tags** tab.



The **Alert tags** tab title displays the number of selected alert tags.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The left column displays the number of available tags in the **Available columns** column title.

The selected tags are displayed in the right column. The number of selected tags is displayed in the **Selected columns** column title.

5. **Optional:** Find a specific tag by entering its name in the **Search** field.
6. **Optional:** Rearrange the selected tags by dragging them up or down in the right column.
7. **Optional:** Deselect a tag by selecting the (**X**) next to it.
8. Select **Apply**.

Result
All the selected tags are displayed in the **Filters** pane under the **Alert tags** tab.

Filter out or show matching alerts

Create different views of categorized alerts in Express List by either displaying or filtering out alerts that match a selected alert.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Right-click an alert row.
4. Match or filter out matching alerts.
   - Display matching alerts by selecting **Show Matching** from the context menu.
   - Filter out matching alerts by selecting **Filter Out** from the context menu.

Save a custom filter in Express List

Save your custom view of categorized alerts in Express List to use again, share, or set as your default view. Saving your custom view saves all filters, tags, and conditions.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Once you have set up a filter that you want to reuse, set as your default view, or share with others, save the filter.
   For more information about filtering the Express List alert display, see the following topics:
   - Filter the Express List display using attributes
   - Filter the Express List display by adding or removing fields
   - Filter out or show matching alerts

   a. In the Express List select **Save new**.

   b. In the **Save new filter** dialog box in the **Filter name** field, enter a name for the filter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. **Optional:** Make this filter your default filter by selecting **Set as default**.

d. Select **Save** to save the filter.

4. **Optional:** Share a saved filter by copying its link to send to others.

a. In the **Filters** panel, select the filter from the drop-down list.

b. Select the Copy link to clipboard icon ( ).

5. **Optional:** Set a saved filter as your default filter.

a. In the **Filters** panel, select the filter from the drop-down list.

b. Select the More Actions icon ( ) and select **Set as default**.

6. **Optional:** Delete a saved filter.

a. In the **Filters** panel, select the filter from the drop-down list.

b. Select the More Actions icon ( ) and select **Delete filter**.

Viewing an alert group analysis by Now Assist in Express List

View an analysis of alert groups in Express List, generated by Now Assist using AI. The analysis helps you better understand the nature of the alert group, why the alerts in the group were correlated, and how to proceed in the remediation process.

The AI-driven alert group analysis offers a simplified, human-readable description of the group and technical information to help you investigate it more efficiently. The information provided is based on descriptions and Configuration Item (CI) details relating to the individual alerts in the group. Alert group analysis is supported for the following alert group types:

Tag-based alert groups

Tags help categorize alerts based on common attributes, such as impacted systems or services. Alerts in tag-based alert groups share certain tags, indicating similarities in the issues. The alert analysis for these groups presents the shared tags that were used to correlate the alerts in the group. It also provides insights into why these alerts were grouped. In addition, the analysis offers suggestions for a course of action based on the similarities between the tags.

CMDB alert groups

When an alert is created on a CI in the Configuration Management Database (CMDB), Event Management looks for alerts on other CIs that are closely related to it in the CMDB topology. A close topological relationship between CIs suggests an interdependence between components in the IT infrastructure and contributes to alert correlation. When a relationship between CIs is found, a CMDB alert group is formed. The alert analysis for CMDB alert groups explains the nature of the group and why it was formed, and the relationships between the CIs. It also provides technical information to help you decide on which alerts to concentrate your investigation.

Log Analytics alert groups

When Event Management identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. The system generates a Log Analytics group when the Log Analytics alerts share one or more relationships related to time, metadata, message text, and trend. The alert analysis for Log Analytics alert groups is based on the analysis of anomaly information provided by Health Log Analytics, and on the descriptions, CIs, and tags of the alerts in the group.

Network Traffic-based alert groups

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Network Traffic-based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group the alerts. Alert analysis for network traffic-based alert groups gives a description for all the alerts in the group and the connections between them.

Mixed alert groups

The Mixed grouping method combines alerts using multiple grouping strategies, such as those used in CMDB alert groups and tag-based groups, in a single, cohesive group. This method leverages the strengths of each strategy to reduce alert noise, improve alert correlation, and highlight the true root cause of incidents.

View an alert group analysis by Now Assist in Express List

View an alert group analysis created by Now Assist using generative AI. The analysis offers a simplified, human-readable description of the alert group and technical information to help you investigate it more efficiently.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note:
Currently, Now Assist for ITOM only analyzes tag-based, CMDB, Log Analytics, Mixed, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) next to an alert group to display the preview panel.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.

Note:
Alert analyses are provided in English, irrespective of the language used in the alert descriptions.

6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.

	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Related topics

Viewing an alert group analysis by Now Assist in Express List

Update an alert description in Express List based on a Now Assist analysis summary

Update alert descriptions in alert groups or single alerts in Express List, to a human-readable summary generated by Now Assist.

About this task

Updating the alert description is available for the alert types:

- Tag-based alert group.
- CMDB correlation alert group.
- Network Traffic correlation alert group.
- Log Analytics single alerts and alert groups.
- Mixed alert group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) of an alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. Review the human-readable, AI-generated summary in the Alert analysis.

   Note:
   Alert analysis is provided in English, irrespective of the language used in the alert description.

6. On the preview panel **Info** tab, select **Update description** to update the description based on the summary content of the alert group.
   The AI-generated summary content replaces the original description of the alert group.

Roles used by Express List

Detailed information on all roles that can access the Express List feature on the Service Operations Workspace.

Role title	Description	Contains roles
Event Management Integrator [evt_mgmt_integration]	Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.	

Dependency View maps

Explore the Dependency Views in Express List and the Event Management Alert form.

Dependency View maps are visual tools that illustrate the relationships between configuration items (CIs), helping you understand how different components are connected. These maps rely on the Configuration Management Database (CMDB) as a foundational data source, which stores detailed information about each CI and their interdependencies. By leveraging the CMDB, dependency maps provide a comprehensive view of the IT environment, enabling better impact analysis and decision-making in IT operations.

View data on configuration items on the preview panel in Express List

View additional details about configuration items (CIs) that are bound to alerts on the Express List preview panel.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. In the **Active Alerts** list, select an alert check box.
4. On the preview panel, select the **Info** tab to view it.
5. Hover over the Configuration item name to display information icons.

6. Display additional information on a CI by selecting the relevant icon.

Configuration item information icons

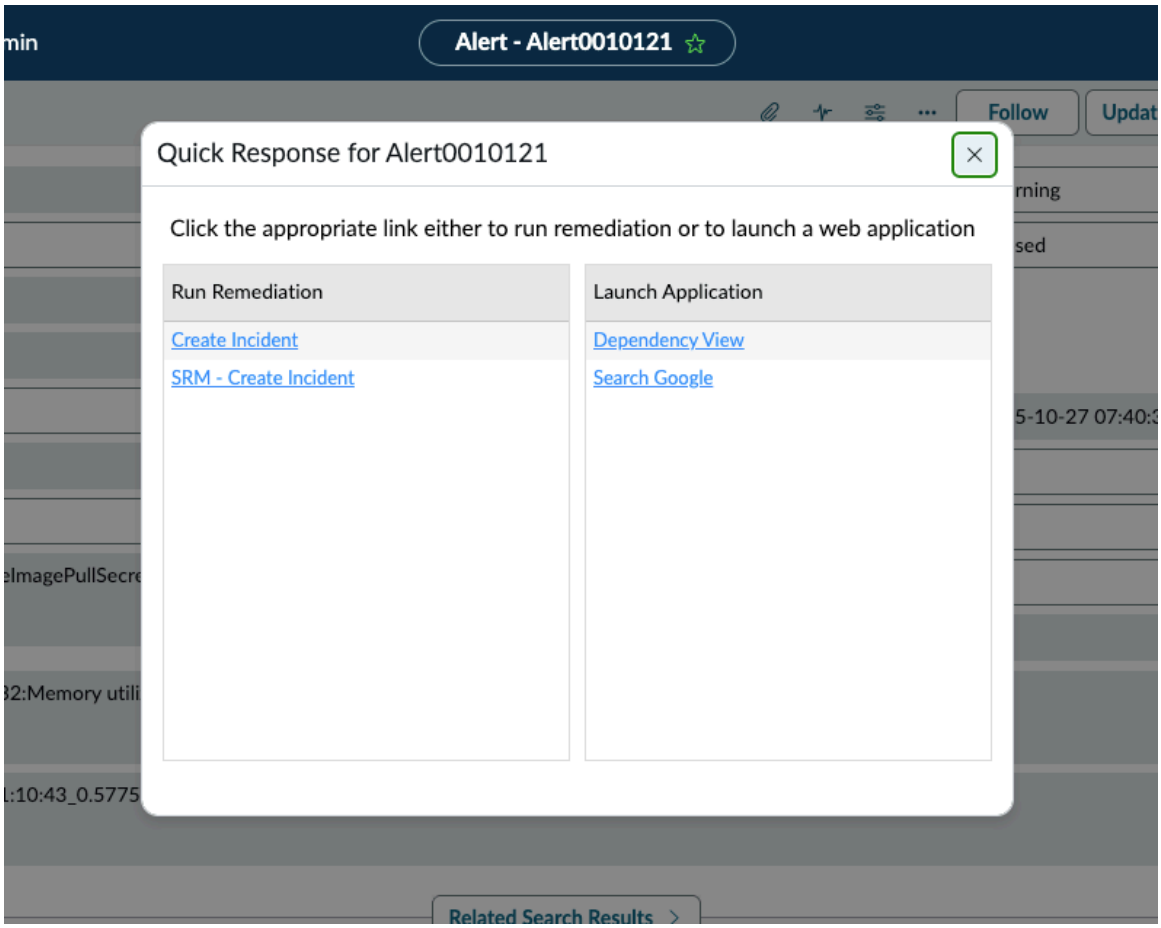
The **Quick Response** menu opens.



4. Under **Launch Application**, select **Dependency View**.
   The map opens in Service Operations Workspace.

Alert automation in Service Operations Workspace for ITOM

Alert automation is crucial as organizations deal with increasing number of alerts and complex IT infrastructures. Manual alert handling is slow, error-prone and inefficient, underscoring the need for automated systems. Automation can improve the mean time to resolve alerts, improve service reliability and better scale staff resources.

Alert automations also support both centralized administrator and distributed team roles. This enables qualified teams to self-serve and create their own alert automations. For example, you may consider granting access to site reliability engineers (SREs). Members of teams can manage automations for their own team and their own alerts without impacting other teams.

For users familiar with our classic experience, alert automation offers an easier user interface and better team support for event rules, tag-based clustering definitions and alert management rules. Some advanced features are currently only available to admins in the classic experience. These two experiences use the same backend tables. You can use whichever experience is most convenient, and changes in one will also update the other.

Alert automation types

Currently, Service Operations Workspace ITOM provides the following types of automation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ignore automation: Reduce irrelevant or false-positive alerts, efficiently manage alert fatigue by filtering out noisy notifications, and allow teams to focus on critical issues.
2. Enrich automation: Enhance raw alerts with contextual information to make them more informative and actionable. In simple terms, this involves taking the raw events generated by monitoring tools and transforming them into a common and standard format to aid automated grouping and response.
3. Group automation: Group multiple related alerts into a single primary alert to reduce alert noise and identify the root cause.
4. Respond automation: Respond to alerts automatically by notifying appropriate stakeholders, escalate them as needed or run remediation actions. Determine how and when alerts are escalated based on severity or type. Integrate with third party systems to create cases, notifications or run remediation actions.

Alert automation process flow

You may start by sending alerts or events from monitoring systems to ServiceNow using the Integrations Launchpad. This is where administrators establish connections between ServiceNow and monitoring tools. These integrations enable the collection of monitored data, generating events from third-party sources.

When alerts are received by ServiceNow, alert automations run in the order shown on the page. First, we ignore alerts to reduce noise. Next, we enrich alerts with extra context, then group the alerts using the added context. Finally, we respond to alerts by escalating or running remediations. There can be several automations for each type. Each automation runs based on specific trigger conditions and executes specific actions. Alerts are only automated when they are received; we do not apply automations to past alerts.

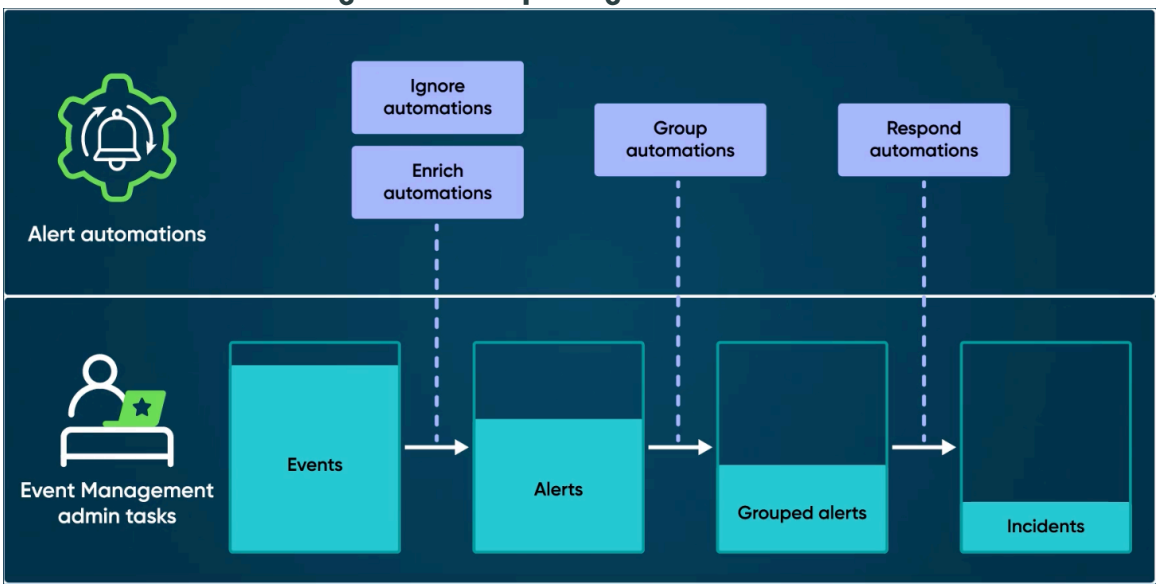
In the alert enrichment phase, administrators add or extract necessary fields from alerts to provide essential information for swift resolution. This ensures that alerts contain all relevant details required for effective incident response. Administrators add context to alerts by modifying and normalizing them. This enhances the correlation of alerts, making it easier to identify patterns and potential threats.

The enriched and composed alerts are then grouped based on predefined criteria, consolidating related alerts. This reduces alert fatigue and facilitates efficient remediation. Finally, escalated alerts trigger notifications to stakeholders through various channels, ensuring timely communication and response to critical alerts.

The following diagram illustrates this process flow.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert automation: Reducing noise and improving resolution time



This comprehensive alert automation process can reduce alert noise, improve mean time to resolution (MTTR), enhance service reliability, and boost staff productivity.

Create Ignore automation

Ignore automation streamlines the process of disregarding irrelevant or false-positive alerts from monitoring systems, efficiently managing alert fatigue by filtering out unnecessary notifications. This allows teams to focus on critical issues.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

Ignore automations filter out alerts from source monitoring systems that match specific conditions. Separately, Event Management ignores alerts that have a duplicated message key field or where the severity is **Clear**.

For users familiar with the classic Event Management experience, ignore automations provide a simpler interface with enhanced team support for the event filter section of event rules.

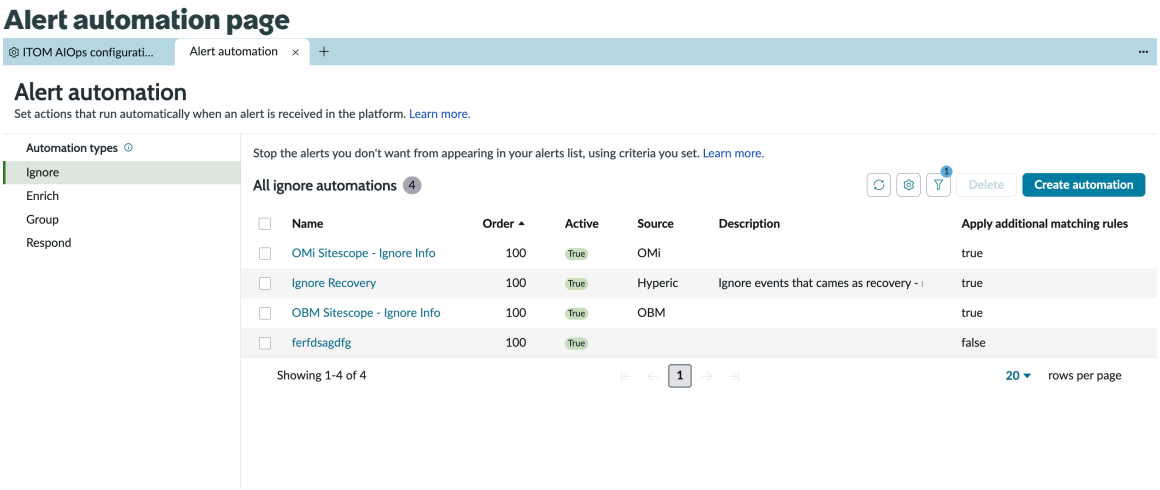
Note:
Ignoring alerts before enriching them improves performance and simplifies the processing flow. The condition filter in ignore automations applies only to the original event, not the enriched one. Enrich automations can prevent ignore automations from running when **Don't run other enrich alert automations** is set to false, they apply to the same source, have a lower order, and match the filter conditions. To avoid conflicts, it is best to consider this when creating enrichments or event rules.

Procedure

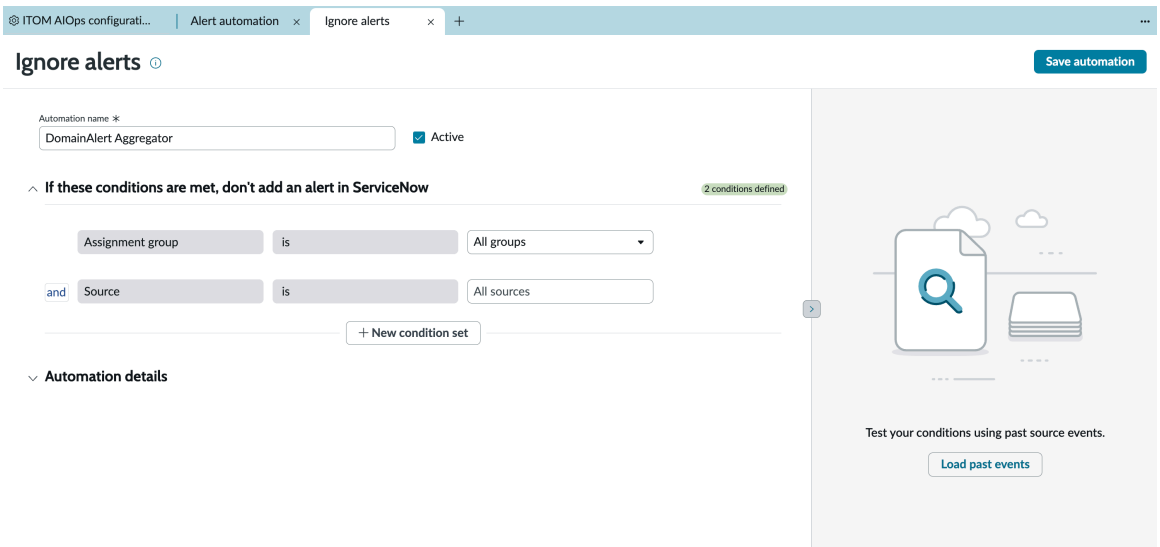
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Ignore alerts**

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Ignore alerts page is displayed.



4. Select **Create automation**.



5. In the **Automation name** field, enter the name of the automation for ignoring alerts.
6. Activate the automation by enabling the **Active** toggle switch.
7. In the **If these conditions are met, don't add an alert in ServiceNow** section, set up filter criteria to identify the events you want to capture.
   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

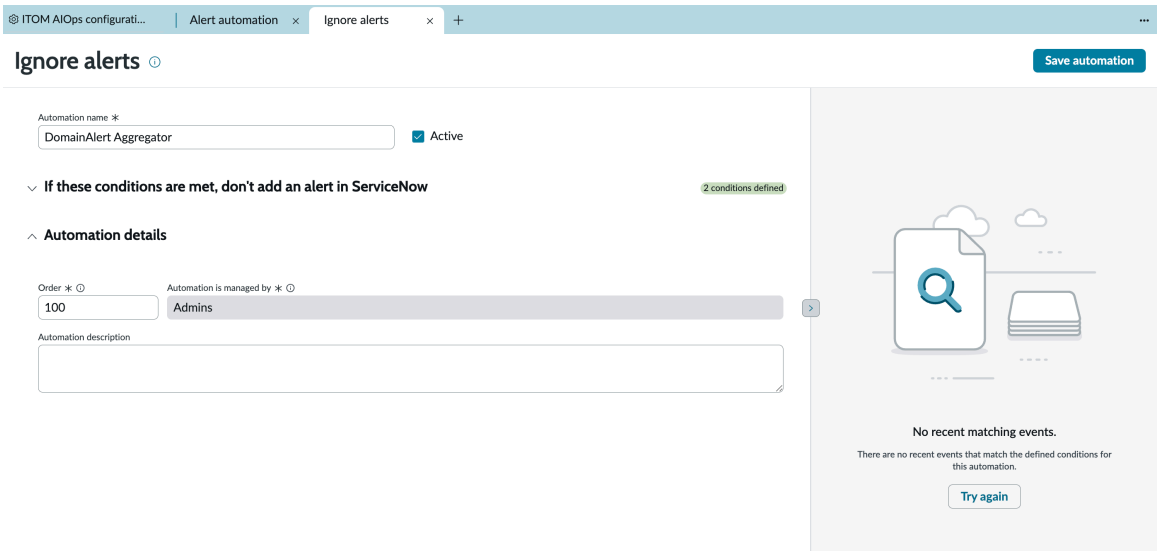
b. From the **Source** field menu, select the monitoring tool from where the alert is generated.

c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

8. To verify that you are ignoring the correct events or to see examples of fields that can be used to set the conditions, select **Load past events**.
You can preview the details of some past events.

9. In the **Automation details** section, provide an order and automation description.



a. In the **Order** field, enter the automation order.

Note:
Automations run in order from the lowest to the highest.

The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The ignore automation that you created appears on the **Ignore alerts** page where you can view, edit, or delete the existing automation.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

You can transform raw events into an understandable format by creating Create Enrich automation.

Create Enrich automation

Alert enrichment involves transforming raw events from monitoring tools into a standard format, aiding automated grouping and response. This includes extracting fields from lengthy alert payloads or composing them into a standardized format. Additionally, you can create tags, which are metadata added to alerts for easier filtering and grouping.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

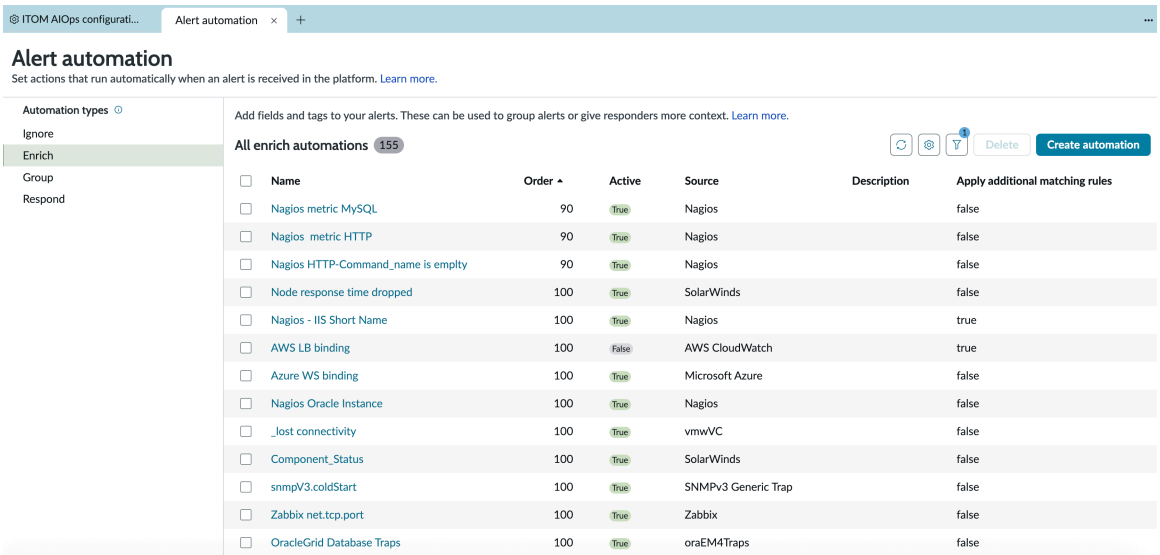
About this task

Extracting takes values from event payload fields and places them in alert output fields, while composing combines multiple alert fields into one. For more information, see Extracting and composing alert fields.

For users familiar with the classic Event Management experience, enrich automations create event rules but with an easier interface and with better teams support. Event rules offer a few advanced features like thresholds and CI identification using IRE that are not yet available in enrich automations. Admins may also enrich alerts with event field mapping rules. Changing alert values creates an event field mapping rule with the mapping type **Map field and transform value (Single field)**. This rule is linked to the event rule and runs simultaneously, allowing for streamlined mapping and transformation of event data to enrich alerts.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Enrich alerts**.
   The Enrich alerts page is displayed.



4. Select **Create automation**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the **Active** check box is selected.

5. In the **Automation name** field, enter the name of the automation for enriching alerts.
6. In the **If these conditions are met** section, set up filter criteria to identify the alerts you want to enrich.

   The condition is evaluated against the raw event received from the source monitoring system and does not account for enriched fields.

   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

      Note:

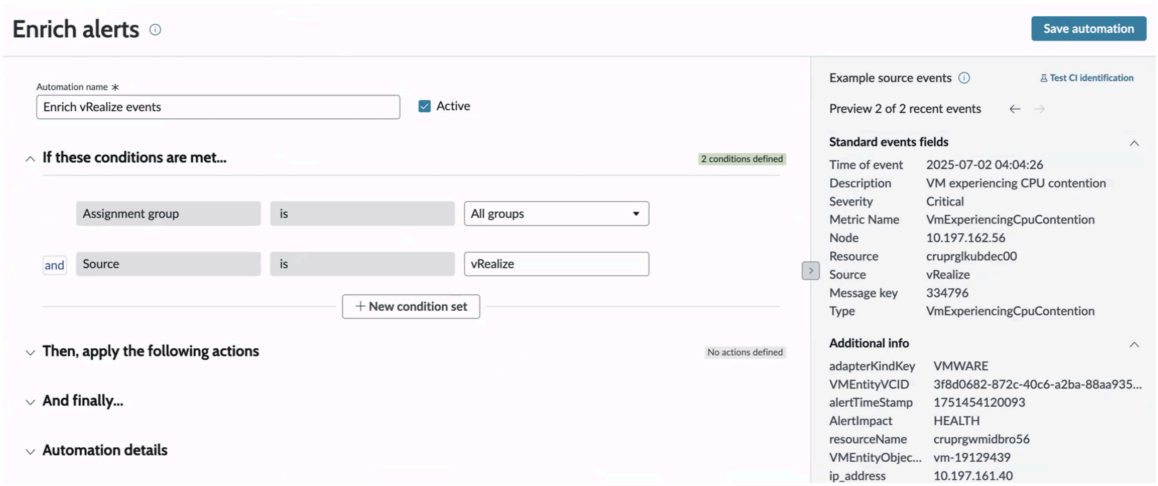
      - If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
      - If you're an team operator, only the groups you're a member of are available.
      - Only members of the selected group or administrators can update or delete the automation.

   b. From the **Source** field menu, select the monitoring tool from where the alert is generated.

   c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

      To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

      Note:
      Select **Load past events** to view previous events when creating the automation.

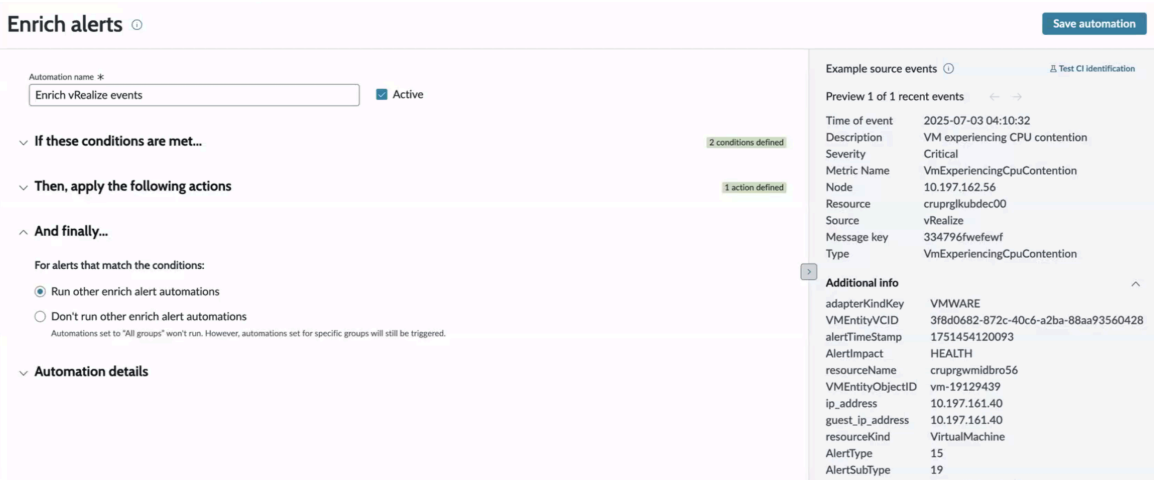


7. In the **Then, apply the following actions** section, select the automation actions that will be triggered by this automation.
   You must select at least one action.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

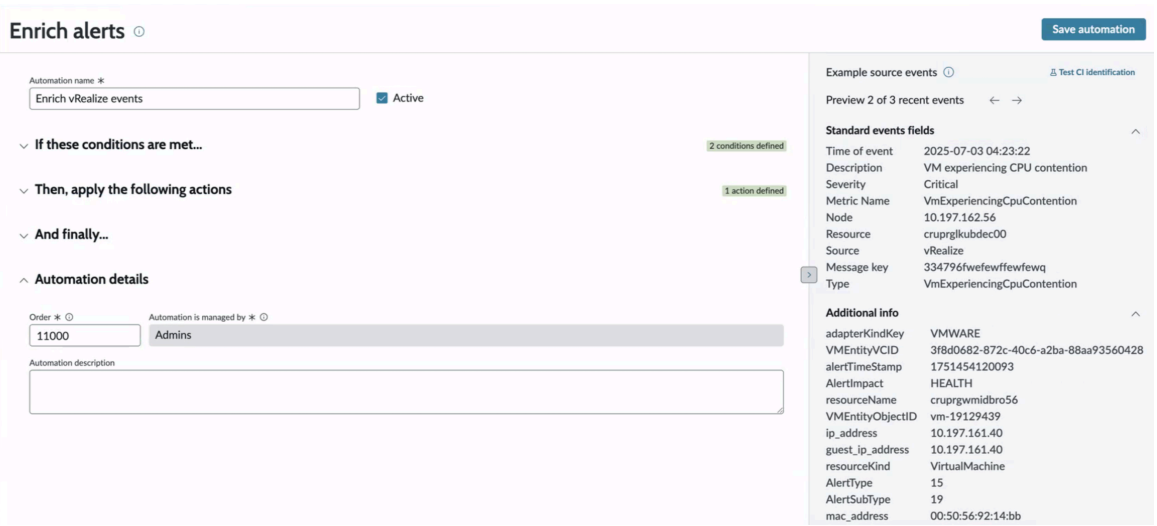
- **Extract alert fields**: Retrieves alert field values from the event payload and places them in an alert output field.
- **Copy or compose fields**: Merges various alert fields, tags and text to generate a composed alert output.
- **Change alert values**: Maps the current value of alert fields to specified new values.
- **Improve configuration item (CI) identification**: Identifies CIs other than a host for better alert grouping, team assignment, and service health.

8. In the **And finally** section, to continue running other enrichment automations with same filter conditions after this automation is executed, select **Run other enrich alert automations**.



If you select **Don't run other enrich alert automations**, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.

9. In the **Automation details** section, provide an order and automation description.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Order** field, enter the automation order.

> **Note:**
> Automations run in order from the lowest to the highest. Ensure there are no enrichment automations with a lower order number that have matching conditions and have **Apply additional automations of this type** set to false. Otherwise, this may prevent subsequent automations from running.

The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The enrich automation that you created appears on the Enrich alerts page where you can view, edit, or delete the existing automation.

What to do next

You can manage alerts more effectively by grouping similar alerts together with the help of Create Group automation.

Related topics

Extracting and composing alert fields

Extracting and composing alert fields

Extracting and composing are ways to manage what you see in the alert output, making it simpler to filter, group, and read. Alert automation enables you to extract values from event payload's alert field and place it in an alert output field. Composing allows you to merge multiple alert fields into a single output field.

Extracting alert fields

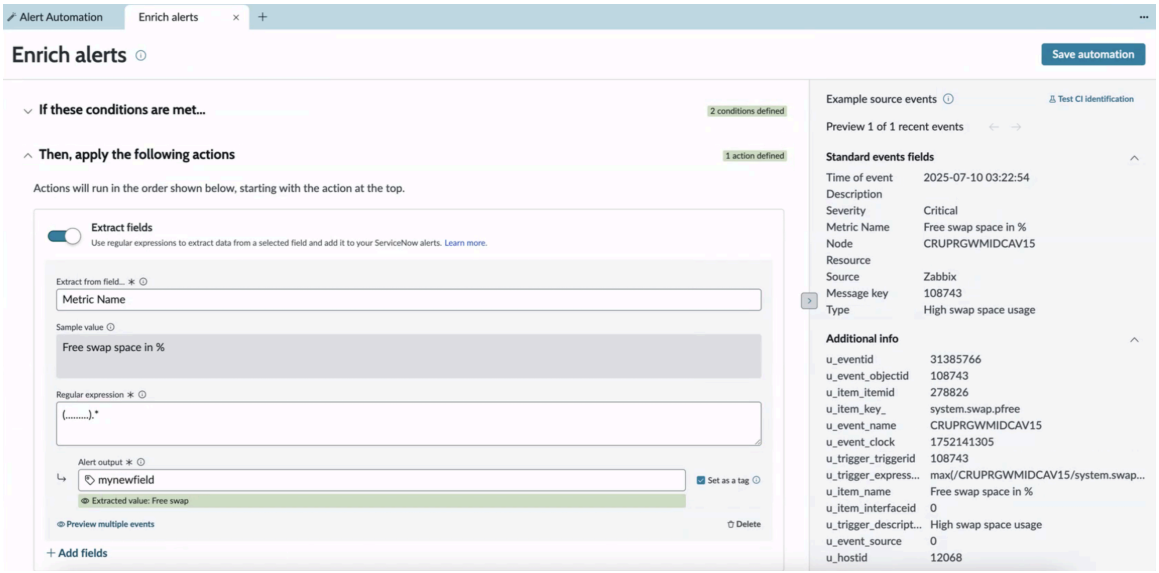
Alert notifications often contain relevant context buried within event payloads. By enriching alert outputs with values from the existing payload, you can better understand the significance of alerts and determine the appropriate steps for resolution. For example, a host name typically includes crucial information such as service, node, cluster, datacenter, and domain. To automatically add the value for a cluster tag based on incoming host data, you can extract just the cluster data.

When extracting alert fields, use regular expressions (regex) to build value formulas. Regex allows you to precisely identify and capture the relevant portions of the payload, enabling the creation of meaningful and actionable alert notifications.

> **Note:**
> You can compose text using regular expression (regex) format conventions. Use one or more capture groups with parentheses to extract parts of the input. Capture groups in the regular expression are assigned to alert outputs based on the order in which they appear. The regex must match the entire input, so consider surrounding your regex with `.*` on each end. For example, `(\w+).acme.com.*` captures the host name in a fully qualified domain name. The parser for the regex engine is Perl Compatible Regular Expressions (PCRE) compatible.

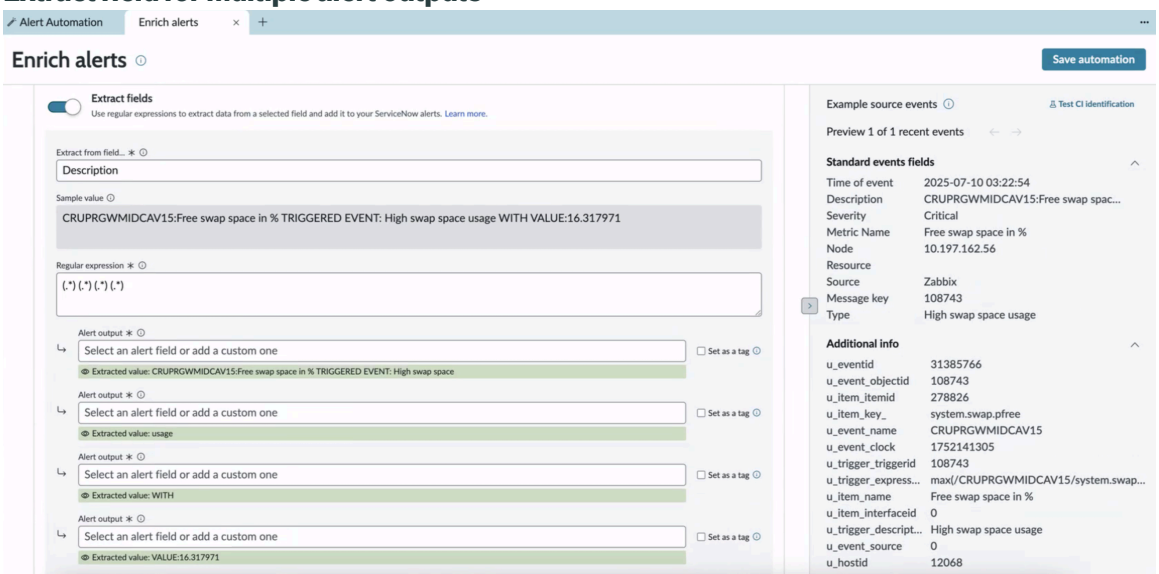
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extract alert fields



If you use multiple capture groups with parentheses, each extracted value appears in a separate output field.

Extract field for multiple alert outputs



Preview the alert output across example events to verify that the values are extracted as expected by selecting **Preview multiple events**.

Note:
This option is available only when example source events are available and matched with the regex filter.

Example: Extracting alert fields

Suppose you need to extract only six letters from a specific field of an event and display them in a new alert field named `mynewfield`. You also want to tag this new alert field for later use in alert grouping. Here's how you can achieve this:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

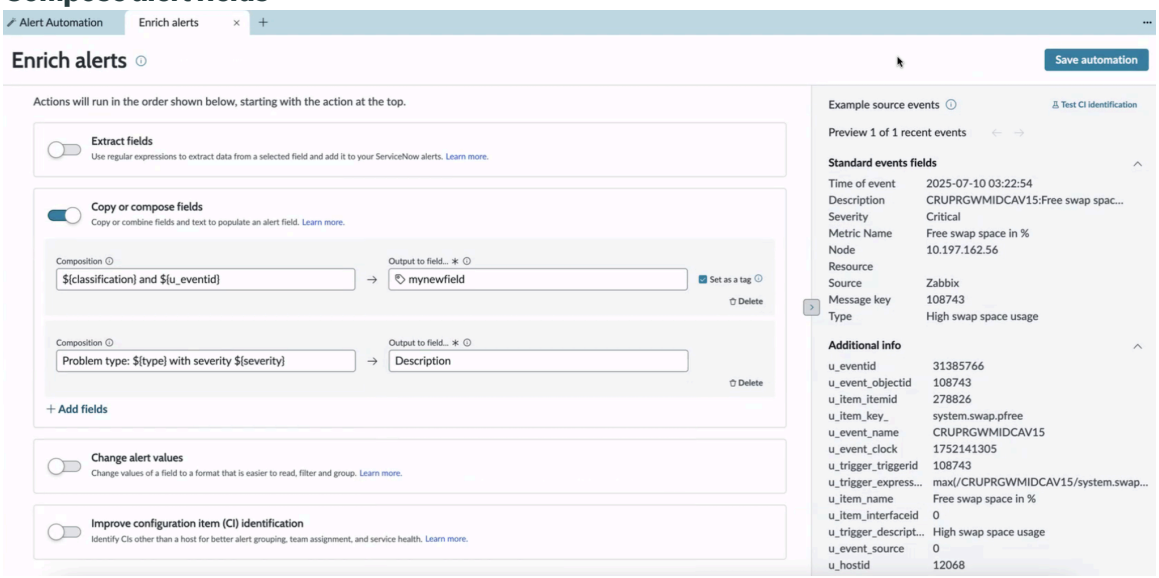
- **Source input field**: Select the event field from which you want to extract data. In this case, the field is **Metric Name**.
- **Regular expression**: Use a regular expression to extract the specific part you need from the selected field's value. For example, if the **Metric Name** field value contains "Free swap space in %" and you want to extract "Free swap", your regular expression must be (.....).*.
- **Alert output**:
  - Choose an existing alert field, an existing alert tag, or manually enter a new field name. In this case, let's enter a new field name `mynewfield`.
  - Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

  After applying the regular expression to the selected field's value (in this case the **Metric Name** field value), verify the extracted word displayed below the **Alert output** field. For instance, it should show "Free swap" if the regular expression matches correctly.
- **Preview multiple events**: Previewing multiple events allows you to verify if the regular expression accurately extracts data from a range of example events. This helps determine if any adjustments to the regular expression are needed.

Composing alert fields

When creating an alert output, you can select or manually enter fields, tags, or free text to include. This data can be easily read, filtered, and grouped for better management and understanding of the alerts.

Compose alert fields



Example: Composing alert fields

Suppose you want to have two input fields that compose data and display it in two different alert output field. In one scenario, you want the source value to come from an existing alert field along with a new field, showing the composed value in a new alert output field. You also plan to tag the new alert output field for later use in tag-based grouping. In the other scenario, you combine existing fields with free text and select the alert output to display in an existing alert field. Here's how you can achieve this:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Scenario 1:
  1. **Source input field**: Select an existing alert field and add the text "and", followed by entering another field **u_eventid**. For example: ${classification} and ${u_eventid}.

     Note that alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down list, and the syntax will be added automatically.

  2. **Alert output**: Enter the name of the new alert field where you want to display the values from the input fields. For example, let's name it `mynewfield`.

     Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

- Scenario 2:
  1. **Source input field**: Select existing alert fields and include any desired free text for how you want them to appear in the alert output field. For example: Problem type: ${type} with severity ${severity}.

     Alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down box, and the syntax will be added automatically.

  2. **Alert output**: Select an existing alert field where you want to display the values from the input fields. For instance, select **Description**.

Set additional info fields to match CI attribute format

Set additional info fields in alerts to match the field and value format of CI attributes in CI records. This ensures accurate alert-to-CI binding, improving alert tracking and reducing manual effort.

Before you begin

Ensure that you are on the Enrich Alerts page and the **Improve configuration item (CI) identification** toggle switch is enabled.

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

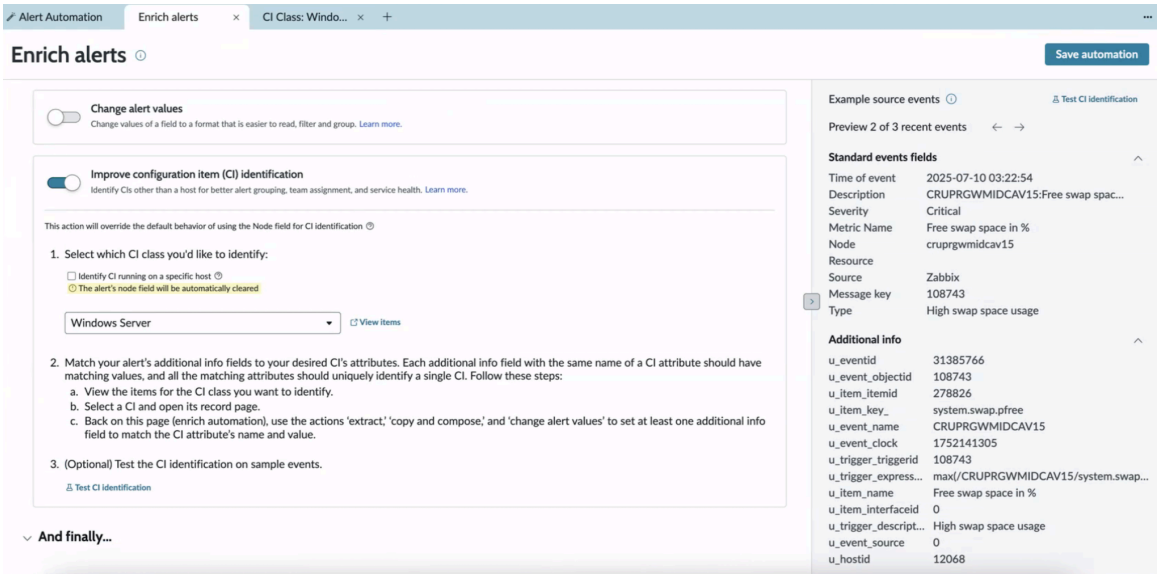
About this task

The system attempts to match the **Additional Info** fields of the alert with attributes in the CI table. If exactly one matching CI is found, the alert is linked to that CI. For CI identification to be successful, add new fields or ensure that your alert has additional info fields corresponding to column name for CI attributes. For example, use column name **ip_address** instead of the column label **IP Address**. Each matching key name must have matching values. If there are matching fields in your alert that you don’t wish to use for binding, copy them to another field then clear the original field.

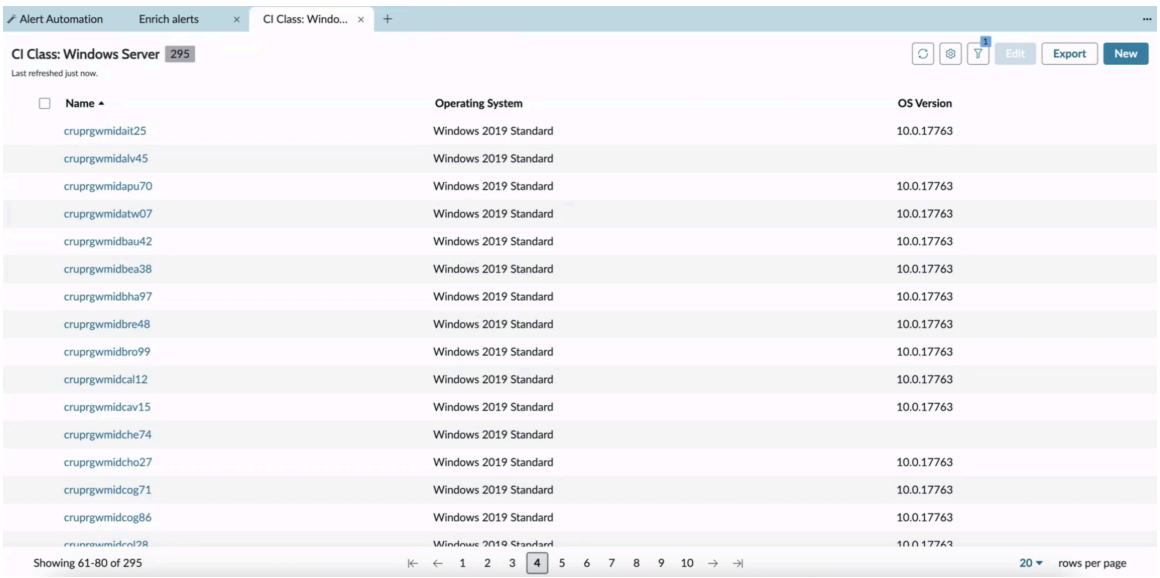
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Under **Improve configuration item (CI) identification**, in the **Select which CI class you'd like to identify** field, select the CI class.



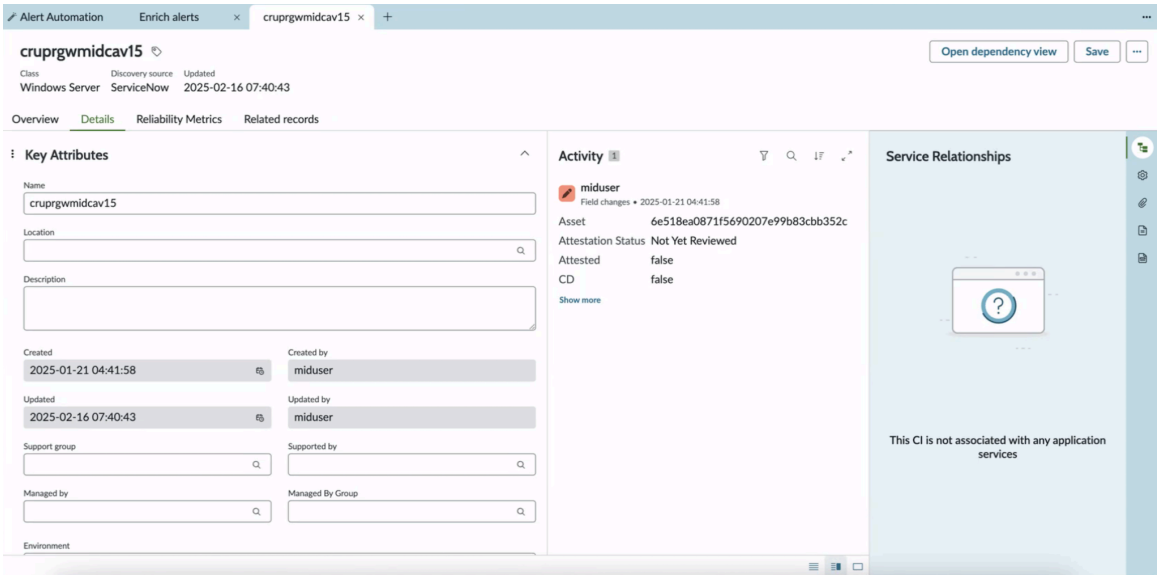
2. Select **View items** next to the **Select which CI class you'd like to identify** field to open the list of CIs of the selected CI class.



3. Select a CI name to open its details or record page.

   At least one field and its corresponding value from the CI details page must appear in the **Additional info** field of the alert.

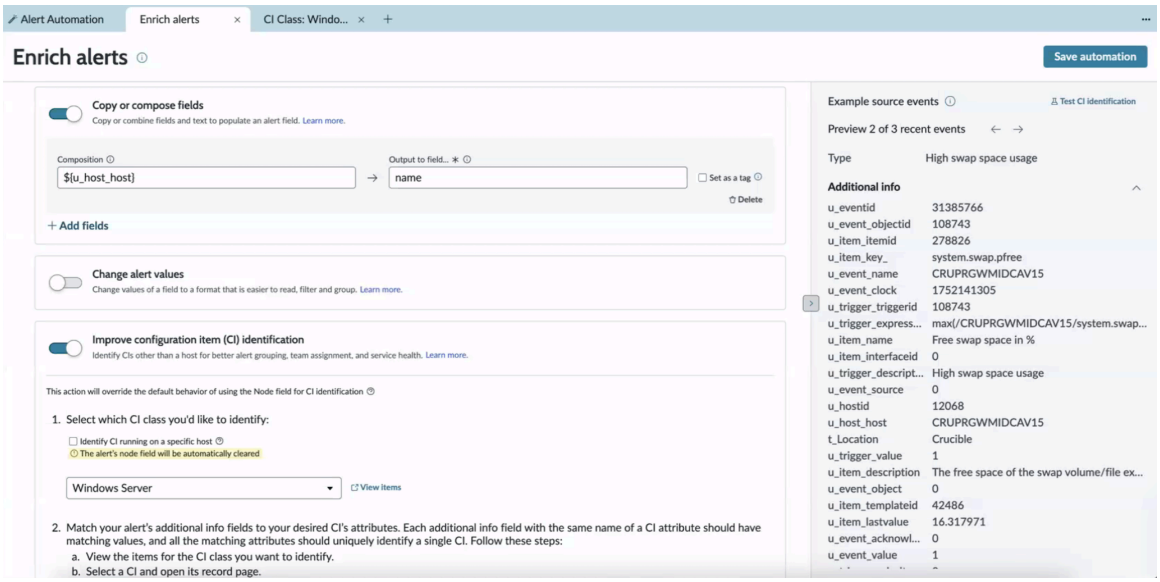
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the Enrich Alerts page, use **Extract fields**, **Copy or Compose fields**, and **Change alert values** to set at least one **Additional info** field in your alert to precisely match the field and value format of the CI attributes in the CI record.

   Example: Suppose the CI record page has the **name** field with the value **CRUPRGWMIDCAV15**. To include these fields and their values in the **Additional info** field of the alert, set the fields as shown in the image.

   Map the `${u_host_host}` field to a new field called **name**. This field is added to the **Additional info** and is used for CI identification during the binding stage.



Create Group automation

Grouping automation helps you manage alerts more effectively by collecting similar alerts together. This makes it easier to see patterns, quickly identify issues, and respond efficiently. By organizing alerts in this way, you can reduce alert noise, identify root causes, and assign them to the appropriate teams.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

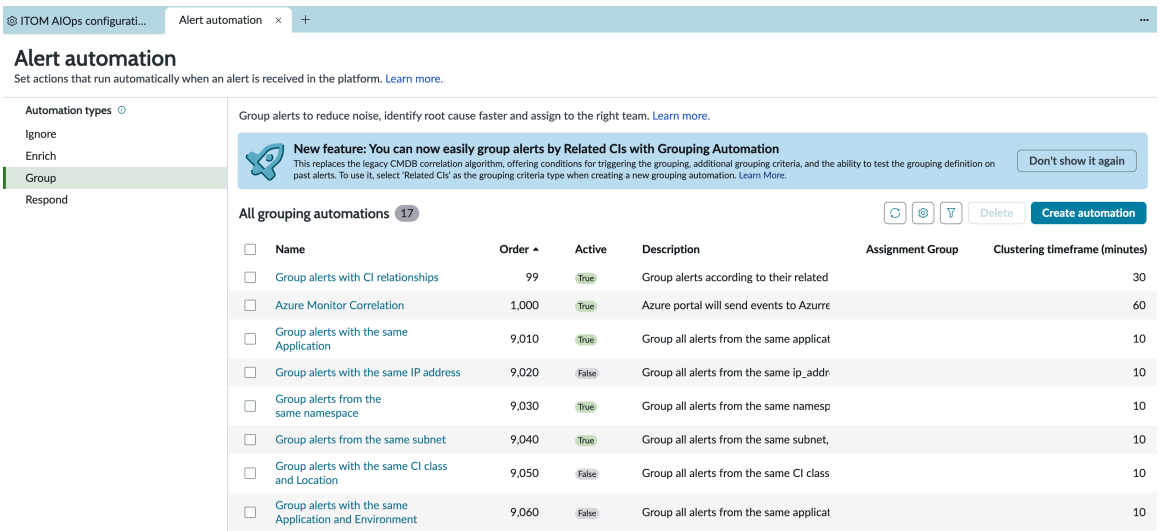
Grouping of this method is most useful when alerts share common data or tags, such as a node or location. You can use fields or tags populated via an enrich automation. It's the best way to group alerts when your CMDB or service maps are immature. This complements our other grouping algorithms, including alert correlation rules, CMDB, ML, and text-based grouping. Alerts are grouped with their first match, and you can control the priority order of these algorithms via system property. For information on correlation logic order, see Configure alert correlation logic order.

Alert automation also provides a simulation feature allowing you to test how many alert groups would be formed, how many are left ungrouped, and the compression rate. A higher compression rate means your team will be more productive and may be able to identify root causes faster. However, consider whether the groups are accurate, operationally correct, and assigned to the right teams. You may adjust the group criteria until you are satisfied with the resulting groups.

For users familiar with the classic Event Management experience, this feature offers an easier interface with improved team support for creating tag-based alert clustering definitions.

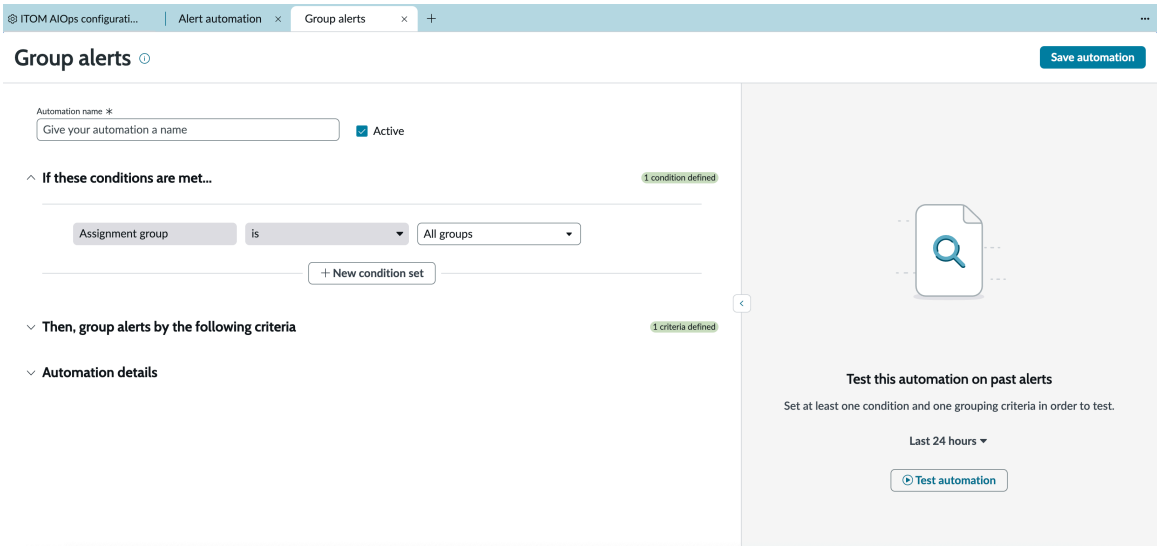
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Group alerts**
   The Group alerts page is displayed.



4. Select **Create automation**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the **Automation name** field, enter the name of the automation for grouping alerts. By default, the **Active** check box is selected.
6. In the **If these conditions are met** section, set up filter criteria to identify the alerts that you want to group.

   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

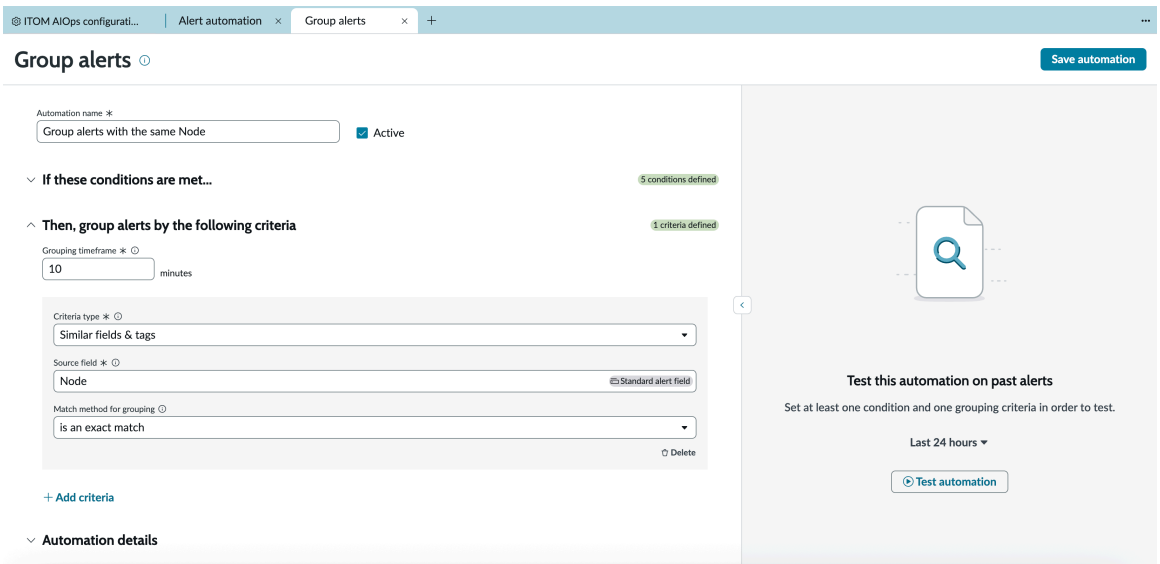
b. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators. You must add at least one more filter besides the assignment group.

Tip:
Select a more specific filter to enhance performance.

To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

Note:
Select **Load past events** to view previous events when creating the automation.

7. In the **Then, group alerts by the following criteria** section, perform the following steps.



a. In the **Grouping timeframe** field, specify the duration (in minutes) when alerts must be collected and grouped together.

b. In the **Criteria type** menu, select how you want to group the alerts.

Currently, there are two options:

- **Similar fields & tags**: Group alerts based on similar fields and tags.
- **Related CIs**: Group alerts based on CI (Configuration Item) relationships—child, parent, or sibling—along with containment and applicative flows.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Impacted service instances**: Groups alerts affecting the same service instances. You can choose either **All Service Instances** or a **Specific Service Instance**. For **Specific Service Instance**, use the **Service Instance** field to select the services you want.
- **Related logs properties**: Groups alerts generated from logs using the Health Log Analytics grouping algorithm. The **Related logs properties** option appears only when you install the Health Log Analytics plugin.

c. In the **Source field** menu, select the source from which you want the alerts to be grouped.

> **Note:**
> You can manually add a field name and select the type of the field. The available options include additional info field, alert tag, and CI tag. This flexibility allows you to customize the information being captured according to your specific needs.

d. In the **Match method for grouping** field, select one of the following options: group alerts based on an exact match, fuzzy match, or pattern match.

When you select a value for the fuzzy match method in the grouping field, the **Similarity threshold (percentage)** field becomes visible. Alerts are grouped when their similarity is greater than or equal to the specified percentage based on edit distance.

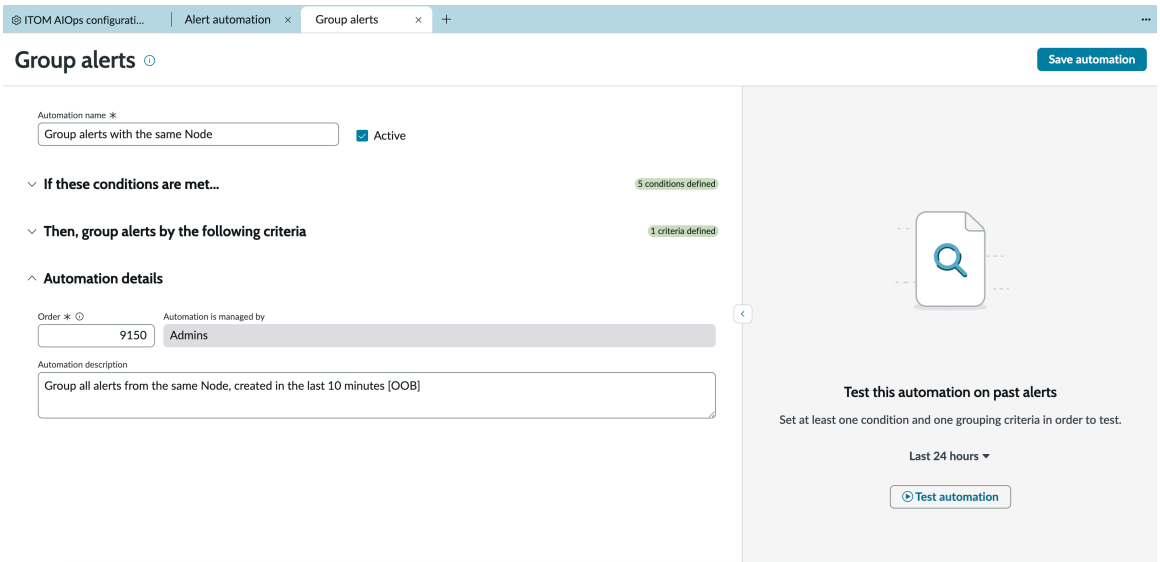
For example, if you have alerts from USA, CA, and USA, NY, and you want to group the alerts by country, you would set the **Source** field to USA. If the **Match Method for Grouping** is a fuzzy match and the **Similarity threshold (percentage)** is 50%, then alerts will be grouped if they are at least 50% similar, meaning they share the country "USA" as a common attribute.

e. When you select a value for the pattern match method in the grouping field, the **Pattern matching** field becomes visible. Alerts are grouped when the specified pattern matches. For more information, see Pattern matching.

Use asterisks (*) in the search string to match any number of characters or a question mark (?) to match any single character. Everything else in the search string matches itself. For example, use "HTTP Error 5??" to match all HTTP 500 errors.

To include additional fields for grouping, select **+ Add criteria**.

8. In the **Automation details** section, provide an order and automation description.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

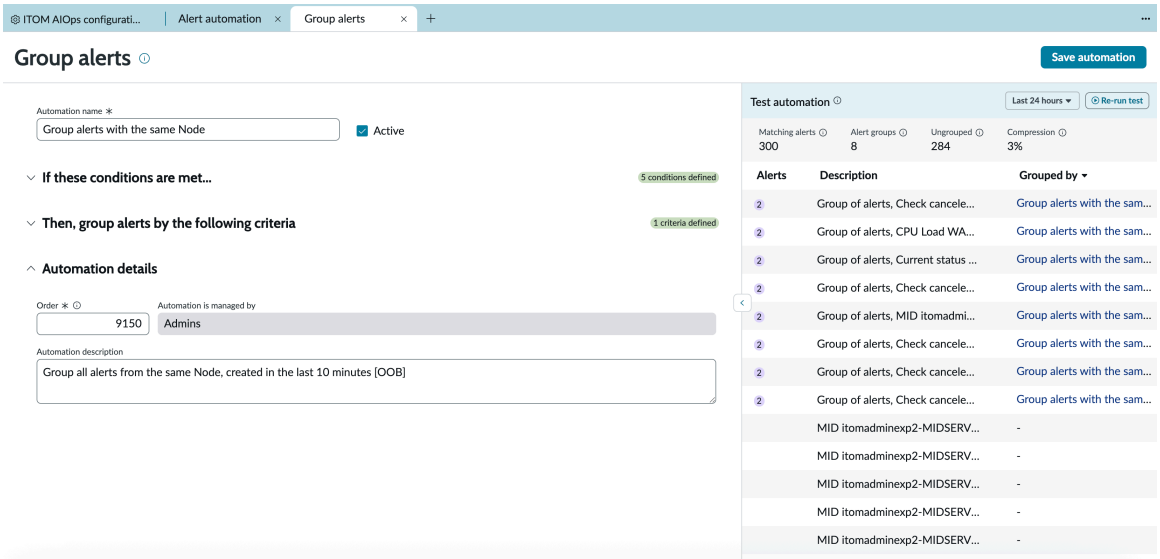
a. In the **Order** field, enter the automation order.

> **Note:**
> Alerts are grouped based on the first match, executed in order from the lowest to the highest number. The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

9. To test if the alert grouping is working correctly, navigate to **Test this automation on past alerts**, select the timeframe for the simulation from the drop-down list and then select **Test automation**.

   You can also modify any alert grouping conditions or field values and initiate the process again by selecting **Re-run test**.



The header of the Test Automation section also displays the following: matching alerts, alert groups, ungrouped alerts, and compression.

- **Matching alerts**: The total number of matching alerts before grouping that match the conditions defined for this automation.
- **Alert groups**: The number of groups containing more than one alerts matching the automation conditions. The smaller number in parentheses represents the number of groups created by this automation.
- **Ungrouped**: The number of alerts matching the automation conditions that remain ungrouped.
- **Compression**: The percentage reduction in the number of total alerts achieved by grouping, calculated as 1 - (Alert groups + Ungrouped) / Total alerts. You can improve the compression rate by grouping your alerts into related problems. The smaller number in parentheses indicates the percentage of matching alerts compressed by this automation.
- When the criteria type is **Related CIs**:
  - The **Open CIs dependency map** link appears in the Test Automation section.
  - The **Configuration Item** field is displayed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

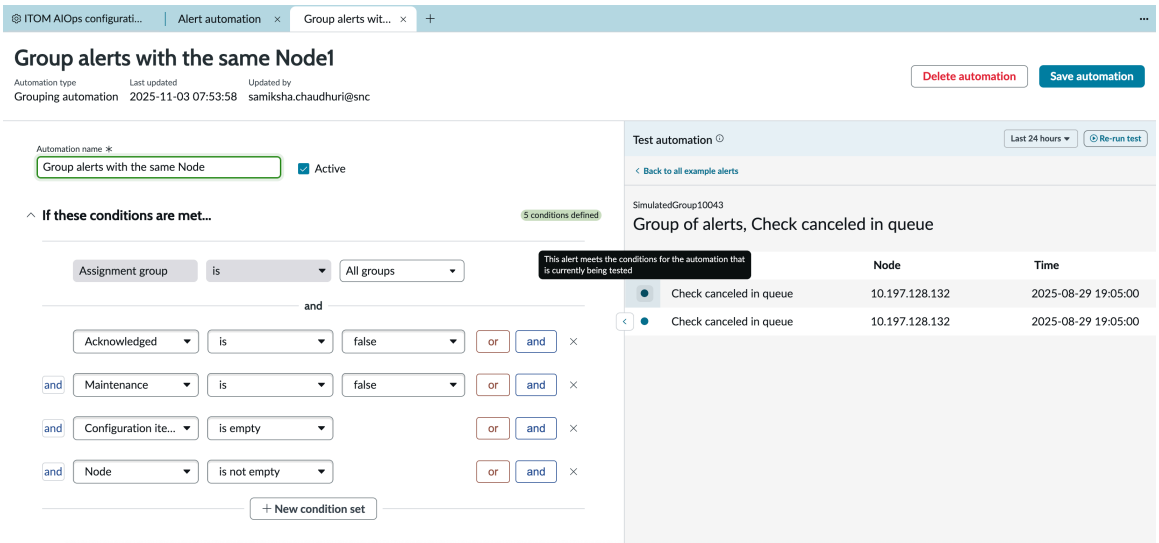
The Test Automation section displays key columns: **Alerts**, **Description**, **Grouped by**, **Node**, and **Time**. The **Description** column outlines the alert group details. Preceding the **Description** column, a number indicates the total alerts contained within that group. **Grouped by** specifies the category of grouping, such as **Group alerts with the same Node** and **CMDB**. You can sort the **Grouped by** column which is by default in the descending order. The value for other automation group displays the name of the corresponding automation group and includes a link to it. For a single alert, the value is displayed as **–**. The **Time** column shows when the test was conducted.

Important:
You can run the simulation of alerts on your test as well as production instance. The test automation simulates the automation using up to 200 recent alerts that match the specified conditions. It only considers groups where all alerts meet the conditions for this automation, although additional grouping algorithms may be applied during actual runtime.

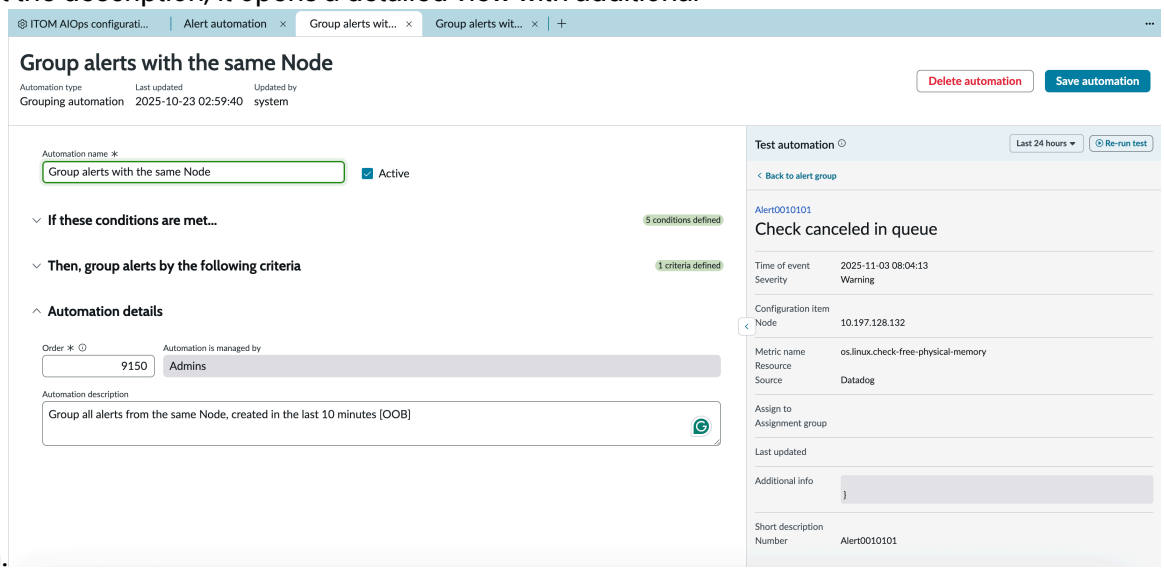
10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The group automation that you created appears on the Group alerts page where you can view, edit, or delete the existing automation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
After you save the automation, when you select an automation result and hover over the green dot next to an alert, a tooltip appears explaining its meaning.



If you select the description, it opens a detailed view with additional information.



What to do next

You can escalate alerts needing quicker responses from teams or individuals by implementing respond automation.

Create Respond automation

Respond to alerts automatically by notifying appropriate stakeholders, escalating them as needed based on severity and type, or other executing response actions. This process ensures that alerts are managed promptly and effectively.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

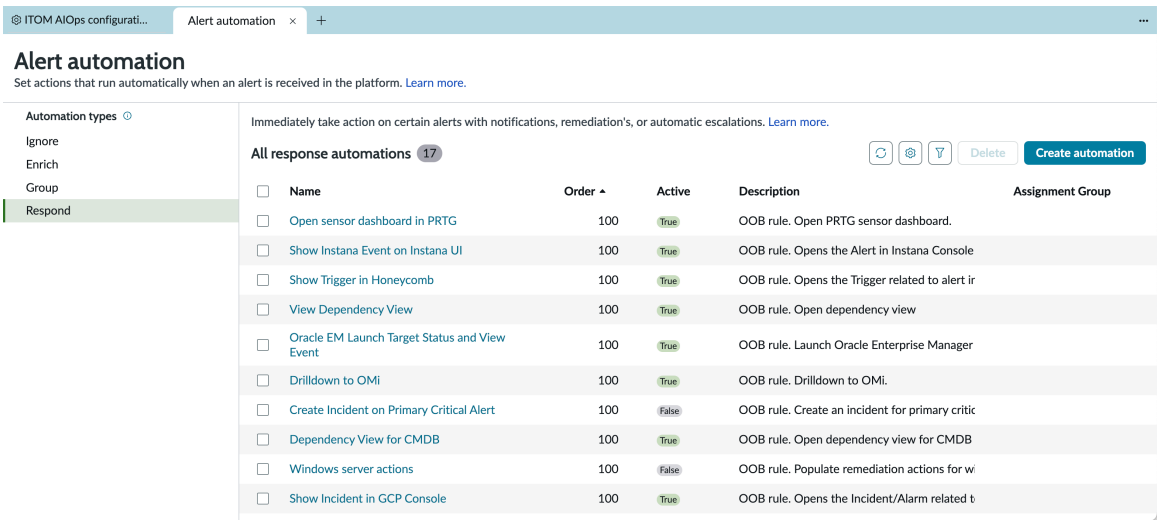
For users familiar with the classic Event Management experience, this provides an easy interface with enhanced team support for creating response automations or alert management rules. Alert management rules or response automations are configurable automated actions triggered in

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

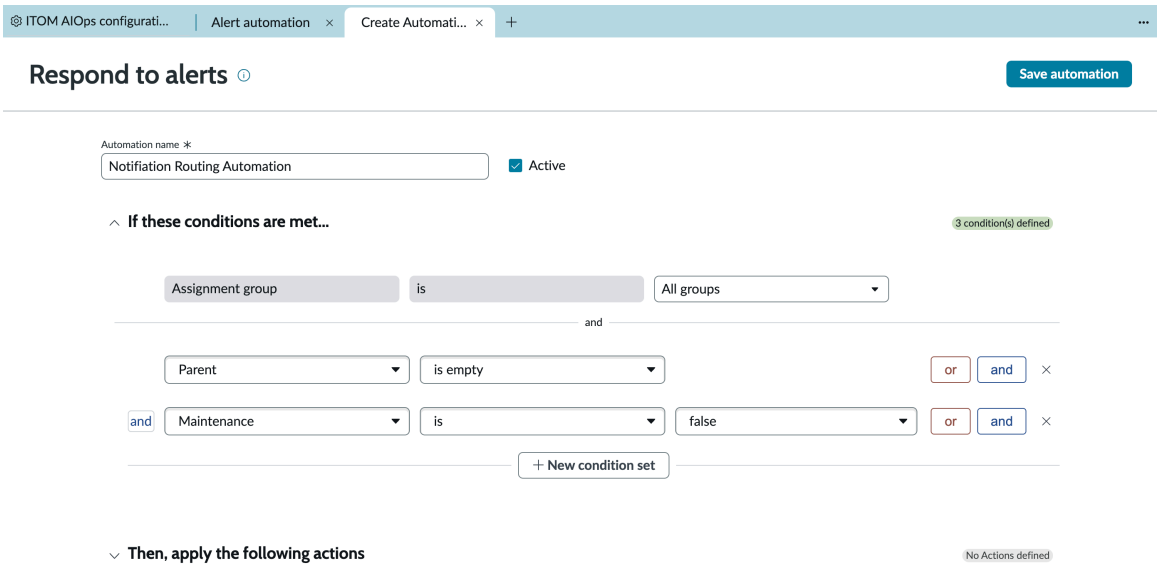
response to alerts that match specific conditions, helping IT teams resolve issues faster and with minimal manual effort. These advanced features are currently only available to administrators and other personas mentioned in the role required section.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Respond to alerts**.
   The Respond page appears.



4. Select **Create automation**.
5. In the **Automation name** field, enter the name of the automation.
   By default, the **Active** check box is selected.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the **If these conditions are met** section, create filter criteria to identify the alerts you want to capture.

> **Important:**
> You can limit respond automations to primary alerts to prevent secondary alerts from being overwhelmed by unnecessary noise. Ensure these automations are applied only to alerts associated with CIs that are not currently undergoing maintenance.

   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team triggers the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

      Note:

      - If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
      - If you're an operator, only the group you're a part of is available.
      - Only members of the selected group or administrators can update or delete the automation.

   b. For the **Parent** field value, select whether the alert for which you want a response is grouped under a parent alert.

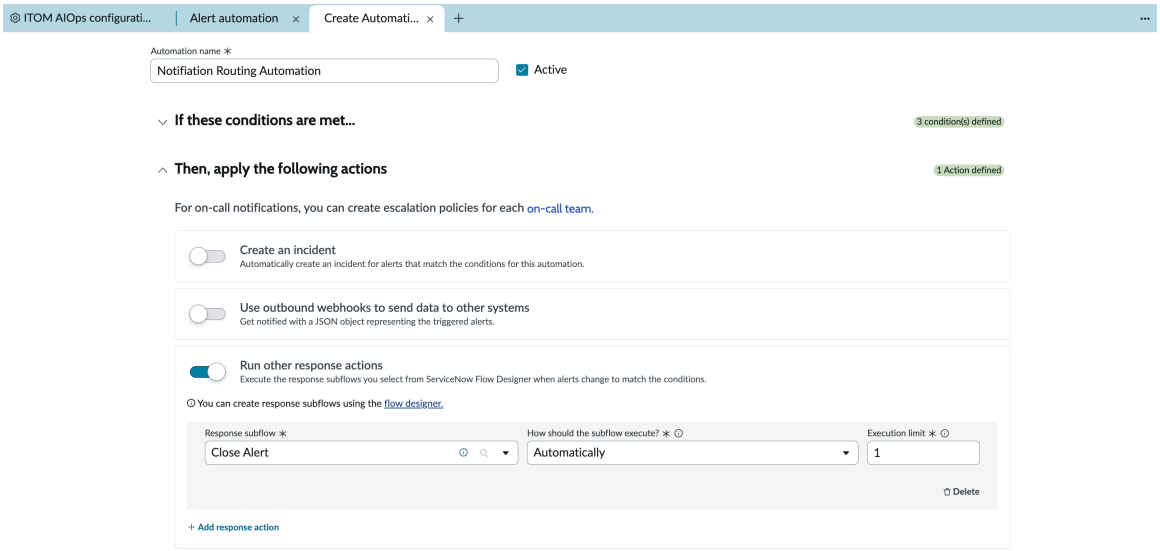
   c. For the **Maintenance** field value, select whether the alert for which you want a response is under maintenance.

   d. To add another set of conditions, select **+ New condition set**. If you don't see it in the drop-down list, you can also manually add an additional info field.

      Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

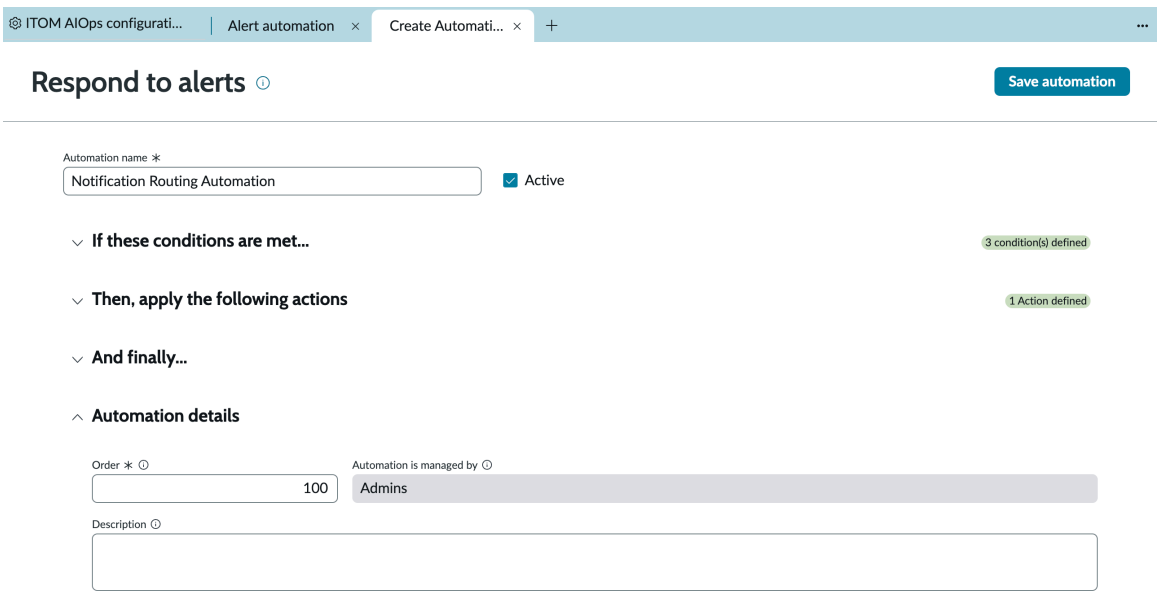
7. In the **Then, apply the following actions** section, select one or more of the three automation actions that can be triggered by the automation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
If you don't select at least one action, the automation is deactivated.

8. In the **And finally** section, to continue running other response automations with same filter conditions after this automation is executed, select **Run other response automations**.
   If you select **Don't run response automations**, additional automation of this type stops running after this automation is executed once. If the automation is managed by an administrator, it stops running administrator-owned automations but continues to run automations owned by other assignment groups.
9. In the **Automation details** section, provide an order and automation description.



For more information, see #unique_2334.

10. Select **Save automation**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A notification appears when the automation is successfully saved. Otherwise, an error message is displayed.

The response automation that you created appears on the **All response automations** page where you can view, edit, or delete the existing automations.

Delete an automation

Delete an automation to permanently remove an automated alert handling rule from your system.

Before you begin

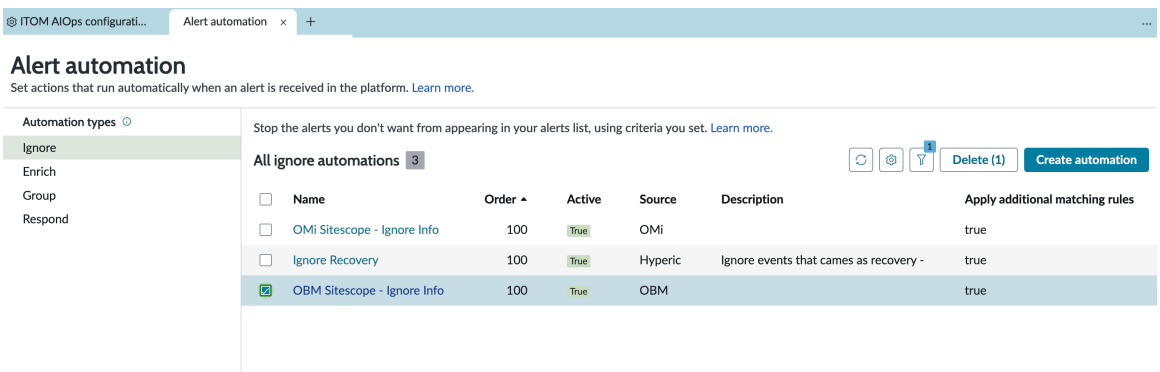
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the ITOM AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace that enables you to configure and manage AIOps features from a single place. For more information, see ITOM AIOps configuration center.
3. On the ITOM AIOps Configuration Center page, under the Optimize section, select the automation, such as Enrich alerts or Group alerts, from which you want to delete an automation.

   The page for that automation type opens, showing a list of all existing automations.
4. On the Alert Automation page, under Automation types, select the automation type that you want to delete, such as Ignore, Enrich, Group, or Respond.

   The page for that automation type opens, displaying all the existing automations.
5. Select the check box next to the automation you want to delete, and then select **Delete**.



6. In the confirmation window, select **Delete**.
   The alert is permanently deleted.

AIOps Dashboards in Service Operations Workspace for ITOM

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. These dashboards provide actionable insights that facilitate proactive responses to potential issues.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access to dashboards

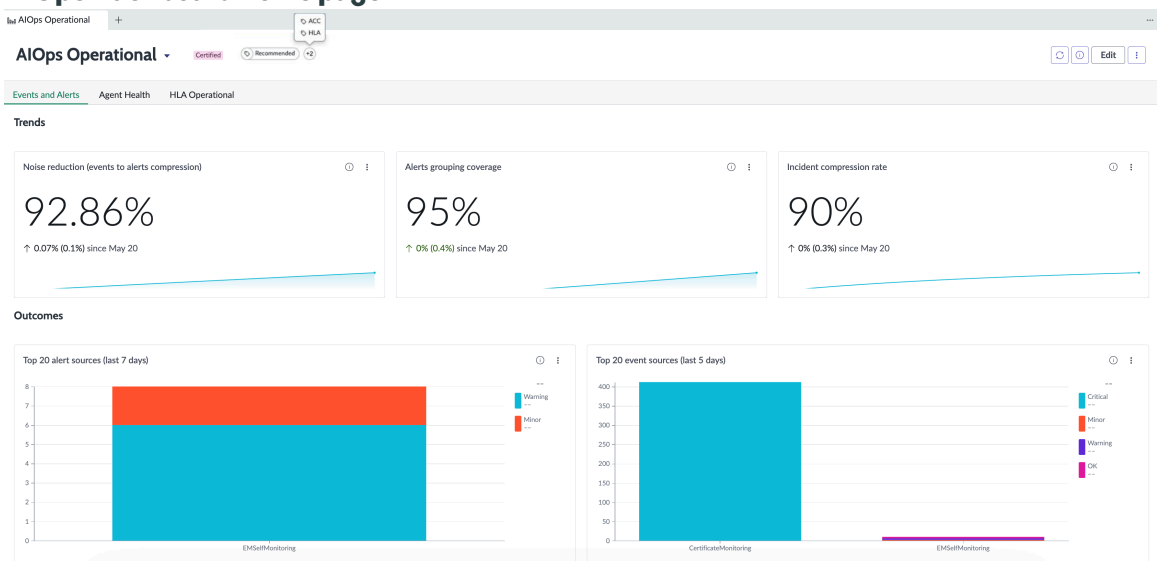
From the bottom of the navigation pane, select the ITOM AIOps configuration center icon . The ITOM AIOps configuration center page appears. Navigate to the Dashboards section and select the required dashboard.

Key benefits of using the AIOps dashboards:

- Configure the dashboards to focus on the metrics and data most relevant to your role.
- Enjoy interactive visual representations of critical operational data.
- Monitor KPIs, service health metrics, and other important performance data at a glance.
- Leverage actionable insights derived from data analysis for better decision-making.

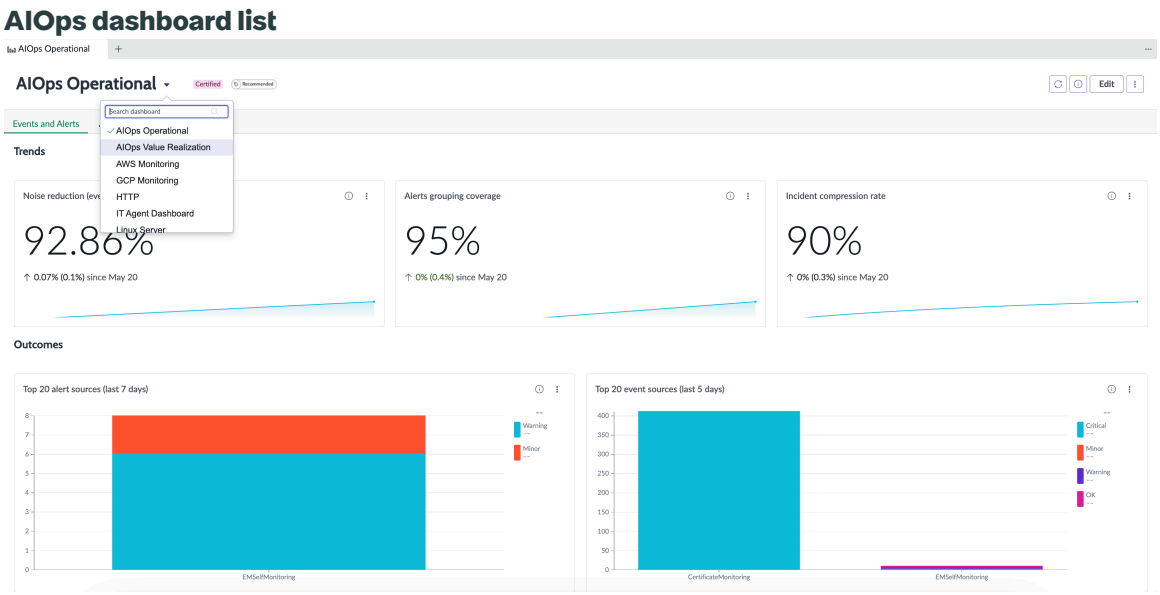
Note:
Opening a set of dashboards shows the most recently accessed dashboard in that category.

AIOps Dashboard home page



To view AIOps Operational dashboards, such as AIOps Value Realization, select the AIOps Operational list and then select the dashboard name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



AIOps 360 overview dashboard

The AIOps 360 Overview dashboard offers a unified view of value and performance across IT operations, helping teams track efficiency, monitor alert handling, and assess automation outcomes. It enhances visibility into AIOps impact, supports informed decisions, and drives faster, smarter operations.

Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Breakdowns

Breakdowns available in the AIOps 360 overview dashboard are:

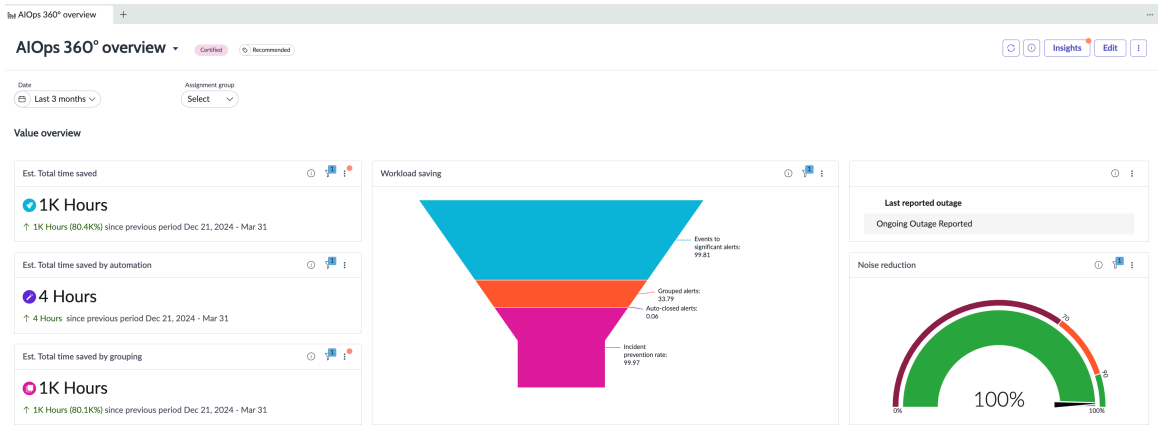
- Value overview
- Performance overview

Value overview section

Use filters such as **Date** and **Assignment Group** to customize the dashboard view and focus on specific time periods and teams. This helps you pinpoint trends, identify areas for improvement, and make data-driven decisions tailored to your operational needs.

The Value overview section highlights the overall impact of AIOps on operational efficiency. It showcases how much manual effort has been reduced through automation and intelligent alert grouping. It also reflects noise reduction levels, outage history, and overall workload savings—giving a clear picture of time and cost benefits realized.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



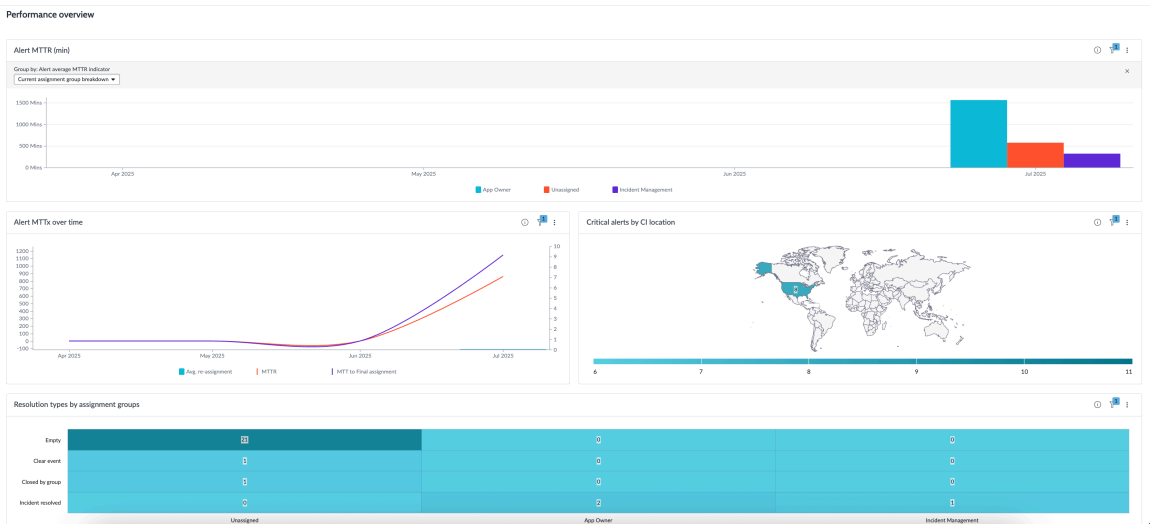
Metrics	Description
Est. Total time saved	Sum of time saved through alert automation and alert grouping, calculated in hours.
Est. Total time saved by automation	Time saved based on the number of alert automation rules executed multiplied by the mean resolution time per alert, calculated in hours. The mean resolution time can be adjusted by administrators in **All** > **System Properties** > **All Properties**. Use the *sn_aiops_dashboard.ITOM.Dashboard.Avg_time_* property to get the actual time saved by automation, in minutes, as used by the Automation Time Saved indicator. By default, it's set to 5 minutes.
Est. Total time saved by grouping	Time saved based on the number of alerts grouped versus the time required to triage each alert individually, calculated in hours. The mean resolution time can be adjusted by administrators in **All** > **System Properties** > **All Properties**. Use the *sn_aiops_dashboard.ITOM.Dashboard.MTTR_for_* property to define the MTTR (in minutes) used in the alert grouping time saved calculation. By default, it's set to 5 minutes.
Workload saving	Measures the reduction in manual effort by filtering, grouping, automating alert closures, and preventing incident escalations. • Events to significant alerts: Percentage of events that were filtered out and did not convert into alerts, reduced through AIOps settings like ignore automations.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics	Description
	• Grouped alerts: Percentage reduction in the number of stand-alone alerts due to grouping rules defined in alert grouping automations. • Auto-closed alerts: Percentage of alerts automatically closed by Respond automation, Clear event actions, or closed as part of alert group resolution. • Incident prevention rate: Percentage of alerts resolved successfully without needing escalation to incidents.
Last reported outage	Most recent date of a major outage (e.g., CMDB) affecting a service or server, based on reported outages on all classes inherited from cmdb_ci_service or cmdb_ci_server.
Noise reduction	Percentage effectiveness in ignoring duplicate and meaningless events. Typical customer value exceeds 90%.

Performance Overview section

This section focuses on how effectively alerts and incidents are being handled. It includes metrics like resolution times across groups, trends in detection and response, automation usage, and the distribution of resolution ownership. It helps identify performance gaps, track improvements, and optimize response strategies across the organization.



Metrics	Description
Alert MTTR	Alert resolution time by assignment group to identify slower-responding teams and enforce SLAs. Can also be grouped by severity using the grouping drop-down menu.
Alert MTTx over time	MTTR (mean time to resolve), MTTA (mean time to final group assignment), and average group reassignment count tracked over time.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics	Description
	Indicates assignment efficiency and the ability to resolve alerts within a single group.
Critical alert by CI location	Critical alerts on a geographic map based on the physical or logical location of Configuration Items (CIs). Helps identify recurring hotspots for retrospective analysis and to spot regional trends.
Resolution types by assignment groups	Closure reasons by top assignment groups, highlighting automation closures (within 10 minutes of execution) to encourage quick resolution, and time threshold closures (after the auto-close interval), which indicate unattended alerts. You should consider the number of alerts that are automatically closed when they reach their time limit. This figure can reveal if your team is unable to resolve or close all alerts, leaving some unaddressed.

Note:
If you're starting with Zurich, some charts, graphs, or metrics in the dashboard may appear blank or show limited data. This is expected if there's no historical data or only a few weeks or months of data available. As your system continues to collect and process alerts, the dashboard will populate with more complete insights over time.

If you want to know about funnel visualization, see Create a funnel visualization.

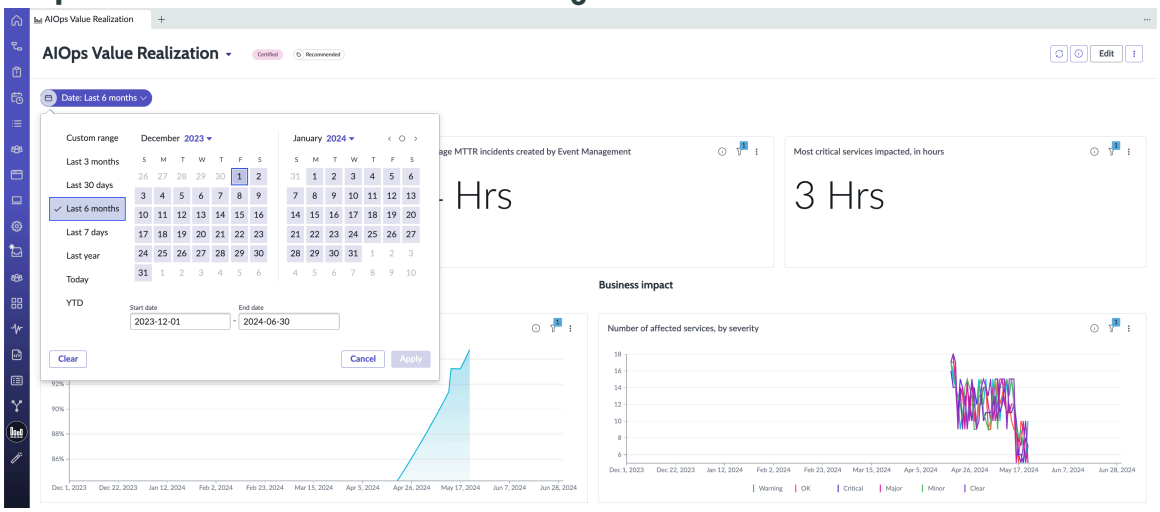
AIOps Value Realization dashboard

The AIOps Value Realization dashboard uses Performance Analytics to offer comprehensive visibility into the business outcomes of alerts, events, and incidents. It features metrics such as noise reduction (events to alerts compression), average MTTR for incidents created by Event Management[var.event-mgmt], and the most critical services impacted by hours.

The AIOps Value Realization dashboard includes a calendar feature that enables users to select various date ranges such as custom dates, the last 3 months, the last 30 days, the last 6 months, the last 7 days, the last year, today, and year-to-date (YTD). You can specify a custom start and end date and apply these selections to view reports specifically for the chosen date range. This feature facilitates tailored analysis and reporting based on specific time periods of interest.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AIOps Value Realization dashboard date range selection

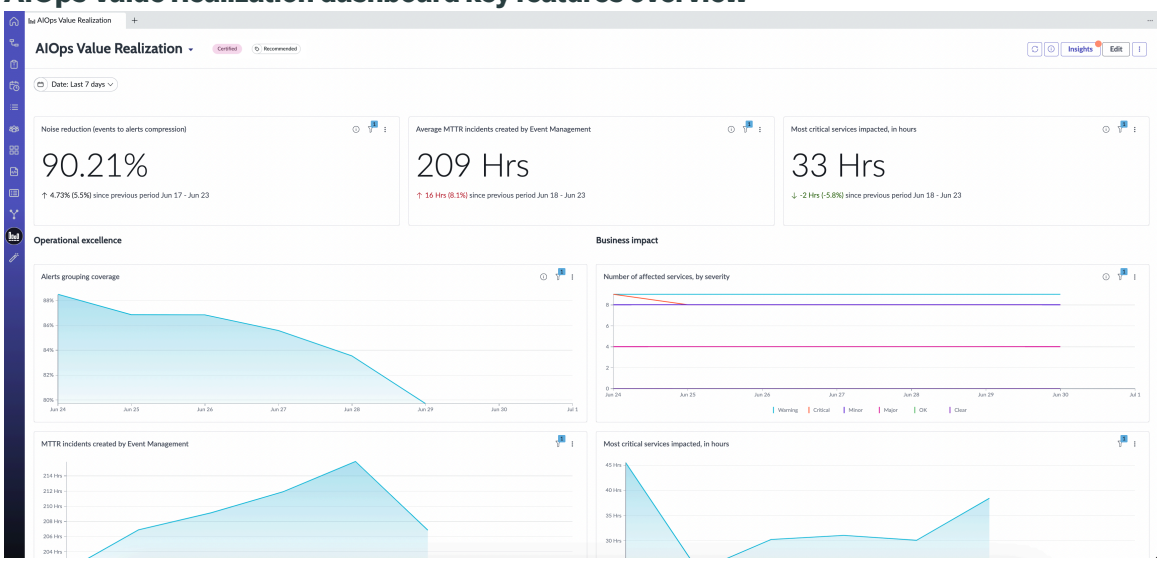


The AIOps Value Realization dashboard offers key insights and metrics crucial for operational efficiency and business impact assessment. It includes features such as noise reduction to enhance focus on critical issues by reducing event-to-alert conversions. Tracking average MTTR for incidents and measuring downtime on critical services aids in improving operational efficiency and prioritizing resolutions. Categorized into Operational Excellence and Business Impact sections, the dashboard provides detailed coverage on alerts grouping, swift resolution of critical incidents reported by users, and quantifying service impacts by severity to optimize operational stability.

Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

AIOps Value Realization dashboard key features overview



Prerequisites

Ensure that the Event Management application is installed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Use cases

For examples of how different people in your organization would use this dashboard, refer to these use cases.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.
evt_mgmt_operator or admin	View the dashboard and review record details to visualize and track the business impact of alerts, events, and incidents.

Breakdowns

Breakdowns available in the AIOps Value Realization dashboard are:

- Operational Excellence
- Business Impact

Reports

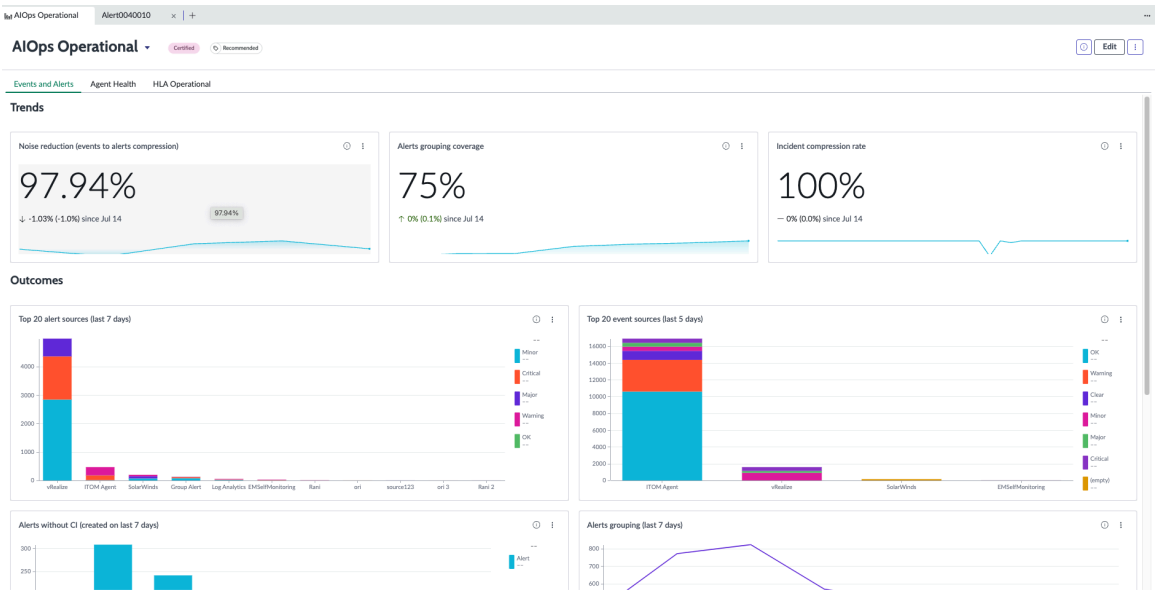
Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation: a higher number indicates fewer alerts are being created.
Average MTTR incidents created by Event Management	Line graph	The average Mean Time to Repair (MTTR) of an incident created by Event Management: a lower number indicates greater efficiency of your IT team.
Most critical services impacted, in hours	Line graph	The total time your organization's most critical business services are impacted: a higher number indicates more time critical services are affected by open alerts.
Alerts grouping coverage	Line graph	The percentage of total alerts that are grouped: a higher number indicates more alerts are being correlated and grouped within an alert group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
Number of affected services, by severity	Line graph	The number of services impacted by alerts, grouped by severity, such as the count of services experiencing critical issues per day.
Number of new P1 incidents on monitored services created by users	Line graph	The number of incidents created on services monitored by Event Management: a lower number indicates fewer users are being impacted by a service outage or performance degradation.

Event and Alert dashboard

The Event and Alert dashboard uses Performance Analytics to provide real-time visibility into events and alerts in Event Management, showcasing key trends, outcomes, and the most impacted configuration items. It highlights metrics such as noise reduction, alert grouping coverage, and top alert sources.



Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Events and Alerts**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ).

  By default, the **Events and Alerts** tab is selected.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.
evt_mgmt_operator or admin	View the dashboard and details of the records contained in it to visualize and track events, alerts, trends, outcomes, and the most impacted Configuration Items in your organization.

Breakdowns

Breakdowns available in the Event and Alert dashboard are:

- Trends
- Outcomes

Reports

Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation. The higher the number, the fewer alerts are being created.
Alerts grouping coverage	Line graph	The percentage of alerts aggregated into grouped alerts over time.
Incident compression rate	Line graph	The percentage of alerts that did not result in incident creation. A higher percentage means more alerts were resolved without generating incidents.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
Top 20 alert sources (last 7 days)	Bar chart	The number of alerts per source categorized by severity over the last 7 days.
Top 20 event sources (last 5 days)	Bar chart	The number of events per source categorized by severity over the last 5 days.
Alerts without CI (created on last 7 days)	Line graph	The number of alerts without CI binding created over the last 7 days.
Alerts grouping (last 7 days)	Bar chart	The distribution of grouped alerts over the last 7 days.

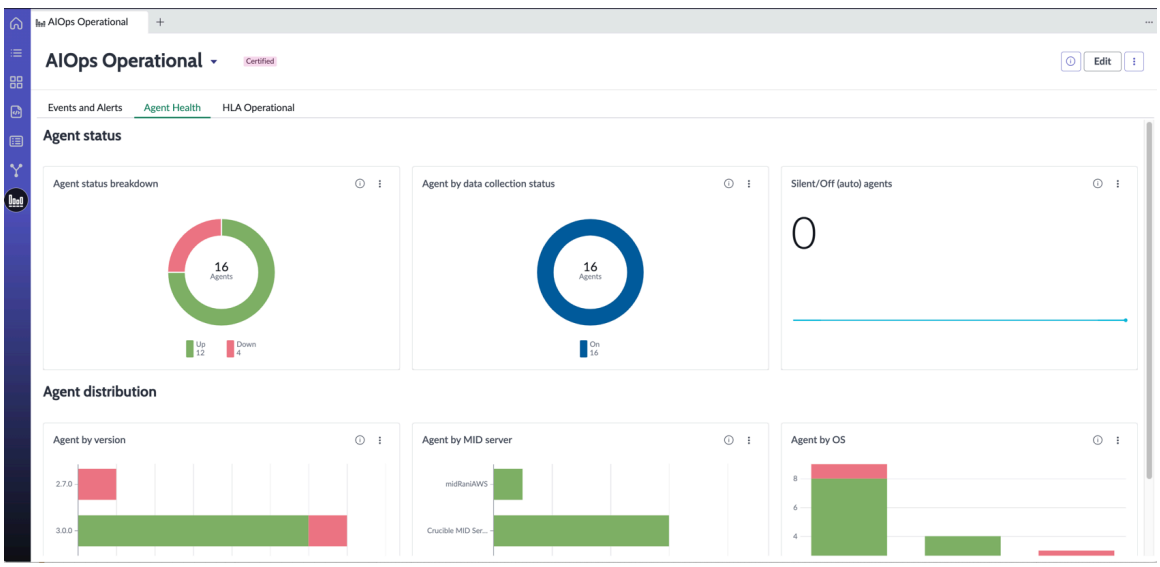
Most impacted Configuration Items

The Most Impacted Configuration Items section of the Event and Alert dashboard provides a comprehensive overview of the configuration items (CIs) that are most impacted by the issue. This section lists key details such as the name of each CI, the number of associated alerts, their classification (such as application service), and location. Additionally, it identifies the owner and support group responsible for each CI, facilitating targeted and efficient incident resolution. By highlighting the most impacted CIs, this section helps prioritize critical assets and resources, ensuring that the most significant issues are addressed promptly to maintain system stability and performance.

Agent Health dashboard

The Agent Health dashboard provides visibility into the status and distribution of agents installed in your system. It allows you to quickly assess the number of deployed agents and their distribution, helping you prioritize your work more efficiently.

The following example shows the agents in your system that are currently up, which agents are configured to collect data, and which agents have stopped data collection due to having reached their CPU threshold (Silent/Off). It also displays the agents according to their version, OS, and connected MID Server.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites

The Agent Client Collector application must be installed.

Required ServiceNow AI Platform roles

A user must have the agent_client_collector_admin role to see all the widgets in the dashboard.

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Agent Health**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ) and then select the **Agent Health** tab.
- After upgrading to Discovery Admin Workspace version 1.3.1 (August 2024 Store), you can navigate to **Workspaces** > **Discovery Admin Workspace** > **Insights** and use the enhanced dashboard.

Use case

For examples of how different people in your organization would use this dashboard, see the use case in the following table.

Dashboard use case

User	Dashboard use
admin	Visibility into the status of the agents.

Breakdowns

Breakdowns available in the Agent Health are:

- Agent status: The status of the agents currently deployed in your system.
- Agent distribution: The distribution of the agents by the agent version number, the MID Server that the agent is assigned to, and the OS that the agent is working on.

Reports

Title	Type	Description
Agent status breakdown	Pie chart	Agents deployed in your system that are up and down. Select the relevant color in the widget to display a list of up or down agents.
Agent by data collection status	Pie chart	Agents deployed in your system with data collection turned on and off. Select the relevant color in the widget

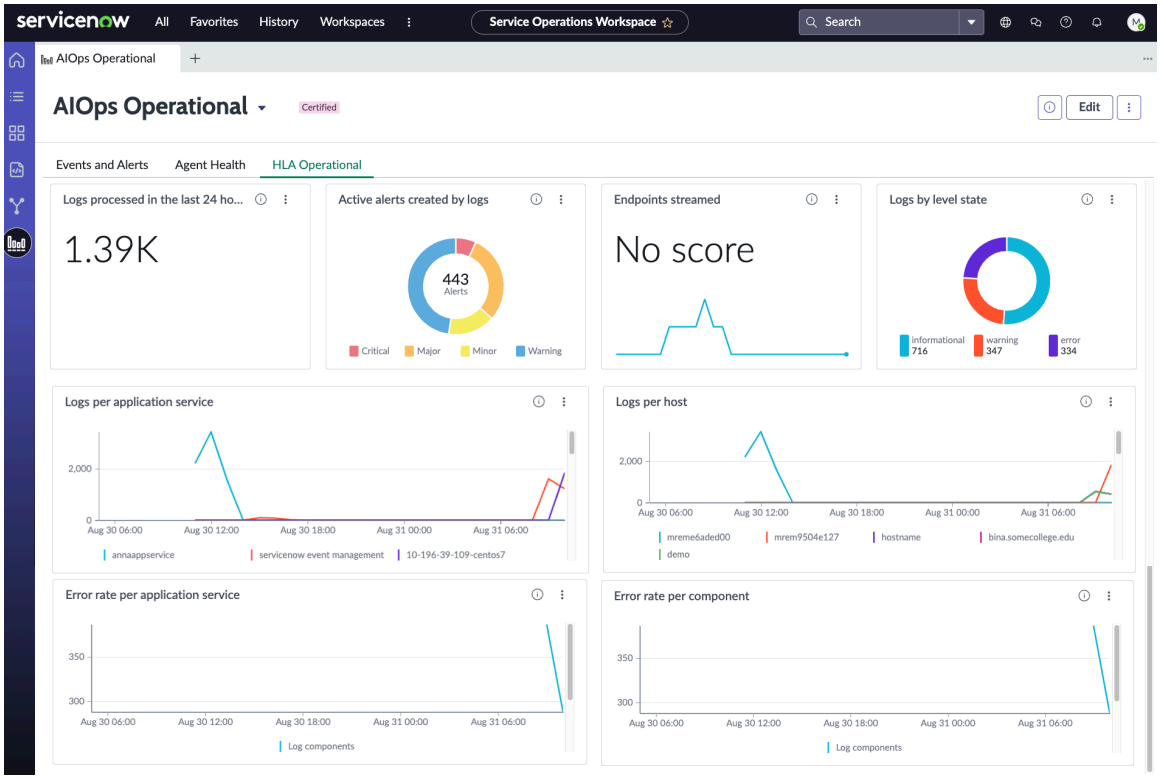
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
		to display a list of agents with data collection on or off.
Silent/Off (auto) agents	Line graph	Agents that automatically stopped collecting data after crossing the CPU usage threshold. The CPU usage threshold is configurable in the `acc.yml` configuration file. For more information on the `acc.yml` configuration file, see Configuration file options.
Agent by version	Bar chart	Breakdown of your deployed agents by their version numbers.
Agent by *`MID Server`*	Bar chart	Breakdown of the deployed agents according to the *`MID Server`* they're assigned to.
Agent by OS	Bar chart	Breakdown of your deployed agents according to the operating systems they are working on.

HLA Operational dashboard

The Health Log Analytics Operational dashboard uses Performance Analytics to enable you to monitor log data, alerts, and error rate information in Service Operations Workspace and address issues as they occur in the system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Prerequisites

Ensure that the Health Log Analytics application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the HLA Operational dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **HLA Operational**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ), then display the HLA Operational dashboard.

Use cases

These use cases provide examples of how different people in your organization would use this dashboard.

User	Dashboard use
evt_mgmt_admin	Edits the dashboard and grants view and share permissions.
evt_mgmt_operator or evt_mgmt_admin	Monitors the dashboard to visualize and track HLA log and alerts data, error rates, and other relevant information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Breakdowns

Breakdowns available in the HLA Operational dashboard are:

- HLA Overview
- Error rate

Reports

Title	Type	Description
Logs processed	Bar chart	The number of logs that were processed and analyzed in the selected period. By default, the dashboard visualizes log data that was ingested in the last 24 hours.
Active alerts created by logs	Table	Detailed data on all currently active alerts.
Endpoints streamed	Line graph	The number of endpoints (IPs, networks, and devices) that are streaming into Health Log Analytics, by application service.
Logs by level state	Bar chart	The severity level of the logs for the streaming sources.
Logs per application service	Line graph	The number of logs streamed for each application service in the selected period. Monitor this data to ensure that log data is streaming as expected for each application service.
Logs per host	Line graph	The number of processed logs for each host in the selected period. Monitor this data to detect hosts that are logging more or less data than expected.
Error rate per application service	Line graph	The number of logs with errors for each application service

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
		analyzed in the selected period. Monitor this data to further investigate the errors. **Note:** Health Log Analytics automatically creates alerts for Error anomalies.
Error rate per component	Line graph	The number of logs with errors for each component analyzed in the selected period. Monitor this data to ensure that the error rate for each component is normal.

Data visualization in ITOM

Gain insights faster with data visualization in IT Operations Management (ITOM). Visualize metrics, logs, events, and alerts through intuitive dashboards and charts to identify trends, monitor performance, and resolve issues proactively.

Anyone with access to data can create a visualization of that data on a dashboard that they own.

Create a funnel visualization

A funnel visualization shows how data progresses through sequential stages, helping you identify drop-offs or bottlenecks at each step. Use it to track conversions, workflows, or process completion rates. You can add a funnel visualization to an existing dashboard or to a new dashboard.

Before you begin

Role required: report_user, admin, or viz_creator

Ensure you have an admin role or permission from the dashboard owner to edit the dashboard.

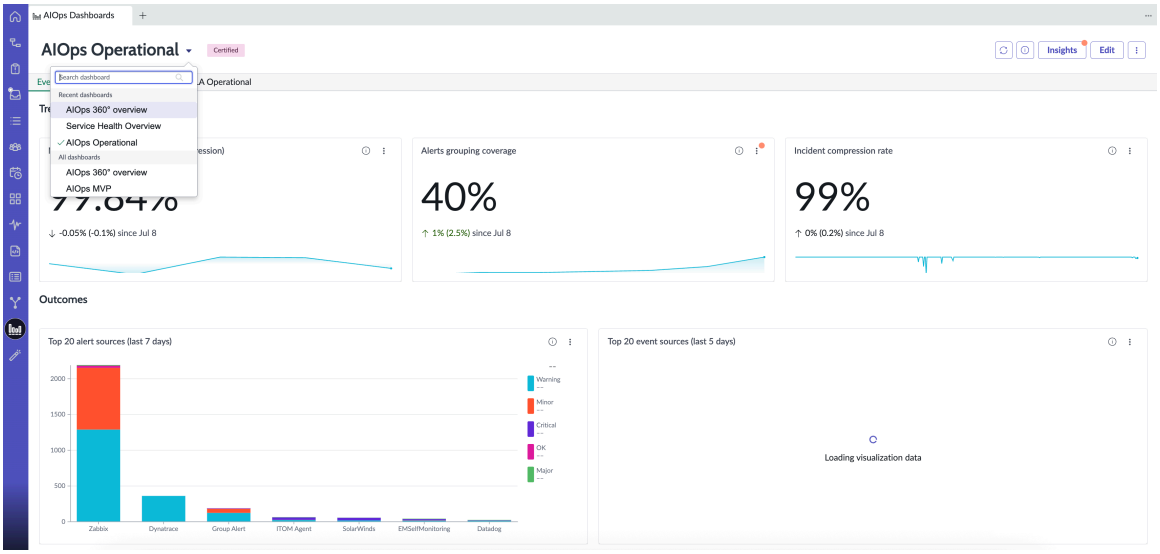
About this task

If you have the appropriate role, you can add and edit funnel reports on a dashboard. The **Edit** button is not available on the ITOM dashboards unless the user has rights to edit it. For more details on creating dashboards, see Common dashboard tasks in the in-line editor.

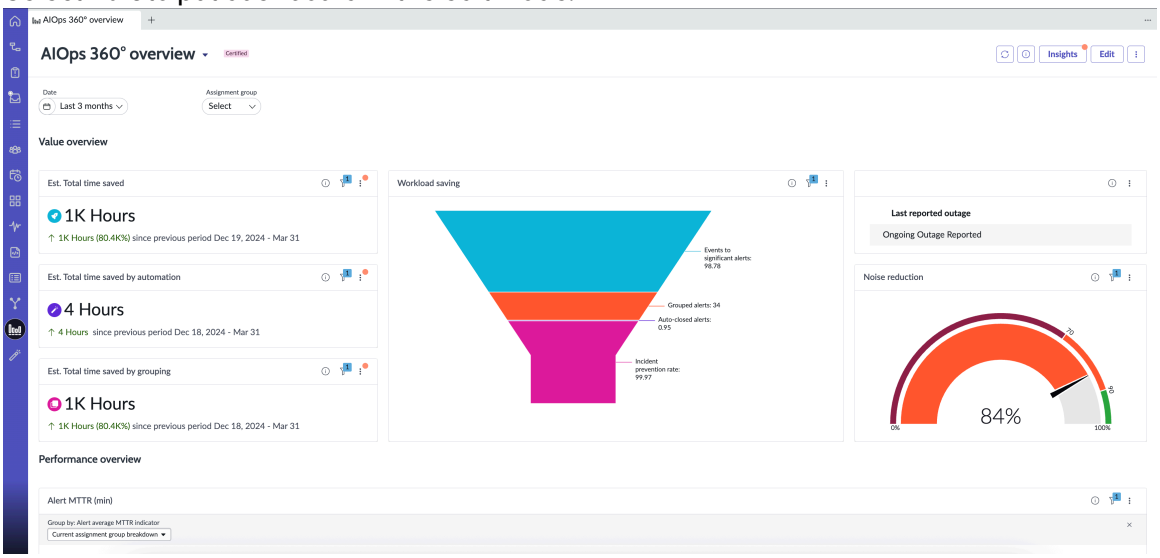
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ).
2. From the Dashboard picker, select **AIOps 360 overview**.

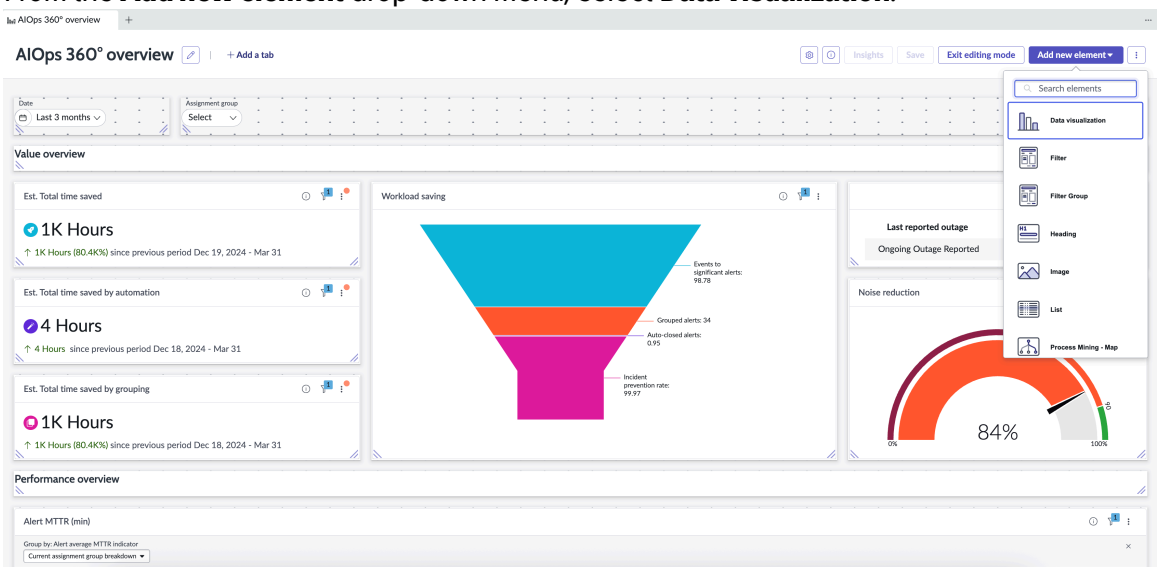
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Edit** to put dashboard in the edit mode.

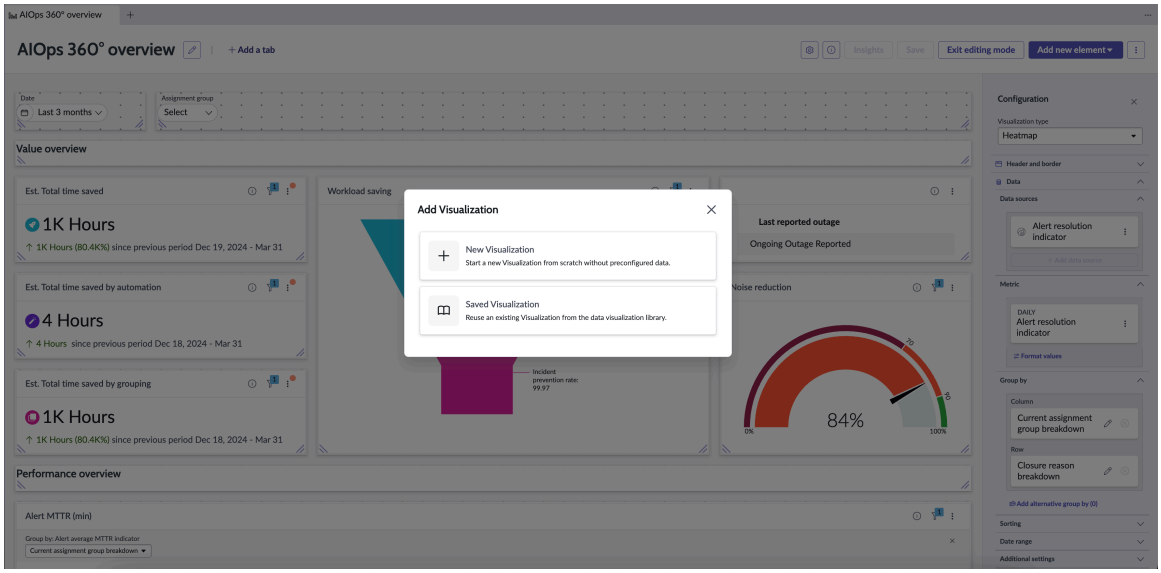


4. From the **Add new element** drop-down menu, select **Data visualization**.



5. In the Add Visualization window, select **New visualization**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. From the **Visualization type** field, select **Funnel**.

> **Note:**
> The **Funnel** visualization type is currently available only to customers who have the ITOM plugin installed.

7. Under **Data sources**, select **+ Add data source**.
   There are two kinds of data sources avail for the **Funnel** visualization type: Table and Indicator. Visualizations based on table data show a snapshot of the state of that data. Indicator visualizations reflect data over time based on data collection jobs. You can configure funnel stages using indicators in one of the following ways:

   You can configure funnel stages using indicators in one of the following ways:

   - Option 1: Use a single indicator or table with a breakdown

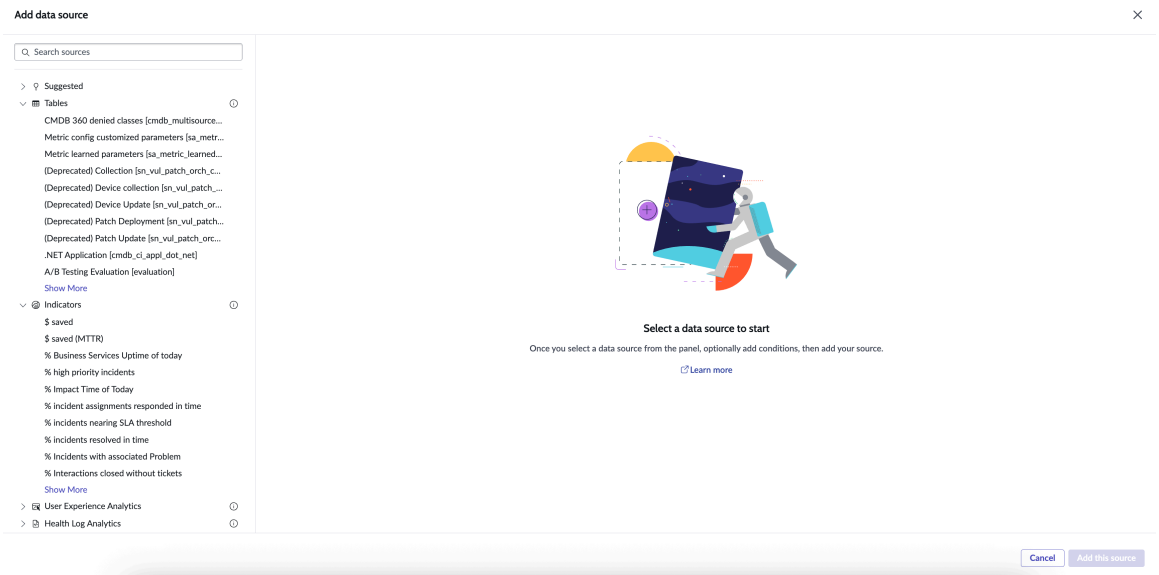
     Select a single indicator or table, and then define the breakdown using the Group by field. The breakdown values are used as the funnel stages.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you select only one indicator without a breakdown, the visualization displays an error: `Invalid configuration. A 'Group By' must be selected for the visualization to render.`

- Option 2: Use multiple indicators without a breakdown

  Select multiple indicators without setting a breakdown. In this case, each indicator's value represents a stage in the funnel.



8. Select the required data source and select **Add this source**.

   When you select a table or indicator data source for a funnel visualization, refer to the following topics for the available data configuration options:

   - Table data options for funnel visualizations
   - Indicator data options for funnel visualizations

9. Select **Save**.

Table data options for funnel visualizations

When you select a table data source for the funnel visualization, the following data configuration options are available.

Data configuration options

Field	Description
Predefined conditions	Preset filters to quickly narrow down data based on common criteria.
+ Add custom conditions	Custom filters based on user-defined criteria.
Header and border	
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
Chart title	Text shown as the title of the chart.
Description	Optional explanatory text shown below the title.
Wrap title	Option to wrap long titles onto multiple lines.
Show border	Option for border visibility setting for the widget container.
Header background color	Background color setting for the header area.
Data	
Data sources	Available inputs that supply data to the visualization.
Metric	
Label	Custom name for the selected metric. By default, the label matches the data source name.
Select an aggregation	Aggregation type applied to the metric (e.g., sum, average). The default is Count, which displays the number of records selected. **Note:** Select **Count Distinct** to count only unique records. For example, when generating a report of users with one or more roles from a list, you count each user only once. Without this option, users with multiple roles are counted more than once.
Field	Source field from the data set for the selected metric. **Note:** The data appears in a format that matches the field type. For example, an integer field like **Priority** is shown as a number. A duration field like **Business duration** from the [Incident] table is displayed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the drop-down list. For more information, see Report on function fields.
Format values	Formatting style for displaying metric values. Select to open the Formatting values dialog. For more information, see Value formatting in reports.
Group	
Field for incident	Field used specifically to group incident data.
Max number of groups	Limit on the number of groups shown in the visualization.
Show others	Option to group excess data into an **Others** category.
Data update	
Follow filter	Follows filters set at the page level.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
	When selected, the visualization reflects workspace filters. When not selected, the visualization ignores all page-level filters.
Show filter icon	Option to display the filter icon and the number of filters affecting the visualization. If the check box is not selected, the icon and filter count are hidden.
Refresh after being away for X min	Trigger based on time spent away from the dashboard within the same workspace, including the Platform Analytics experience. Defines the number of minutes after which the visualization automatically refreshes when you return. Do not confuse this setting with **Scheduled repetition** on inline dashboards, which refreshes the entire dashboard only while it remains open.
Info messages	
Set custom message when no data	Custom text displayed when no data is available for the visualization.
Colors	
Set color type	Color scheme applied to different data values or ranges.
Chart interaction	User actions supported within the chart, such as hover or select.

Indicator data options for funnel visualizations

When you select an indicator data source for the funnel visualization, the following data configuration options are available.

You can either select a single indicator and use the **Group by** field to calculate stage values, or select multiple indicators without a breakdown, where each indicator's value represents a funnel stage.

Data configuration options

Field	Description
Breakdown	Provides a way to segment data using fields like Alert Severity or Alert Status. Each condition includes a **Breakdown** field, an **Operator**, and an **Element** that defines the target value. All conditions are applied using AND logic, meaning data must meet every specified criterion to be included in the visualization.
Header and border	
Show header	Option for visibility setting for the widget header.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
Show header separator	Option to display a dividing line below the header.
Chart title	Text shown as the title of the chart.
Description	Optional explanatory text shown below the title.
Wrap title	Option to wrap long titles onto multiple lines.
Show border	Option for border visibility setting for the widget container.
Header background color	Background color setting for the header area.
Data	
Data sources	Available inputs that supply data to the visualization.
Metric	
Label	Custom name for the selected metric. By default, the label matches the data source name.
Select an aggregation	Aggregation type applied to the metric (e.g., sum, average). The default is Count, which displays the number of records selected. **Note:** Select **Count Distinct** to count only unique records. For example, when generating a report of users with one or more roles from a list, you count each user only once. Without this option, users with multiple roles are counted more than once.
Field	Source field from the data set for the selected metric. **Note:** The data appears in a format that matches the field type. For example, an integer field like **Priority** is shown as a number. A duration field like **Business duration** from the [Incident] table is displayed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the drop-down list. For more information, see Report on function fields.
Format values	Formatting style for displaying metric values. Select to open the Formatting values dialog. For more information, see Value formatting in reports.
Group	
Field for incident	Field used specifically to group incident data.
Max number of groups	Limit on the number of groups shown in the visualization.
Show others	Option to group excess data into an **Others** category.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
Data update	
Follow filter	Follows filters set at the page level. When selected, the visualization reflects workspace filters. When not selected, the visualization ignores all page-level filters.
Show filter icon	Option to display the filter icon and the number of filters affecting the visualization. If the check box is not selected, the icon and filter count are hidden.
Refresh after being away for X min	Trigger based on time spent away from the dashboard within the same workspace, including the Platform Analytics experience. Defines the number of minutes after which the visualization automatically refreshes when you return. Do not confuse this setting with **Scheduled repetition** on inline dashboards, which refreshes the entire dashboard only while it remains open.
Info messages	
Set custom message when no data	Custom text displayed when no data is available for the visualization.
Colors	
Set color type	Color scheme applied to different data values or ranges.
Chart interaction	User actions supported within the chart, such as hover or select.

Log Analytics in Service Operations Workspace for ITOM

View and address the alerts that Health Log Analytics generates in the Service Operations Workspace.

Take action on a Log Analytics alert from the Overview tab

Start the Log Analytics alert remediation process from the **Overview** tab in the Service Operations Workspace. This tab provides information on the alerts, log data associated with the anomalous behavior, CIs that generated the triggering metric, and services impacted by the alerts.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

Procedure

1. In the Service Operations Workspace, select the lists icon ( ).
2. Select the appropriate list in the Alerts sublist and navigate to the desired alert or group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All alerts generated by Health Log Analytics have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the type of Log Analytics alert. See Types of Health Log Analytics alerts for a more detailed description of each type of alert or group.

Tip:
To preview an alert in the list, click its info icon ( ).

3. Select the alert number.

   The **Overview** tab displays.

4. View the section of the **Overview** tab that provides the information that you need.

   For a description of the sections and cards, see Sections and cards on the alert Overview tab in Health Log Analytics.

   Note:
   Because some sections on the **Overview** tab show only a portion of the information, many sections include a link that displays different or more complete information.

5. **Optional:** Run predefined remediation tasks to resolve alert issues.
   a. Select **Launch playbook**.
   b. Select the **Playbook** tab.

      The **Run remediation** card displays the available remediation actions.

   c. Select the tile corresponding to the action you want to run.
   When the action is complete, it appears in the **Completed** card.

Sections and cards on the Overview tab for a Component-based alert in Health Log Analytics

The **Overview** tab in the Service Operations Workspace helps you understand Component-based alerts.

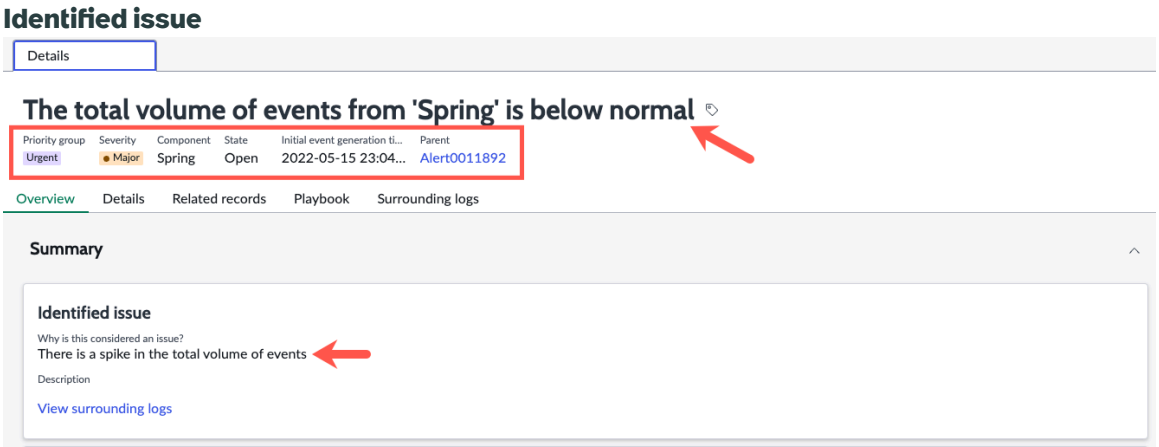
For a detailed description of Component-based alerts, see Types of Health Log Analytics alerts.

Summary

Identified issue

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select **View surrounding logs** to view log messages that are relevant to the alert. See Analyze log lines that surround an anomaly in Health Log Analytics.

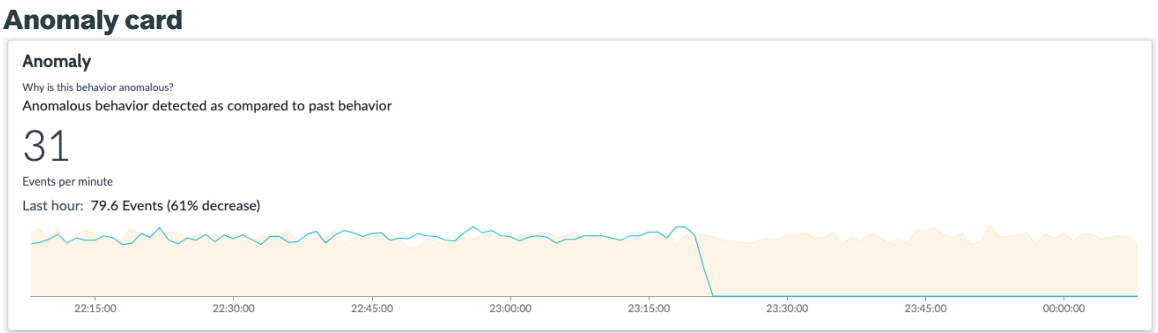
Anomaly

This card illustrates the anomalous activity that led to the alert.

- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

In this example, the peach-shaded area shows the data for the same hour one day earlier. The drop in the metric value (events per minute) is clearly visible.



For more information on the kinds of anomalies that you might encounter, see Types of anomalous behavior in Health Log Analytics.

Impact

Configuration Items

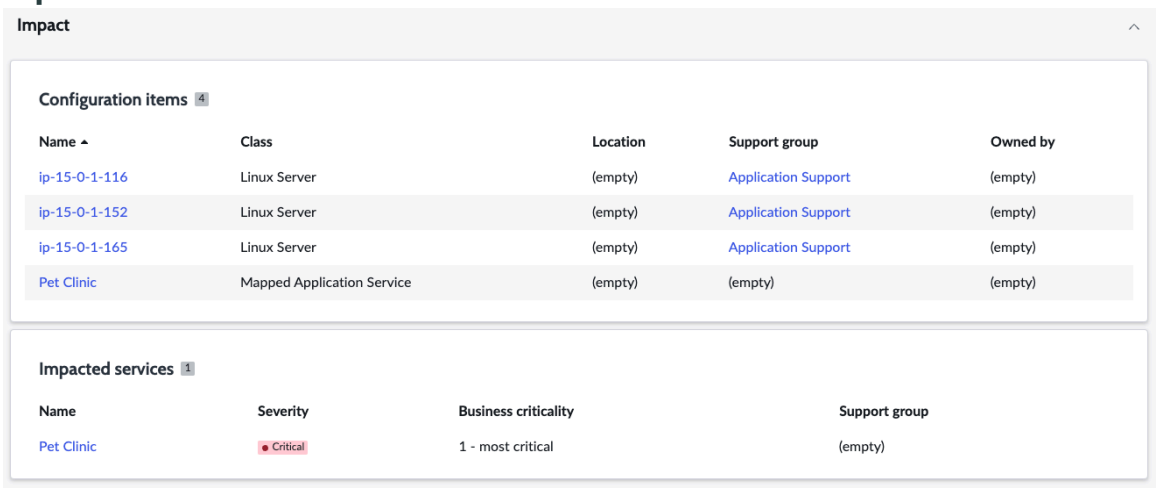
This card provides information about the CIs that are impacted by the alert.

Impacted services

This card provides information about the services that are impacted by the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact section

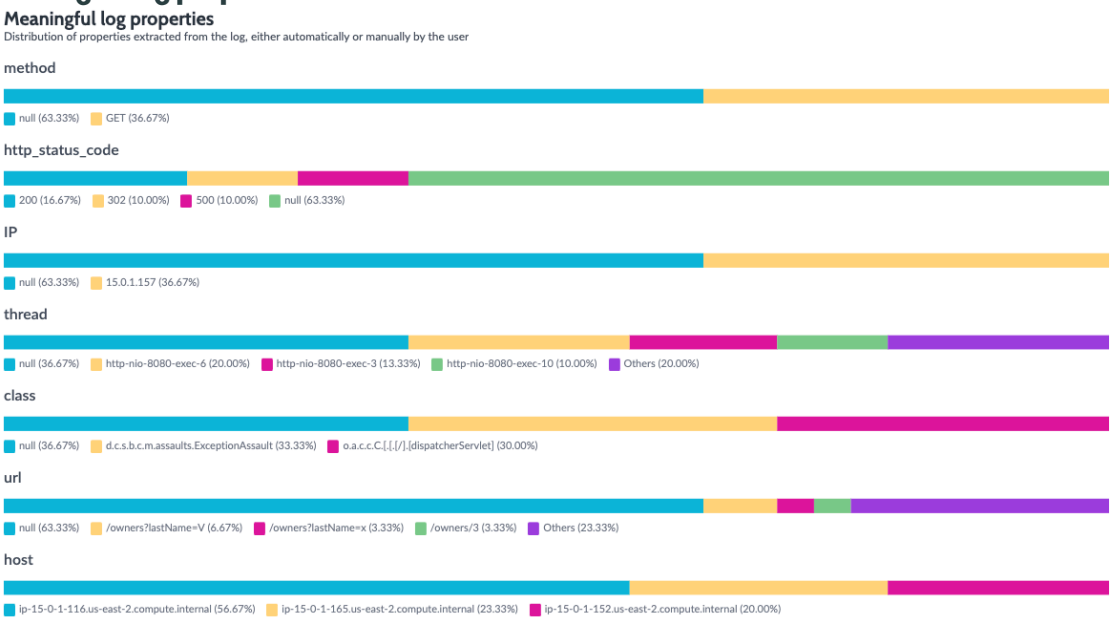


Cause

Meaningful log properties

On this card, each bar chart shows the distribution of values for a single log property that contributed to the anomaly. Each property value is associated with a color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property.

Meaningful log properties



Sections and cards on the Overview tab for a Log Analytics group in Health Log Analytics

The **Overview** tab in the Service Operations Workspace helps you understand Log Analytics groups.

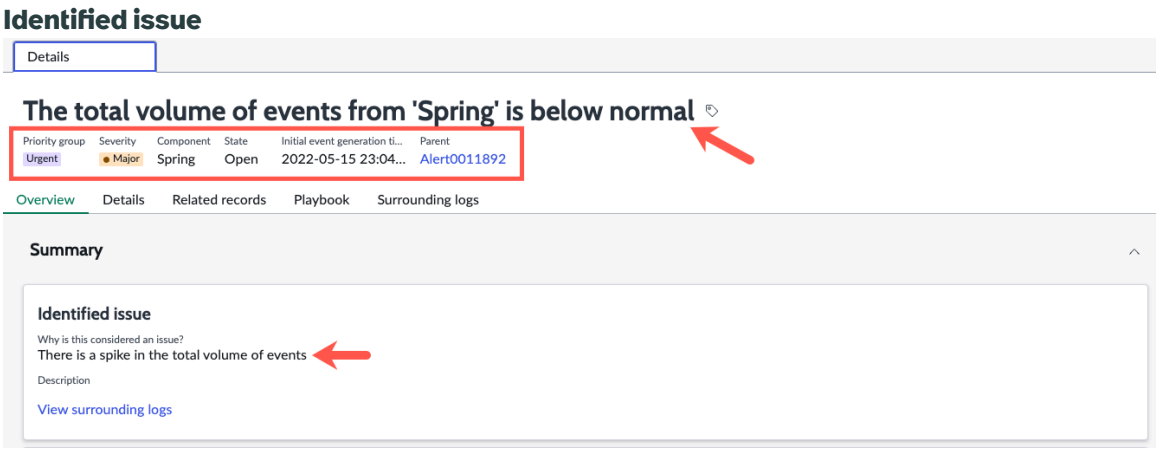
For a detailed description of Log Analytics groups, see Types of Health Log Analytics alerts.

Summary

Identified issue

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.



Select **View correlations** to view the list of correlations that relate the Log Analytics alerts.

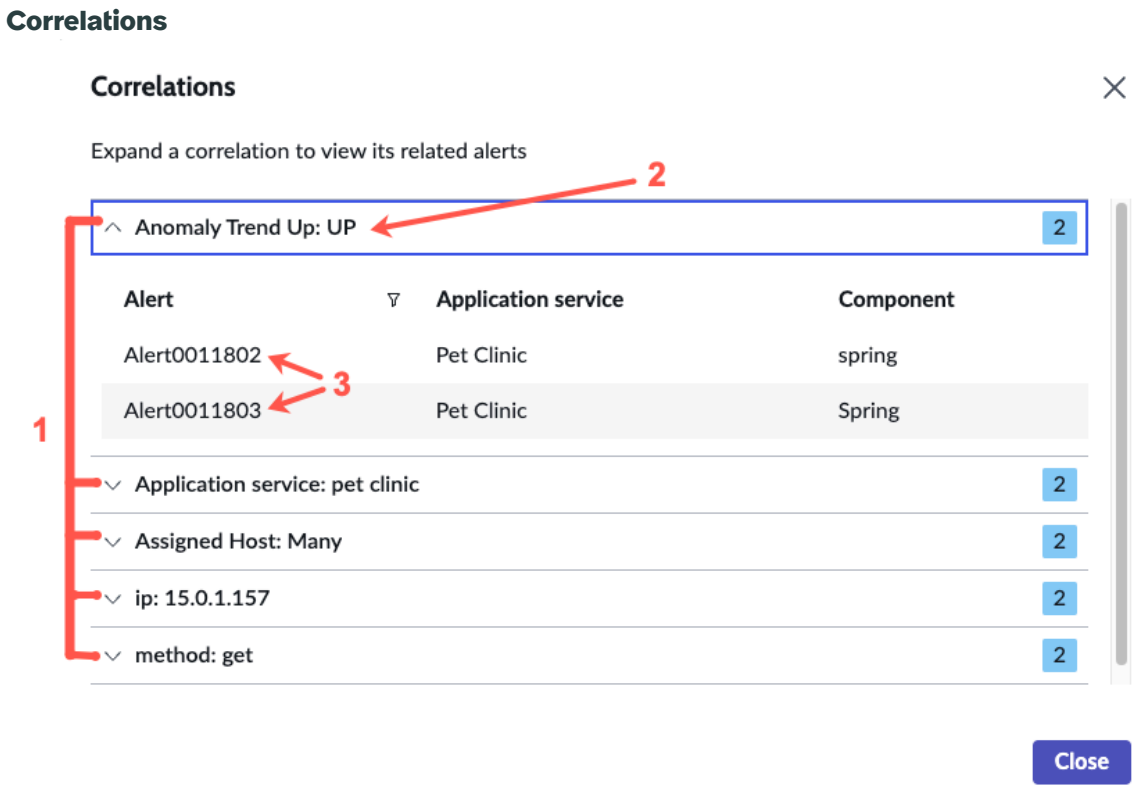
Correlations list

During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics group.

The following kinds of data are considered when determining whether alerts are correlated:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

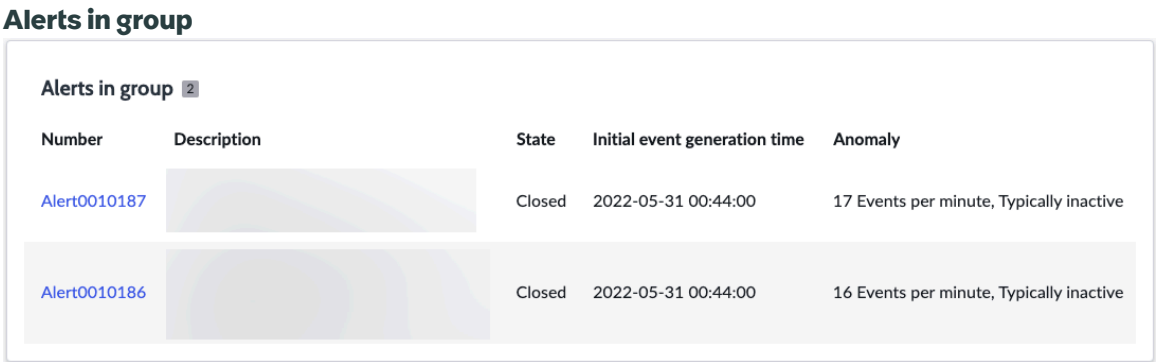
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in the blue square indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

For a Log Analytics alert, the Alerts in group card shows the Log Analytics alerts that are grouped under the Log Analytics alert. Select a Log Analytics alert to view its details.



Select **View all** to the view the list of all Log Analytics alerts in the group and relevant information about them. You can also view the Alerts in group list by selecting the **Related records** tab and then selecting **Alerts in group**. For more

View the Log Analytics alerts in a Log Analytics group in Health Log Analytics

View a list of all Log Analytics alerts in a Log Analytics group on the **Related records** tab.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

About this task

For a detailed description of Log Analytics groups and Log Analytics alerts, see Types of Health Log Analytics alerts.

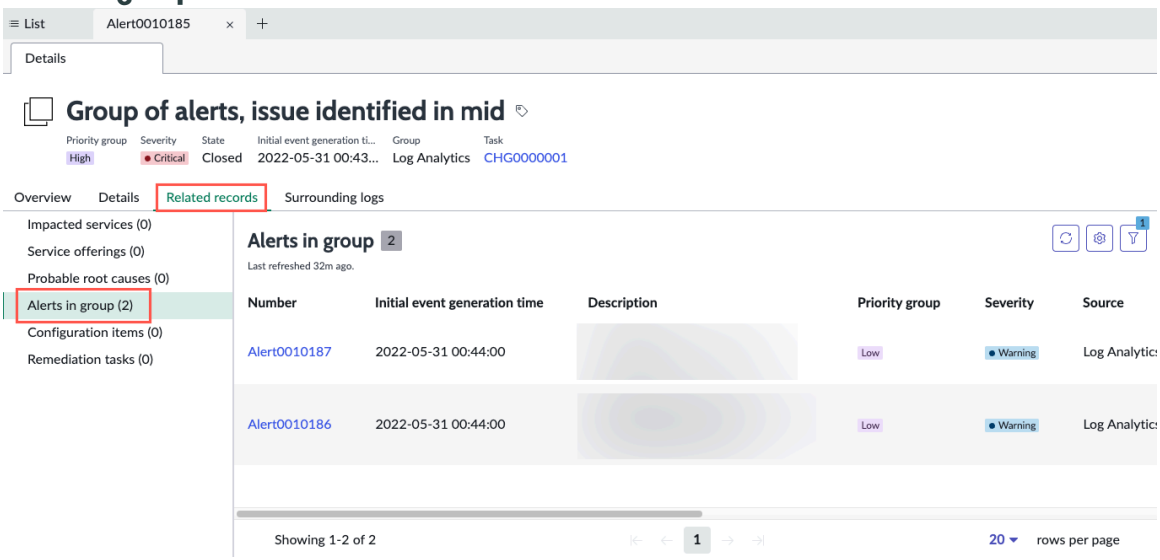
Procedure

1. On the **Overview** tab for a Log Analytics alert, go to the **Alerts in group** card and select the **View all** link.

   The **Alerts in group** section on the **Related records** tab displays.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group section on the Related records tab



2. For each Log Analytics alert in the Log Analytics group, the information described in the table is available.

Alerts in group

Column	Description
Number	The number of the alert. Select the number to view detailed information for an alert. This field is automatically set.
Initial event generation time	The time when the event that generated the alert first occurred. **Note:** Time here is the ServiceNow processing time, not the source system time.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.
Description	Anomalous pattern or metric that caused the alert to be generated.
Severity	Severity value for the alert. The available values are: ○ **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ **Minor**: Either performance has degraded or there is a partial, non-critical loss of functionality. ○ **Warning**: Attention is required even though the resource is still functional. ○ **Info**: An informational message. An alert is created, but the resource is still functional. ○ **Clear or Resolved**: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Priority group that indicates the order in which to resolve alerts. Choices are as follows: ○ **Urgent** ○ **High** ○ **Moderate** ○ **Low** The priority group value is more important than severity alone. For example, a high priority and low severity alert should be addressed before a low priority and high severity alert. For information on how priority is calculated, see Alert priority.
State	Processing state of the alert. A newly generated alert is in the **Open** state. Other states are as follows: ○ **Reopen**: A previously closed alert is open again, and it requires your attention. ○ **Flapping**: The alert is receiving identical events from the same source at high frequency. This state can cause an alert to re-open from the Closed state, resulting in a high frequency of changes between Open and Closed states. ○ **Closed**: The alert is closed and does not require any further action. You close an alert when it is remediated.
Configuration item	CI in the CMDB. The CI is applied to by the alert.
Node	Node field that is received in the log message. The event described in the log message occurred on this node. Often, the node is the name of the CI that is associated with the alert. For example, a computer name, IP address, FQDN, or MAC address.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Source	All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column to indicate that the Health Log Analytics app generated the alert.
Metric name	Name of the metric whose anomalous behavior led to the alert. For example, the *I/O request* in the case that the I/O request took longer than 15000 ms to complete.
Updated	Most recent time when the alert information or state was updated.

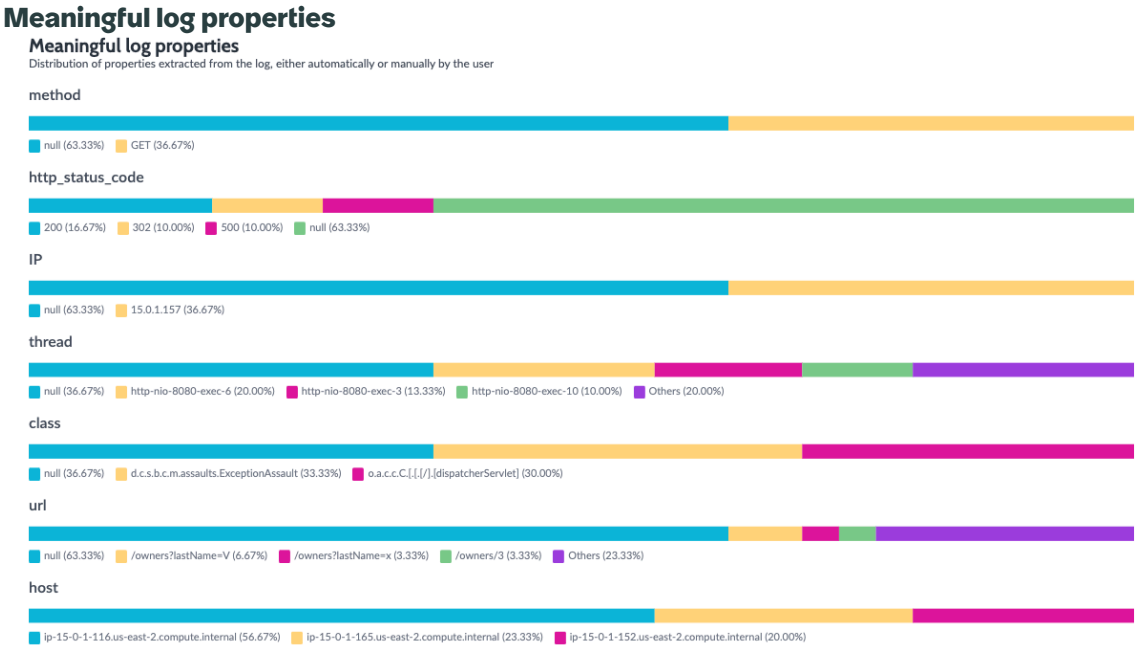
color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property.



Analyzing the logs around an anomaly to help find the alert's root cause in Health Log Analytics

When Health Log Analytics identifies an anomaly, viewing the logs that surround the anomaly provides clues about the state of faulting systems. This information can help you narrow down the root cause of an alert.

While viewing a Log Analytics alert, the **Surrounding logs** tab lists the log lines that were generated one minute before and one second after the anomaly occurred. The log lines are related to the metric or pattern that triggered the alert. The list is filtered to the relevant component.

Logs generated immediately before the anomaly might point to warning signs or conditions that led to the issue. By reviewing these logs, you can trace the sequence of events that led to the anomaly, helping you understand what went wrong. Logs created right after the anomaly can help you evaluate the impact of the event by analyzing how the system responded and whether other components were affected. The timeline of the logs around the anomaly can help clarify what might have caused the issue, for example a configuration change or a software update.

You can modify the time range of the displayed log lines, for example to investigate logs from more than one minute before the anomaly, or more than a second afterward.

Note:
Logs that surround the anomaly are retained and available for 30 days after the creation of the alert. The system does not delete these logs when the global retention period of logs expires. When the retention period expires, the surrounding logs are available only on the **Surrounding logs** tab and not in the Log viewer.

Health Log Analytics enables you to view the anomalous log data graphically on the Log viewer, accessed from the Service Operations Workspace. The Log viewer displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log lines. It automatically shows the query that relates to the anomaly, the selected component, and the appropriate time filter. For more information, see Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.

Related topics

Analyze log lines that surround an anomaly in Health Log Analytics

Analyze log lines that surround an anomaly in Health Log Analytics

View the log lines around an anomaly to help you identify the root cause of a Log Analytics alert.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert.
2. Select the **Surrounding logs** tab and review the information.
   The tab displays the list of log lines that were generated one minute before and one second after the Log Analytics alert. For an explanation of the information on the tab, see Surrounding logs tab fields.
3. **Optional:** View a different timespan of the log lines using one of the following methods:
   - Update the time range relative to the alert to a predefined time range in the **Select range** list.
   - Specify a **Start time** or **End time** using the time picker.
4. **Optional:** View the anomalous log data graphically as a function of time by selecting **Log viewer**.
   For more information, see Reviewing the logs for an alert on the Log Viewer in Health Log Analytics.

Reviewing the logs for an alert on the Log Viewer in Health Log Analytics

The **Log Viewer** tab lets you browse the logs for an alert by timestamp or time range, and visualize anomaly frequency within a specific time period. Customizing the displayed data and adjusting time filters enables you to better understand the framework in which the anomaly occurred, helping you find the root cause faster.

The Log Viewer presents all data connected with the Log Analytics alert. It shows the query that relates to the anomaly, the selected component, and the appropriate time filter. You can personalize the displayed data, and manually adjust the time range without affecting the other settings. The applied filters appear in the **Filters** pane. You can add or remove filters as needed to show only the data you want to view.

The **Log Viewer** displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log data. This information helps you identify trends leading up to and following the event, providing context for root cause analysis.

As you analyze the logs for an alert on the **Log Viewer**, you can modify the query to fine-tune the search, save useful searches, and share them with others. For a description of the information displayed in the **Log Viewer** table, see Log Viewer table fields.

You can perform the following tasks on the **Log Viewer**:

- View log data for an alert in Health Log Analytics

  View a chart of the frequency of anomalous log lines and the associated log data.

- Define, save, and share a search of log data in Health Log Analytics

  Fine-tune the search query to help determine the causes of the issue, and save and share useful searches.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use or modify a saved log data search in Health Log Analytics

  Use a saved search. As the owner of a saved search, you can modify the search values and save your changes.

- Filter search results on the Log Viewer in Health Log Analytics

  Apply filters to show only the data you want to view.

- Customize the Log Viewer table in Health Log Analytics

  Add or remove columns in the table to show only the data you want to view.

If you discover an important metric in the log data, you can use it to define a new Log Analytics alert rule. For more information, see Add a Log Analytics alert rule in Health Log Analytics.

Related topics

Analyzing the logs around an anomaly to help find the alert's root cause in Health Log Analytics

View log data for an alert in Health Log Analytics

View a chart of the frequency of anomalous log lines and the associated log data on the Log Viewer.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** tab using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. **Optional:** Personalize the displayed data and how it is presented on the Log Viewer.
   - Filter search results on the Log Viewer in Health Log Analytics to show only the data you want to view.
   - Customize the Log Viewer table in Health Log Analytics by adding or removing columns.

   These features are supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.
3. Analyze log-based anomalies and added context to help you achieve faster mean time to repair (MTTR).
   For example, say you find a log line with errors found in a configuration file. On the **Anomaly** card, a sudden spike on the chart indicates where the configuration file is generating the errors. You can view additional key-value pairs extracted from the logs on the **Meaningful log properties** card and find the affected application services and their related service offerings on the **Impacted services** card. For greater context, you may want to investigate the logs that surround the anomaly, locate the configuration file, and find the time frame where the issues occurred.

What to do next

Use additional features on the Log Viewer to refine your search or define alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Modify the search query to fine-tune the search and save useful searches. See Define, save, and share a search of log data in Health Log Analytics.
- If you discover important relationships in the log data, select **Define alert** to define the kind of alert that should be triggered by the data. See Add a Log Analytics alert rule in Health Log Analytics for instructions.

Related topics

Reviewing the logs for an alert on the Log Viewer in Health Log Analytics

Define, save, and share a search of log data in Health Log Analytics

Define, save, and share searches of log data to help determine the causes of Log Analytics alerts.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define a search.

   a. Select the selection icon ( ) and then select **New search**.

   b. Set the values of the search parameters in the search fields.

Search fields

Search field	Description
Query	Search query. **Tip:** The Log viewer uses the Elasticsearch search engine, so you can use any supported search term structure in the **Query** field.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Time range	Time range to apply to the X-axis when displaying the returned data. The setting that you specify appears in the **Start time** and **End time** fields. Use one of the following methods: ▪ Select a time period from the list. ▪ Click **Custom range** to use the date and time picker to specify a range.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Field	Description
	(Optional) This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

To revert changes you have made to the search values, select the selection icon ( ) and then select **Discard Changes**. The changes that you made to the search values are discarded. You can continue to update the search settings.

c. Save the updated search.

i. Select **Save as**.

ii. In the **Search name** field, specify a unique and descriptive name for the search and then click **Save**.

Filter search results on the Log Viewer in Health Log Analytics

Apply filters on the **Log Viewer** to show only your desired data.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

About this task

This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define and run a search.
   For more information, see Define, save, and share a search of log data in Health Log Analytics.
3. Filter the search results in one of the following ways.

Option	Description
Add filters using the fields list	**a.** Select the filter icon ( ). The Selected fields list includes the fields that currently display as columns in the **Log Viewer** table. By default, the table includes the following columns: Application service, Component, Host, Level, Message, Raw message, and Time. The Available fields list includes all remaining fields that the sys tem has extracted from the log.

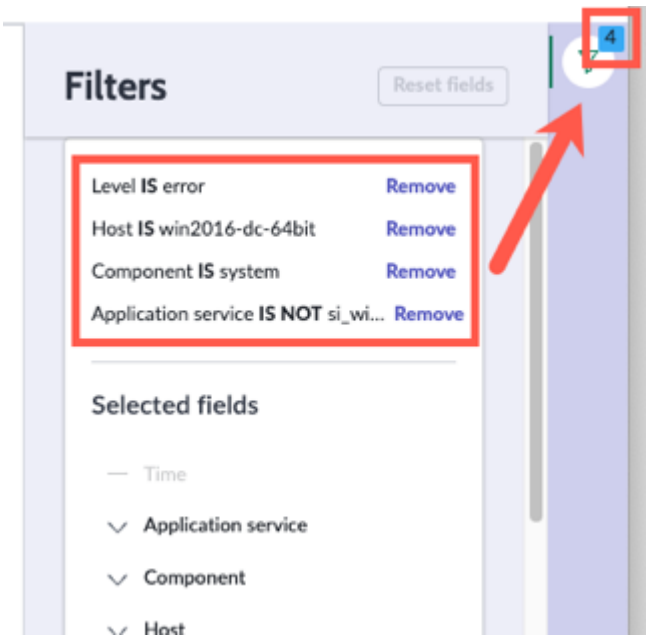
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	b. Select a field in the list. **Note:** You can search for a specific field us ing the search option. The top five values the system has found in the records for this field are displayed, along with the percentage of their occur rence.  **c.** Define a filter for a value in the field. ▪ To display only data that contains a val ue, select **Add** for it. For example, to set the filter **[Level][is] [critical]**, select **Add** for the value "criti cal" in the Level field. ▪ To create negative filters that exclude da ta that contains a value, select **Exclude** for it. For example, to set the filter **[Level][is not][critical]**, select **Exclude** for the val ue "critical" in the Level field.
Add filters from the Log Viewer table	**a.** In a column header, select the more actions icon (⋮). **b.** In the dialog box, select the operator and specify the filter terms for the field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	 **c.** Select **Apply**. A filter icon in the column header indicates that a filter applies for this field.

The applied filter appears at the top of the **Filters** pane. The total number of applied field value filters in the **Filter** icon adjusts.



4. Optional: Remove a filter in one of the following ways.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Filters** pane:
  a. Locate the filter you want to remove.
  b. Select **Remove**.
- In a column header:
  a. Select the more actions icon (⋮).
  b. Select the filter you want to remove.
  c. Select **Remove filter**.

Customize the Log Viewer table in Health Log Analytics

Add or remove columns in the **Log viewer** table to show only the data you want to view.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_admin

About this task

This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Select the filter icon ( ) to display the **Filters** pane.
   The Selected fields list includes the fields that currently display as columns in the **Log viewer** table. By default, the table includes the following columns: Application service, Component, Host, Level, Message, Raw message, and Time. The Available fields include all remaining fields that the system has extracted from the log.

   In the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, available from the ServiceNow Store, the Log message column is added and the Raw message column no longer displays by default. You can add the Raw message column to the table by selecting it from the **Filters** pane.
3. Add or remove columns in the **Log viewer** table.
   - To add a column to the table, select the field of the same name in the Available fields list and then select the add icon ( ).

     The added field displays as a column in the table. It is now listed in the Selected fields list.
   - To remove a column, select the field of the same name in the Selected fields list and then select the remove icon ( ).

     The corresponding column is removed from the table. The removed field is added to the Available fields list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have filtered the data for specific values in a field, that data still displays even when the field is no longer selected. For more information about filtering data, see Filter search results on the Log Viewer in Health Log Analytics.

Note:
The Time column can't be removed from the table.

4. **Optional:** Adjust the maximum number of characters per field in the table.
   a. Navigate to **Health Log Analytics** > **Health Log Analytics Administration** > **System Properties**.
   b. Open the *sn_occ.log_viewer.max.characters* property record.
   c. In the **Value** field, edit the default value.
   d. Select **Update**.

Result
The **Log viewer** table shows the customized view from the current session onward until you change your preferences.

Adding, changing, or deleting Log Analytics alert rules in Health Log Analytics

Add, change, or delete an alert rule that generates an alert for a specified metric.

For more information, see Use alert rules to control when Health Log Analytics generates alerts.

Add a Log Analytics alert rule in Health Log Analytics

Define a Log Analytics alert rule when you encounter log data that should generate an alert. The alert rule generates an alert for a specified metric with a threshold that you specify and sets the properties of the generated alert.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure
1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define and run a search.
   For more information, see Define, save, and share a search of log data in Health Log Analytics.
3. When a search returns log data that should generate an alert, click **Save** or **Save as** to save the search.

   Note:
   If you are using Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store , you don't have to perform this step.

4. Access the form for creating an alert rule by selecting **Define alert** at the top right of the **Log viewer** tab.
5. On the form, provide the name and description for the alert rule.
   The name appears on the Anomaly card for generated alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Determine whether the rule generates alerts when the threshold conditions are met in the log data by setting the **State** field.
   To activate the rule, select **Enabled**.
7. If you have installed the Health Log Analytics application, Version 20.0.11 - July 2021 , set the Severity value for the alert generated by this alert rule.
   - **Low**: Attention is required even though the resource is still functional.
   - **Medium**: Either performance has degraded or a partial, non-critical loss of functionality has occurred.
   - **High**: Major functionality is severely impaired or performance has degraded.
   - **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent.
8. If you have installed the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, fill in the details for the query.

Query details

Field	Description
Your query	The query to search for in the log data. By default, this is the query that was defined on the Log viewer. You can modify the query by adding search requirements to it. To search for all queries, specify an asterisk (*).
Active filters	The filters defined for the query on the Log viewer. You can delete the filters.
Component	The component to which this alert rule applies. By default, this is the component that was defined on the Log viewer. You can choose a different component by selecting the search icon ( ) in the Component row and then selecting the required component from the list.

9. Fill in the fields related to the threshold that will trigger the alert rule.

Threshold

Field	Description
Operator	Mathematical comparison operator that qualifies how the hit count triggers an alert of this kind. This field is automatically set to Bigger Than.
Hit count	Number of matching log entries that serve as the trigger for an alert of this kind.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Time period	Period of time over which the hit count is measured. The period is measured in the units specified by the **Time unit** value.
Time unit	Units of the time period. This field is automatically set to minutes.
Persistence	Time period over which the specified hit count per unit time must persist in order to trigger an alert of this kind. The field is automatically set to 1 minute.

10. Select **Save**.

Change a Log Analytics alert rule in Health Log Analytics

Modify a Log Analytics alert rule that you have defined.

Before you begin

This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Open a defined alert.
   a. Select the selection icon ( ) at the top right of the **Log viewer** tab, and then choose **Manage my defined alerts** from the drop-down list.
   b. From the **Defined alerts** table, select the alert rule that you want to modify.
3. On the form, update the settings.
   For a description of the settings, see Add a Log Analytics alert rule in Health Log Analytics.
4. Select **Save** to save your changes.

Delete a Log Analytics alert rule in Health Log Analytics

Delete a Log Analytics alert rule that you have defined if it is no longer necessary.

Before you begin

This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Role required: evt_mgmt_operator or evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Open a defined alert.
   a. Select the selection icon ( ) at the top right of the **Log viewer** tab, and then choose **Manage my defined alerts** from the drop-down list.
   b. From the **Defined alerts** table, select the alert that you want to delete.
3. Select **Delete**.

Assigning higher or lower significance to an alert in Health Log Analytics

Label an alert as meaningful or insignificant, or restore normal importance to the metric involved in generating it.

Mark an alert as significant in Health Log Analytics

Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert and then select **Apply ML feedback** > **Mark as significant**.
2. Confirm the action in the dialog box.

   Note:
   Processing this feedback might take a few seconds.

3. **Optional:** Restore the significant alert.
   If you no longer want the significant alert to be treated specially, you can restore normal significance to the alert metric. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

Mute an unimportant alert in Health Log Analytics

Eliminate distracting new alerts for insignificant issues by muting them.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

When you mute an alert that is based on the keyword metric or the pattern severity metric, the system mutes the metric in the dominant pattern. The dominant pattern is the main pattern that contributes to the anomaly. For the specified source only, anomalous behavior for the metric that is associated with the muted alert no longer generates alerts. You can also mute the metric that is associated with an unimportant alert for all components of the Application Service. A component can be multiple CIs that perform the same function.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Service Operations Workspace, open the Log Analytics alert that you don't want to see again.
2. Select **Apply ML feedback**
3. Mute the metric associated with the alert by doing one of the following:
   - Select **Mute alert metric** to mute the metric for the specified source only.
   - Select **Mute alert metric for all components** to mute the metric for all components of the Application Service.
4. Confirm the action in the dialog box.

   Note:
   Processing this feedback might take a few seconds.

5. **Optional:** Restore the muted alert.
   If you no longer want the muted alert to be treated specially, you can restore normal significance to the alert metric. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

View the list of muted metrics in Health Log Analytics

Decrease sensitivity to similar anomalies in Health Log Analytics

Make anomaly detection less sensitive to anomalies like the one that triggered the current Log Analytics alert.

Before you begin

Note:
This functionality is not available for customer alerts and new signal alerts.

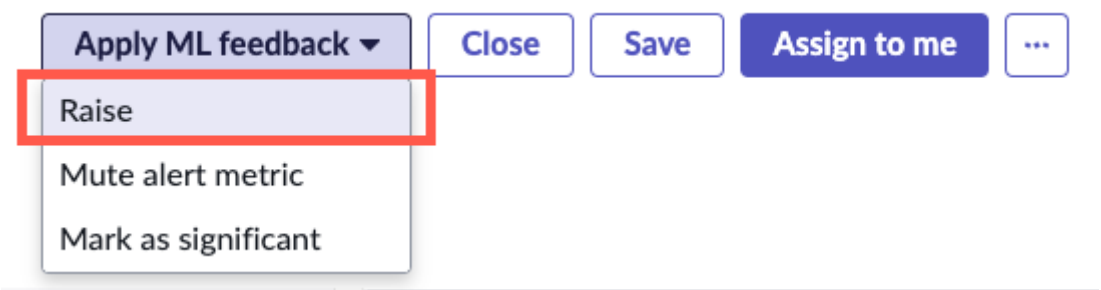
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Selecting the Raise feedback option raises the threshold for generating alerts when Health Log Analytics identifies future anomalies similar to the one that led to this alert.

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert and then select **Apply ML feedback** > **Raise**.



2. Confirm the action in the dialog box.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Processing this feedback might take a few seconds.

3. **Optional:** Restore normal sensitivity to anomalies like the one that triggered this alert.
   a. While viewing the alert, select **Remove feedback**.
   b. Confirm the action in the dialog box.

Restore normal importance to an alert metric in Health Log Analytics

Return normal significance to the metric involved in generating a Log Analytics alert. Use this option if you no longer want an alert to be treated specially that was muted, marked as significant, or made less sensitive to similar anomalies.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. While viewing a Log Analytics alert in the Service Operations Workspace, select **Restore ML feedback**.
2. Confirm the action in the dialog box.

Result
The metric that is associated with the alert returns to normal importance.

Dashboards for real-time visualization of log data in Health Log Analytics

Health Log Analytics enables you to create log data dashboards and visualizations in real time for enhanced data monitoring and faster identification of deviations.

Log data dashboards and visualizations can give you a high-level visual understanding of important issues as they occur in the system. The Health Log Analytics data source of your choice is used to ingest the data that is provided to the visualization. The log data is taken directly from your stored logs, enabling you to create dashboards for any aspect of the data that interests you. For example, by visualizing the components that are generating logs, you can get an indication of the number of components that are fully integrated.

The data can be presented in various types of graphs and charts. You can adjust the time range and the other settings of the visualization as needed.

This functionality is supported in the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, and has a dependency on the Platform Analytics Workspace, available from the ServiceNow Store.

As an alternative to defining your own dashboard, you can use the AIOps dashboards, which offer comprehensive visualizations of critical operational data. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

© 2025 ServiceNow, Inc. All rights reserved.

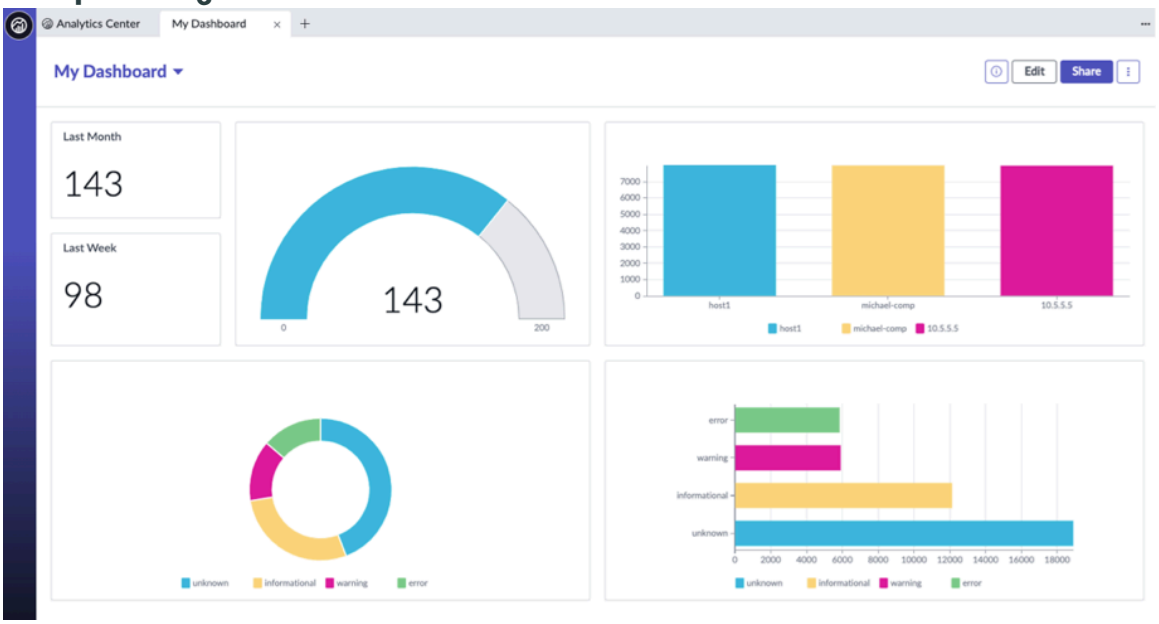
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of a log data dashboard



Create log data dashboards and visualizations in Health Log Analytics

Build Health Log Analytics log data dashboards and visualizations in real time for easier identification and understanding of issues.

Before you begin

This functionality is supported in the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, and has a dependency on the Platform Analytics Workspace, available from the ServiceNow Store.

For detailed information about creating and working with dashboards, see Dashboards in the Analytics Center.

Note:
As an alternative to defining your own dashboard, you can use the AIOps dashboards, which offer comprehensive visualizations of critical operational data. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Role required: evt_mgmt_operator or viz_admin

Procedure

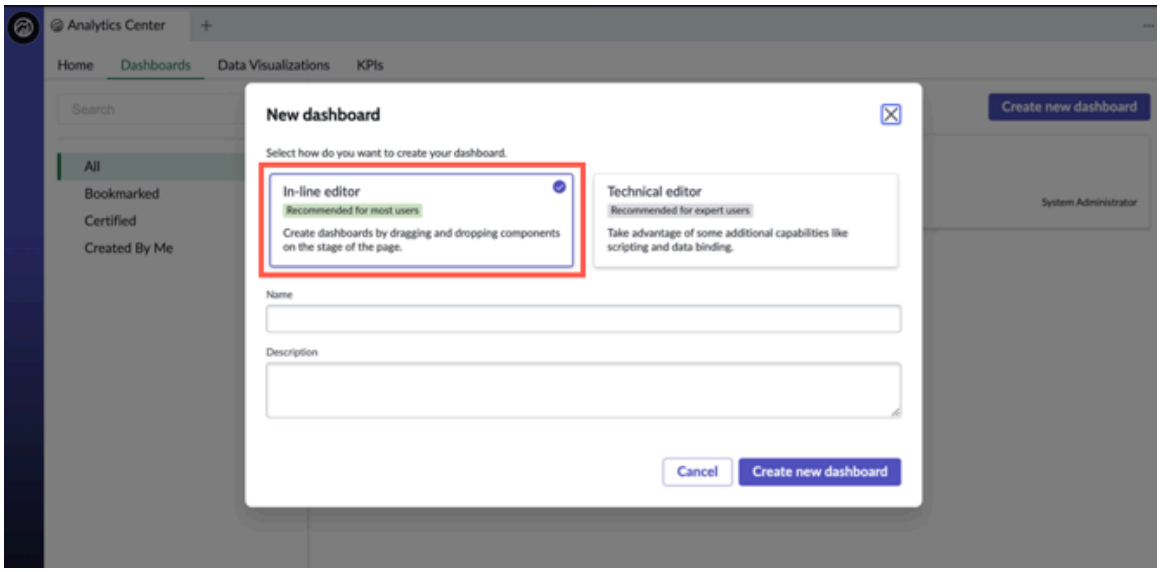
1. Navigate to **Workspaces** > **Platform Analytics Workspace**.
2. On the Analytics Center page, select the **Dashboards** tab.
   This tab enables you to view all the dashboards you have rights to access on your instance. You can filter the dashboard tiles to limit the number that are visible.

   Note:
   If you want to use an existing dashboard, select the dashboard here to open it. Otherwise, create a dashboard as explained in the remainder of this procedure.

3. Create a dashboard.
   a. Select **Create new dashboard**.
   b. In the New dashboard dialog, choose **In-line editor** and specify a name and optional description for the dashboard.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The in-line editor does not automatically save your work. Ensure that you save regularly.



c. Select **Create new dashboard**.

4. Add an element to the dashboard.
Various elements are available to help you organize and populate the information on the dashboard. For more information, see Analytics Center dashboard elements.

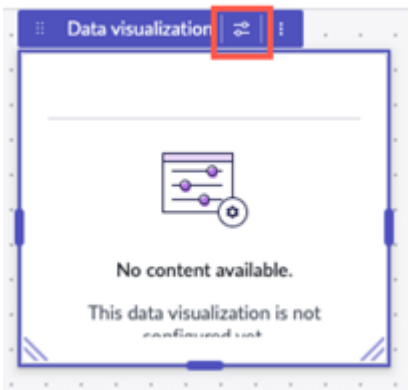
a. Select **Add new element**.

b. Select **Data visualization** from the available elements.
The **Data visualization** element appears on the dashboard, where you can edit it.

Note:
You can click and drag the corners of the element to resize it.

5. Edit the element.

a. On the element, select the Settings icon:



The Configuration panel opens.

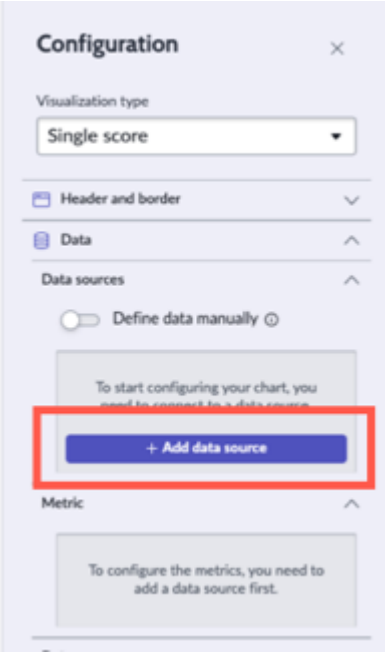
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. From the **Visualization type** list, choose the type of visual representation you want for the log data.
You can choose from various types of graphs and charts.

For detailed information, see Data visualizations in the Analytics Center.

c. In the Data section, select **+ Add data source**.

The Health Log Analytics data source that you select is used to ingest the log data that is provided to the visualization.



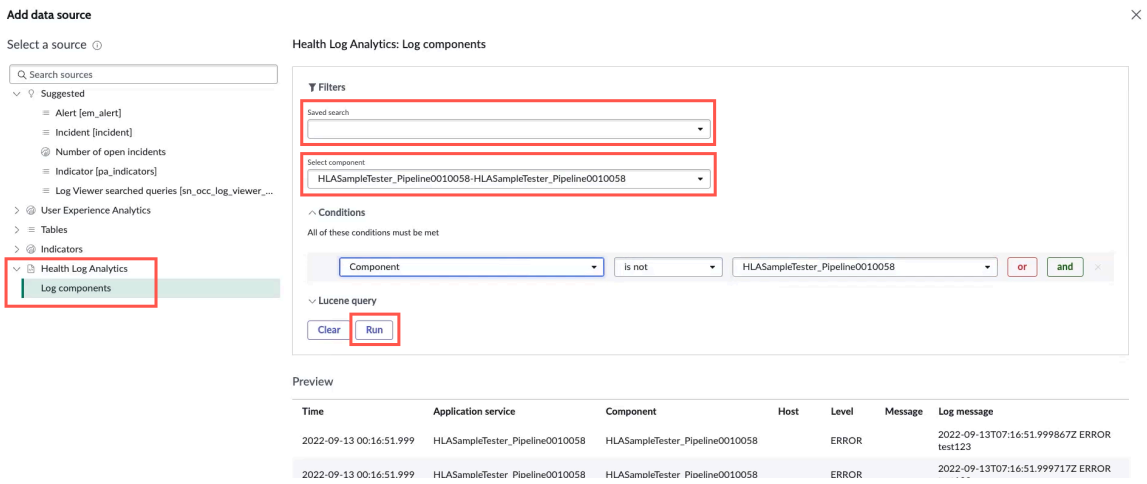
d. Select the Health Log Analytics Log components data source.

e. Choose the required data source from these options:

- Saved searches – a list of all the searches you saved in the Log viewer.
- Select component – a list of all the components that stream data to Health Log Analytics.

f. Use Conditions, a Lucene query, or both to specify the data segment you're interested in and then select **Run**.

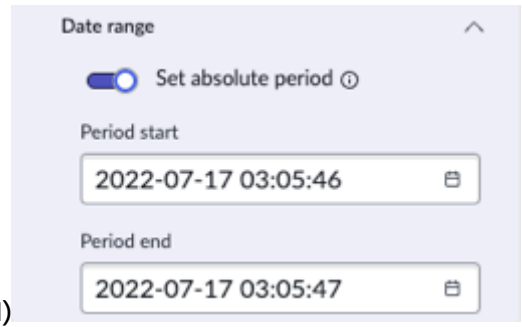
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



g. Select **Add this source** to add the selected Health Log Analytics data source. The specified visualization displays in the **Data visualization** element.

h. Optional: Set fixed start and end dates to customize the time range of the presented data.

(Optional)



i. In the Date range section, select **Set absolute period**.

ii. Specify the start and end date for the absolute period in the appropriate calendars.

i. Optional: Adjust the other settings of the visualization as needed.

(Optional) For detailed information on settings for all the visualization types, select the link for the relevant type in Data visualizations in the Analytics Center.

j. Optional: Add more elements as needed.

k. Select **Save** to save your changes and continue editing.

l. Select **Exit editing mode** to stop editing and display the dashboard.

Monitor visualized log data on a predefined dashboard in Health Log Analytics

Use visualizations to monitor log data on the built-in Operational Dashboard in Service Operations Workspace Log Analytics and address issues as they occur in the system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

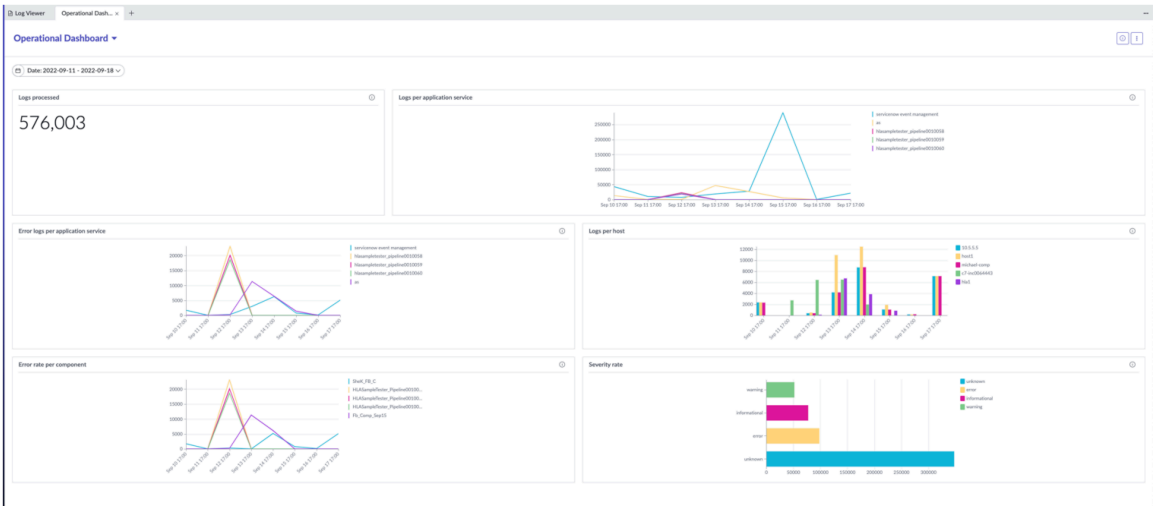
Role required: evt_mgmt_operator or viz_admin

Important:
From the Vancouver release onward, this feature is deprecated and replaced with the AIOps HLA Operational dashboard. For more information about AIOps dashboards, see AIOps Dashboards in Service Operations Workspace for ITOM. You can also build a custom dashboard per your needs. For more information, see Create log data dashboards and visualizations in Health Log Analytics.

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Select the selection icon at the top right of the **Log viewer** tab, and then choose **Manage my dashboards** from the drop-down list.
   The **Operational Dashboard** tab displays.

   By default, the dashboard visualizes log data that was ingested in the last 24 hours.



3. **Optional:** Change the time range for which data is shown by selecting the required range from the **Date** drop-down.
   You can specify a custom range by selecting **Custom** and then selecting the required start and end dates.
4. Monitor the visualized log data and use it to identify and address issues.

Operational Dashboard

Name	Description	How to use the data
Logs processed	The number of logs that were processed and analyzed in the selected period.	Ensure that the log data is streaming as expected.
Logs per Application Service	The number of logs streamed for each application service in the selected period.	Ensure that log data is streaming as expected for each application service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	How to use the data
Error rate per Application Service	The number of logs with errors for each application service in the selected period. **Note:** Health Log Analytics automatically creates alerts for Error anomalies.	Identify errors in the logs.
Logs per Host	The number of processed logs for each host in the selected period.	Identify hosts that are logging more data, or less data, than expected.
Error rate per Component	The number of logs with errors for each component in the selected period.	Ensure that the components have a normal Error rate.
Severity rate	The severity level rate of the logs for the streaming sources.	Ensure that Critical and Error level rates are as expected.

Add a KB article to a Log Analytics alert

Add your own knowledge base (KB) article to an alert that was generated by Health Log Analytics. For example, you can provide additional information that might help to resolve the underlying issue.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, and the Health Log Analytics Viewer application, Version 21.0.0 - December 2021 and later. These applications are available from the ServiceNow Store.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open a Log Analytics alert.
   a. In the Service Operations Workspace, select the lists icon ( ).
   b. Select the appropriate list in the Alerts sub-list and navigate to the desired alert.
      In the **All Alerts** list, alerts that were generated by Health Log Analytics have the value **Log Analytics** in the **Source** column.
   c. Select the alert number.
2. Select the more actions icon ( ) at the top right of the **Details** tab and then choose **Create KB article for this issue** from the list.
3. On the form, fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Knowledge form

Field	Description
Knowledge base	The knowledge base where the new KB article is stored. By default, this value is the Health Log Analytics knowledge base.
Workflow	(Read-only) The status of the KB article. When you publish the article, its status automatically changes from Draft to Published.
Category	The category of the component that caused the alert.
Short description	Summary of the KB article.
Article body	Content of the KB article.

4. Select **Save**.
5. When the content of the article is final, select **Publish**.

Result
The KB article is added to the selected alert. You can search for and display the article in the Agent assist side panel. Health Log Analytics also uses your article to enhance similar alerts with the same Event ID property or alert pattern.

Service Operations Workspace for ITOM reference

Reference topics provide additional information about ServiceNow Service Operations Workspace.

Components installed with AIOps Experience

Several types of components are installed with activation of the AIOps Experience [sn_sow_aiops] application, including user role and plugins.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
evt_mgmt_user	Manages the alert lifecycle and performs basic operations, such as viewing alerts.	itil

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
evt_mgmt_operator	Manages alerts, including tasks such as closing and acknowledging them.	evt_mgmt_user
evt_team_operator	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific to their team, including updates to Alert Automation and the Integrations Launchpad. **Note:** The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.	sn_sow_alert_rules.automation_create_nonglobal sn_sow_alert_rules.automation_delete_nonglobal
evt_mgmt_admin	Configures and sets up Event Management properties and rules.	evt_mgmt_user and evt_mgmt_operator

Plugins installed

Plugin	Description
Event Management [com.glideapp.itom.snac]	Provides service-oriented availability and monitor events through an intuitive console.
Performance Analytics - Premium [com.snc.pa.em]	Provides core out-of-the-box Key Performance Indicators (KPIs) to help monitor and enhance event management processes. Please note that activating this plugin on production instances may require a separate Performance Analytics license.
Performance Analytics - Content Pack - Event Management	Includes core out-of-the-box Key Performance Indicators (KPIs). Activating this plugin on production instances may require a separate Performance Analytics license.

To return to the procedure, see Install Service Operations Workspace for ITOM application.

Attributes in Express List Link View

The table lists the node attributes available in Link View with their icon and description.

Note:
"Attribute" is a generic term that represents fields and tags found on the alerts or configuration items (CI).

Attributes in Link View

Attribute name	Icon	Description
Impacted service		Service in the Configuration Management Database (CMDB) impacted by an alert on a CI.
Resource		Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Source		Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Region		Predefined attribute extracted from connector payload.
Location		Predefined attribute extracted from connector payload.
Assignment group		Alert assignment group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
Environment		Predefined attribute extracted from connector payload.
Metric		Unique name that describes which metric data is collected.
IP address		Predefined attribute extracted from connector payload.
CI		JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the Additional information field. Maximum length: 1000 characters.
Node		Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Application		Predefined attribute extracted from connector payload.
Process		A process or a cluster of processes running on the host that are identified by the horizontal discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
Component		A logical part of a service instance where the alert was detected, with one component shown for each child alert.
Service		Attribute extracted from the log file. The impact of this alert on the service might not be clear or defined.
Host		Attribute extracted from the log file. It might not be identified in the CMBD.
User		Attribute extracted from the log file.
Account		Attribute extracted from the log file.
Path		Path or route extracted from the log file.
Request id		The request ID extracted from the log file.
URL		Web address or URL extracted from the log file.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
Detection		An identified anomaly on a metric measured by Health Log Analytics.
Other **Note:** This attribute is user-defined. All the other attributes are predefined in the system.		User-defined attribute. **Note:** All the other attributes are predefined in the system.

Lines linking attributes

Link	Visual representation	Description
Solid line		Solid line linking attributes in Link View, indicating that the attributes share one or more alerts.
Dotted line		Dotted line linking attributes in Link View, indicating that the attributes are correlated by grouping criteria.

Alert field mapping on the Respond page

The fields to be configured on the Respond page, when selecting an action to be triggered by an alert automation.

Select automation actions fields

Field	Description
Incident field name	Name of the field that will appear in the incident.
Map field	Option that indicates how the incident field is to be mapped: • **Same as**: The selected incident field will have the same value as the indicated alert field. • **To**: The selected incident field will be set to a specified value.
Alert field value	Value that will be set in the alert field:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select automation actions fields (continued)

Field	Description
	• If you select **Same as** in the Map field column, the alert field value that you want to appear in the incident field also appears in the Incident field name column. • If you select **To** in the Map field column, enter the alert field value that you want to appear in the specified incident field.

To return to the procedure, see Create Respond automation.

Outbound webhook parameters

The parameters to be configured when sending data to other systems using an outbound webhook.

Outbound webhook parameters

Parameter	Definition
Destination URL field	The webhook endpoint (URL) where the alert is to be sent.
JSON payload data tab	The alert data, composed in JSON format, being sent to the indicated URL. Enter the details you want to be notified about in the JSON object when the automation is triggered. You can insert alert fields by selecting **Insert Field Values** or add custom fields by typing {custom_field.JSON_path}. To add additional alert fields, select **Insert alert fields**.
Payload headers	Add predefined or custom metadata headers in the **Key** and **Value** fields. A key is the name of a header field, and a value is the corresponding data assigned to that header field.
Test payload	Select to verify that the webhook is functioning correctly and that the receiving system can process the data as expected.

To return to the procedure, see Create Respond automation.

Application service details page

Provides comprehensive information about an application service, including its name, business criticality, ownership, process and operational status, traffic-based discovery details, discovery status, and relevant comments. This enables thorough analysis of the application service's current state and usage, provides clarity on ownership and criticality, and aids in prioritizing resources and actions effectively.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application service details page fields

Field	Description
Name	Name of the application service.
Business criticality	Importance level of the service to business operations.
Owned by	Person or team responsible for managing and overseeing the service.
Process Status	Current stage or status of the service's operational processes.
Operational status	Current stage or condition of the service's operational processes, showing whether it is functioning smoothly or encountering issues.
Traffic based discovery	Option to identify service instances based on network traffic patterns.
Discovery status	System's ability to locate and recognize the service within its network.
Comments	Additional notes or pertinent information regarding the service that may be helpful for understanding its management or usage.

To return to the procedure, see View application service details in Service Operations Workspace.

Create list fields

Create customized lists with fields tailored to your needs.

The form you complete varies depending on whether you choose to base your list on an existing one (**Start from existing**) or create a new list (**Create your own**).

Start From Existing form

Field	Description
List	Existing list that you want to modify.
List Name	Name for your list. The default name in this field is the name of the existing list in the **List** field with `- Copy` appended.
Select columns	Record fields to include in list view. The columns from the list you selected appear. You can add or remove columns to modify the list.
Add Filters	Condition used to filter the list. By default the conditions applied to the list selected appear. You can modify this condition.

Create Your Own form

Field	Description
List Name	Name for your list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Your Own form (continued)

Field	Description
Select Source	Source table for the records.
Select columns	The columns to display in the list. This field is populated with columns from a Workspace list view if one exists. If a Workspace list doesn't exist, the columns are populated with the Default list view of the table selected.
Add filters	Condition used to filter the list.

To return to the procedure, see Create a list in Service Operations Workspace for ITOM

Metrics View Configuration form fields

Define how metrics are displayed within Service Operations Workspace.

Metrics View Configuration form

Field	Description
Title	Name of the metric.
Active	Option to activate the metric.
Order	Numerical value indicating the order of the metric on the page.
Configuration Item Type	Configuration item type. Available options are: • cmdb_ci_app_server_tomcat • cmdb_ci_metric_extension • cmdb_ci_app_win_server
Source Metrics Types	Metric types you want the metric to monitor. Select the Lock icon ( ) to unlock the list of source metric types and select metric types to be monitored.
Chart Type	Type of chart in which the metric is presented in Service Operations Workspace, either **Line** or **Stacked Bar**.

To return to the procedure, see Configure alert metrics.

Integration and configuration health event fields

Populate the event fields to capture details such as the event time, description, alert number, state, severity, metric name, node, message key, and error message, enabling precise tracking, effective incident management, and improved error analysis.

Event fields

Field	Description
Time of Event	Indicates when the event occurred.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event fields (continued)

Field	Description
Description	Provides details about the event or incident.
Alert	Specifies the alert number that is triggered based on the event.
State	Describes the current state of the event (e.g., open, closed).
Severity	Indicates the severity level of the event (e.g., critical, warning).
Metric Name	Identifies the specific metric associated with the event.
Node	Specifies the node or device related to the event.
Message Key	Unique identifier for the event message.
Error Message	Provides additional information about any errors associated with the event.

To return to the procedure, see Review integration and configuration health.

Dynatrace advanced settings fields

Populate the pull connector advanced settings fields to optimize event retrieval and synchronization based on specific requirements such as connection preferences, event frequency, and time zone settings.

Dynatrace advanced settings fields

Field	Description
Base API path	Root URL or endpoint used to connect to the Dynatrace Metrics API. All API requests are made relative to this base path.
Initial sync in mins	Time, in minutes, that the system takes to complete the first synchronization of data with the Dynatrace Metrics API. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. Default: 15
Max metrics per query	Maximum number of metrics that can be requested in a single query to the Dynatrace Metrics API. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Requests exceeding this limit must be split into multiple queries. Default: 32
Page Size	Number of records returned in a single response when querying the Dynatrace Metrics API. If the total results exceed this number, multiple pages are returned. Default: 500

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynatrace advanced settings fields (continued)

Field	Description
Port	Port number used for connecting to the Dynatrace server.
Request per minute	Maximum number of API requests that can be sent to the Dynatrace Metrics API within one minute. Exceeding this limit may result in throttling or temporary blocking of requests. **Note:** Relevant only when you enable **Throttle API calls**. Default: 1000
Throttle API calls	Limits the rate of API requests to the Dynatrace Metrics API, preventing overload, request failures, or temporary blocking. Enable this option to automatically limit the rate of API requests, preventing overloading the Dynatrace Metrics API and avoiding request failures. Default: false
Protocol	Communication protocol used for retrieving events from Dynatrace server. Default: https
Debugging	• Debug: Provides detailed logs for troubleshooting. • Log payload: Displays raw log data. Use only for debugging, as it can quickly fill the MID Server logs.

To return to the procedure, see Configure Dynatrace metric pull connector.

Pull connector fields

Populate the pull connector advanced settings fields to optimize event retrieval and synchronization based on specific requirements such as connection preferences, event frequency, and time zone settings.

Advanced settings fields

Field	Description
Connected MID Server	Determine whether you want to have the system choose the optimal MID Server or choose a specific MID Server yourself. Perform only if you must make modifications to the MID Server otherwise leave it empty and let the system choose the optimal MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings fields (continued)

Field	Description
Event collection schedule (seconds)	Enter the frequency in seconds that indicates how often the system should check for new events from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Protocol	Defines the communication protocol used for retrieving events from external devices.
severity_by_state_type	Determines the severity level assigned to events based on their state type.
time_zone	Specifies the time zone used for recording and displaying event timestamps.
offset_min	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in. Specifies the port number used for communication with external devices.
max_fetch_interval_min	Limits the maximum interval between event fetch operations.
initial_sync_in_days	Sets the duration for the initial synchronization process when retrieving historical data.

To return to the procedure, see Configure an event pull connector.

Synthetic monitoring

The ServiceNow® synthetic monitoring application empowers organizations to proactively manage and enhance the performance and availability of critical services. By simulating user transactions on API endpoints, this solution identifies performance bottlenecks, helps ensure up-time, and optimizes user experiences.

Exploring synthetic monitoring

Learn how synthetic monitoring provides proactive, automated testing of service endpoints. By simulating user interactions, it can identify bugs, performance issues, and outages before they impact real users.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synthetic monitoring overview

Synthetic monitors continually call HTTP endpoints in the Configuration Management Database (CMDB) to test availability, response times, or the presence of a defined string in the response body. When a test fails the configured criteria, it can alert you to endpoint issues before your customers do.

For example, you might create a monitor that tests the *GET* HTTP endpoint of a service. You could configure that monitor to check for a status code of 200 and a response time of under 500 ms. If any code other than 200 is returned or the request takes longer than 500 ms, the test fails. An alert can then be generated and sent through Event Management.

The synthetic monitoring tests can be run by an Agent Client Collector (ACC) deployed in your network, on a MID Server, or on the ServiceNow platform.

Note:
The HTTP endpoints must exist in the HTTP Endpoints [cmdb_ci_endpoint_http] table. Endpoints tested from the ServiceNow platform must be publicly accessible.

Synthetic monitoring users

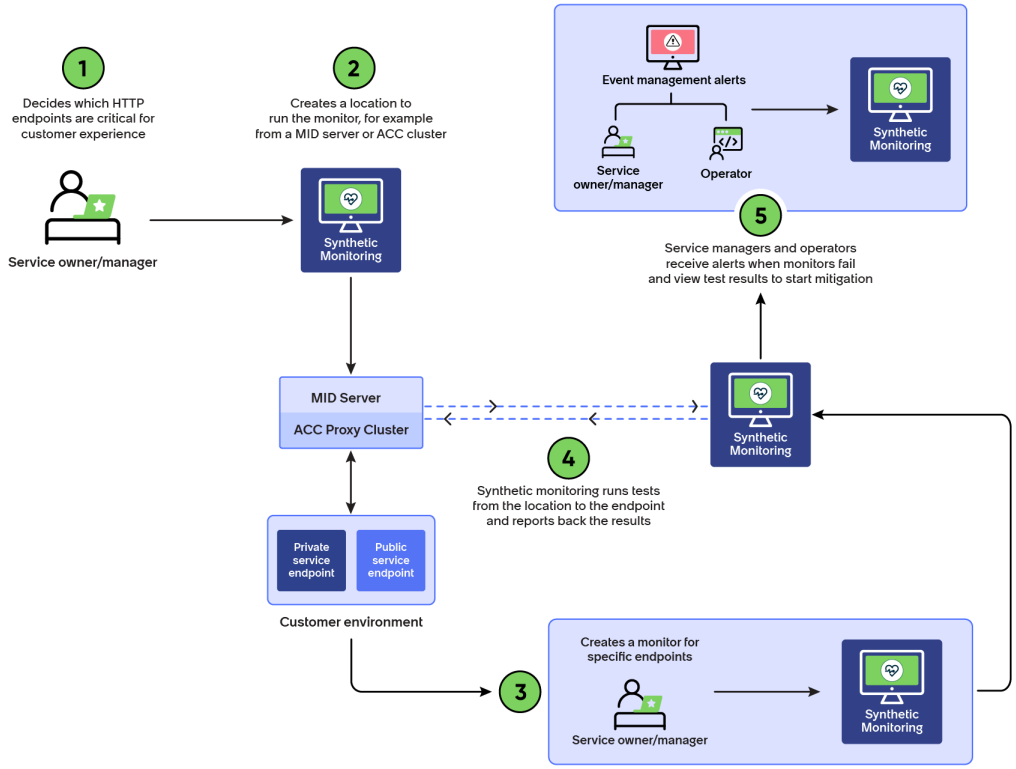
Synthetic monitoring users

User	Description
Synthetic monitoring administrator (Admin role)	Assigns roles, creates and edits monitors, and views monitor tests and their results.
Service owner (Editor role)	Creates and edits monitors and can also view monitor tests and their results.
Network operation center (NOC) operator (Viewer role)	Monitors tests and their results.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synthetic monitoring customer-hosted workflow

Synthetic monitoring workflow



Admins, service owners, and NOC operators use synthetic monitoring in the following way:

1. As a service owner, you determine which endpoints to monitor based on business criticality.
2. As an admin or service owner, you configure locations to run the monitor from.

> **Note:**
> The ServiceNow hosted location is available by default and doesn't need to be configured. However, endpoints tested by that location must be publicly available. You can also run the monitor from an ACC Proxy cluster or a MID Server.

3. As an admin or service owner, you configure the monitor and then after it runs once, review the results of the tests. If the results aren't successful, you troubleshoot the configuration. You can also create an alert that fires when a test fails.
4. Synthetic monitoring runs tests based on the monitor's configuration and reports the results of each test.
5. As a service owner or operator, you monitor the test results and also respond to any generated alerts.

What to explore next

To learn more about configuring and using synthetic monitoring, see:

- Configuring synthetic monitoring
- Identifying system issues with synthetic monitoring
- Synthetic monitoring reference
- Use synthetic monitoring with Service Observability

Configuring synthetic monitoring

Plan and configure your implementation of synthetic monitoring.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

Install synthetic monitoring

You can install the synthetic monitoring application (`com.snc.uib.sow_synthetics`) with the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the synthetic monitoring application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Confirm that the Configuration items (CI) that you want to monitor exist in the CMDB HTTP Endpoints [cmdb_ci_endpoint_http] table.
- Confirm that configured credentials exist in the Credentials [discovery_credentials] table if your endpoint requires authentication.

> **Note:**
> Synthetic monitoring supports API key credentials, basic authentication credentials, and OAuth.

Role required: sn_sow_synthetics.synthetics_admin

About this task

The following items are installed with synthetic monitoring:

- Plugins
- Roles
- Tables

For more information, see Components installed with synthetic monitoring.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the synthetic monitoring application (com.snc.uib.sow_synthetics) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box that is displayed, any dependencies that are installed along with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

What to do next

Create synthetic monitoring locations

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create synthetic monitoring locations

Create a synthetic monitoring location to run a synthetic monitor. If you plan to run monitors from a ServiceNow Glide instance, you can skip this procedure.

Before you begin

You need at least one of the following:

- A MID Server
- One or more Agent Client Collector (ACC) agent that monitors the health and performance of the HTTP endpoints to be monitored using synthetic monitoring. If you plan to run tests only from the ServiceNow AI Platform, you don't need to set up a location.

Note:

- If your synthetic monitor is testing a private HTTP endpoint, your location must only include ACC agents that are within the same network boundaries as the HTTP endpoint.
- If your monitor is testing an HTTP endpoint from different datacenters, cloud providers, or geographic regions, a different location must be used for each.

Role required: sn_sow_synthetics.synthetics_admin

About this task

Synthetic monitors can be hosted from:

- A MID Server
- A cluster of Agent Client Collector agents
- A ServiceNow Glide instance, as long as all monitored endpoints are publicly available. You don't need to configure a local instance as a location. It's available by default.

You can create as many locations as needed, but you must have at least one location to create a synthetic monitor.

Procedure

1. Navigate to **All** > *Service Operations Workspace* > **Configurations**.
2. Navigate to **Synthetic monitoring setup** > **Manage Locations**.
3. Select **Create a new location**.
4. Expand the Location details card and enter a unique name and an optional description for this location.
   The description should clearly state where the servers or agents in this location are running. For example, `US-1-east-cluster`.
5. In the **Location type** field, select either **MID Server** or **Agent Client Collector**, depending on where you want the monitor to be hosted.
6. Expand the **Select** card and select one or more MID Servers or ACC agents.
7. Select **Save**.

Note:
You can delete locations from the Synthetic Locations menu, which you can navigate to by selecting **All** > **Synthetic Monitoring** > **Synthetic Locations**. However, you must first remove any monitors running on that location, either by editing the monitors to use a different location or deleting the monitors. See Create and edit a synthetic monitor for more information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Create and edit a synthetic monitor

Create and edit a synthetic monitor

Create or edit a synthetic monitor to test the availability and performance of your HTTP endpoints before your customers discover issues.

Before you begin

- A configuration item (CI) for the endpoint you want to test.
- If you're testing private endpoints or want to run the monitors from your environment, one or more locations must be created to host the monitor. To create a location, see Create synthetic monitoring locations.

Role required: sn_sow_synthetics.synthetics_editor or sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. On the Overview page, either create a synthetic monitor or edit an existing one.
   - To create a synthetic monitor, select **New**.
   - To edit an existing one, select the link for the monitor you want to edit and then select the **Details** tab.
3. On the form, fill in the fields.

   a. In the Monitor details section, enter a unique name for the monitor and a description.

   b. In the HTTP settings section, fill in the fields.

HTTP settings section

Field	Description
HTTP method	HTTP method that you want to monitor for the endpoint. **Note:** HEAD and OPTIONS methods aren't supported from a MID Server.
HTTP endpoint CI	CI for the endpoint that you want the monitor to test. If the endpoint doesn't exist, choose **Manage HTTP endpoints in CMDB** to create a CI.
Related service CI	Application service CI related to the HTTP endpoint. The entered value is used to create or update the CI relationship between the HTTP endpoint and the application service.
Support group	Group who is notified and assigned alerts when this monitor fails. **Note:** To view this field in the HTTP Endpoints table, use the Synthetic Monitoring view.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Query parameters	String of query parameters to include in the request URL. **Note:** The string shouldn't include the leading question mark. For example, use `id=xyz&customer=myco` instead of `?id=xyz&customer=myco`.
Credentials	Credential needed if the endpoint requires authentication. OAuth, Basic Auth, and API keys are supported.
Headers	Key-value pairs for the HTTP request headers. You can add multiple pairs.
Body	Text that is used if the API expects a message body, such as a JSON snippet.

c. In the Locations section, select one or more locations.

Choose a MID Server or Agent Client Collector location, or to run this monitor's test from your ServiceNow instance, choose **Current Instance**.

Note:
When running tests from your instance, only six tests can be run every minute for performance reasons.

Choose **Create new location** to create a location.

For more information on how to create a location, see Create synthetic monitoring locations.

d. In the Assertion section, define a successful test by selecting one or more criteria, an operator, and a value.

Note:
Multiple criteria are joined with an `AND` phrase, so the test must pass all criteria to be successful.

Criteria type	Description of success
Status code	Endpoint returns the given status code.
Response time (in ms)	Endpoint response time is less than the given value.
Response body	Endpoint sends a string value in the response body that matches the selected operator and given value.

e. In the Frequency section, enter the number of minutes between each test run.

f. Optional: To have an alert sent through Event Management when a test fails:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the Alert settings section, activate the toggle switch.
- Select an alert severity for a test failure.
- Add tags to the alert. For more information about using tags in alerts, see Tag cluster alert grouping.

4. Select **Save**.

Result

The Overview page for the synthetic monitor displays the results of the tests that the monitor runs. See Identifying system issues with synthetic monitoring for more information.

Manage synthetic monitors

Edit or delete synthetic monitors after creating them.

Before you begin

Role required: sn_sow_synthetics.synthetics_editor

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Follow these instructions to edit a monitor.

Identifying system issues with synthetic monitoring

Tests run by synthetic monitors enable service owners and operators to view service endpoint performance at scale.

Overview of using synthetic monitoring

As a service owner, you can use synthetic monitoring to monitor your service's endpoints, verifying that they're available and performing as expected. You can be notified when synthetic tests fail, enabling you to mitigate issues quickly. You can see trends in HTTP API success rates and response times.

As an operator, you can use synthetic monitoring as part of triaging issues. When you learn a service is reported to have issues, you can view test results for that service's endpoints. If tests are failing or response times are slow, that might be something to investigate.

View aggregate information about the monitors

The synthetic monitoring landing page shows an overview of all created monitors, including inactive monitors.

From here, you can see the status for all your monitors. Selecting a card at the top filters the list of monitors. For example, you can view only the monitors that have failed or that are in an unknown state.

By default, the list of monitors is sorted by the timestamp in the **Updated** column. You can select a different column header to sort by that category.

Selecting a monitor lets you view details about the monitor's tests, including details, configuration, and associated alerts.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View a monitor and its tests

To view a monitor's details and the results of its tests, select a monitor from the synthetic monitoring landing page. The Monitor details page provides key information needed to understand how the monitor is performing.

Use the information in the header to understand the basic health of the monitor, including its status and when it last ran a test.

View individual tests

The Metrics card displays two charts to help you understand the health of each test the monitor has run. The **Failed tests** chart displays each test with a value of 0 when it was successful and a value of 1 when it failed. Hover over a point on the chart to view further details.

The **Response time** chart shows the amount of time in milliseconds that it took to receive a response from the endpoint. Hover over a point on the chart to view details.

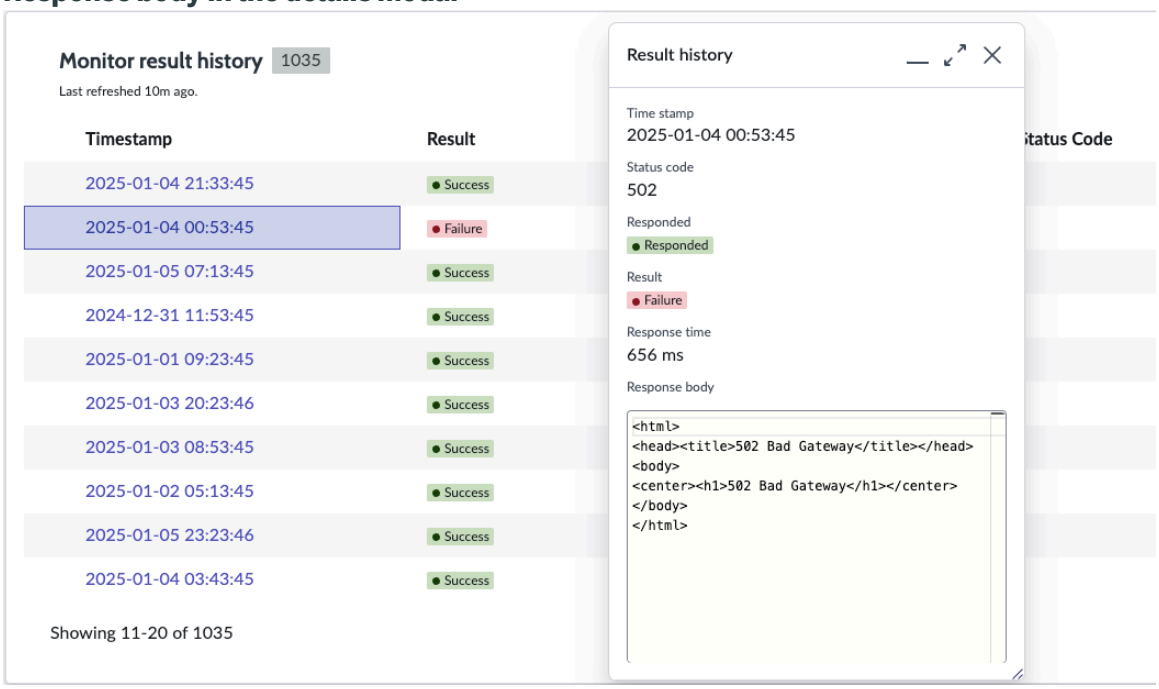
Note:
Test results are retained for 21 days.

The **Monitor result history** table lists each test. By default, the table is sorted from newest to oldest by the timestamp. You can sort by any column to help find issues. For example, you can sort by **Result** to see all failures together or you can sort by **Response time** to view the tests with the highest latency.

If a monitor was configured to generate an alert when it fails, a link to the alert displays in the **Alert** column. Select an alert link to view its details.

When you see a failure or high latency, select a test to view details, including the response body, which might help explain any issues.

Response body in the details modal



View aggregate monitor information

View information about all your synthetic monitors.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. To filter the list of monitors, select a card at the top of the page.
   For example, to view only monitors that have failed tests, select the **Failed** card.
3. To view details about each test run by the monitor, select a monitor name.
   The monitor's Overview tab opens. For more information about this page, see View a monitor's test results.
4. To export the list of monitors, select **Export**.
   You can export to the following file formats:
   - XLSX
   - CSV
   - JSON
   - PDF

View a monitor's test results

View the results of tests run by a monitor, along with configuration details, and related configuration items (CIs).

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors.
3. View the overall health of the monitor in the header, which shows its status, and when it was last run and updated.
4. View health metrics for the monitor from the **Metrics** card.
   The **Failed tests** chart displays each test with a value of 0 when successful and a value of `1` when it failed. The **Response time** chart shows the amount of time in milliseconds that it took to receive a response from the endpoint. Hover over a point on the charts to view details.
   - To change the time period, use the drop-down menu.
   - To refresh the chars, use the context menu.
5. View the status of each test in the **Monitor result history** card.
   To view the details for a test, select its timestamp. For more information about the test details, see View test details.

> **Note:**
> If your monitor uses OAuth and a test fails with a 4xx error, it may be because your refresh token expired. Re-authenticate by visiting the OAuth credential page and clicking the credential link.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view active alerts created by the monitor, select the Alert link to open its details.

Note:
Filtering the list affects the data displayed in the metric charts.

View test details

View the results of an individual synthetic test run by a monitor.

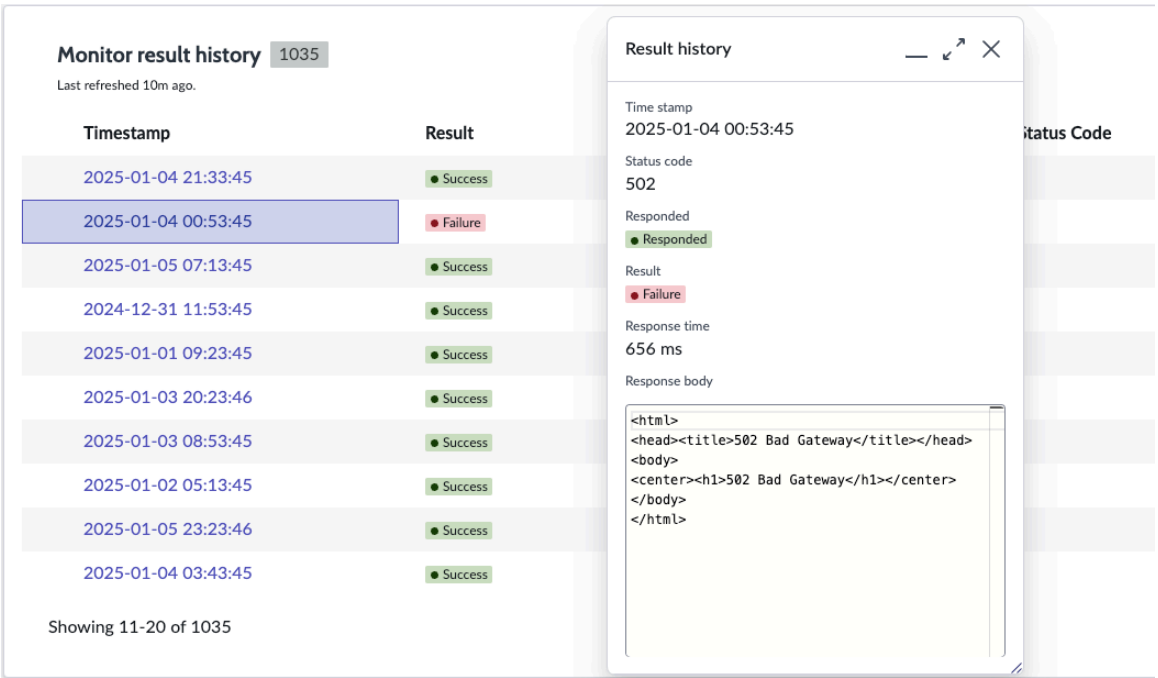
Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors.
3. Select a test from the list of tests.
   The modal displays information about the test including a response body. In this example, it shows that the request was sent to a bad gateway.

Note:
If your monitor uses OAuth and a test fails with a 4xx error, it may be because your refresh token expired. Re-authenticate by visiting the OAuth credential page and clicking the credential link.



View alerts for a synthetic monitor

View all the current active alerts for your monitors.

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can view open alerts from all your monitors by selecting the **Open Alerts** card on the synthetic monitoring home page. To view a single alert, select the alert link from the resulting list.

To view alerts for a specific monitor, follow this procedure.

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors and then select the **Alerts** tab.
   The **Alerts** tab shows the alerts for the monitor. Select an alert to view details.

Note:
The alert shows the impacted service associated with the monitor. If for some reason this field isn't populated, see Impacted Service not appearing in alerts.

Synthetic monitoring reference

Reference topics provide additional information about the synthetic monitoring application, such as components installed and page details.

Components installed with synthetic monitoring

Several types of components are installed with activation of the synthetic monitoring plugin, including tables and user roles.

Roles installed

Role	Description	Contains roles
Synthetic monitor viewer [sn_sow_synthetics.synthetics_viewer]	Views test configurations and their results.	• cmdb_read • sn_sow.sow_user • agent_client_collector_user • sn_sow_synthetics.credential_reader
Synthetic monitor editor [sn_sow_synthetics.synthetics_editor]	Creates and edits tests. Views test configurations and their results.	• credential_admin • sn_cmdb_editor • sn_sow_synthetics.synthetics_viewer
Synthetic monitor admin [sn_sow_synthetics.synthetics_admin]	Assigns roles. Creates and edits tests. Views test configurations and their results.	• agent_client_collector_admin • sn_sow_synthetics.synthetics_editor • sn_sow_itsm_admin.sow_admin_user
Synthetic monitor credential reader [sn_sow_synthetics.credential_reader]	Used internally to read from the Credentials [discovery_credentials] table.	None

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description	Contains roles
Synthetic monitor event writer [sn_sow_synthetics.synthetics_event_writer]	Used internally to communicate with the MID Server.	None

Tables installed

Table	Description
Check [sn_synthetics_check]	Configuration information for synthetic checks.
Check Execution Location [sn_synthetics_check_execution_location]	Execution location configuration for synthetic checks.
Single API [sn_synthetics_check_single_api]	Additional configuration information and last run results for single API synthetic checks.
Single API Header [sn_synthetics_check_single_api_header]	Key value pairs of requests headers for single API synthetic checks.
Single API to Policy [sn_synthetics_check_single_api_policy]	Single API synthetic test data and its corresponding Agent Client Collector (ACC) policies.
Single API Result [sn_synthetics_check_single_api_result]	Results from each synthetic check run.
Synthetic Private Locations [sn_synthetics_private_location]	Definitions of the ACC Agent Proxy Clusters available for synthetic monitoring. Extends the Proxy Agent Cluster [sn_agent_cluster] table.

Synthetic monitoring properties

Synthetic monitoring includes the following properties.

These properties are available for synthetic monitoring.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for synthetic monitoring

Property	Description
sn_sow_synthetics.logger	Controls logging output. Valid values are: • debug • info • notice (default) • warning • err • crit

Domain separation and synthetic monitoring

Domain separation is supported for synthetic monitoring. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and synthetic monitoring overview

Domain separation is present in all aspects of the synthetic monitoring application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in synthetic monitoring

When data is separated by domains in synthetic monitoring, users can only configure and see the monitoring data in their own domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

You define the domain-separated environment when you configure your data inputs. All relevant records and data processing in the synthetic monitoring program flow reside in the same domain as the data input. The domain name of a data input appears in the Domain column that is displayed in the tables in your instance.

Using domain separation in your instance is transparent to synthetic monitoring. The application manages all aspects of the data, such as the monitor configurations and results. When a property is changed, the new value affects new sources only in the specific domain.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When setting up Agent Client Collector (ACC) for non-hosted synthetic checks, each domain that supports non-hosted synthetics requires its own ACC cluster and MID Server. The ACC cluster and MID Server must be created in a leaf domain.

Related topics

Domain separation for service providers

Troubleshoot synthetic monitors

Read these topics to understand how to fix common issues in synthetic monitoring.

Upgrade issues

What to do when monitors don't work after upgrading synthetic monitoring.

Condition

After upgrading synthetic monitoring, monitors remain in unknown state.

Cause

After upgrading synthetic monitoring, if the monitor is hosted on a MID Server, the server must be restarted to re-recognize the hosted monitors.

Remedy

Restart the MID Server. See Manually start, stop, and restart a MID Server.

OAuth issues

Learn how to fix OAuth token refresh issues.

Condition

OAuth token doesn't refresh as expected.

Cause

Your OAuth provider and server have different refresh time periods. Refresh time periods are based on the OAuth provider. When creating an OAuth connection, you configure it to have an x-amount of time before needing reauthentication. If that configured amount of time isn't the same as your provider's, your token might require a refresh sooner or later than expected.

Remedy

Refer to your OAuth provider's documentation when configuring OAuth. See OAuth inbound and outbound authentication for more information.

Impacted Service not appearing in alerts

When a test fails for a monitor and you have configured an alert to trigger, the alert record should show the impacted service. There are a few reasons why this field might not be populated.

Condition

The Impacted Services field isn't populated on an alert record from a failed synthetic monitor. Following are the causes and remedies for the different reasons the field isn't populated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause: Service isn't a mapped service

The service isn't a mapped service.

Remedy

This field only populates when the associated service is configured as a mapped application service in the Configuration Management Database (CMDB).

Cause: The field didn't have time to populate

Impacted Services are populated at alert creation.

Remedy

Close and reopen the alert so new mappings are applied.

Cause: Race condition encountered

If an alert triggers immediately, the platform might not have time to establish the necessary CMDB relationships before the alert attempts to populate impacted services.

Remedy

Try reloading the page or consider running tests from the MID Server.

Cause: Delayed population

The relationship might take up to a minute to appear, which means the field might not populate until after the initial alert creation event.

Remedy

Check back after a few minutes.

Synthetic monitoring Landing Page

Read the following to understand what is displayed on the Synthetic monitoring landing page where you can view aggregate information about your synthetic monitors.

Aggregate information

The cards show aggregate information for all monitors, whether they're active or not. Select a card to filter the Monitors list.

Aggregate cards

Card title	Description
Total monitors	Total number of monitors created.
Passed	Number of total monitors that have returned the value that was set as the monitor's assertion, for example a status code of 200.
Failed	Number of total monitors that returned a value other than what was configured as the assertion.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Aggregate cards (continued)

Card title	Description
Pending	Number of total monitors that are in the Pending state. Monitors are set to **Pending** before the first test runs.
Paused	Number of total monitors that are in the Paused state. Paused monitors are monitors that have been set to **Monitor disabled** on the Configuration page.
Unknown	Number of total monitors that aren't running due to an issue with the related Agent Client Collector (ACC) proxy.

Monitor list

By default, this list displays all monitors that have been created. You can select a card at the top of the page to filter to a list of monitors with that state. Select a monitor to view its details page.

Details page of a synthetic monitor

Read the following to understand how to use the Details page of a synthetic monitor to view the results of its tests.

Header

The header provides an overview of the monitor.

Item	Description
Monitor name	Name given to the monitor when it was created.
Enabled	Indication of whether the monitor is active.
Status	Status of the latest test run. Values can be one of the following: • Pending: The monitor is waiting for the first test to run, based on the configured frequency. • Success: The test ran and passed the assertion criteria that you set. • Unknown: The test failed to run, likely due to an issue with the related Agent Client Collector (ACC) proxy. • Failure: The test ran but didn't pass the assertion criteria. Select a timestamp link to view the response body for more information about the test.
Last test ran	Timestamp for when the latest test finished running.
Last updated	Timestamp for when the monitor was most recently edited and saved.

Overview tab

The **Overview** tab provides an aggregated view of all the tests that the monitor has run. This tab shows the following:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Metrics card: Charts that provide performance of each test for the time period selected in the time picker.
- Monitor result history: All tests run by the monitor and its results.

Details tab

You can use the **Details** tab to create a monitor or edit an existing one. See Create and edit a synthetic monitor for more information.

Alerts tab

You can use the Alerts tab to view alerts generated by a monitor.

Applying the CSDM guidelines to ITOM AIOps

ITOM AIOps helps you track and maintain the health of services in your organization. ITOM AIOps CSDM reference serves as a foundational blueprint for maintaining optimal IT operations by standardizing data models and processes. The main goal is to help you understand the two main capabilities that work together within the CSDM framework.

ITOM AIOps consists of two main capabilities that use the CSDM framework.

Event Management

Event Management gathers alerts from infrastructure events captured by third-party monitoring tools. Event Management uses IT-related information gathered by Discovery to map alerts to CIs. Based on the collected information, Event Management then provides dashboards showing a consolidated view of all service-impact events.

Metric Anomaly Detection

Proactively analyzes your IT infrastructure to spot issues and prevent service outages. Using advanced machine learning to analyze information about your IT infrastructure, the application automatically determines dynamic thresholds and identifies anomalies that may indicate potential service outages.

For CSDM set-up information, see Implementing the CSDM framework in stages.

For more information on CSDM framework, see Exploring the CSDM model.

ITOM AIOps considerations for CSDM framework

ITOM AIOps aligns with CSDM framework to ensure standardized data management and optimize IT operations.

Key considerations for implementing ITOM AIOps for CSDM framework include the following.

Identifying necessary Configuration Items (CIs) for optimal Event Management benefits

Event Management utilizes Configuration Items (CIs) monitored by the operations team to correlate alerts with the appropriate CI and assess their impact on the monitored service.

Defining Technical Services within Event Management

Dynamic CI Group services, formerly known as Technical Services, leverage the CMDB CI Group capability to query the CMDB, enabling efficient grouping of Configuration Items (CIs) for various operational purposes.

Recognizing common use cases for the Dynamic CI Group service

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In Event Management (EM), the Dynamic CI Group service functions as a logical grouping mechanism for Configuration Items (CIs), offering technology or service owners insight into the health status of the grouped entities.

ITOM AIOps and CSDM tables

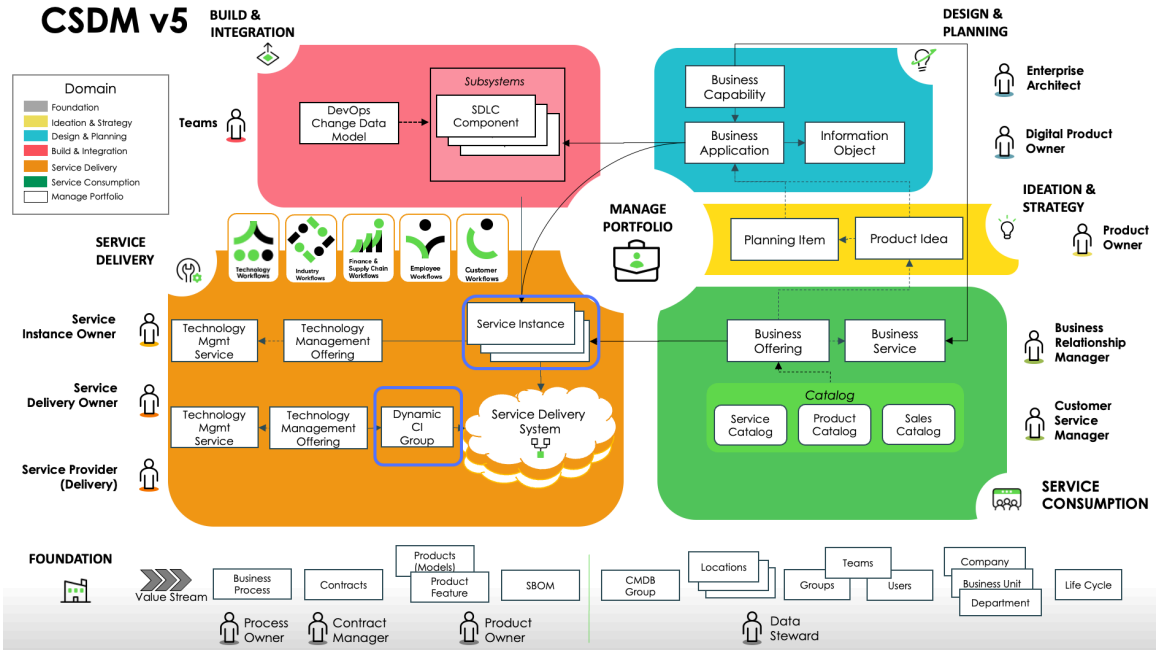
ITOM AIOps leverages and maintains CSDM tables, while various ServiceNow products enhance and contribute value to its operations.

CSDM tables in the CMDB that are managed by ITOM Health

ITOM AIOps manages the following tables:

- Mapped Application Service table [cmdb_ci_service_discovered] (With CSDM v5, the label for the table has changed from application service to service instance.)
- Configuration Item table [ci_*]
- Dynamic CI Group table [cmdb_ci_query_based_service]

CSDM tables managed by ITOM



Plugins or applications installed with ITOM AIOps

Tables that list the plugins or applications that are installed with ITOM AIOps applications. When you update your application, any newly required application dependencies are installed.

Event Management

Plugins or applications installed with Event Management (com.glideapp.itom.snac)

Plugin or application name	Description
Alert Management Content (com.em-alert-mgmt-content)	Contains all the necessary base system subflows that can be used for alert remediation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Event Management (com.glideapp.itom.snac) (continued)

Plugin or application name	Description
ITOM Licensing (com.snc.itom.license)	Central components for the ITOM Licensing Model, which calculates and displays how many subscriptions for ITOM applications your organization purchases and consumes.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.
Service Analytics (com.snc.sa.analytics)	Provides alert analytics based on machine learning (ML) and topology learning.
Event Management and Service Mapping Core (com.snc.service-watch)	Comprises the common components of Event Management and Service Mapping.
Tag Based Alert Clustering Engine (sn_em_tbac)	Provides a zero-code method that helps simplify alert grouping and performs alert correlation without the need for CMDB, model training, or fine-tuning.
Alert Rules Management (sn_em_arm)	Enables Event Management users to respond automatically to alerts. An alert management rule determines the required alert response.

Health Log Analytics

Plugins or applications installed with Health Log Analytics (sn_occ)

Plugin or application name	Description
Integration Commons for CMDB (sn_cmdb_int_util)	Contains a collection of utility functions that provide a common methodology for the processing of key CMDB attributes and is available to all CMDB certified integrations.
ITOM Cloud Services Core (sn_itom_cloud_svc)	Generates relevant topics for tenants, enabling them to transmit data from their customer infrastructure to ServiceNow automatically. These topics are predominantly intended for use with the Hermes Messaging Service.
Service Operations Workspace ITOM Apps (sn_sow_itom_cont)	A configurable workspace that provides a unified experience for multiple IT Operations Management workflows. You can manage the life cycle of alerts in IT Operations Management workflows through simple, intuitive, and clear user interface, automated recommendations, and targeted experience.
Health Log Analytics Core (com.glideapp.itom.occultus)	Essential components for the Health Log Analytics scoped application.
Microsoft Teams Spoke for ServiceNow IntegrationHub (com.sn.ms_teams.ah)	Provides actions that a process analyst can use when designing flows to automate

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Health Log Analytics (sn_occ) (continued)

Plugin or application name	Description
	sending messages about ServiceNow incident and problem records to a Microsoft Teams channel.
Slack Webhooks Spoke for ServiceNow IntegrationHub (com.sn.slack.ah)	Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.
Normalization Data Services Client (com.glide.data_services_canonicalization.client)	Helps maintain consistency by checking that records for a given company match the list of standard company names. If the plugin finds a company-name field with a variant of that name, it substitutes the standard name in its place.

Service Reliability Management

Plugins or applications installed with Service Reliability Management (sn_sow_srm)

Plugin or application name	Description
Service Operations Workspace Service Reliability Management (SRM) Common (sn_sow_srm_common)	Delivers common utilities and configuration settings used by Service Reliability Management such as core functionality related to managing teams and services, and metric calculation for services.
Service Reliability Management (Global dependencies) (com.snc.srm)	Supports global scripts and utilities for Service Reliability Management for Service Operations Workspace.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
Service Operations Workspace ITOM Apps (sn_sow_itom_cont)	A configurable workspace that provides a unified experience for multiple IT Operations Management workflows. You can manage the life cycle of alerts in IT Operations Management workflows through simple, intuitive, and clear user interface, automated recommendations, and targeted experience.
On-Call Scheduling (com.snc.on_call_rotation)	Provides the ability to create on-call schedules and escalation trees. When an incident is created, you can dynamically route the escalation to an on-call resource.
SOW - Alert Automation (sn_sow_alert_rules)	Provides operators in Service Operations Workspace with the ability to create and manage alert automation for their team. This automation can be used to enrich, process, and group alerts.
Service Level Objective Management for Service Operations Workspace (sn_sow_slo)	Includes features to monitor and manage service health using Service Level Indicators (SLIs), Service Level Objectives (SLOs), and error budgets.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Operations Workspace for ITOM

Plugins or applications installed with Service Operations Workspace ITOM Apps (sn_sow_itom_cont)

Plugin or application name	Description
Service Operations Workspace Core (sn_sow)	Core capabilities and workspace configurations for Service Operations Workspace.
Event Management Core (sn_em_ai)	Enables you to track and monitor alerts in the ServiceNow Agent Workspace.
Service Operations Workspace Integrations launchpad (sn_itom_integ_app)	Provides a new and enhanced experience for viewing, configuring, and managing all your available ITOM AIOps integrations.
Service Operations Workspace Alert Mngmt (sn_sow_em)	A detailed alert record page with supplementary data such as Quick Overview, Playbook, and Metrics tabs.
Service Operations Workspace Express List (sn_itom_aiops_list)	A centralized and consolidated platform that enables operators to triage, analyze, and remediate alerts, all in one place. Express List provides a live view of alerts, dynamic filtering, a preview panel with additional context and essential details about each alert, and automated technical analysis using Now Assist.
Service Operations Workspace Log Analytics (sn_sow_hla)	A log viewer in Service Operations Workspace. The application also includes the custom Elasticsearch data source for Performance Analytics (PA) dashboards.
AIOps Dashboards (sn_aiops_dashboard)	Offers comprehensive visualizations of critical operational data and actionable insights that facilitate proactive responses to potential issues. The application targets multiple ITOM personas with different needs, enabling you to monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment.
Event Management Connectors (sn_em_connector)	A collection of predefined interfaces (connectors) for ingesting events from third-party monitoring tools or Agent Client Collector into a ServiceNow instance.
Service Operations Workspace UI Components (sn_itom_uib_comp)	A joined repository for holding common internal UI components.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Intelligence

Plugins activated with Metric Intelligence (com.snc.sa.metric)

Plugin name	Description
Operational Intelligence - Extension Health Monitoring (com.snc.sa.metric.health)	Contains some features that enable self-monitoring capabilities for the Metric Intelligence components in the MID Server.
Highcharts Reporting (com.glide.highcharts)	Provides some UI functionality to Metric Intelligence.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
ITOM UI Components (com.snc.itom.ui)	Shared UI components for ITOM products that provide some UI functionality to Metric Intelligence.
MID Server Distributed Cluster (com.snc.agent.distributed.cluster)	Enables management of the mid cache component of Metric Intelligence from the ServiceNow instance.
List v3 Components (com.glide.ui.list_v3_components)	Provides some UI functionality to Metric Intelligence and components required for List v3, including REST endpoints, directives, and templates.
MetricBase (com.snc.clotho)	The database where the raw metric data such as CPU usage and Disk Free is saved and where model fitting for anomaly detection occurs.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.

Agent Client Collector

Plugins or applications installed with Agent Client Collector Framework (sn_agent)

Plugin or application name	Description
Agent Client Collector Global Utilities (com.snc.sa.accutils)	A set of globally scoped utilities that facilitates cross-scope transactions between Agent Client Collector Framework and a ServiceNow instance.
Configuration Management For Scoped Apps (CMDB) (com.snc.cmdb.scoped)	Provides scoped applications with access to Identification Engine APIs.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Agent Client Collector Monitoring (sn_itmon)

Plugin or application name	Description
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
Metric Intelligence (sn_metrics_ng)	A companion application to the family Metric Intelligence plugin that provides additional functionality and enhancements.
Service Operations Workspace Metric Explorer (sn_itom_metric_exp)	Enables operators to investigate metric behavior and compare and correlate different metrics across hosts, applications, and services so they can troubleshoot issues and find the root cause.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
Metric Intelligence (com.snc.sa.metric)	Provides the ability to capture, explore and analyze application metrics data, identifying and indicating anomalies. Metric Intelligence generates anomaly alerts, which can be promoted to IT alerts and appear on the Service Operations Workspace and Service Health dashboard.

Plugins or applications installed with Agent Client Collector for Visibility - Content (sn_acc_visibility)

Plugin or application name	Description
Agent Client Collector for Visibility - Content Content (sn_acc_vis_content)	Provides agent-based infrastructure discovery and collects Software Asset Management (SAM) metrics to support Discovery and Digital End-User Experience (DEX) applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

Applications installed with Agent Client Collector Log Analytics (sn_accl)

Application name	Description
Agent Client Collector Monitoring (sn_itmon)	Provides the ability to monitor your configuration items (CIs). This application comes with predefined monitoring checks and policies that are applied on the agent.

Applications installed with Agent Client Collector Log Analytics (sn_accl) (continued)

Application name	Description
Health Log Analytics (sn_occ)	Helps you solve issues faster by ingesting, analyzing, and correlating machine-generated log data in real-time to predict IT issues before they affect you.

Plugins or applications installed with Agent Client Collector Security Incident Response (sn_secops_acc)

Plugin or application name	Description
Security Incident Response (sn_si)	Enables you to manage and automate the life cycle of your security incidents from initial prioritization to containment and resolution. Use the automated workflows to respond quickly and consistently, and understand trends and bottlenecks through the data provided by analytics-driven dashboards and comprehensive reporting systems.
Security Support Orchestration (sn_sec_cmn_orch)	Dependency for the Vulnerability Response and Security Incident Response applications.
Threat Intelligence Support Common (sn_ti)	Enables you to find Indicators of Compromise (IoCs) and enrich security incidents with threat intelligence data. Threat Intelligence enables you to access and provide a reference point for your company's Structured Threat Information Expression (STIX) data.
Agent Client Collector Spoke (sn_acc_spoke)	Provides a framework to write customized workflows or automations to execute on agents or CIs.
Security Support Core (com.snc.security_support.core)	Provides a robust core data model and UI framework specifically for security operations integrations. This comprehensive model serves as the backbone for seamlessly integrating various security tools and systems, promoting smooth data flow and efficient operations.
Security Support Common (sn_sec_cmn)	Enables core functionality used by the Security Operations applications.
Security Integration Framework (sn_sec_int)	Manages the common functionality for Security Operations integrations including both Security Incident Response and Vulnerability Response. Security Integration Framework enables you to use existing features and functionality without having to reimplement them.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
Vulnerability Response Dependencies (com.snc.si_dep)	Activates all the dependent plugins required to support the Vulnerability Response application.

Agent Client Collector

The Agent Client Collector is an agent that is installed on infrastructure components. The Agent Client Collector is built on a Sensu framework which enables you to adopt and extend monitoring checks from the community. It executes commands on the machines it is installed on and sends output data to the ServiceNow® instance via the MID Server, storing events and metrics in the relevant database.

Watch this video for an overview of how the Agent Client Collector works.

https://player.vimeo.com/video/1096666842?h=77a5520958&badge=0&autopause=0&player_id=0&app_id=58479

Exploring Agent Client Collector Framework

The Agent Client Collector Framework (ACC-F) is a powerful solution for monitoring the performance and health of infrastructure components by using agents installed on servers and devices. It collects and sends critical system data to ServiceNow for analysis, enabling proactive management and troubleshooting of Configuration Items (CIs).

Agent Client Collector Framework overview

The Agent Client Collector Framework enables organizations to monitor and manage the health of their infrastructure through agents installed on key systems. These agents execute predefined commands on the machines they are installed on, sending the resulting data back to the ServiceNow® instance via a dedicated MID Server. The framework enables seamless management of both the Agent Client Collector and MID Server, storing event data and performance metrics in the appropriate database. By providing insights into CI performance, ACC-F helps organizations identify and resolve issues quickly, improving operational efficiency and system reliability.

Agent Client Collector Framework workflow

The following illustration describes the layout and data flow within the Agent Client Collector Framework application.

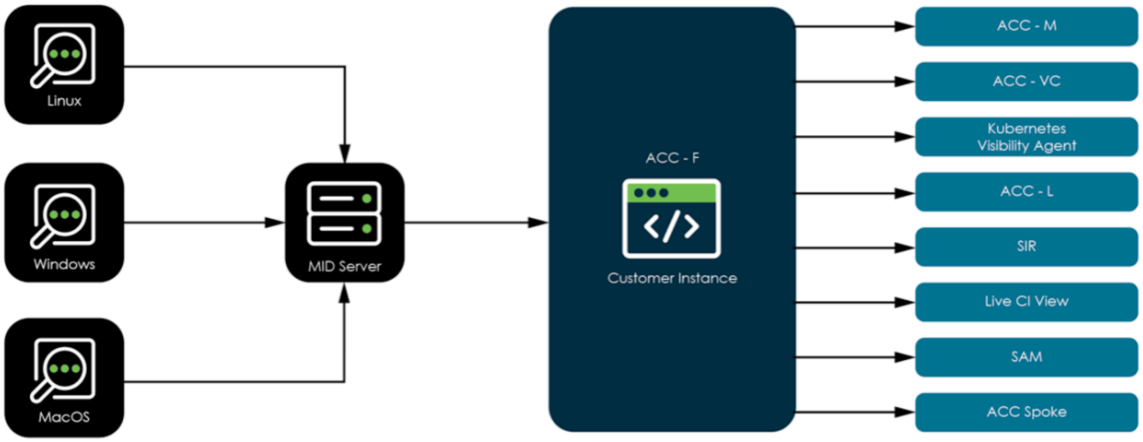
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Collecting and distributing data with ACC-F



1. Agent Installation: The agent is installed on infrastructure components, such as servers, devices, and network equipment. These agents are responsible for executing system commands and gathering performance data from the host machine. ACC-F is deployed on the customer's ServiceNow® instance.
2. Data collection: The agent runs predefined scripts or queries (checks) on the infrastructure components to collect various system metrics and events. This includes performance data such as CPU usage, memory utilization, disk space, and network activity. The agent also collects error logs and system alerts.
3. MID Server communication: The agent sends the collected data to the ServiceNow instance through a dedicated MID Server. The MID Server acts as a secure communication bridge between the infrastructure and the ServiceNow platform, ensuring data is transmitted reliably and securely.
4. Data Storage: Upon receiving the data, the ServiceNow instance stores the events and performance metrics in the relevant database. This data is then associated with the respective Configuration Items (CIs) within the ServiceNow CMDB Configuration Management Database (CMDB), enabling efficient tracking and reporting.
5. Data Analysis and Reporting: The collected data is analyzed within the ServiceNow instance, where it is used for monitoring, troubleshooting, and reporting purposes. This analysis helps identify potential issues or areas of improvement, triggering alerts or actions to resolve problems proactively.
6. Feedback Loop: Based on the analysis, the system can trigger remediation actions, such as running corrective scripts, reconfiguring settings, or notifying responsible teams for further investigation. The feedback is looped back into the system, allowing for continuous monitoring and optimization.

Agent Client Collector Framework benefits

Agent Client Collector Framework provides data to other Agent Client Collector components.

Benefit	Feature	Users

Trigger remote actions against managed devices, without additional credential or network communication.	Agent Client Collector Security Incident Response	Automation expert
Stream log data into your instance to predict problems and solve them before they happen, to minimize user impact.	Agent Client Collector Log Analytics	Agent Client Collector administrator

Agent Client Collector Framework use case

The Agent Client Collector Framework use case demonstrates how a financial organization can use Agent Client Collector Framework to assist in IT asset discovery.

Use case overview

A leading financial organization needed a robust IT discovery solution to maintain compliance, secure critical systems, and manage a growing remote workforce. While the organization initially relied on agentless discovery methods — where MID Servers interrogate systems and populate the CMDB—it faced significant challenges. These limitations affected their ability to monitor secure environments and remote endpoints effectively, leading to potential security and compliance risks.

Challenges

- Restricted server access: The financial organization's security policies restricted MID Servers from initiating connections to core banking servers and sensitive financial databases. This made agentless discovery insufficient for these high-security assets.
- Remote workforce visibility: The company's growing remote workforce meant many employee laptops and mobile devices operated outside the corporate network. Agentless discovery couldn't capture data from these endpoints, creating blind spots in asset tracking and compliance monitoring.
- Regulatory compliance: Financial institutions face stringent regulations (such as PCI, DSS and SOX) requiring detailed and auditable asset data. Agentless discovery struggled to meet these requirements, especially for in-depth monitoring and policy enforcement.

Solutions

To address these challenges, the financial organization implemented an agent-based discovery approach.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Agent deployment on critical servers: Agents were installed on core banking servers and sensitive financial databases. This allowed continuous, secure monitoring without violating access restrictions.
- Remote endpoint management: Agents deployed on remote employee laptops provided real-time data collection and monitoring, regardless of location. This ensured that all devices, even those outside the corporate network, were included in asset discovery.
- Enhanced data collection: The agents collected detailed system information and enforced security policies directly on each asset, ensuring compliance with regulatory standards and improving audit readiness.

Outcomes

- Comprehensive asset visibility: The organization achieved full visibility across its IT environment, including secure data centers and remote endpoints. This reduced blind spots and improved decision-making for IT operations and security teams.
- Improved compliance and audit readiness: Agent-based discovery provided granular, auditable data that met stringent regulatory requirements. This streamlined compliance reporting and reduced the risk of regulatory penalties.
- Enhanced security posture: By enforcing policies at the endpoint level, the organization strengthened its cybersecurity defenses, protecting sensitive financial data from potential threats.

This approach enabled the financial institution to maintain control over its IT environment, support its remote workforce effectively, and ensure compliance with industry regulations - critical factors in safeguarding sensitive financial operations and maintaining customer trust.

Agent Client Collector architecture

The Agent Client Collector is a ServiceNow agent installed on your Windows, Linux, and macOS devices to monitor your company's infrastructure and installed applications.

Agent Client Collector architecture - overview

The Agent Client Collector is built on a Sensu framework and comes installed with monitoring capabilities for servers, databases, application servers, and middleware. It also supports extending monitoring through additional checks from the Sensu community or Nagios-compatible plugins, allowing you to customize monitoring to your needs.

Monitoring with checks and policies

The agent runs checks on the host to gather relevant data, transforming it into events or metrics. These checks are defined within ServiceNow and are associated with monitoring policies. A policy is a combination of the Configuration Items (CIs) being monitored and the checks that run on those CIs. The checks are associated with policies to monitor different aspects of the system.

You can customize check instances - such as adjusting the frequency or specifying parameters like login credentials for databases - without affecting the original check definition. Customization of a check instance takes effect only on the check instance associated with the policy and does not change the global check definition. This customization ensures flexibility in monitoring various CIs under different scenarios.

Data collection and transmission

After installation, the agent collects information on its host and processes. The agent pushes the collected data to the ServiceNow instance through the MID Server. The MID Server serves as a

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

bridge between the agent and the ServiceNow instance, ensuring the data is transformed and securely sent for processing.

On the instance, CIs are created for the host and applications classified from the running processes (such as Microsoft SQL Server). Once these CIs are created, the active monitoring policies associated with the CIs are downloaded to the agent's MID Server, which then pushes the policies to the agent for execution.

Data storage and use

The results from the checks are stored in the ServiceNow instance:

- CI data: CMDB for Configuration Items.
- Event data: Events table (for example, alerts triggered by threshold breaches).

This data can be leveraged for monitoring, alerting, and reporting. Integration ensures real-time visibility into the health of your infrastructure and applications, while also enabling proactive issue detection and remediation.

1. Define a monitoring policy in the ServiceNow instance.
2. The MID Server fetches the check instances from the instance and passes them to the agent.
3. The agent runs the checks, collects data, and sends the results back to the MID Server.
4. The MID Server sends the collected data to the ServiceNow instance, where it is stored in the CMDB or events tables.

The commands and their configurations that run on the Agent are called **checks**. The Agent comes by default with **check definitions**, which determine a specific command and the default frequency with which it runs. Checks are defined on the instance and are passed to the Agent via the MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A **policy** is a combination of the CIs being monitored by the Agent Client Collector and the checks that run on those CIs. You associate check definitions with policies. Those check definitions are then referred to as **check instances**. You can customize check instances to meet your needs. For example, customize the running interval or the parameters specific to the policy, such as the login credentials to access a MySQL database. Customization of a check instance takes effect only on the check instance associated with the policy, which does not affect the original check definition or already created check instances in other policies.

Agent Client Collector plugins

An Agent Client Collector plugin is a script or group of scripts that extend the Agent Client Collector's capabilities. Plugins enhance monitoring by collecting metrics, performing specialized checks, and triggering events based on conditions, like monitoring an application's queue size when it reaches 60% or 80%. Plugins ensure scalable, customizable monitoring to adapt to evolving infrastructure or application needs.

Plugin-check dependency

Plugins are tightly integrated with checks in the Agent Client Collector Framework. A dependency is created between the plugin and the check to ensure that the plugin is executed alongside the associated check.

- Plugin Dependency: A plugin can be associated with one or more checks, and vice versa, where checks can depend on multiple plugins.
- Execution: Plugins and checks run on the same agent, working in unison to gather data, perform specialized tasks, or trigger necessary events

Creating and managing plugins

You can create Agent Client Collector plugins as needed to customize the monitoring to your specific environment. These plugins are typically formatted as tar.gz files, which contain the scripts that define the plugin's functionality.

- Plugin creation: Custom plugins are developed and packaged into tar.gz files.
- Integration with checks: Once created, the plugin is integrated with checks by establishing the appropriate dependencies, ensuring that the plugin and check run together.
- Customization: Plugins can be customized to meet the specific requirements of your monitoring needs, whether it's adding more detailed metrics, checking system thresholds, or generating custom events.

Pre-installed plugins

Agent Client Collector Framework includes a set of pre-installed plugins that provide basic functionalities for common monitoring tasks, such as gathering standard metrics or monitoring key system parameters. For more detailed information on the plugins that come with the Agent Client Collector as part of ITOM AIOps, see Plugins or applications installed with ITOM AIOps.

Verify data collection in Agent Client Collector

Collect data by gathering essential information from an agent's host system before executing any checks or policies. This process ensures that the Agent Client Collector has accurate and up-to-date data on the infrastructure, processes, and applications running on the host.

Before you begin
Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Collected data is stored as Configuration Item (CI) data, which serves as a foundation for monitoring, alerts, and Metric Intelligence in the ServiceNow® instance.

Before checks and polices can be executed, Agent Client Collector collects data on:

- Host system details (such as hardware and the system's OS version)
- Installed applications and services
- Running processes
- Resource usage metrics (such as CPU, memory, and disk utilization)

Collected data is stored in the ServiceNow instance in either the CMDB (Configuration Management Database) or events table.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. On the Agent Client Collectors page, locate the **Host Data Collection** column for an agent. A green Collected icon • Collected indicates successful data collection for the specific agent.

Checks and policies

A check is a combination of a command and its configuration. The check is executed on the Agent Client Collector's devices to gather data from those devices.

Checks

Checks are provided with the base system, and their commands execute scripts which provide monitoring data for your operating systems and applications. A check's default name indicates what is being monitored and measured, the entity, and the monitoring data. For example, a check named *`os.linux.check-system-cpu`* checks the CPU data on a Linux system. The identified command in the check runs on the monitored device, providing an output and status. Each individual check is referred to as a **check definition**. After being associated with policies, check definitions are then referred to as **check instances**.

You can customize check instances to meet your needs. For example, customize the running interval or the parameters specific to the policy, such as the login credentials to access a MySQL database. Customization of a check instance takes effect only on the check instance associated with the policy, which does not affect the original check definition or already created check instances in other policies.

The following check types are provided with the Event Management base system:

- **Event**: The check's result is transformed into an Event Management event.
- **Metric**: The values from the check result are transformed to metrics.

For details on the Agent Client Collector Framework default checks, see Agent Client Collector Framework default checks.

For details on the Agent Client Collector Monitoring default checks and policies, see Agent Client Collector Monitoring default checks and policies.

For details on the Agent Client Collector for Visibility - Content default checks and policies, see Agent Client Collector for Visibility - Content default checks and policies.

If checks are not running on the agent's devices, your agent may be in CPU protection mode. CPU protection mode is activated when a device's CPU consumption is too high. To view a list

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

of all disabled checks related to the agent, navigate to the agent record on the Agent Client Collectors page (**All** > **Agent Client Collector** > **Agents**), select an agent and select the **Disabled Checks** tab at the bottom of the page.

In the `acc.yml` configuration file, you can modify the CPU protection mode thresholds which determine when a check is disabled. To re-enable a check, select the check and select **Re-enable disabled check** in the **Actions on selected rows...** drop-down. For details on the CPU protection mode thresholds, see Agent Client Collector CPU protection thresholds. For details on manually turning off data collection, see Pause Agent Client Collector data collection.

Configure the cpu_protection_behavior property to determine whether all checks enter CPU protection mode, or only the check that crosses the configured cpu_percentage_limit value with the highest CPU usage within the monitoring interval. For details, see Agent Client Collector CPU protection thresholds.

A check is marked as **Stale** if it is no longer associated with a policy. To remove a stale check, renable it by selecting the box next to the check and selecting **Re-enable disabled checks** from the **Actions on selected rows...** cell.

In the base system, the event's exit status indicates its severity, as follows:

- 0 = OK
- 1 = WARNING
- 2 = CRITICAL

You can add additional severities (such as MAJOR and MINOR) by running a customized script. The following exit statues indicate these severities:

- 13 = MAJOR
- 14 = MINOR

Privileges for running check commands

If the servicenow base system user does not have privileges to run specific check commands, do the following for the relevant operating systems:

- In a Linux system: Enable the servicenow user to run the command with `sudo` permissions. Ensure that the following sudo configuration requirements are met:
  - Disable tty and password requirements
  - Preserve all environment variables
  - Support dynamic PATH for executing commands

  Example configuration in the `/etc/sudoers` file:

```
Cmnd_Alias ACC_F = /usr/sbin/dmidecode -s
 baseboard-serial-number, /usr/sbin/dmidecode -s
 chassis-serial-number, /usr/sbin/dmidecode -s
 system-serial-number, /usr/sbin/dmidecode -s
 system-uuid, /usr/sbin/ss -tanp
servicenow ALL=(root)
 SETENV: /
var/cache/servicenow/agent-client-collector/osquery/bin/osque
ryi *, ACC_F
Defaults:servicenow !requiretty
Defaults exempt_group += servicenow
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Command paths may vary. Consult the sudoers manual for special considerations.

- The `SETENV:` string enables the servicenow user to preserve environment variables.
- The `!requiretty` string disables tty.
- Adding the servicenow user to the `exempt_group` bypasses password requirements and enables dynamic PATH for executing sudo commands.

Ensure that you configure the *must_sudo* check parameter with a value of **true** in the check command parameters section of the check definition.

- In a macOS system: Ensure that the user running the agent service belongs to a user group with privileges to query all tcp connections on the host.
- In a Windows system: Using Windows User Management, add the servicenow user to the groups with the relevant privileges, enabling the user to execute the required commands.

Policies

A **policy** is a combination of the CIs being monitored by the Agent Client Collector and the check definitions that run on those CIs.

To enable a single policy to support multiple credentials, assign a credential alias to the policy. For example, if you have MySQL servers for both Linux and Windows with different credentials, you must create separate policies for each credential type. However, if you use a credential alias, you can assign a single policy to the alias. The agent then matches the relevant credential to the application being monitored. For details on credential aliases, see Create a Connection and Credential alias.

Alerts generated by policies with an event-type check are automatically closed when the CI monitoring stops due to any of the following:

- De-activating the policy
- De-activating the check that caused the alert
- Deleting the check from the policy
- Deleting the policy
- Modifying the policy filter that determines the monitored CIs

Secure parameters in the Agent Client Collector

Secure parameters in the Agent Client Collector (ACC) refers to securely passing sensitive data, such as user names, passwords, and API keys, during check execution, without exposing the sensitive data in the command line. Parameters are passed to the script through standard input (STDIN), hiding them from logs or any process that might capture command-line arguments.

Depending on the coding language in use, implementation of secure parameters may vary. For example, in Linux's Bash, the *read* command (*read <variable_name>*) is used, populating *<variable_name>* with the value entered in STDIN.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Secure parameters data flow

1. Create secure parameters: Define secure parameters in the instance, referencing credentials that need protection (such as usernames and passwords). For details, see Create secure parameters for a check.
2. Configure secure parameters: Set an **Order** value to determine the sequence in which credentials are passed to the standard input.
3. Pass credentials: Transfer credentials from the MID Server to the agent, based on the check to which they are assigned. When the check executes, the agent passes the secured parameters to the script using STDIN, in the order specified by the **Order** value configured in the instance.
4. Execute the check: Upon execution, the agents send the secure parameters to the script via STDIN, following the specified order.
5. Run the script: The script retrieves and uses the secure parameters from STDIN to execute with the secured credentials.

Secure parameters benefits

- Enhanced security: Passing sensitive data like usernames and passwords directly in the command line is a security threat, as they could be exposed to unauthorized access or malicious users. Secure parameters ensure that such data is securely handled and hidden from view.
- Prevent data exposure: When using secure parameters, the credentials are not written in plain text in the command line, avoiding the risk of them being captured in logs or process listings.
- Data flow control: Secure parameters enable controlled and customizable passing of credentials to the script, ensuring the correct handling and timing of sensitive information.

Agent Client Collector configuration data files

Configuration data files store dynamic instance data, such as virtual machine details, that check definitions use during execution. This ensures that checks are executed with up-to-date and accurate information about the instance being monitored.

Configuration data files structure

- Attachment based: A configuration data file contains a single attachment with instance data, such as Azure VM details.
- Synchronization: When an attachment is added or deleted, the data file is synchronized across all MID Servers configured with the Agent Client Collector. If a file or its attachment is deleted, it is also removed from the MID Server.
- Access point: The configuration data files can be accessed on the MID Server at `\static \acc_config`.
- Size: Configuration data files cannot be larger than 10MB.

Check definitions used by configuration data files

- Check definition: Individual check entries are referred to as check definitions. For instance, *`os.linux.check-system-cpu`* checks the CPU on Linux systems.
- Accessing check definitions: Check definitions can be accessed from **All** > **Agent Client Collector** > **Configuration** > **Check Definitions**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File association

- Download process: When a check executes, the agent downloads the configuration data file associated with that check.
- Domain-Specific Synchronization: Files are synchronized only with agents within the same domain, ensuring secure and localized data handling.

Working with configuration data files

Configuration data files serve as a repository for dynamic instance data that is used by check definitions when they are executed. These files ensure that checks are run with accurate, real-time information about the systems or instances being monitored. Configuration data files work as follows:

- Store instance-specific data: Configuration data files store dynamic instance data, such as virtual machine details, server configurations, and other system-specific information. This data is used by check definitions during execution to ensure the latest information is available.
- Create check definitions: A check definition is created with an associated configuration data file. For example, a check definition monitoring system CPU data may include configuration data detailing the system's environment, ensuring checks use accurate and relevant instance data.
- Synchronize with MID Servers: When a configuration data file is added or updated, it synchronizes across all MID Servers communicating with the Agent Client Collector. If the file or attachment is deleted, it is also removed from the MID Servers, ensuring consistency and up-to-date data availability.
- Execute with updated data: During execution, the Agent Client Collector agent downloads the relevant configuration data file from the MID Server. The agent uses this data to execute the check, ensuring access to the most current and accurate instance information.
- Store and access data: Configuration data files are stored on the MID Server in the `static/cache/config-files` directory. This storage location facilitates easy access and management, ensuring the necessary data for checks is always available when needed.

Agent Client Collector logs

Agent Client Collector (ACC) logs play a critical role in monitoring the activity and performance of the agent. Logs offer valuable feedback that helps identify potential issues, especially when the agent's performance is suboptimal. By providing insights into areas of concern, these logs are essential for troubleshooting and resolving issues, ultimately improving the overall effectiveness of the agent.

Agent Client Collector (ACC) logs offer key benefits for monitoring and maintaining agent performance.

- Configurable severity levels: Agent Client Collector logs enables you to configure the severity levels for monitoring, including *`Error`*, *`Debug`*, and *`Info`*. This flexibility helps focus on specific areas, such as tracking errors or diagnosing issues.
- Log retention management: You can set up log retention policies, determining how often to delete logs to preserve system resources. This ensures that the logs remain manageable and do not negatively impact system performance.
- Performance issue identification: Logs provide valuable insights to identify areas where the agent may be experiencing issues, helping to improve agent performance.

For details on locating and managing Agent Client Collector logs, see View the Agent Client Collector logs.

Agent Client Collector API

Use the Agent Client Collector (ACC) API to create a flow that executes an `osquery` command on agents and processes the results. By leveraging the ACC API, you can automate the querying of agent data and streamline the processing of results, making it easier to monitor and manage system performance.

The system supports osquery 5.7.0, providing compatibility with a range of queries for efficient data collection.

The ACC API enables seamless integration and automation for executing queries and managing agents. Here's how it works:

1. Execute osquery commands: You can use the ACC API to send osquery commands to agents. These commands collect a wide range of system and performance data from the target machines.
2. Process results: After the osquery command is executed on the agents, the ACC API processes the results and returns the necessary data. This data can be used for monitoring, troubleshooting, or reporting purposes.
3. Support for osquery 5.7.0: The ACC API is compatible with osquery 5.7.0, which ensures it supports the latest features and improvements, enabling you to leverage advanced query capabilities for enhanced data collection.
4. Enable API features: To use the ACC API, enable the agent and policy APIs. This allows you to configure and manage various aspects of your agents, including their communication, data collection, and query execution.

For details on agent APIs, see Enable agent APIs.

For details on enabling policy APIs, see Enable policy APIs.

Agent Client Collector health instance scan suite

The Agent Client Collector (ACC) health instance scan suite consists of checks that detect anomalies and other issues that might occur on your instance. These checks are designed to ensure the overall health and performance of the ACC, proactively identifying potential problems before they impact system operations.

The ACC health instance scan suite consists of the following checks.

ACC Health Instance Scan Suite checks

Check name	Description
ACC duplicate agent for host CI	Identifies configuration items (CIs) associated with multiple active agents, indicating potential issues with CI identification. Requires importing the `global.ACCInstanceScanUtil` for instances associated with the Xanadu release or earlier.
ACC Error Framework	Verifies whether the ACCErrorManager has been created, which enables associating errors to the relevant ACC scoped app. Detects whether an automation source application, automation error category, and

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Health Instance Scan Suite checks (continued)

Check name	Description
	automation error code exist for the Agent Client Collector Framework application.
ACC find modified script includes	Detects modified Agent Client Collector Framework script includes that might have been altered post-upgrade. Requires importing the `global.ACCInstanceScanUtil` for instances associated with the Xanadu release or earlier.
ACC skipped upgrades	Reports upgrades that were skipped since the last upgrade. Requires importing the `global.ACCInstanceScanUtil` for instances associated with the Xanadu release or earlier.
ACC verify plugin folder hierarchy	Validates the correct creation of ACC Plugin folders and flags duplicate folders that may cause synchronization issues.
ACC active policies count	Counts the number of active published policies, and if the number is above 300, recommends policy consolidation to improve performance.
ACC agent to MID Connection	Verifies the connection of 1000 agents per 1-GB Java Virtual Machine (JVM) to ensure the MID Server isn't overloaded. If overloaded, configure additional JVMs or redistribute agents to other MID Servers.
ACC verify sn_agent CI counts match	Ensures the records in the sn_agent_ci_extended_info and sn_agent_cmdb_ci_agent tables match, confirming data consistency for agents.

For details on importing the `global.ACCInstanceScanUtil` script include, see the Script Include ACCInstanceScanUtil [KB1630132] article in the Now Support Knowledge Base.

For details on instance scans, see Instance Scan.

For details on executing the Agent Client Collector health instance scan suite, see Execute a suite scan.

Domain separation and Agent Client Collector

Domain separation is supported for Agent Client Collector (ACC). Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in Agent Client Collector

Domain separation in ACC allows the isolation of data collected by the Agent Client Collector to a particular domain. As a result, only users within that domain can access and view this data. Similarly, agents and their associated configurations are tied to specific domains, ensuring that operations within one domain do not affect or leak into others. This creates a more organized and secure environment for managing multiple groups, business units, or regions.

- Data Security and Privacy: Restricting data access based on domains reduces the risk of unauthorized access and cross-domain data leakage, ensuring that sensitive information stays within its designated domain.
- Access Control: By isolating domains, organizations can enforce strict access controls, allowing only designated users or teams to view or interact with the data relevant to their domain.

Use cases for domain separation in Agent Client Collector

- Multi-department collaboration with data isolation: IT and Finance departments can independently monitor their respective systems without data overlap. For example, if there's an issue with a server in the payment processing system, Finance can run specific checks in their domain without interference from IT.
- Regulatory compliance: Domain separation helps comply with regulations like GDPR or SOX by ensuring that only authorized personnel can access sensitive data. For instance, the Compliance department can monitor regulatory checks while being restricted from accessing IT infrastructure data.
- Incident management and troubleshooting: IT can troubleshoot network issues, while Finance monitors transaction systems. Domain separation allows both departments to work independently, ensuring faster resolution and preventing data exposure.

Related topics

Domain separation for service providers

Use case: Optimizing data isolation and monitoring with domain separation

Optimizing data isolation and monitoring with domain separation ensures financial institutions protect sensitive information, improve operational efficiency, and maintain compliance by securely segregating departmental data.

Use case overview

In a large financial institution, departments like IT, Finance, Compliance, and HR need to manage their systems independently while keeping sensitive data protected. The Agent Client Collector (ACC) collects data from various agents on servers and devices, and domain separation ensures that each department's data is securely isolated. This allows departments to manage their own monitoring, troubleshooting, and reporting, greatly reducing the risk of cross-domain interference or unauthorized access.

Challenges without domain separation

- Data privacy and security risks: Sensitive data could be exposed to unauthorized users. For example, IT staff could inadvertently access financial or payroll data, violating privacy policies.
- Operational inefficiency: Departments would have to share configurations, making it harder to manage and troubleshoot issues, leading to confusion and inefficiencies.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Compliance issues: Meeting regulatory requirements for data isolation would be difficult, risking compliance violations.
- Increased risk of data corruption: Shared environments can lead to accidental data corruption, as changes in one department could affect others.

Solution

- Data isolation: Each department has a dedicated domain, ensuring that data collected by agents is accessible only within that domain.
- Independent configuration and monitoring: Departments set their own checks, policies, and tasks without affecting others.
- Access control: Role-based access control (RBAC) restricts user access to data within their domain. For example, IT can access only infrastructure data, while Finance can access only financial transaction data.
- Enhanced security: Domain separation ensures that users in one department cannot access data from other departments, reducing the risk of unauthorized access.

Outcome

- Improved data security: Sensitive data is protected, reducing unauthorized access risks.
- Operational efficiency: Departments operate independently, managing configurations and monitoring without conflicts.
- Regulatory compliance: Easier adherence to data privacy regulations (GDPR, SOX) due to secure data segregation.
- Reduced data corruption: Isolated environments prevent unintended cross-departmental impacts, enhancing system stability.

Use case: Regulatory compliance in a financial services solution

A financial institution needs to ensure that its data is accessible only to the departments that have authorization for the indicated data.

Challenge

The financial institution must comply with regulations that require strict data separation between departments (such as HR, IT, or Finance).

Solution

1. Create separate domains for each department (IT, Finance, HR, Compliance, and so forth) in the Agent Client Collector (ACC) configuration.
2. Apply access controls so that sensitive data (such as employee records and financial transactions) is accessible only to authorized departments.
3. Use ACC health instance scans to ensure that data separation is maintained, especially when updating or troubleshooting systems.
4. Periodically audit domain separation settings to ensure compliance with data privacy regulations such as GDPR, SOX, or PCI-DSS.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outcome

Compliance with legal and regulatory requirements is ensured, and sensitive data is protected from unauthorized access.

Configuring Agent Client Collector Framework

Plan and configure your Agent Client Collector Framework implementation.

Agent Client Collector Framework configuration typically follows these steps:

1. Configure an agent registration key.
2. Configure the websocket server on the MID Server.
3. Configure a websocket endpoint.
4. Configure the frequency of updating the agent MID Server list.
5. Create and edit Agent Client Collector plugins.
6. Incorporating the Agent Client Collector into a custom base image for mass deployment.
7. Install the Agent Client Collector.

   The installation procedure to follow depends on the OS you are performing installation on (Linux, Windows, or macOS).

   Note:
   Agent Client Collector does not support multiple Agents installed on a single host device. Each host should have only one ACC Agent configured to communicate with a single ServiceNow. instance.

8. Enable Agent Client Collector monitoring on the MID Server.
9. Optimize distribution of agents to MID Servers.
10. View the Agent Client Collector configuration file for an agent.
11. Create an Agent Client Collector configuration data file.
12. Manually refresh Agent Client Collector certificates.
13. Enable OpenSSL secure signing for plugins.
14. Perform Zscaler remediation.

Configuring Agent Client Collector with a MID Server

Configure the Agent Client Collector with a MID Server to enable communication between network servers and the ServiceNow instance.

Configure an Agent Client Collector with a MID Server using a single-line command

Use a single-line command to set up an Agent Client Collector with a MID Server. You can also use the single-line command to migrate agents with MID-less configuration to be used with a MID Server.

Before you begin

Role required:

- In a Linux or macOS environment: root
- In a Windows environment: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Running the single-line command includes flags, which indicate the options to be added to the `acc.yml` configuration file. These options dictate the configuration of the Agent Client Collector with the MID Server. If you don't specify an option in the command, the existing option in the `acc.yml` file is used. If there's no existing option, an error message indicates that the parameter is required to enable connecting to an endpoint.

Running a command validates that a connection can be made with the specified parameter (for example, the specified api-key value). However, the command doesn't verify if the value of the parameter is valid.

Procedure

1. Run the following command in a terminal window: `acc gateway mid <flags>`.
   The available flags appear in the following table:

MID Server configuration flags

Flag	Type	Description
-y, <--acc-yml>	String	Location of the `acc.yml` being configured. Can also be used to modify and validate parameters if the file is in a different location that the default. Optional. If no value is entered, the default location of the `acc.yml` file is used.
-a, <--api-key>	String	The API key to be used by the MID Server.
-b, <--backend-url>	String	One or more backend connection URLs specifying a websocket endpoint to a MID Server. Multiple values are specified using commas between entries with no spaces separating the values; for example, `<url1>,<url2>`.
-h, help	N/A	Explains what the specified command does.

2. Restart the agent for the configuration settings to be entered into the `acc.yml` file.

Configure the websocket server on the MID Server

Configure the websocket server on MID Servers to enable connections from agents to the MID Server. You can configure only one websocket server per MID Server.

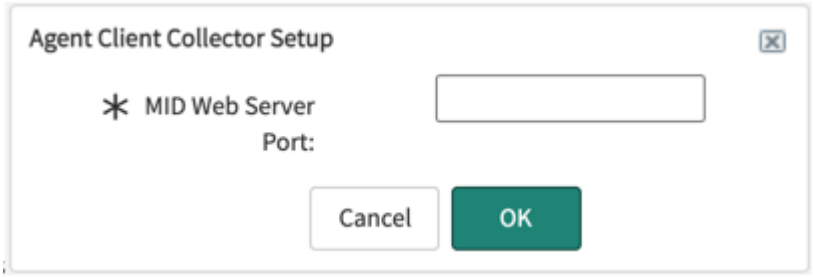
Before you begin

- Ensure that you download and install curl (or similar software) on your MID Server Windows machine.
- Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Select the relevant MID Server name.
3. In the **Related Links** section, click **Setup ACC Listener**.
   The **Agent Client Collector Setup** dialog box appears.



4. Enter the MID web server port (**8800**) in the displayed field.

   Note:
   You can change the default port, **8800**, as needed.

   - To invoke secure TLS configuration, run the following command: `wss://<mid_ip>:<websocket_port>/ws/events`
   - To invoke TLS 1.3 support on the MID Web Server, set the following parameter in the `wrapper-override.conf` file on the MID Server: `-Djdk.tls.server.protocols="TLSv1.3"`
   - In a Linux environment, port numbers under 1024 can be used only with superuser privileges.

5. Click **OK**.
   A confirmation message with the URL for the agent configuration file appears.

   The web server and websocket extension are configured for the MID Server. To verify that the configuration is working, you must navigate to the following menu options:

   - **Agent Client Collector** > **MID Web Server**. When editing the fields on the resulting form, you must restart the MID web server extension to save your changes.
   - **Agent Client Collector** > **Websocket Endpoint**

6. Verify the validity of the websocket, using curl:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter the following command into a cmd or terminal window: *curl -Lk -H "Authorization: Key <API_KEY>" https://<mid_server_address>:<port>/api/mid/mon*

b. Verify that you receive a valid JSON response (and not an error message), such as the following:

Successful installation JSON script

```
{
  "uptime" : "53d 23h 50m 3s",
  "memory" : "used 127MB, total 503MB",
  "connectedAgentsNum" : 1,
  "interactiveResultQueueSize" : "0",
  "nonInteractiveResultQueueSize" : "0",
  "policiesNum" : 3,
  "allChecksNum" : 3,
  "eventsRate" : "MIN: 0.00(0), HOUR: 0.00(0), DAY: 0.00(0)",
  "metricRate" : "MIN: 0.00(0), HOUR: 0.00(0), DAY: 0.00(0)",
  "connectedAgents" : [ {
    "client" : {
      "name" : "10-196-39-193-new",
      "address" : "[redacted]",

      "version" : "2.1.9",
      "timestamp" : 1602838990267,
      "isWindows" : false,
      "silent_mode" : false,
      "checkTimeout" : 120
    },
    "metricsRate" : "MIN: 0.00(0), HOUR: 0.00(0), DAY: 0.00(0)"
  } ]
```

Configure a websocket endpoint

Configure a websocket to enable the endpoint to provide web access from the MID Server to the Agent Client Collector (ACC).

Before you begin

Role required: agent_client_collector_admin

About this task

For added security, ensure that MID Servers deployed for the Agent Client Collector aren't deployed for other components.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select a MID Server.
3. Select the **ACC Websocket Endpoints** tab on the bottom of the page.
4. Select **New**.
5. Configure the fields on the page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Websocket Endpoint page

Field	Description
Name	Enter a descriptive name for the websocket endpoint.
MID Server	The name of the selected MID Server.
Short description	Optionally, enter a short description for the websocket endpoint.
Accessible IP address	Apply an external/public IP when the MID Server has an internal IP that is not accessible from an agent. Used for cloud solutions with an agent that has access only to the MID Server's public IP. If the MID Server and all agents are in the same Virtual private cloud (VPC), this field can be left empty.

6. In the **Related Links** section, select **Start** to activate the websocket endpoint.

Configure the frequency of updating the agent MID Server list

By default, the list of MID servers connected to agents is updated once daily. If you have a dynamic environment that adds MID servers frequently, you may want to schedule updates more often, or execute the job on demand.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Locate the **Update Mid List for All Agents** job.
3. To run the job immediately, click **Execute Now**.
4. To edit the frequency by which the job runs:

   a. In the **Run** field, select **Periodically**.
   The **Repeat Interval** field appears.

Repeat interval field

   b. Configure the frequency by which you want the job to run.
   The cells next to the **Hours** cell represent minutes and seconds, respectively.

   c. Click **Update** to update the job frequency.

Enable Agent Client Collector monitoring on the MID Server

Enable Agent Client Collector monitoring on the MID Server by configuring the Agent Client Collector framework (ACC-F) and Metric Intelligence extensions in a single action. Enabling

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector monitoring also enables monitoring on agents connected to the MID Server.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. On the MID Server page, select a MID Server to view the MID Server's details.
3. In the **Related Links** section, select **Setup ACC Monitoring** and enter the relevant port number in the **MID Web Server Port** field of the dialog box.

Result
The MID Server is configured to support both the Agent Client Collector and Metric Intelligence.

Note:
You are prompted to enter a port number only on initial ACC Monitoring setup.

Automatic MID Server selection

Automatic selection of MID Servers ensures that each agent uses the most efficient available MID Server.

The Agent Client Collector automatic MID Server selection feature set is disabled by default. There are several factors to consider before determining if automatic MID Server selection is right for your use cases.

Use case considerations

Automatic MID Server selection provides several benefits. MID Server capabilities can narrow the list of MID Servers an agent can potential connect to. Automatic MID Server selection keeps the back-end URL configuration list up to date on the agent host without additional work flows.

When automatic MID Server selection is enabled, the agent performs a connectivity test against the list of available MID Servers and determines the best connection based on latency and number of currently connected agents.

However, there are several additional considerations that may make automatic MID Server selection wrong for your use case.

The ACC automatic MID Server selection is not a true load balancer and should be considered a fail-over mechanism. There is higher complexity for choosing a back-end URL as it is derived from multiple input sources. If, instead, an application load balancer is used only one back-end URL needs to be specified. See Enable the Agent Client Collector load balancer for more information.

By default, each agent is sent the list of all MID Servers listening for ACC connections. Since that list includes MID Servers running in restricted areas, the agents can try to connect to them which can generate security alerts.

Your DNS configuration should be considered before using automatic MID Server selection because the resolution can lead to unexpected results. The DNS resolution is done periodically. End User Compute systems that alternate between internal corporate, Wi-Fi, VPN, or external networks may not be able to reconnect if the network context has changed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatic selection process

When automatic selection is enabled, the ServiceNow instance sends periodic MID Server updates to existing agents. The agent selects a MID Server based on information it receives from the ServiceNow instance.

During automatic MID Server selection, the agent selects a primary MID and a secondary MID list, and writes them to the agent's config file. The agent uses this list for fail-over protection when the primary MID/secondary MID in the list loses connection.

When an agent detects that its IP address has changed, it automatically connects with the most efficient MID Server available from the agent's list of MID Servers.

To secure communication between the MID Server and the agent, use the MID Server's unified key store. For details on using the MID Server unified key store, see MID Server unified key store.

Related topics

Enable automatic MID Server selection

Enable automatic MID Server selection

Enabling automatic MID Server selection lets the agent perform a connectivity test against the list of available MID Servers and determine the best connection based on latency and number of currently connected agents. Automatic MID Server selection is disabled by default.

Before you begin
Role required: agent_client_collector_admin

Procedure

- To enable sending periodic MID Server updates from the ServiceNow instance to existing agents, set the *sn_agent.enable_auto_mid_selection* system property to **true**.
- To enable automatic MID Server selection for individual agents:
  1. Set the *enable-auto-mid-selection* property in the agent's `acc.yml` file to **true**.
  2. Enable and execute the Update MID List for All Agents and Update MID List for All New Agents scheduled jobs.

What to do next
To disable automatic MID Server selection again, set each of the properties back to **false**.

To schedule updates more often than once daily, or execute the job on demand, see Configure the frequency of updating the agent MID Server list.

Configure the Agent Client Collector capabilities for MID Servers

Configure the MID Servers with Agent Client Collector capabilities to enable the MID Servers to work with agents. Agents that have identical MID Server capabilities are eligible for automatic MID Server selection.

Before you begin
Role required: agent_client_collector_admin

About this task
A capability defines MID Server functions. Any MID Server that is assigned with a capability that has **Is ACC Capability=true** is enabled to work with an agent. For details on the MID Server capabilities, see MID Server capabilities.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **MID Server** > **Capabilities**.
2. Select a capability to enable the MID Server to work with the agent.
   a. Select the ACC Capability column next to the AgentClientCollector entry.
   b. Set the value to **true**.
3. Enable other capabilities for Agent Client Collector MID Servers by selecting the Is ACC Capability column next to the AgentClientCollector entry and setting the value to **true**.

Result

MID Servers with the same capabilities are eligible to be used during automatic MID Server selection.

Configure the automatic MID Server selection based on the Agent Client Collector capabilities

Configure the MID Servers that are ineligible for automatic MID Server selection with the agent. For example, you may want to block a MID Server from connecting to your agent due to firewall constraints.

Before you begin

Role required: agent_client_collector_admin

About this task

Agents with different levels of Agent Client Collector (ACC) capability can't be considered for automatic MID Server selection. If you want to block a MID Server from automatic MID Server selection, you can assign the MID Server different ACC capabilities from all MID Servers, but not the primary MID Server, in your environment.

Procedure

1. Configure the Agent Client Collector capabilities for MID Servers, as described in Configure the Agent Client Collector capabilities for MID Servers.
2. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
3. Select the MID Server that you want to be ineligible for automatic MID Server selection.
4. Select the additional actions icon ≡ and select **View** > **Default View**.
5. Select the **Capabilities** tab.
6. Ensure that the MID Server isn't assigned with the capabilities that have **Is ACC Capability=true** on the **Capabilities** tab.

Example: Configuring MID Servers to be ineligible for automatic MID Server selection

1. Assign the **AgentClientCollector** capability to MID Server A and MID Server C, but not to MID Server B.
2. On the MID Server Capabilities page:
   a. Assign a capability to MID Server A and MID Server C.
   b. Assign a different capability to MID Server B.
3. Install Agent Client Collector Framework and specify MID Server A as the MID Server during installation.

   After installation, the agent has **Status=Up** and its MID Server is MID Server A.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Execute the MID Server Selection scheduled job to determine which MID Servers are eligible for automatic MID Server selection.

   MID Server B is ineligible for automatic selection, because it doesn't have the same ACC capability as MID Server A. MID Server C is eligible, because it has the same ACC capability as MID Server A.

Configuring MID-less Agent Client Collector

Configure MID-less Agent Client Collector to enable sending information through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Configure MID-less Agent Client Collector using a single-line command

Use a single-line command to set up a MID-less Agent Client Collector. You can also use the single-line command to migrate agents configured with a MID Server to have a MID-less configuration.

Before you begin

Role required:

- In a Linux or macOS environment: root
- In a Windows environment: agent_client_collector_admin

About this task

Running the single-line command includes flags, which indicate the options to be added to the `acc.yml` configuration file. These options dictate the configuration of the MID-less Agent Client Collector. If you don't specify an option in the command, the existing option in the `acc.yml` file is used. If there's no existing option, an error message indicates that the parameter is required to enable connecting to an endpoint.

Running a command validates that a connection can be made with the specified parameter (for example, the specified registration-key value). However, the command doesn't verify if the value of the parameter is valid.

Procedure

1. Run the following command in a terminal window: `acc gateway ics <flags>`.
   The available flags appear in the following table:

MID-less configuration flags

Flag	Type	Description
-y, <--acc-yml>	String	Location of the `acc.yml` being configured. Can also be used to modify and validate parameters if the file is in a different location from the default. Can also be used to modify a different file location to check if the parameters specified are valid. Optional. If no value is entered, the default location of the `acc.yml` file is used.
-b, <--backend-url>	String	The gRPC URL for the ITOM cloud services (ICS) gateway.
-i, <--instance-url>	String	The instance URL.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flag	Type	Description
-r, <registration-key>	String	The registration key for the ITOM cloud services (ICS) gateway.
-h, help	N/A	Explains what the specified command does.

2. Restart the agent for the configuration settings to be entered into the `acc.yml` file.

Installing MID-less Agent Client Collector

Installing MID-less Agent Client Collector enables you to send data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before using MID-less Agent Client Collector, do the following:

1. Ensure that your ServiceNow instance has migrated from an F5 load balancer to Application Delivery Controller, version 2 (ADCv2) and has mTLS support.
   a. Navigate to `<instance_url>/adcv2/server`
      - If a server name appears, the instance is on ADCv2.
      - If the page isn't found or is redirected, the instance isn't on ADCv2. To migrate from F5 to ADCv2, contact Customer Support.
   b. Navigate to `<instance_url>/adcv2/supports_tls`

      If the URL returns a value of **true**, mTLS is supported.
2. Install the ITOM Cloud Services Core (sn_itom_cloud_svc) scoped app plugin.

   If you're using Agent Client Collector for Visibility - Content, install the Agent Client Collector for Visibility - Content (sn_acc_vis_content) plugin.
3. Configure an agent registration key on the instance. For details, see Configure an agent registration key.

Install MID-less Agent Client Collector using a single-line command in a Windows environment

Install MID-less Agent Client Collector on a Windows machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway.amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway.emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway.apac.sncapps.service-now.com:443`
2. On the Windows server where the agent is installed, enter the following command:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
 CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>"
```

The following table shows the parameter values in the command.

Installation command-line parameters

Parameter	Description
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less Agent Client Collector installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Specify a public gateway endpoint for Agent Client Collector.
REGISTRATION_KEY	Active and valid registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registered with.
ACC_ALLOW_LIST	Optional string. To disable the allow list, set *ACC_ALLOW_LIST=0*. By default, the allow list is enabled. **Note:** Disabling the allow list compromises your system's security and is intended as a temporary measure while you're updating the allow list. After completing the update, enable the allow list by setting **ACC_ALLOW_LIST=1**.
ACC_VALIDATE_SIG	Optional string. To disable verification of the installer certification validation, set *ACC_VALIDATE_SIG=0* that you can add to disable the verification of the installer certification validation. By default, validation is enabled. **Note:** Disable the certification validation only when using non-standard signature validation tools.

Install MID-less Agent Client Collector manually in a Linux environment

Install MID-less Agent Client Collector manually on a Linux machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Download the relevant installation package.
   a. Navigate to > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
   b. Download the relevant .rpm or .deb installation file.
   c. Download the relevant signature files to validate the installation files.
2. **Optional:** Verify the package signature.
   a. Extract the installation file (if it is compressed) by running the following command:
   `unzip agent_client-collector-<version_number>-x86_64-rpm-rpm.zip`
   b. Validate the installation file signature by running the indicated commands.
      - On an RPM-based system:

```
openssl dgst -sha256 -verify {<ServiceNow
 DGST pem key>} -signature {<signature file>}
 agent-client-collector-<version number>-x86_64.rpm
```

      Where `<ServiceNow DGST pem key>` is the `.pem` file extracted from the `.zip` file, and `<signature file>` is the `.bin` file extracted from the `.zip` file.

      For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64.rpm
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
$ unzip agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
Archive: agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
inflating: ServiceNow_Digicert_DGST.pem
extracting: agent-client-collector-3.0.0-x86_64.bin
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
$ openssl dgst -sha256 -verify ServiceNow_Digicert_DGST.pem
 -signature agent-client-collector-3.0.0-x86_64.bin
 agent-client-collector-3.0.0-x86_64.rpm
Verified OK
```

Note:
Each command must appear on a single line.

- On a Debian-based system:

  (Optional) `gpg --import ServiceNow_Digicert_Public.gpg`

  `sudo gpg --verify agent-client-collector-<version number>-<distro>_amd64.deb`

  For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64.deb
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
$ unzip
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
Archive:
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
extracting: ServiceNow_Digicert_Public.gpg
$ gpg --import ServiceNow_Digicert_Public.gpg
gpg: /home/admin/.gnupg/trustdb.gpg: trustdb created
gpg: key 985DD52C6A0ABB45: public key "ServiceNow, Inc.
 (Signing) <seceng@servicenow.com>"
imported
gpg: Total number processed: 1
gpg: imported: 1
$ dpkg-sig --verify
 agent-client-collector-3.0.0-debian-9_amd64.deb
Processing
 agent-client-collector-3.0.0-debian-9_amd64.deb...
GOODSIG _gpgbuilder 9B928FB49771DF6C047430DD985DD52C6A0ABB45
 1665054068
```

Note:
Each command must appear on a single line.

3. Install the Agent Client Collector package using the package manager associated with Linux distribution.

OS	Command
RHEL-based	`yum / dnf localinstall`
SLES	`zypper install`
Debian-based	`apt-get install`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, if these commands are not configured correctly, you can use the core commands that are configured to run with the package manager commands.

- RPM-based system: `# rpm -vi agent-client-collector-<version number>-x86_64.rpm`
- Debian-based system: `# dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

Verify that the package commands are configured correctly with your system administrator.

Note:
Some file systems may have restrictions enabled; for example, `/var/` may be mounted with a *noexec* flag. Because the agent must execute Agent Client Collector plugins that are normally store in the `/var/cache` directory, you must deploy the application into specific folders by customizing the installation paths using the *--relocate* option as an `.rpm` parameter.

For example: `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`

The following paths can be relocated:

Path	Notes
`/etc`	When updating, you must also update the *allow-list* parameter in the `acc.yml` file with the new path.
`/usr/share`	N/A
`/var/cache`	Updating the `/var` directory retains all `/var` subdirectories, nested under the new directory.
`/var/log`	
`/var/run`	
`/var`	

Review the paths in `/usr/lib/systemd/system/acc.service` to ensure that they appear as expected.

4. Run the relevant package upgrade command, based on the cpu your machine runs with:
   - Intel cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_x64.pkg -target /
     ```

   - Apple silicon cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_arm64.pkg -target /
     ```

   This command also backs up and restores the agent-id and configuration files before upgrading.

5. In the `acc.yml` configuration file:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Set the following parameters:

Parameter	Value
backend-url	"<gateway URL>"
connect-without-mid	true
instance-url	"<instance URL>"
registration-key	"<regsitration-key>"
insecure-skip-tls-verify	false

b. Comment out the *api-key* parameter.

6. Save the configuration file.

7. Configure sudoers.

Configuration is typically automated by your Linux sysadmin. To configure manually if you want to ensure correctness before full configuration, run the following.

```
# visudo -f /etc/sudoers.d/01_servicenow
User_Alias ACC_USERS = servicenow
Cmnd_Alias ACC_CMD = /usr/sbin/dmidecode -s
 baseboard-serial-number,/usr/sbin/dmidecode
 -s chassis-serial-number,/usr/sbin/dmidecode
 -s system-serial-number,/usr/sbin/dmidecode -s
 system-uuid,/usr/sbin/ss -tanp
ACC_USERS ALL = (root) NOPASSWD:ACC_CMD
Defaults:ACC_USERS !requiretty
```

8. Configure the agent to run as a service.

a. Safeguard resource consumption by adding the indicated values to the `/usr/lib/systemd/system/acc.service` file.

- CPUShares=128
- CPUQuota=10%
- MemoryLimit=192M
- BlockIOWeight=10
- LimitNICE=15

For example:

```
# vi /usr/lib/systemd/system/acc.service
[Unit]
Description=Agent-Now acc
After=network-online.target
[Service]
Environment=AGENT_ROOT=/usr/share
Environment=AGENT_CACHE_ROOT=/var/cache
Environment=AGENT_CONFIG_ROOT=/etc
Environment=AGENT_LOG_ROOT=/var/log
Environment=AGENT_RUN_ROOT=/var/run
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Environment=RUBYOPT=-Eutf-8
User=servicenow
Group=servicenow
ExecStart=/usr/share/servicenow/agent-client-collector/bin/ac
c-service start acc
KillMode=process
Restart=on-failure
RestartSec=1min
CPUShares=128
CPUQuota=10%
MemoryLimit=192M
BlockIOWeight=10
LimitNICE=+15
[Install]
WantedBy=network-online.target
```

b. Run the reload daemon command If you modified the service file after enabling the acc service.

```
# systemctl daemon-reload
```

c. Enable and start the service by running the following commands.

```
# systemctl enable acc
```

```
# systemctl start acc
```

Install MID-less Agent Client Collector using a single-line command in a Linux environment

Install MID-less Agent Client Collector on a Linux machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Retrieve the agent registration key:
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
   b. Select the relevant agent registration key.
   c. Copy the registration key value and store it in a place where you can easily retrieve it, when needed.
2. Retrieve the publicly accessible gateway URL, based on your location.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AMER (Americas): `itomcnc-prod-gateway.amer.sncapps.service-now.com:443`
- EMEA (Europe): `itomcnc-prod-gateway.emea.sncapps.service-now.com:443`
- APAC (Asia Pacific): `itomcnc-prod-gateway.apac.sncapps.service-now.com:443`

3. On the Linux server where the agent is installed, enter the following command:

```
CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>" bash -c "$(curl -L
 https://<instance_url>/api/sn_agent/agents/install_agent)"
```

For details on the parameter values in the command, see Agent Client Collector MID-less installation command parameters.

Install MID-less Agent Client Collector manually in a macOS environment

Install MID-less Agent Client Collector manually on a macOS machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Download the installation files to your local machine.

```
curl -L <download link from the Agent Downloads page on the
 instance>
```

2. Validate the installation file signature.

```
pkgutil --check-signature agent-client-collector-<version
 number>-macos-catalina_x64.pkg
```

Note:
Ensure that the `pkg` certificate chain has the ServiceNow developer ID installer certificate.

3. Install the Agent Client Collector package.

```
sudo installer -pkg agent-client-collector-<version
 number>-macos-catalina_x64.pkg -target /
```

4. Copy the installation files.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Sample configuration file:
```
sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/acc.yml.example /Library/Application\ Support/servicenow/agent-client-collector/acc.yml
```

b. Sample allow list file:
```
sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json.default /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json
```

5. **Optional:** To create new check definitions to be included in the allow list, first disable the allow list by commenting out the *allow-list* parameter in the `acc.yml` file.

   (Optional) `sudo -H -u _servicenow vi /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   Note:
   This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, uncomment the allow list parameter in the configuration file to re-activate the allow list.

   For details on adding custom checks to an allow list, see Generate an Agent Client Collector allow list.

6. In the `acc.yml` configuration file:

   a. Set the following parameters:

Parameter	Value
backend-url	"<gateway URL>"
connect-without-mid	true
instance-url	"<instance URL>"
registration-key	"<regsitration-key>"
insecure-skip-tls-verify	false

   b. Comment out the *api-key* parameter.

7. Save the configuration file.
8. To ensure that the configuration file points to a valid endpoint, run the following commands to restart the Agent Client Collector:

```
sudo launchctl unload
 -w /Library/LaunchDaemons/com.sn.acc.plist
sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist
```

   Note:
   By default, exiting the installation program causes the program to restart immediately. To ensure that the program remains stopped after exiting, set the KeepAlive property in the `/Library/LaunchDaemons/com.sn.acc.plist` file to **false**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install MID-less Agent Client Collector using a single-line command in a macOS environment

Install MID-less Agent Client Collector on a macOS machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key.
- Role required: root

About this task

Procedure

1. Retrieve the agent registration key:
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
   b. Select the relevant agent registration key.
   c. Copy the registration key value and store it in a place where you can easily retrieve it when needed.
2. Retrieve the publicly accessible gateway URL, based on your location:
   - AMER (Americas): `itomcnc-prod-gateway.amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway.emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway.apac.sncapps.service-now.com:443`
3. On the server where you're installing the Agent Client Collector, enter the following command:

```
CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>" bash -c "$(curl -L
 https://<instance_url>/api/sn_agent/agents/install_agent)"
```

The following table describes the parameter values in the command.

Command-line parameter values

Parameter	Value
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Public gateway endpoint for Agent Client Collector that you can specify.
REGISTRATION_KEY	Active and valid agent registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registering with.
ACC_ALLOW_LIST	Optional *ACC_ALLOW_LIST=0* string that you can add to disable the allow list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Value
	Default: The allow list is enabled. **Note:** When you disable the allow list, you compromise your system's security. This action is intended as a temporary measure while you're updating the allow list. After you complete the update, remove *ACC_ALLOW_LIST=0* from the command line.
ACC_VALIDATE_SIG	Optional *ACC_ VALIDATE_ SIG=0* string that you can add to disable the verification of the installer certification validation. Default: Validation is enabled. **Note:** Disable the certification validation only when you're using non-standard signature validation tools.

Configure an agent registration key

Configure an agent registration key so that you can deploy MID-less Agent Client Collector. Deploying MID-less Agent Client Collector enables you to use the MID Server for more persistent resources.

Before you begin
Install the plugins necessary for deploying MID-less Agent Client Collector.

Role required: agent_client_collector_admin

About this task
The Cleanup Agent Registration Keys scheduled job runs daily and deletes expired registration keys. The length of time for which a registration key is valid is controlled by the *sn_agent.registration_key_validity.days* property, based on when the key was created. The amount of time that the customer is notified prior to upcoming key expiration is controlled by the *sn_agent.registration_key_notification.days* property.

If a key's expiration date is approaching, create a new registration key and enter it into any existing automation jobs to prevent registration outage.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the registration key.
4. **Optional:** To receive notifications when a registration key is soon to expire, select a group with a valid email address in the **Ownership Group** field.
   When keys are deleted via the Cleanup Agent Registration Keys scheduled job, the indicated group receives an email notification.
5. Select **Submit**.

Result
The new agent registration key is ready to use for installation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Installing MID-less Agent Client Collector

Agent Client Collector Framework configuration properties

Create and edit Agent Client Collector plugins

You can edit the default plugins, or you can add new plugins, as needed. Creating and editing plugins customizes the Agent Client Collector monitoring capabilities.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **ACC Plugins**.
2. Click **New**.
   The **Agent Client Collector Plugin - New record** page appears.
3. Enter values in the fields on the page, as described in the following table.

Agent Client Collector Plugin fields

Field	Description
Name	Name of the plugin. This field is populated automatically with the name of the tar.gz file attached to the plugin, and is visible only when selecting an existing record.
Description	Description of the plugin.
Operating System	Select the operating system to be monitored by the plugin.
Platform	Select the platform to be monitored by the plugin.
Active	Select to activate the plugin and download it to the MID server.
Advanced	Select to enable selecting the operating system version to be monitored by the plugin.
OS Version	Select the operating system version to be monitored by the plugin. This field is visible only when selecting the **Advanced** check box.

4. Attach the `tar.gz` file to the plugin record, according to the instructions that appear on the UI page.

Secure a custom plugin with a certificate

When you customize or create an Agent Client Collector plugin, you can secure the plugin with either a third-party certificate or an internal secure certificate in the plugin's script. Official plugins are signed by an external certificate authority.

Using a self-signed certificate is enabled by default. To disable this feature, set the *`verify-plugin-signature`* property to **False**. When you disable a self-signed certificate, your configured plugins use no certificate.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on how to configure a self-signed certificate by using OpenSSL, see Enable OpenSSL secure signing for plugins. For details on how to configure a third-party certificate, consult the third-party vendor's documentation.

When the agent's current certificates can't validate a plugin, Agent Client Collector requests the updated certificates from its synchronized MID Server. You can manually refresh the agent to receive these certificates before the scheduled synchronization. For details, see Manually refresh Agent Client Collector certificates.

You can manually save the certificates in a directory on the MID Server that is connected to the installed agents. Any agent that's installed in your environment can then access the certificates from that MID Server.

For details on how to configure the certificate synchronization properties, see Synchronization properties for validating Agent Client Collector plugins.

Agent Client Collector installation

You can install the Agent Client Collector on any supported host machine. The Agent Client Collector connects to a MID Server using the HTTP/S protocol, and the connection remains active after being established. One MID Server may handle several agents simultaneously, while a single agent works with one MID Server at a time and switches to a different MID Server when necessary to provide failover protection.

When an agent's IP address changes, it selects a MID Server to connect to based on the agent's MID Server list.

The maximum number of agents that can be connected to a single MID Server is configurable in the *sn_agent.mid.max_allowed_agents* MID Server property. The default value is 4,000.

For ACC-VC, a default 1 GiB MID Server can support 700 agents concurrently. An 8 GiB configuration for a MID Server can support 8,000 agents concurrently. You can also scale out. For example, 5 MID Servers with 8 GiB of heap size can handle up to 40k agents.

The default user account is a local user called **servicenow**. This user has basic level permissions.

The following table describes the permissions required to work with various features associated with the agent, per OS. An asterisk (*) indicates that no special permissions are required.

Agent on Endpoints Deployment

Feature	Windows	Linux	macOS
Basic inventory	*	*	*
Serial number(s)	*	sudo dmidecode	*
Running processes	Debug programs	*	*
Mapping TCP connections to running processes	*	sudo ss	*
Storage devices	LOCAL SYSTEM	*	*
Logged-in users	LOCAL SYSTEM	*	*

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent on Endpoints Deployment (continued)

Feature	Windows	Linux	macOS
Package self-upgrade	LOCAL SYSTEM	sudo rpm/dpkg	Not supported

If you completely reinstall the agent on a single host server, a second agent record registers on the instance. Delete the original agent on the **Agent Client Collectors** page (**All** > **Agent Client Collector** > **Agents**).

Agents whose **Status = Down** or **Disconnected** which haven't been deleted are deleted automatically after 30 days. You can modify this setting on the Autoflush form page (see Autoflush form).

Use the Manual Transport Layer Security protocol (mTLS) for secure authentication between your MID Web Server and the agent (the client). For details, see Connect the agent to the MID Server using mTLS.

For details on using Agent Client Collector in an air-gapped environment, see the Agent Client Collector Framework Air Gapped Configuration Item Management Solution [KB1585753] article in the Now Support Knowledge Base.

Agent Client Collector supports domain separation. The domain of the agent and the CIs it creates is determined by the domain of the MID Server that the agent is connected to. The user's domain must be the lowest domain level (known as a leaf domain) to enable creating a Websocket endpoint extension for the MID Server.

Related topics

Agent Client Collector installation on a Linux OS system

Install the Agent Client Collector on a Windows machine manually

Agent Client Collector installation on macOS system

Agent Client Collector system requirements

System requirements are the fundamental specifications and configuration needed to install and run Agent Client Collector (ACC) effectively.

Before installing the Agent Client Collector, you must do the following:

- When working with a MID Server:
  - Ensure that one or more MID Servers are properly registered and validated with your instance, to be available for an agent connection request. For details, see Configuring MID Servers . In a staging environment, you need only one MID Server. However, in a production environment, configure at least two MID Servers to support zero-touch configuration and ensure that a MID Server is always available if one fails.
  - Ensure that there's a validated connection from the designated server where you're installing the agent to the MID Server.
  - Ensure that the MID Server port on which the Agent Client Collector listener runs is accessible.
- When working with MID-less deployment, follow the instructions described in Configuring MID-less Agent Client Collector.
- Ensure that the following plugins are installed on your instance:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Plugin
ACC-F	○ MID Server ○ CMDB for scoped applications ○ Agent Client Collector global utilities ○ MID Web Server ○ Service Error Management
ACC-VC	○ Agent Client Collector for Visibility - Content ○ Agent Client Collector Framework ○ Discovery [com.snc.discovery] plugin
ACC-M	○ Agent Client Collector Framework ○ Agent Client Collector Monitoring ○ Event Management and Service Mapping Core ○ Metric Intelligence - [com.snc.sa.metric] plugin
ACC-L	○ Agent Client Collector Framework ○ Agent Client Collector Log Analytics ○ Health Log Analytics
DEX	○ Agent Client Collector Framework ○ ITOM Cloud Services Core [sn_itom_cloud_svc]

You can verify that these plugins are installed on the **System Definitions** > **Plugins** page.

All plugins that come with the base system are signed with the ServiceNow certificate. Optionally, you can use custom plugins and sign them using your own certificate, as described in Enable OpenSSL secure signing for plugins.

- Ensure that your system has the minimum requirements for agent installation.

Minimum installation requirements

Agent Client Collector component	Requirements
Agent Client Collector Framework	○ 1 GB RAM ○ 300 MB free disk space ○ 1 CPU core
Agent Client Collector Monitoring	○ 1 GB RAM ○ 1 GB free disk space ○ 1 CPU core

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector component	Requirements
Agent Client Collector for Visibility - Content	○ 1 GB RAM ○ 1 GB free disk space ○ 1 CPU core

- Ensure that you are installing Agent Client Collector on one of the supported operating system distributions:

Supported Operating System Distributions

Operating System	Distribution
Linux	○ Red Hat Enterprise Linux - RHEL and Oracle Linux - OL 7, 8, 9 ○ CentOS 7, CentOS Stream 8 and 9 ○ SLES 12, 15 ○ Debian 9, 10, 11 ○ Ubuntu 18.04, 20.4, 22.04, 24.04 LTS ○ Amazon Linux 2 AMIs ○ Amazon 2023 ○ Rocky Linux 8 and 9
Windows (ACC-M and ACC-L are supported only on servers, not endpoints)	○ Windows Server 2012, 2012r2, 2016, 2019, 2022 ○ Windows 10 Enterprise Edition ○ Windows 11 Professional and Enterprise ○ Windows 11 Surface on ARM64
macOS (on both x86_64 and arm64 (Apple Silicon) architectures. ACC-M and ACC-L are supported only on servers, not endpoints)	○ Catalina ○ Big Sur ○ Monterey ○ Ventura ○ Sequoia

Important:
All supported operating systems work only with the x86-64 CPU architecture type. ACC-F v3.1.1 also adds native support for ARM64 on Apple Silicon architectures. For the latest information, see the Agent Client Collection on non- x86-64 computers and embedded boards [KB1172387] article in the Now Support Knowledge Base.

When using ACC-L: The Agent Client Collector comes with the default *servicenow* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *servicenow* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and `C:\Windows\System32` in Windows. For information about configuring permissions for the *servicenow* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When determining the number of machines and servers needed to support your agents (such as the number of machines requiring proxy agents), you must consider the agents' performance KPIs. For details on agent performance KPIs, see Agent Client Collector performance and footprint for URL monitoring.

Incorporating the Agent Client Collector into a custom base image for mass deployment

Deploy the Agent Client Collector on a virtual machine during mass deployment using the machine's base image. Mass deployment uses silent installation, which hides installation status.

Before you begin

Use Microsoft SCCM to manage the deployment and security of your devices, as described in the Create a Windows service account with Log on as a Service KB article.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Downloads**.
2. Download the installation file of the relevant OS.
3. Install the agent according to the relevant OS instructions.
4. Run the following command to stop the agent service:
   - In a Windows environment: Run the command `sc stop AgentClientCollector`
   - In a Linux environment: Run the command `sudo systemctl stop acc`
5. Ensure that the `acc.yml` file doesn't include an encrypted API key.
   For example: `api-key: "<insert plain text API key here>"`
6. Delete the contents of the agent's cache directory, keeping the directory structure intact:
   - In a Windows environment: `C:\ProgramData\ServiceNow\agent-client-collector\cache`
   - In a Linux environment: `/var/cache/servicenow/agent-client-collector`
7. When installing on a Windows machine, ensure that the installation was successful by doing one of the following:
   - Enable logging in silent installation and verify that the log file ends with the string, `Windows Installer installed the product.`
   - Ensure that the **AgentClientCollector** service has the status `Running`.
8. When installing on a Linux machine, access the machine where the agent is installed and modify the `/usr/share/servicenow/agent-client-collector/serial_number.txt` file in one of the following ways:
   - Change its content with the host's serial number, by running the following command: `sudo -n dmidecode -s system-serial-number`
   - Assign sudo permissions to the servicenow user to enable running the following `osqueryi` command: `sudo -E env "PATH=$PATH" osqueryi --logger_min_status=3 --line "select hardware_serial from system_info"`

   Note:
   You must change the virtual machine's host name after deployment to a unique value, to avoid damaging the host's CI.

9. As a post-deployment step, restart the agent service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In a Windows environment: Run the command `sc start AgentClientCollector`
- In a Linux environment: Run the command `sudo systemctl start acc`

Enable the Agent Client Collector load balancer

Enable a load balancer to ensure that you have functional MID Servers. A load balancer distributes resources over multiple MID Servers to ensure that no single MID Server is overloaded.

Before you begin

1. Install the Agent Client Collector Framework.
2. Configure the Agent Client Collector web server.
3. Ensure that you have access to the internal application's load balancer configuration.
4. Verify that the file `<mid_server_install_path>/static/hello.txt` was created during MID Server setup.

   `hello.txt` is an empty file that is created manually, to retrieve an HTTP response 200.

Role required: agent_client_collector_admin

About this task

Load balancers are not configured by default. Follow this procedure to configure a load balancer in your environment.

Procedure

1. Configure the load balancer so that it can be used in the *`backend-url`* parameter in the `acc.yml` configuration file.
2. Perform the following setup actions on the load balancer:

   a. Increase the idle timeout to 300 seconds.

   b. Configure the load balancer target group with *`https`* and port 443.
   Configure all MID Servers behind the load balancer as targets.

   c. Configure the load balancer health check to monitor the `<mid_server_install_path>/static/hello.txt` file created during MID Server setup.
   The health check ensures that there are no communication interruptions between the load balancer and the MID Server.

3. Add the `<mid_server_install_path>/static/hello.txt` file to the static folder for each MID Server.
   You can place the file in another location that doesn't require credentials, to simplify the setup.
4. Update the acc.yml configuration file with the appropriate FQDN (*`backend-url`* value) and port number, and turn off automatic MID Server selection.

```
backend-url:
 - wss://<fqdn>:<port>/ws/events
enable-auto-mid-selection: false
```

5. Restart the Agent Client Collector.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The Agent Client Collector data flow proceeds as described in Agent Client Collector architecture.

Note:

When working with SSL, all certificates or certificate chains used by the configured MID Servers must be signed by root certificate authorities whose certificates are bundled inside a single `.pem` file. To transfer the signed certificates to the agent, specify the `.pem` file in the *`trusted-ca-file`* property of the agent's `.yml` configuration file. For information on enhancing security with SSL/TLS configuration, see the ITOM Agent Client Collector documentation material article in the Now Support Knowledge Base.

Upgrade an agent in an instance

Perform selective self-upgrade instead of bulk upgrade for enhanced efficiency when working with agents that are difficult to access, such as agents deployed in the cloud. You can perform selective upgrade on up to 20 agents at a time.

Before you begin

Note:

Selective upgrade is available for the agents version 2.7.0 and above.

Supported Operating Systems: Windows and Linux.

Ensure that data files are up to date by restarting the MID Server and collecting host data. For details on collecting host data, see Run host data collection on demand.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

When working in a Linux environment, ensure that you have sudo permissions and that the following configurations are set:

Linux Operating Systems

OS	OS version	Commands	Agent version
CentOS,Red Hat	7, 8	• `/usr/bin/systemctl start acc` • `/usr/bin/systemctl stop acc` • `<systemctl location> daemon-reload` (default location is `/usr/bin`) • `/usr/bin/rpm -Uv <cache dir location>/upgrade/agent-client-collector-upgrade.rpm` Default cache directory location: `/var/cache/servicenow/agent-client-collector` • `unzip -o`: Unzips the signature file to validate the installation. • `openssl dgst -sha256 -verify`: Verifies use of a signature from a servicenow installation file.	2.7
Debian, Ubuntu		• `/usr/bin/systemctl start acc` • `/usr/bin/systemctl stop acc` • `<systemctl location>`	2.7

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When connecting via a MID Server, ACC installs need to access one of the following URLs:

- `https://<MID-WEBSERVER-URI:PORT>/static/acc_installers/agent-client-collector`
- `https://install.service-now.com/`

When upgrading MID-less agents, upgrade is performed at the URL set in the *`agent-upgrade-url-path`* property of the acc.yml file. If no URL is set at this property, upgrade is performed by downloading the installer script from the following Content Delivery Network (CDN) URL: `https://cdn-install.sncapps.service-now.com/glide/distribution/builds/package`

Note:
When using a CDN, send your download request through a proxy server, for added security. For details, see Configure proxies when performing MID-less upgrade using a Content Delivery Network (CDN).

Select the version to which you want to upgrade your agent.

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Assign the following values:
   - Name = **sn_agent.agent_upgrade_version**
   - Type = **string**
   - Value = The version number to be upgraded to, in the format <major_version.minor_version.patch_version>. For example: **4.3.2**
4. Select **Submit**.

If you do not select a version, the agent automatically upgrades to the current Agent Client Collector Framework scoped app version.

Role required:

- Windows: Local SYSTEM account (Agent Client Collector service running as *`Local System`*)
- Linux: sudo rpm/dpkg
- macOS: sudo pkg

About this task

Agent Client Collector supports selective self-upgrade in the following operating systems:

- Windows: Due to Windows UAC restrictions, the agent must run as a local SYSTEM account to perform the upgrade via *`msiexec`*.
- Linux: RPM and DEB

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the agent that you want to upgrade.
3. In the **Related Links** section, select **Upgrade agent**.
4. In the confirmation dialog box, select **Upgrade**.
   The **Agent Upgrade Histories** page appears, where you can monitor the upgrade progress in the **State** column, which displays either **Success** or **Failed**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. View the log for the agent upgrade in the **Message** column.
   For a failed upgrade on a Linux machine, navigate to the `<cache directory location>/upgrade/agent-client-collector-upgrade.rpm` file and ensure that the configurations are set for the relevant OS, according to the Linux Operating Systems table, above.

   For a failed upgrade on a Windows machine, check the relevant log file, located at `<user folder>\AppData\Local\Temp\ACC_Logs`:

   - ACC logs: `ACC_Upgrade.log`
   - MSI logs: `MSI_ACC_Upgrade.log`

Upgrade multiple agents in an instance

When performing selective upgrade of an agent in an instance, you can select multiple instances to upgrade at once.

Before you begin

Supported Operating Systems: Windows and Linux.

Agent Client Collector installs need to access this URL: `https://install.service-now.com/`. MID connected agents can download the installer from the MID Server (`https://<MID-WEBSERVER-URI:PORT>/static/acc_installers/agent-client-collector`).

Select the version to which you want to upgrade your agent.

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Assign the following values:
   - Name = **sn_agent.agent_upgrade_version**
   - Type = **string**
   - Value = The version number to be upgraded to, in the format <major_version.minor_version.patch_version>. For example: **4.3.2**
4. Select **Submit**.

If you do not select a version, the agent automatically upgrades to the current Agent Client Collector Framework scoped app version.

When working with MID-less agents, ensure that the agents are connected to a Content Delivery Network (CDN). For details, see Configure proxies when performing MID-less upgrade using a Content Delivery Network (CDN).

Role required: agent_client_collector_admin

About this task

You can select up to 20 agents at a time for upgrade. To upgrade large numbers of agents, incorporate the Agent Client Collector into your software deployment tools.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the check box next to the agents that you want to upgrade.
   You can select up to 20 agents.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Actions on selected rows...** box, select **Upgrade agent**.
4. In the confirmation dialog box, select **Upgrade**.

Related topics

Upgrade an agent in an instance

Perform high-volume Agent Client Collector upgrade

Perform high-volume Agent Client Collector upgrade

Perform high-volume upgrade of your Agent Client Collector agents when you want to upgrade all of your agents at one time.

Before you begin

Configure the Agent Client Collector web server. For details, see Configure the websocket server on the MID Server.

Ensure that the MID Server, MID Web Server, and the MID Server websocket server are running.

Select the version to which you want to upgrade your agent.

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Assign the following values:
   - Name = **sn_agent.agent_upgrade_version**
   - Type = **string**
   - Value = The version number to be upgraded to, in the format <major_version.minor_version.patch_version>. For example: **4.3.2**
4. Select **Submit**.

If you do not select a version, the agent automatically upgrades to the current Agent Client Collector Framework scoped app version.

Roles required: agent_client_collector_admin

- In a Windows environment: Local SYSTEM account
- In a Linux environment: sudo rpm/dpkg
- In a macOS environment: sudo pkg

About this task

High-volume upgrade is supported only in a Windows or Linux environment.

High-volume upgrade does not support Agent Client Collector to MID Server communication via mTLS.

When performing high-volume upgrade, all agents that aren't using the most up-to-date version are upgraded. No upgrade is performed on agents already using the upgraded version.

An agent is excluded from high-volume upgrade when you reach the failed upgrade limit for an agent. The failed upgrade limit is specified in the *sn_agent.auto_upgrade.retry_limit* system property. The default value for this property is 3.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- This property applies to both high-volume and selective upgrades that have failed.
- When an agent reaches the failed upgrade limit, an Agent Client Collector administrator can still run selective upgrade on the agent.
- You can manually reset the failed upgrade limit by selecting the **Reset failed upgrade attempts** option on the agent page (select **All** > **Agent Client Collector** > **Agents** and select an agent).
- After a successful upgrade, the upgraded agent is considered to have zero failed upgrades (for future upgrades).

Procedure

1. Verify that the version number you want to upgrade to is available.
   a. Navigate to **All** > **System Properties** > **All Properties**.
   b. Locate the *sn_agent.agent_version* property.
   Verify that the version number displayed is a valid agent version, representing the version that the agent will be upgraded to. If the version number is not valid, the version updates to the *sn_agent.agent_version* number.
2. Enable the property on the System Properties table (**All** > **System Properties** > **All Properties**) to activate the upgrade.
   a. Locate the *sn_agent.auto_upgrade.enabled* property.
   b. Set the property value to **true**.
   Upgrading starts within one minute of enabling the property.

Result

- For agents connected to a MID Server: The scheduled job upgrades 50 agents on each MID Server per hour. The maximum number of agents that can be upgraded at a time for all MID Servers is 1,000.
- For MID-less agents: The scheduled job upgrades up to 1,000 agents per hour by default.
- For both MID Server and MID-less agents: To modify the number of agents being upgraded at a time, update the value of the *sn_agent.auto_upgrade.max_upgrades_per_handler_per_hour* property (**All** > **System Properties** > **All Properties**). The default value is 1,000.

  Note:
  Modifying this value can negatively impact system performance.

To modify the frequency of the upgrade, update the value of the Repeat Interval in the **Upgrade Agents Incrementally** scheduled job (**All** > **System Definition** > **Scheduled Jobs**).

Configure proxies when performing MID-less upgrade using a Content Delivery Network (CDN)

Create proxies for added security when upgrading MID-less agents via a Content Delivery Network (CDN). You add proxy servers to the sn_agent_proxy table on the ServiceNow instance.

Before you begin

Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Package Download Proxies**.
2. Select **New** to create a new proxy server.
3. Fill in the fields on the page.

Proxy - New record page fields

Field	Description
Name	A descriptive name to identify the proxy server.
URL	The URL of the proxy server that is accessed when the agent downloads the installer. Enter the URL in the following format: `some.example.com:8800`.
Domain	Select one of the following: ○ **leaf**: Select if domain separation is active, and select the leaf domain for the proxy to be used in. ○ **global**: Select if domain separation is not active.
Order	A number indicating which proxy is used first when the agent downloads the installer from the CDN. Lower numbers are used first.
Active	Select for the URL to be invoked. Clear for the URL to be ignored.

If no proxy server is specified, the default of *`direct`* is invoked, instructing the agent to download the installer directly from the CDN.

Restart an agent manually

Perform manual restart of an agent when the agent configuration file has been refreshed, or if the agent is unstable. You can perform manual restart only on agents installed in a Windows environment and for Linux-based agents that use `systemd`.

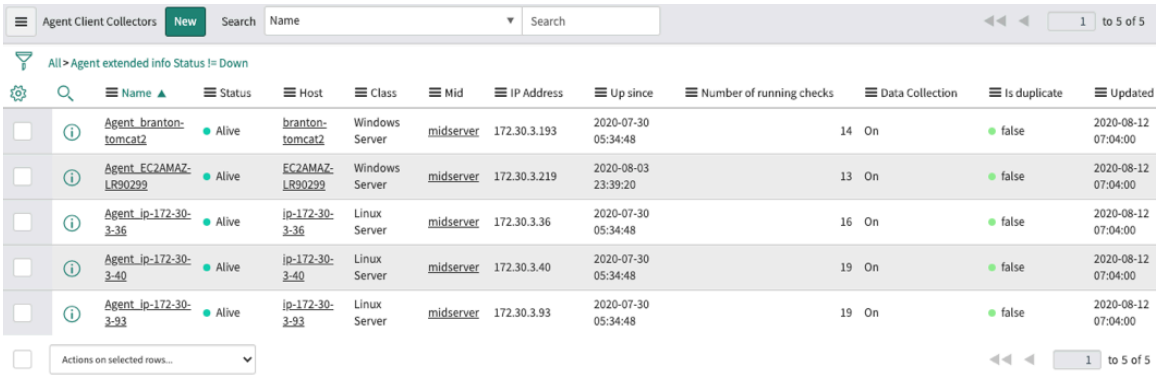
Before you begin

Role required: agent_client_collector_admin

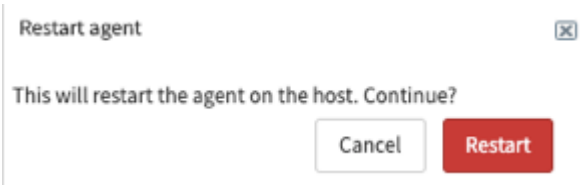
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears with the list of agents.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select the check box of the agent you want to restart.
   You can select multiple agents.
3. In the **Actions on selected rows...** list underneath the list of agents, select **Restart agent**.
   A confirmation dialog box appears.



4. Select **Restart**.
   Alternatively, you can restart the agent from within the agent record by selecting the agent name and, in the **Related Links** section, select **Restart agent**.

Agent Client Collector installation on a Linux OS system

Install Agent Client Collector on a system that uses a Linux OS, either using a single-line command script, or following the installation procedure to embed in your own package distribution mechanism. The installation procedure provides consistency when using package distribution solutions.

Install Agent Client Collector on a Linux system

Install Agent Client Collector using a package distribution tool. Prior to installing, you can manually install the Agent Client Collector on a few machines to ensure that your agents contain the correct policies and checks before installing a large number of agents.

Before you begin

- Ensure that the Agent Client Collector Listener is configured on your MID Servers, and the service is available from your target hosts.
- Verify that your server's OS and version is supported. For a list of supported OS's and versions, see Agent Client Collector installation.
- Verify whether there are restrictions or requirements to be aware of during deployment, such as specifying an account other than the default servicenow account. For more information about embedding the agent into your own automated system, see ITOM Agent Client Collector documentation material [KB1122613].
- Ensure that the MID Server and its MID Web Server and ACC Websocket Endpoint extensions are up and running.
- Retrieve the MID Server ACC Listener information to be specified in the agent's *backend-url* parameter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select a MID Server.
3. Select the **ACC Websocket Endpoints** tab.
4. Select a websocket endpoint.
5. Copy the value in the **Endpoint URL** field.

- Retrieve the MID Server API key specified in the agent's *api-key* parameter.

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Web Server API Key**.
2. Select the API key you want to use.
3. In the **Related Links** section, select **View API key**.
4. Copy the API key value and close the pop-up window.

Role required: agent_client_collector_admin

About this task

During Linux installation (and upgrade), the agent executable file is enabled with Linux capabilities (CAP_SETFCAP, CAP_SETPCAP) by default. Store apps such as Agent Client Collector Log Analytics (ACC-L) can use this to grant capabilities to read the entire file system (CAP_DAC_READ_SEARCH). The system undergoes various security measures, such as double verification of the content origination, leveraging the plugin verification process and more, to ensure that granting capabilities does not pose a security risk. This procedure assumes that you are familiar with commands for Linux capabilities.

To opt out of these enhanced capabilities, run the following commands, based on your Linux OS/packaging system:

Linux enhanced capability opt-out commands

OS/Packaging System	Commands

RPM	`ACC_SKIP_CAPS=true yum / dnf localinstall`
	
	`ACC_SKIP_CAPS=true rpm -vi agent-client-collector-<version number>-x86_64.rpm`

Debian	`ACC_SKIP_CAPS=true apt-get install`
	
	`ACC_SKIP_CAPS=true dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

SLES	`ACC_SKIP_CAPS=true zypper install`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Download the relevant installation packages.
   - For manual installation:
     a. Navigate to > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
     b. Download the relevant .rpm or .deb installation file.
     c. Download the relevant signature files to validate the installation files.
   - For command-line installation, run the following commands to download both the signature and installation files to your local machine:

```
curl -LO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-<version_number>-x86_64.rpm
curl -LO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-<version_number>-x86_64-rpm-rpm.zip
```

Note:
Each curl command must appear on a single line.

2. **Optional:** Verify the package signature.

   a. Extract the installation file (if it is compressed) by running the following command: `unzip agent_client-collector-<version_number>-x86_64-rpm-rpm.zip`

   b. Validate the installation file signature by running the indicated commands.
      - On an RPM-based system:

```
openssl dgst -sha256 -verify {<ServiceNow
 DGST pem key>} -signature {<signature file>}
 agent-client-collector-<version number>-x86_64.rpm
```

Where `<ServiceNow DGST pem key>` is the `.pem` file extracted from the `.zip` file, and `<signature file>` is the `.bin` file extracted from the `.zip` file.

For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64.rpm
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
$ unzip agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
Archive: agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
inflating: ServiceNow_Digicert_DGST.pem
extracting: agent-client-collector-3.0.0-x86_64.bin
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
$ openssl dgst -sha256 -verify ServiceNow_Digicert_DGST.pem
 -signature agent-client-collector-3.0.0-x86_64.bin
 agent-client-collector-3.0.0-x86_64.rpm
Verified OK
```

Note:
Each command must appear on a single line.

- On a Debian-based system:

  (Optional) `gpg --import ServiceNow_Digicert_Public.gpg`

  `sudo gpg --verify agent-client-collector-<version number>-<distro>_amd64.deb`

  For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64.deb
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
$ unzip
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
Archive:
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
extracting: ServiceNow_Digicert_Public.gpg
$ gpg --import ServiceNow_Digicert_Public.gpg
gpg: /home/admin/.gnupg/trustdb.gpg: trustdb created
gpg: key 985DD52C6A0ABB45: public key "ServiceNow, Inc.
 (Signing) <seceng@servicenow.com>"
imported
gpg: Total number processed: 1
gpg: imported: 1
$ dpkg-sig --verify
 agent-client-collector-3.0.0-debian-9_amd64.deb
Processing
 agent-client-collector-3.0.0-debian-9_amd64.deb...
GOODSIG _gpgbuilder 9B928FB49771DF6C047430DD985DD52C6A0ABB45
 1665054068
```

Note:
Each command must appear on a single line.

3. Install the Agent Client Collector package using the package manager associated with Linux distribution.

OS	Command
RHEL-based	`yum / dnf localinstall`
SLES	`zypper install`
Debian-based	`apt-get install`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, if these commands are not configured correctly, you can use the core commands that are configured to run with the package manager commands.

- RPM-based system: `# rpm -vi agent-client-collector-<version number>-x86_64.rpm`
- Debian-based system: `# dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

Verify that the package commands are configured correctly with your system administrator.

Note:
Some file systems may have restrictions enabled; for example, `/var/` may be mounted with a *noexec* flag. Because the agent must execute Agent Client Collector plugins that are normally store in the `/var/cache` directory, you must deploy the application into specific folders by customizing the installation paths using the *--relocate* option as an `.rpm` parameter.

For example: `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`

The following paths can be relocated:

Path	Notes
`/etc`	When updating, you must also update the *allow-list* parameter in the `acc.yml` file with the new path.
`/usr/share`	N/A
`/var/cache`	Updating the `/var` directory retains all `/var` subdirectories, nested under the new directory.
`/var/log`	
`/var/run`	
`/var`	

Review the paths in `/usr/lib/systemd/system/acc.service` to ensure that they appear as expected.

4. When installing a .deb package, configure the agent's `acc.yml` configuration file.

   a. Copy the sample configuration file by running the following command.

   ```
   # cp -p /etc/servicenow/agent-client-collector/
   acc.yml.example /etc/servicenow/agent-client-collector/acc.yml
   ```

   b. Rename the allow list file.

   ```
   # cp -p /etc/servicenow/agent-client-collector/check-allow-
   list.json.default /etc/servicenow/agent-client-collector/check-
   allow-list.json
   ```

   Note:
   This step is not relevant for .rpm packages, which come with `acc.yml` and `check-allow-list.json` files included in the base system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Update the configuration file, adding *check-allow-list.json* to `/etc/servicenow/agent-client-collector` and copying the `backend-url` and `api-key` from the instance.
   For example:

```
---
# Agent Client Collector configuration
backend-url:
 - "wss://YOUR_MID_ENDPOINT_HERE:YOUR_MID_PORT_HERE/ws/events"
api-key: "YOUR_API_KEY_HERE"
log-level: "info"
insecure-skip-tls-verify: false
allow-list: /
etc/servicenow/agent-client-collector/check-allow-list.json
verify-plugin-signature: true
max-running-checks: 10
disable-sockets: true
disable-api: true
statsd-disable: true
enable-auto-mid-selection: false
agent_cpu_threshold:
 cpu_percentage_limit: 25
 repeated_high_cpu_num: 3
 monitor_interval_sec: 60
 agent_cpu_threshold_disabled: false
```

   The *allow-list* feature, indicating the commands permitted to be executed by the agent, is enabled.

6. Configure sudoers.

   Configuration is typically automated by your Linux sysadmin. To configure manually if you want to ensure correctness before full configuration, run the following.

```
# visudo -f /etc/sudoers.d/01_servicenow
User_Alias ACC_USERS = servicenow
Cmnd_Alias ACC_CMD = /usr/sbin/dmidecode -s
 baseboard-serial-number,/usr/sbin/dmidecode
 -s chassis-serial-number,/usr/sbin/dmidecode
 -s system-serial-number,/usr/sbin/dmidecode -s
 system-uuid,/usr/sbin/ss -tanp
Cmnd_Alias ACC_CMD_SETENV = /usr/bin/netstat -ltnup,/usr/bin/ls
 -l /proc/*,/usr/bin/cat /proc/*
ACC_USERS ALL = (root) NOPASSWD:ACC_CMD
ACC_USERS ALL = (root) NOPASSWD:SETENV:ACC_CMD_SETENV
Defaults:ACC_USERS !requiretty
```

7. Configure the agent to run as a service.

   a. Safeguard resource consumption by adding the indicated values to the `/usr/lib/systemd/system/acc.service` file.

      - CPUShares=128
      - CPUQuota=10%
      - MemoryLimit=192M

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- BlockIOWeight=10
- LimitNICE=15

For example:

```
# vi /usr/lib/systemd/system/acc.service
[Unit]
Description=Agent-Now acc
After=network-online.target
[Service]
Environment=AGENT_ROOT=/usr/share
Environment=AGENT_CACHE_ROOT=/var/cache
Environment=AGENT_CONFIG_ROOT=/etc
Environment=AGENT_LOG_ROOT=/var/log
Environment=AGENT_RUN_ROOT=/var/run
Environment=RUBYOPT=-Eutf-8
User=servicenow
Group=servicenow
ExecStart=/usr/share/servicenow/agent-client-collector/bin/ac
c-service start acc
KillMode=process
Restart=on-failure
RestartSec=1min
CPUShares=128
CPUQuota=10%
MemoryLimit=192M
BlockIOWeight=10
LimitNICE=+15
[Install]
WantedBy=network-online.target
```

b. Run the reload daemon command If you modified the service file after enabling the acc service.

```
# systemctl daemon-reload
```

c. Enable and start the service by running the following commands.

```
# systemctl enable acc
```

```
# systemctl start acc
```

Validate Linux installation

After installing the Agent Client Collector on a Linux system, validate the installation by ensuring it was completed properly.

Before you begin

Install the Agent Client Collector on a Linux system (see Install Agent Client Collector on a Linux system).

Role required: agent_client_collector_admin

Procedure

1. Run the `# systemctl status acc` command.
   The *`active (running)`* indicator appears when the service is running properly.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
# systemctl status acc
● acc.service - Agent-Now ACC
Loaded: loaded (/usr/lib/systemd/system/acc.service; enabled;
 vendor preset: disabled)
Active: active (running) since Mon 2022-04-25 14:10:24 UTC; 6
 months 23 days ago
Main PID: 2693 (acc)
Tasks: 10 (limit: 512)
Memory: 143.4M (limit: 192.0M)
CPU: 12h 57min 50.442s
CGroup: /system.slice/acc.service
 └─2693 /usr/share/servicenow/agent-client-collector/bin/acc
 start --config-file
/etc/servicenow/agent-client-collect...
```

2. View the encrypted *api-key* and *agent-key-id* in use by running the `grep -E '^api-key|agent-key-id' /etc/servicenow/agent-client-collector/acc.yml` command.

```
# grep -E
 '^api-key|agent-key-id' /
etc/servicenow/agent-client-collector/acc.yml
api-key:
 "encrypted:adskfjldfjlasd+ajflksadjmoreunreadablestringasdfdfk
djksdjaasdfas"
agent-key-id:
 b4ac2ab4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2
b4a
```

Note:
The *grep* command must appear on a single line.

3. View the agent's connection with its backend URL by running the `grep 'successfully connected' /var/log/servicenow/agent-client-collector/acc.log` command.

```
# grep 'successfully
 connected' /var/log/servicenow/agent-client-collector/acc.log
2022-11-17T19:03:17.94 [INFO] [agent] successfully connected to
 the url:
wss://MY_BACKEND_FQDN:MY_BACKEND_PORT/ws/events
```

Note:
The *grep* command must appear on a single line.

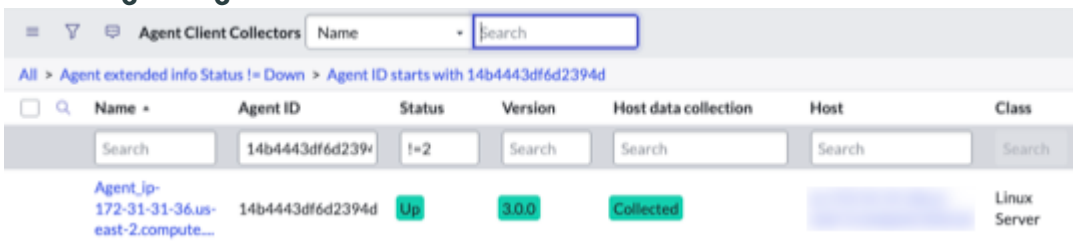
4. Verify the unique agent ID by running the `# echo $(hexdump -e '/1 "%02x"' /var/cache/servicenow/agent-client-collector/agent_now_id)` command.

```
# echo $(hexdump -e '/1
 "%02x"' /
var/cache/servicenow/agent-client-collector/agent_now_id)
14b4443df6d2394d
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The indicated agent ID appears on the Agents page in an instance (**All** > **Agent Client Collector** > **Agents**) with **Status = Up** and **Host data collection = Collected** (both appearing in green).

Linux agents - green status



Upgrade Agent Client Collector on a Linux system

Upgrade your existing Agent Client Collector version on a system running a Linux OS if the single-line command script is not connected to the instance or you want to use enhanced customization options.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

1. **Optional:** Back up sensitive files by running the following command.

```
tar
 -Pcvzf /root/acc_backup.tar.gz /
etc/servicenow/agent-client-collector \
/var/cache/servicenow/agent-client-collector/agent_now_id \
/usr/lib/systemd/system/acc.service
```

2. Download the .rpm/.deb agent package and signature files, as described in Install Agent Client Collector on a Linux system.
3. Upgrade the package.
   - In an RPM-based system:

     ```
     rpm -Uv agent-client-collector-<version number>-x86_64.rpm
     ```

   - In a DEB-based system:

     ```
     dpkg -i agent-client-collector-<version number>-
     <distro>_amd64.deb
     ```

4. Restore the systemd service file (if you customized the file), using either an automation tool or by reloading systemd configuration.

```
tar -C / -Pxvzf /root/acc_backup.tar.gz
 usr/lib/systemd/system/acc.service
```

```
systemctl daemon-reload
```

5. Change the *owner:group* setting to the correct one by running the following command.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
chown -R
 servicenow:servicenow /
{etc,var/cache,var/log,usr/share}/servicenow/agent-client-colle
ctor
```

6. Restart the service and verify that it connects to its backend-url.

```
systemctl restart acc
tail -f /var/log/servicenow/agent-client-collector/acc.log
```

Uninstall Agent Client Collector from a Linux system manually

Uninstall the Agent Client Collector from a Linux machine manually if the command script is unavailable due to the specific agent not being connected to the instance.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

About this task

By default, an uninstalled agent is removed from the system after 30 days. To modify this amount of time, update the *sn_agent_ci_extended_info* table, accessible from the Auto Flushes page (enter *sys_auto_flush.LIST* into the instance's search filter field).

Procedure

1. Stop the service.
   `sudo systemctl stop acc`
2. Use the relevant package management tool to remove the service.
   - yum remove agent-client-collector
   - apt-get remove agent-client-collector
   - zypper remove agent-client-collector

   Alternatively, you can run one of the following commands, based on the OS in use.

   - `rpm -e agent-client-collector`
   - `dpkg -r agent-client-collector`
3. If you ran either the `rpm` or `dpkg` command, remove any remaining files from your system.

```
# userdel -r servicenow
# groupdel servicenow
# rm
 -R /
{etc,var/cache,var/log,usr/share}/servicenow/agent-client-colle
ctor
```

> **Warning:**
> Do not use the command rm -Rf, as this can cause data loss.

Perform a single-line Agent Client Collector installation on Linux

Use an efficient single-line command script to install Agent Client Collector on a machine that uses a Linux operating system. If a script is not connected to the instance or you want to use enhanced customization options, you might have to install Agent Client Collector manually.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector installation.
- Ensure that the unzip program is installed on your Linux machine.
- Determine the resource limits for the agent to be configured in the `/usr/lib/systemd/system/acc.service` file after installation.
- Ensure that you have the `openssl` and `dgst` (for RHEL/Centos/SUSE installation) packages available, to be used by the install script.
- Ensure that you have the `gpg` package available for validation (for Ubuntu/Debian installation).
- When performing single-line installation on more than one agent, download the agent package to your local machine. Place the package on your *ftp* server, using an Ansible script. For details on mass deployment of agents, see Incorporating the Agent Client Collector into a custom base image for mass deployment.
- In order for the Agent to retrieve the OS serial numbers and TCP connections along with associated running processes, sudo access for "dmidecode" and "ss" is required on Linux systems.

Role required: agent_client_collector_admin

Procedure

1. Retrieve MID Server websocket URL parameters.
   a. Navigate to **Agent Client Collector** > **Websocket Endpoint** and select the relevant websocket endpoint.
   b. Copy the value of the **Endpoint URL** field to be used in the installation command.
2. Copy and edit the following command line, substituting your own information for the command parameters.

```
ACC_API_KEY=<api_key> ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events bash -c "$(curl -L https://<instance URL>/api/sn_agent/agents/install_agent)"
```

Command parameters

Parameter	Value
ACC_API_KEY	The API key used to access the MID Server websocket. If no ACC_API_KEY value is specified, you will be asked to enter the API key value during execution of the script.
ACC_MID	The URL of the MID Server websocket. If you are specifying multiple MID Servers, enter a string separated by commas for each MID Server.

3. **Optional:** If you need to create new check definitions to be included in the allow list that indicates the checks enabled to run on the agent, disable the allow list by adding *ACC_ALLOW_LIST=0* to the single-line command string.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, re-activate the allow list by removing *ACC_ALLOW_LIST=0* from the single-line command string.

4. **Optional:** If the certificate validation process is too time consuming or if you are using the agent for development purposes, you can bypass certificate validation by adding *ACC_VALIDATE_SIG=0* to the single-line command string.
5. Run the single-line command (specified in step 2, above) on the server where the Agent Client Collector is installed.
6. **Optional:** Configure resource limits for the agent in the `/usr/lib/systemd/system/acc.service` file, according to your business needs.

   (Optional) The default values in the file are:

   - *CPUShares*: 128
   - *CPUQuota*: 10%
   - *MemoryLimit*: 192M
   - *BlockIOWeight*: 10
   - *LimitNICE*: +15

Upgrade the Agent Client Collector manually on a Linux system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a Linux OS if the single-line command script is not connected to the instance or you want to use enhanced customization options.

Before you begin

- Ensure that you have configured the Agent Client Collector web server. For more information, see Configure the websocket server on the MID Server.
- Restart the MID Web Server.
- Collect host data, to ensure that all files are up to date. For details, see Run host data collection for an agent.
- Ensure that you have installed a Linux version of the Agent Client Collector. For more information, see Agent Client Collector installation on a Linux OS system.
- Role required: agent_client_collector_admin

About this task

The upgrade procedure is the same for both MID Server and MID-less deployments.

Procedure

1. Back up the `agent-id` and configuration files.

```
mkdir -p /tmp/acc-upgrade-backup
sudo cp
 -rp /etc/servicenow/agent-client-collector/acc.yml /
tmp/acc-upgrade-backup
sudo cp
 -rp /
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
etc/servicenow/agent-client-collector/check-allow-list.json /
tmp/acc-upgrade-backup
sudo cp
 -rp /
var/cache/servicenow/agent-client-collector/agent_now_id /
tmp/acc-upgrade-backup
```

2. Uninstall the package.

   a. Stop the service.
   `sudo systemctl stop acc`

   b. Disable the service.
   `sudo systemctl disable acc`

   c. Uninstall the package:
   - For RHEL/CentOS/SUSE: `sudo rpm -e agent-client-collector`
   - For Ubuntu/Debian: `sudo dpkg -r agent-client-collector`

3. Download the installation file.
   For example, when working with an Ubuntu/Debian OS, use both of the following:

   ```
   curl -L -O https://<MID-WEBSERVER-URI:PORT>/static/
   acc_installers/agent-client-collector/glide/distribution/builds/
   package/app-signed/agent-client-collector-<version number>-
   <Ubuntu/Debian version>_amd64-deb-deb.zip -O
   ```

   ```
   https://<MID-WEBSERVER-URI:PORT>/static/acc_installers/agent-
   client-collector/glide/distribution/builds/package/app-signed/
   agent-client-collector/agent-client-collector-<version number>-
   <Ubuntu/Debian version>_amd64.deb
   ```

4. Verify and install the package.

   a. Unzip the compressed file.

   ```
   unzip agent-client-collector-2.3.0-debian-9_amd64-deb-deb.zip
   ```

   b. Validate the installer file signature.
   - RHEL/Centos/SUSE OS:

     ```
     openssl dgst -sha256 -verify {<ServiceNow DGST pem key>}
     -signature {<signature file>} agent-client-collector-<version
     number>-x86_64.rpm
     ```

   - Ubuntu/Debian OS:

     ```
     gpg --import ServiceNow_Digicert_Public.gpg
     dpkg-sig --verify agent-client_collector-<version
      number>-<Ubuntu/Debian version>_amd64.deb
     ```

   c. Install the package.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- RHEL/CentOS/SUSE: `sudo rpm -vi --force agent-client-collector-<version number>-x86_64.rpm`
- Ubuntu/Debian: `sudo dpkg -1 agent-client-collector-<version number>-<Ubuntu/Debian version>_amd64.deb`

5. Restore the `agent-id` and configuration files.

```
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/acc.yml /
etc/servicenow/agent-client-collector/acc.yml
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/check-allow-list.json /
etc/servicenow/agent-client-collector/check-allow-list.json
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/agent_now_id /
var/cache/servicenow/agent-client-collector/agent_now_id
```

6. Configure the agent to run as a service.
   `sudo systemctl enable acc`
7. Start the service.
   `sudo systemctl start acc`
8. View the logs to verify that the startup was successful.
   `sudo tail -f /var/log/servicenow/agent-client-collector/acc.log`

Uninstall Agent Client Collector from a Linux system using a single-line command

Uninstall the Agent Client Collector from a Linux machine by running an efficient single-line command. If the script is not connected to the instance, you might have to uninstall Agent Client Collector manually.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

Uninstall Agent Client Collector by running the following command in a command window where `<instance url>` is the URL of the ServiceNow instance.
`bash -c "$(curl -L https://<instance url>/api/sn_agent/agents/install_agent)" -s "--remove"`.

Note:
Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine.

Agent Client Collector installation on a Windows machine

When installing the Agent Client Collector on a Windows machine, either download an installation file and use a wizard to install the agent manually, or use silent installation to automate agent installation and configuration. Manual installation enables you to test the agent on a single system, while silent installation enables you to deploy the agent at scale.

Install the Agent Client Collector on a Windows machine manually

Install the Agent Client Collector on a Windows machine manually when you want to test the agent on a single system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

1. Ensure that you've configured the Agent Client Collector web server. For details, see Configure the websocket server on the MID Server.
2. Verify your server's OS and version.
3. When using Microsoft Internet Explorer, do the following to prepare the Agent Client Collector installation file:
   a. Navigate to **Server Manager** > **Local Server**.
   b. Turn off **IE Enhanced Security Configuration**.
   c. Download the installation file.
   d. Change the extension of the installation file from `.man` to `.msi`

For troubleshooting, see KB2200094 article in the HI Knowledge Base.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **Agent Client Collector** > **Agent Downloads**.
2. To perform installation using the wizard:

   a. Download the .msi file that is accessible from the link on the UI.
   The Installation Wizard opens.

   b. Select **Next** until you reach the **MID Web Server Connection Settings** page.

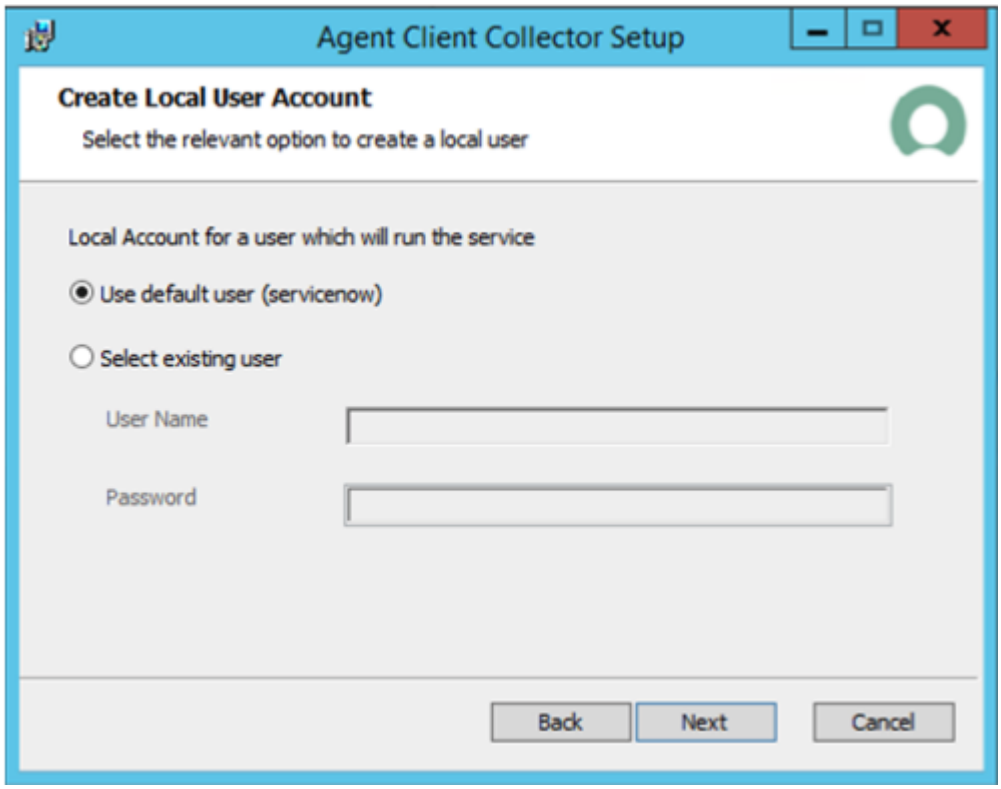
   c. Enter the relevant parameters in the dialog box fields:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Connection Settings fields

Field name	Description
MID Web Server Name/IP	IP address of the MID Web server.
MID Web Server Port	Port number of the MID Web server. Use a number between 1024-49151.
MID Web Server API Key	API key to access the MID Web server.

d. Select **Next**.
The **Create Local User Account** page appears.



e. Select the relevant option in the dialog box.

Create Local User Account dialog box

Option	Description
Use default user (servicenow)	Default user with which to run the Agent Client Collector on a Windows machine. Selecting this option creates a local user called **servicenow** as part of the installation. The servicenow user password is randomly generated and is not stored in the system. A security event is created on the host machine which, if repeated, requires opening a support case. For details, see

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	KB1649116 article in the HI Knowledge Base.
Select existing user	When selecting this option, configure the following subfields: ▪ **User Name**: User name to log in to the Windows environment. ▪ **Password**: Password of the selected user. The user can be one of the following: ▪ Local user (created by the virtual machine owner; provides added resiliency). ▪ Domain user (created by IT personnel). ▪ Group Managed Service Account (gMSA): Enter the name of the group managed service account in the **User Name** field and leave the **Password** field empty. ▪ Local Service Account: Enter *LOCALSERVICE* in the **User Name** field and leave the **Password** field empty. ▪ Local System Account: Enter *SYSTEM* in the **User Name** field and leave the **Password** field empty. Due to Windows UAC restrictions, running the agent as a local SYSTEM account is necessary to perform an upgrade via *msiexec*.

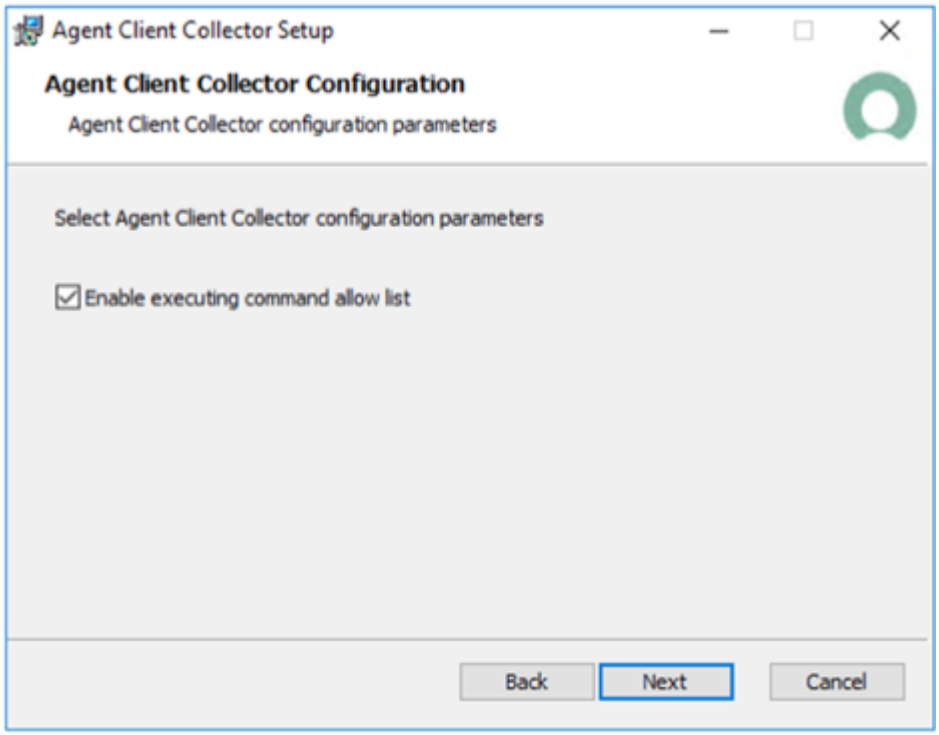
Note:
Using a Local System account creates the local group *ServiceNow Users*, and adds the created user to the group. The ServiceNow Users group has access to Agent Client Collector directories and has the following privileges:

- **Performance Monitor**: Comes with the base system; enables viewing all performance counters in the system.
- **Log on as a service**: Enables starting network services and services that run continuously, even when no one is logged onto the console.
- **Debug programs**: Enables debugging processes and reading process details for users outside the ServiceNow user group.

f. Select **Create User**.
The system creates a Windows user with the specified credentials, and the Agent Client Collector Configuration page appears.

g. To enable the **Allow-List** containing the checks enabled to run after setup, select the **Enable executing command allow list** check box on the resulting page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. Select **Next** to open the installation page.

When installation completes, click **Next** to complete and exit the wizard.

After a successful installation, the service starts automatically and generates the following:

- User: Default = servicenow (an existing user can also be configured to manage the service). The servicenow user belongs to the local user group **ServiceNow Users**.
- Service: AgentClientCollector
- File location:
  - Default for installation = `C:\Program Files\ServiceNow\agent-client-collector`
  - Default for service files = `C:\ProgramData\ServiceNow\agent-client-collector`, which holds the `cache`, `config`, and `log` folders.

3. To run Silent installation to disable installation reports, run the command line appearing in the **Silent installation** section of the procedure, as follows:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
ACC_API_KEY=<key_value> ACC_MID=wss://<mid_ip>:<websocket_port>/
ws/events ACC_ALLOW_LIST=False
```

To enable the allow list of specified checks when running Silent installation, set the *ACC_ALLOW_LIST* parameter to **True**.

4. To configure multiple MID Servers with Silent installation, run the command line appearing in the **Silent installation** section of the procedure with comma-separated values, as follows:

```
msiexec /i <msi_file_path> /quiet /qn /
norestart ACC_API_KEY=<key_value> ACC_MID="wss:/
/<mid1_ip>:<websocket1_port>/ws/events,wss://
<mid2_ip>:<websocket2_port>/ws/events"
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insert the following parameter values in the command:

Command parameters

Parameter	Value
ACC_API_KEY	The API key used to access the MID Server websocket.
ACC_MID	The URL of the MID Server websocket.
DENY_LOCAL_LOGON	When set to *True*, prevents any user other than the default servicenow user from logging onto the service. Default value: False
PASSWORD_NEVER_EXPIRES	When set to *True*, the password for the default servicenow user never expires. Default value: False
START_SERVICE	When set to *True*, the Agent Client Collector service automatically starts after installation. Default value: True
LOCALUSERNAME	Account running the Agent Client Collector as a Windows service. Possible values: ○ SYSTEM ○ LOCALSERVICE ○ DOMAIN\gMSA$ ○ string (local username) Default = `servicenow` When using the SYSTEM, LOCALSERVICE, or DOMAIN\gMSA$ accounts, you do not have to configure a password.
LOCALPASSWORD	Password for the user specified in the LOCALUSERNAME parameter.

The configured MID Server values are automatically added to the `acc.yml` file. The agent connects to the first available MID Server in the list.

To configure a secondary MID server, enter the following syntax in the `backend-url` section of the `acc.yml` file, per the `.yml` standard: `- "wss://<MID IP>:<Web socket port>/ws/events"` (with the quotation marks).

Upgrade the Agent Client Collector manually on a Windows system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a Windows OS.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Backup the Agent Client Collector configuration files, such as `acc.yml`, `check-allow-list.json`, `agent_now_id` and `agent_now_keystore`. The `agent_now_id` is located in the cache directory: `C:\ProgramData\Servicenow\agent-client-collector\cache`

Backing up configuration files is a safety precaution to safeguard the files during the upgrade. Configuration files need to be restored only if there are upgrade issues which require new installation.

Role required: agent_client_collector_admin

Procedure

1. Select the Windows button on your keyboard and enter **Services** to open the Services page.
2. Locate the Agent Client Collector service.
3. Right click the Agent Client Collector service and select **Stop**.
4. On the Windows Control Panel, select **Uninstall a program**.
5. Select the Agent Client Collector program and select **Uninstall**.
6. Navigate to **Agent Client Collector** > **Agent Downloads** and download the MSI Installer in the **Windows Downloads** section.
7. Install the new agent, as described in Install the Agent Client Collector on a Windows machine manually.
   You can use either the manual or single-line procedure. When restoring backup files, the system replaces the configuration file values.
8. After installation is complete, stop the service.
9. Restore the `agent_now_id` and `agent_now_keystore` configuration files.
10. Restart the Agent Client Collector service.

Uninstall the Agent Client Collector manually from a Windows machine

Uninstall the Agent Client Collector from a Windows machine manually instead of using the single-line procedure. Use the manual procedure if the command script is unavailable due to the specific agent not being connected to the instance.

Before you begin

Role required: agent_client_collector_admin

Procedure

Uninstall the Agent Client Collector in the Windows Control Panel.

Install the Agent Client Collector on a Windows machine using silent installation

Install the Agent Client Collector on a Windows machine using silent installation when you want to deploy the agent at scale.

About this task

Silent installation automatically creates a local user called **servicenow** (unless another existing user is invoked with the *LOCALUSERNAME* parameter, as described in the command parameters table in the following procedure). The servicenow user password is randomly generated and is not stored in the system. A security event is created on the host machine which, if repeated, requires opening a support case. For details, see KB1649116 article in the Now Support Knowledge Base.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

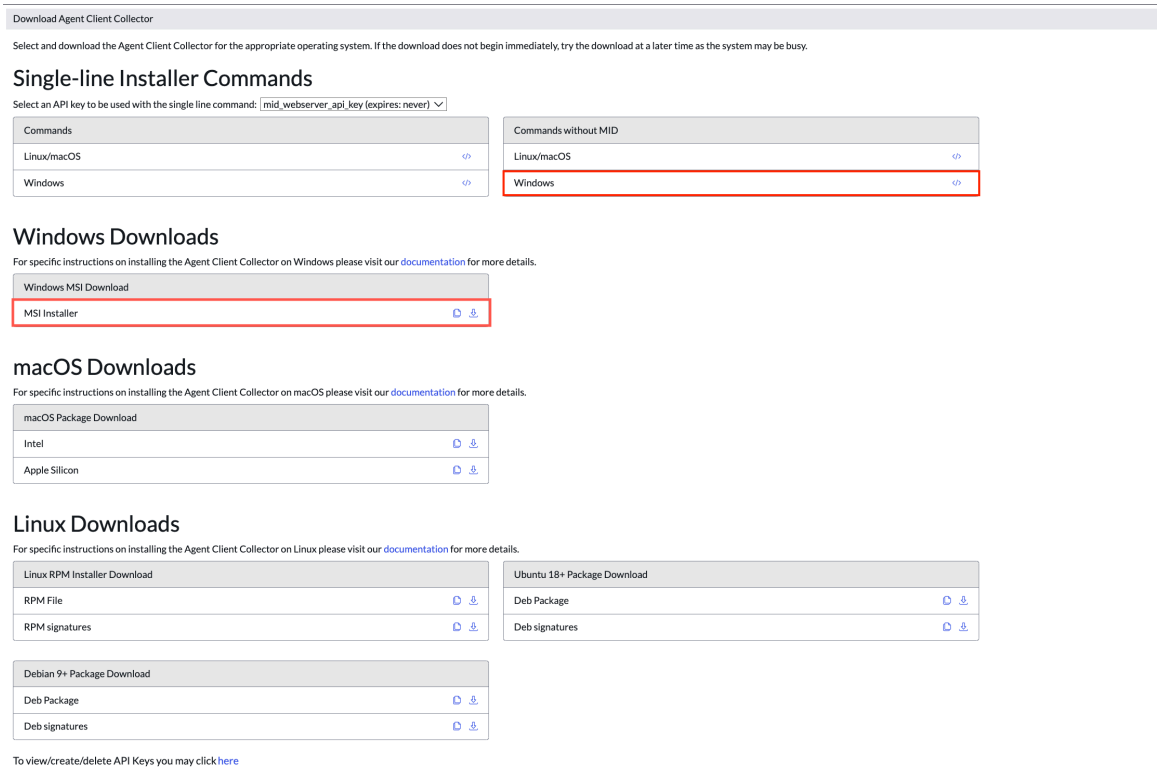
Before you begin

ACC installs need to access this URL: https://install.service-now.com/.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
2. From the Windows Download section, download the MSI installer by selecting the Download icon ( ).



3. To run Silent installation to disable installation reports, run the command line appearing in the **Silent installation** section of the procedure, as follows:
   `msiexec /i <msi_file_path> /quiet /qn /norestart ACC_API_KEY=<key_value> ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events ACC_ALLOW_LIST=False`

   To enable the allow list of specified checks when running silent installation, set the *ACC_ALLOW_LIST* parameter to **True**.

4. To configure multiple MID Servers with Silent installation, run the command line appearing in the **Silent installation** section of the procedure with comma separated values, as follows:
   `msiexec /i <msi_file_path> /quiet /qn /norestart ACC_API_KEY=<key_value> ACC_MID="wss://<mid1_ip>:<websocket1_port>/ws/events,wss://<mid2_ip>:<websocket2_port>/ws/events"`

   Insert the following parameter values in the command:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Command parameters

Parameter	Type	Value
ACC_API_KEY	String	The API key used to access the MID Server websocket.
ACC_MID	String	The URL of the MID Server websocket.
ACC_ALLOW_LIST	Boolean	Indicates whether the allow-list is enabled (True) or disabled (False). Default = True
START_SERVICE	Boolean	Indicates whether the agent starts automatically upon installation (true) or must be started manually (false). Default = True
LOCALUSERNAME	String	Account running the Agent Client Collector as a Windows service. Possible values: ○ SYSTEM ○ LOCALSERVICE ○ DOMAIN\gMSA$ ○ string (local username) Default = `servicenow` When using the SYSTEM, LOCALSERVICE, or DOMAIN \gMSA$ accounts: ○ You do not have to configure a password. ○ You must run the relevant .msi command, as described in Account commands for LocalService, LocalSystem, and gMSA during Windows installation.
LOCALUSERPASSWORD	String	Password used to access the agent. Default = <randomly generated password>
ISDOMAIN	Boolean	Assigns a domain user account to the Windows service. Possible values:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Type	Value
		○ 0 - DOMAIN is ignored ○ 1 - DOMAIN is used
DOMAIN	String	Indicates the user domain. Applies only to domain user accounts (not gMSA)
PASSWORD_NEVER_EXPIRES	Boolean	Indicates whether the user password expires (false) or never expires (true). Default = false

The configured MID Server values are automatically added to the `acc.yml` file. The agent connects to the first available MID Server in the list.

To configure a secondary MID server, enter the following syntax in the `backend-url` section of the `acc.yml` file, per the `.yml` standard: `- "wss://<MID IP>:<Web socket port>/ws/events"` (with the quotation marks).

For the `<MID IP>` value, you can assign either the MID FQDN or CNAME. To enable high availability, use either the Auto MID Selection algorithm, or manage a virtual IP with a load balancer. For more information, see the ITOM Agent Client Collector documentation material [KB1122613] article in the HI Knowledge Base.

Uninstall Agent Client Collector from a Windows system using a single-line command

Uninstall the Agent Client Collector from a Windows machine by running an efficient single-line command. If the script is not connected to the instance, you might have to uninstall Agent Client Collector manually.

Before you begin

Role required: agent_client_collector_admin

Procedure

Uninstall Agent Client Collector by running the following command in a command window.
`msiexec /quiet /x <path_to_acc_msi_file>.`

Note:
Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine.

Agent Client Collector installation on macOS system

Install Agent Client Collector on a system that uses macOS. You can either use a single-line command script or follow a manual installation procedure if the agent is not connected to the instance or you want enhanced customization options.

To enable privileged access to information on the macOS system, add the *_servcienow* user account to the admin group (or equivalent).

Incorporating the Agent Client Collector into a custom base image for mass deployment is not supported on macOS.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Perform a single-line Agent Client Collector installation on macOS

Use an efficient single-line command script to install Agent Client Collector on a machine that uses macOS operating system. Use the manual installation procedure if the agent is not connected to the instance or you want enhanced customization options.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector installation.
- Ensure that you have the *pkgutil* packages available, to be used by the install script.
- Ensure that the target agents have connectivity to the following:
  - ServiceNow install server [install.service-now.com]
  - ServiceNow instance
  - The MID Server to which the agent will connect

Role required: agent_client_collector_admin

Procedure

1. Retrieve the MID Server websocket URL parameters.
   a. Navigate to **Agent Client Collector** > **Websocket Endpoint**.
   b. Select the relevant websocket endpoint.
   c. Copy the **Endpoint URL** field value to be used in the installation command.
2. Retrieve the API Key.
   a. Navigate to **Agent Client Collector** > **Deployment** > **MID Web Server API Key**.
   b. Copy the **API Key** value, to be used in the installation command.
3. Run the following command on the server where the Agent Client Collector is being installed.

```
ACC_API_KEY=<api_key>
 ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events
 bash -c "$(curl -L https://<instance
 URL>/api/sn_agent/agents/install_agent)"
```

Enter the following values in the command line:

Command line parameters

Parameter	Value
ACC_API_KEY	Replace the *<api_key>* string with the API key used to access the MID Server websocket. If no value is specified, you will be prompted to enter the API key value during the script's execution.
ACC_MID	Replace the *<mid_ip>* string with the URL of the MID Server websocket. When specifying multiple MID Servers, enter a string separated by commas for each MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Value
ACC_ALLOW_LIST	(Optional) Add the string *ACC_ALLOW_LIST=0* to disable the allow list. By default, the allow list is enabled. **Note:** Disabling the allow list compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, re-activate the allow list by removing *ACC_ALLOW_LIST=0* from the single-line command string.
ACC_VALIDATE_SIG	(Optional) Add the string *ACC_VALIDATE_SIG=0* to disable verifying the installer certificate validation. By default, validation is enabled. Default: Validation is enabled. **Note:** Disable certification validation only when using non-standard signature validation tools.

Manually install Agent Client Collector on macOS

Install Agent Client Collector manually on a machine that uses macOS when the agent is not connected to the instance or you want enhanced customization options.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector installation.
- Navigate to **Agent Client Collector** > **Deployment** > **Agent Downloads** and download the signed `.pkg` relevant for your OS.
- Store the `.pkg` installation package on one of your installed agents.

Role required: agent_client_collector_admin

Procedure

1. Download the installation files to your local machine.

```
curl -L <download link from the Agent Downloads page on the
 instance>
```

2. Validate the installation file signature.

```
pkgutil --check-signature agent-client-collector-<version
 number>-macos-catalina_x64.pkg
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that the `pkg` certificate chain has the ServiceNow developer ID installer certificate.

3. Install the Agent Client Collector package.

```
sudo installer -pkg agent-client-collector-<version
 number>-macos-catalina_x64.pkg -target /
```

4. Copy the installation files.

   a. Sample configuration file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/acc.yml.example /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   b. Sample allow list file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json.default /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json`

5. **Optional:** To create new check definitions to be included in the allow list, first disable the allow list by commenting out the *`allow-list`* parameter in the `acc.yml` file.

   (Optional) `sudo -H -u _servicenow vi /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   Note:
   This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, uncomment the allow list parameter in the configuration file to re-activate the allow list.

   For details on adding custom checks to an allow list, see Generate an Agent Client Collector allow list.

6. Save the configuration file.
7. In the configuration file, connect the agent with the MID Server.

   a. Set the MID Server connection.

   ```
   "wss://<MID Server IP>:<Web Socket Port>/ws/events"
   ```

   The web socket port was configured on the MID Server when it was set as an Agent Client Collector listener.

   b. Locate the *`api-key`* parameter and specify the API key value inside double quotation marks, as follows:
   `api-key:"111111111"`
   The specified API key is encrypted the first time the agent runs.

8. To ensure that the configuration file points to a valid endpoint, run the following commands to restart the Agent Client Collector:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
sudo launchctl unload
 -w /Library/LaunchDaemons/com.sn.acc.plist
sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist
```

Note:
By default, exiting the installation program causes the program to restart immediately. To ensure that the program remains stopped after exiting, set the KeepAlive property in the `/Library/LaunchDaemons/com.sn.acc.plist` file to **false**.

Upgrade Agent Client Collector manually on a macOS system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a macOS. Manual upgrade is useful if the single-line command script isn't connected to the instance or you want to use enhanced customization options.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

1. **Optional:** Manually back up the `agent-id` and `acc.yml` configuration files by running the following commands.

```
mkdir -p /tmp/acc-upgrade-backup

cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/acc.yml /
tmp/acc-upgrade-backup

cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/check-allow-list.js
on /tmp/acc-upgrade-backup

cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/agent_now_id /
tmp/acc-upgrade-backup
```

   Manually backing up the configuration files provides an added layer of security by ensuring that your files are backed up before beginning the upgrade process.

2. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
3. In the **macOS Downloads** section, download the relevant agent package and signature `.pkg` files.
4. Perform package upgrade, based on the cpu your macOS runs with.
   - Intel cpu:

```
sudo installer -pkg agent-client-collector-<version
 number>-macos_x64.pkg
```

   - Apple silicon cpu:

```
sudo installer -pkg agent-client-collector-<version
 number>-macos_arm64.pkg
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This command also backs up and restores the agent-id and configuration files before upgrading.

5. Verify that the upgrade was successful.

   a. Navigate to **All** > **Agent Client Collector** > **Agents**.

   b. Verify the following values for your agent:
      - **Host data collection** = Collected
      - **Version** = <Relevant version number>

Uninstall the Agent Client Collector from macOS using a single-line command

Uninstall the Agent Client Collector from macOS machine by running an efficient single-line command. If the agent is connected to the instance, uninstall Agent Client Collector manually.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

Run the following command.

```
bash -c "$(curl -L https://<Instance
 URL>/api/sn_agent/agents/install_agent)" -s "--remove"
```

Note:
Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine. The user and group **_servicenow**, created as part of the installation process, is also removed.

Uninstall the Agent Client Collector from macOS machine manually

Uninstall the Agent Client Collector from macOS machine manually instead of using the single-line procedure when the specific agent is not connected to the instance.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

1. In a command window, disable and stop the service:
   sudo launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist
2. Delete the following files/directories:

```
sudo rm /Library/LaunchDaemons/com.sn.acc.plist
sudo rm -rf /opt/servicenow/agent-client-collector
sudo rm -rf /var/run/servicenow/agent-client-collector
sudo rm -rf /Library/Application\
 Support/servicenow/agent-client-collector
```

3. Remove the **_servicenow** user and group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
sudo /usr/bin/dscl . -delete /Users/_servicenow
sudo /usr/bin/dscl . -delete /Groups/_servicenow
```

4. Remove the **pkg** from the list of installed packages.

```
sudo pkgutil --forget com.servicenow.agent-client-collector
```

Optimize distribution of agents to MID Servers

Optimize the distribution of agents by allowing redistribution from one MID Server to another. Agents will always be connected to the MID Server with the fastest response time.

Before you begin

Ensure that the following settings are configured:

- The *sn_agent.enable_auto_mid_selection* system property is set to true. When using the `acc.yml` file, the property is *enable_auto_mid_selection*.
- On the MID Server page (**Agent Client Collector** > **MID Server**):
  - Status: Up
  - Validated: Yes

Role required: agent_client_collector_admin

About this task

Only validated MID Servers can accept connections from agents.

Procedure

1. Navigate to **Agent Client Collector** > **Deployment** > **MID Servers**.
2. On the **MID Servers [Agent Client Collector view]** page, select the check box next to the MID Server from which you want to redistribute agents.
3. In the **Actions on selected rows** list, select **Try redistributing connected agents**.
   Note the number of agents assigned to your MID Servers.
4. Refresh the page to view the results of the redistribution attempt.
   The values in the **Number of agents** column for any affected MID Server will show a change if any agents were redistributed.

View the Agent Client Collector configuration file for an agent

View the `acc.yml` Agent Client Collector configuration file without having to access the host server by retrieving the file from an agent.

Before you begin

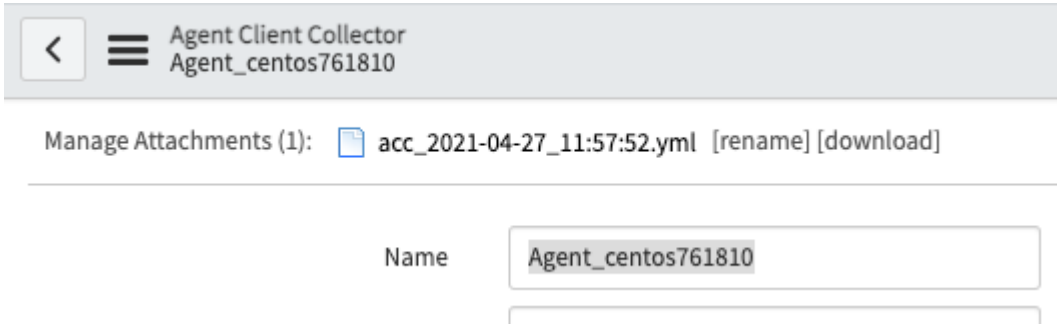
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. On the Agent Client Collectors page, select an agent.
3. In the **Related Links** section, select **Grab agent config (acc.yml)**.
   A message appears on the page that indicates that the file is attaching.
4. Wait several seconds and refresh the page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The `acc.yml` configuration file appears as an attachment on the agent.



Related topics

Configuration file options

Create an Agent Client Collector configuration data file

Create an Agent Client Collector configuration data file and associate it with check definitions so that you can view the information about your instance. You can also add or delete an attachment to the configuration data files, which are used by check definitions during check executions.

Before you begin

Role required: agent_client_collector_admin

About this task

A check definition is an individual check entry in the system. For details, see Agent Client Collector configuration data files.

Configuration data file attachments contain instance data, such as configuration item (CI) information, which is used when executing a check.

Domain separation is supported in the Agent Client Collector configuration data files.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Configuration Files**.
2. Select **New**.
3. Add or remove an attachment.

   The attachment name must be unique for each domain and can consist only of alphanumeric characters.

   If the attachment contains invalid characters or is a duplicate of another attachment, the following situations occur:

   - The configuration file is automatically set to **Active = False**.
   - A message appears in the Error column indicating a problem with the attachment.

   Each record can contain only one attachment.

4. **Optional:** In the **Description** field, enter a description for the configuration data file.
5. Select **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The configuration data file is listed on the Agent Client Collector Configuration File page.
- The **Name** value is automatically set to the name of the attachment.

Checks use the configuration data file with instance data during check execution.

Manually refresh Agent Client Collector certificates

Pull self-signed certificates from the ServiceNow install server, instead of waiting for the scheduled MID Server synchronization.

Before you begin

- Ensure that the self-signed certificate is placed in a `.zip` file on the MID Server in the following location: `agent\static\cert`
- Ensure that the certificate authority is part of the agent host's truststore, as the certificate chain is validated before the customer plugin signature.
- Role required: agent_client_collector_admin

About this task

The MID Server checks for updates once each day, or after being restarted.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. Select a MID Server.
3. In the Related Links section, select **Trigger ACC certificate sync**.
4. Restart the MID Server.

Result

When an agent fails to perform a certificate check, the agent synchronizes certificates available on the MID Server. Synchronization is carried out for certificates on the ServiceNow install server and the self-signed certificates placed in the `.zip` file on the MID Server's `agent\static\cert` folder. Certificates are downloaded by the Agent Client Collector if the agent fails to validate a check definition's associated plugin assets.

Enable OpenSSL secure signing for plugins

Create a self-signed certificate for an Agent Client Collector plugin. The following procedure gives an example of how to create an x509 certificate using OpenSSL. For other certificate types, consult OpenSSL documentation.

Before you begin

- Ensure that the *`verify-plugin-signature`* property is set to **True** in the agent's `acc.yml` file to verify plugin signing.
- Ensure **OpenSSL** is installed on your system.

Role required: agent_client_collector_admin

About this task

Enabling an OpenSSL secure signing mechanism for plugins works with an Agent Client Collector installed on a Linux system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a plugin file with a `tar.gz` extension.
   For more information, see Create and edit Agent Client Collector plugins.
2. Generate your own secure self-certificate for the plugin file.

   a. Create an x509 certificate.

   ```
   openssl req -nodes -x509 -sha256 -newkey rsa:2048 -keyout
    "sign.key" -out "sign.crt" -days 365 -subj

    "/C=<CountryName>/ST=<StateOrProvinceName>/L=<Locality>/O=<O
   rganization>/OU=<OrganizationalUnit>/CN=sign"
   ```

   b. Sign the plugin file.

   ```
   openssl dgst -sha256 -sign "sign.key" -out sign.txt.sha256
    <plugin-name>.tar.gz
   ```

   Alternatively, you can sign plugins using a certificate authority. When doing so, assign the certificate .pem format and place it in the agent's `cert` directory.

   c. Verify that the signature is configured correctly.

   ```
   openssl dgst -sha256 -verify  <(openssl x509 -in
    "sign.crt" -pubkey -noout) -signature sign.txt.sha256
    <plugin-name>.tar.gz
   ```

   If the file is valid, the output is `Verified OK`.

   d. Encode the signature's certificate with base64 coding.

   ```
   base64 sign.txt.sha256 > sign.txt.sha256_encode64.sig
   ```

   A `sign.txt.sha256_encode64.sig` file is created.

3. Run the following commands to create a new directory and insert the `tar.gz` and `sign.txt.sha256_encode64.sig` files.

   a. `mkdir signed-plugin`

   b. `mv <plugin-name>.tar.gz signed-plugin`

   c. `mv sign.txt.sha256_encode64.sig signed-plugin`

   d. `cd signed-plugin`

4. Create another `tar.gz` file by running the same commands as you ran for the first `tar.gz` file.

   a. `tar -C . -zcvf ../<plugin-name>.tar.gz *`

   b. `cd..`

   Note:
   Save the new file as `../<plugin-name>.tar.gz` to avoid naming collisions with the original `<plugin-name>.tar.gz` file that exists in the current directory.

5. Upload the new `tar.gz` plugin file to the instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Set the plugin file as *active=true*.
7. Place the `sign.crt` file in the agent's `cert` directory, which is located in the `config` folder.
8. In the `acc.yml` file, set `verify-plugin-signature` to **true**.

Add a self-signed certificate to your operating system's truststore

Add a self-signed certificate to the truststore of your operating system (OS). By adding a certificate to the truststore, you can verify that the certificate is authentic and that your connections are secure.

About this task

The procedure for adding a certificate to a truststore depends on the host's OS.

Adding a self-signed certificate to the truststore instructs the operating system to trust the certificate when it's establishing secure connections. This way, the applications can communicate securely with services that use the self-signed certificate. If you add a certificate that isn't trustworthy, you might compromise your system's security.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. On a Windows OS:

   a. Press the Windows button + R on your keyboard.
   The **Run** field opens.

   b. Enter the string `certmgr.msc` and press **Enter**.
   The Certificate Manager opens.

   c. Expand the Trusted Root Certification Authorities directory.

   d. Select and hold (or right-click) **Certificates**.

   e. Select **All tasks** > **Import**.
   The Certificate Import Wizard opens.

   f. Follow the steps in the Certificate Import Wizard.
   For details, see Import a self-signed certificate.

   Alternatively, you can add a Windows certificate using PowerShell by running the following command as an administrator:

   ```
   Import-Certificate -FilePath <path to your certificate file>
    -CertStoreLocation Cert:\LocalMachine\Root
   ```

2. On a macOS:

   a. Import the certificate into a keychain by running the following command in a terminal window:

   ```
   bash
   ```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
code:
sudo security add-trusted-cert -d -r trustRoot -k
 "/Library/Keychains/System.keychain" <path to your
 certificate file>
```

b. Enter the administrator password when prompted.

c. Open the Keychain Access application to verify that the certificate has been added. A successfully added certificate is labeled as, **This certificate is marked as trusted for...plugin verification.**

3. On a Linux OS:

a. Prepare the self-signed certificate file as a Privacy Enhanced Mail (PEM) file.

b. Copy the certificate to the Certificate Authority (CA) directory, which is the directory where the certificates are stored.

- On a Debian/Ubuntu-based system, run the following command:

```
sudo cp <path to certificate
 file> /usr/local/share/ca-certificates/
```

- On a Red Hat/Fedora-based system, run the following command:

```
sudo cp <path to certificate
 file> /etc/pki/ca-trust/source/anchors
```

c. Update the CA certificates:

- On a Debian/Ubuntu-based system, run the following command:

```
update-ca-certificates
```

The command reads the certificate bundle in the `/usr/local/share/ca-certificates` directory, updates the certificate bundle, and stores it in `/ext/ssl/certs/ca-certificates.crt`.

- On a Red Hat/Fedora-based system, run the following command:

```
sudo update-ca-trust extract
```

Result

Your self-signed certificate is on the OS that you are working with.

Import a self-signed certificate

Import a self-signed certificate in a Windows system by using the Certificate Import Wizard. The Certificate Import Wizard is required to complete the self-signed certificate import process on a Windows Operating System (OS).

Before you begin

Ensure that you have followed the procedure for importing a self-signed certificate in a Windows system, as described in Add a self-signed certificate to your operating system's truststore.

Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the first page of the wizard, select **Next**.
   The truststore is typically located in the Trusted Root Certification Authorities directory of the certificate manager.
2. Browse to the location where you have the self-signed certificate file.
   The file is typically located in the agent's `config/cert` directory.
3. Select and hold (or right-click) the certificate file and select **Install certificate**.
4. Select **Next**.
5. Select the option to place the certificate in the Trusted Root Certification Authorities truststore.
6. Select **Next** and **Finish** to complete the wizard.

Result
The certificate is imported into the truststore.

What to do next
If a security warning appears, select **Confirm** to confirm the import.

Revoke Agent Client Collector certificates

Stop communication between the agent and ITOM cloud services by removing an Agent Client Collector certificate. For example, there might be a security breach due to which you want to stop communication by revoking the agent's certificate.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the agent for which you want to revoke the certificate.
3. Select the **Revoke Agent Certificate** button.
4. Select the reason for certificate revocation.
   For a list and explanation of the available revocation reasons, see Agent Client Collector certificate revocation reasons.
5. Select **OK**.
   The agent's certificate is revoked and the ITOM cloud services layer has its certificate revocation list (CRL) updated.

Result
Communication between the agent and ITOM cloud services is stopped.

Related topics

Add a self-signed certificate to your operating system's truststore

Agent certificate rotation

The Agent Client Collector certificate is valid for two years and must be rotated before it expires to avoid issues with agent connectivity. When expiration is approaching, the agent initiates a certificate rotation request.

When an Agent Client Collector's certificate expiration is approaching, system properties verify that a valid certificate is in place when the existing certificate expires.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *certificate-rotation-days-out*: Indicates the number of days before certificate expiration that an agent attempts to rotate its certificate. Configured in the `acc.yml` configuration file. Default = 28.
- *sn_agent.certificate_rotation_days_out*: Indicates the number of days before certificate expiration that the system accepts a certificate rotation request for a specific agent. Configured on the System Properties page (**All** > **System Properties** > **All Properties**). Default = 28.

Use the Agent Client Collector (ACC) diagnostic workflow

Invoke the Agent Client Collector (ACC) diagnostic workflow to examine Agent Client Collector agents. Viewing the agent status enables you to monitor agents not working properly that may require attention.

Before you begin

Ensure that the Now Assist panel is enabled on your instance. For details, see Turn on the Now Assist panel.

Ensure that Now Assist for IT Operations Management (ITOM) is installed on your instance. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

Ensure that you have installed Agent Client Collector Framework version 6.0.0 or higher.

AI agents use role masking to determine which users can access them and what data they have access to. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Role required: agent_client_collector_admin, agent_client_collector_user, or now_assist_panel_user.

About this task

Invoke the Agent Client Collector (ACC) diagnostic workflow to:

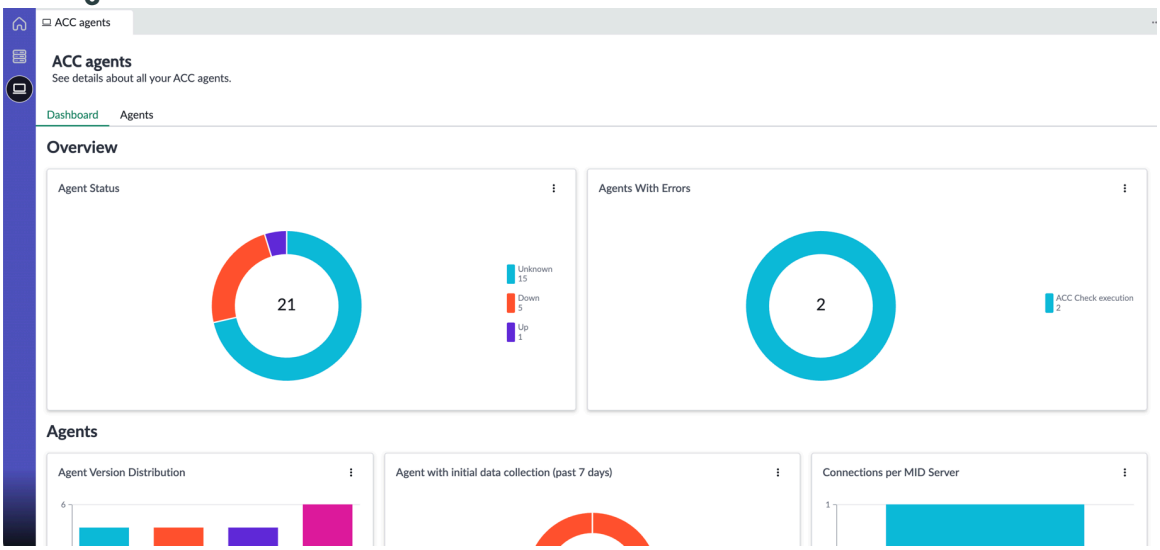
- Question issues of an ACC agent while on an ACC form.
- Request suggestions to remediate a specific ACC error code.

Procedure

1. Navigate to **Workspaces** > **ITOM Infra Services Workspace**.
2. Select the **ACC agents** icon.
   The ACC agents page appears, displaying an overview of the agents in your system on the Dashboard tab.

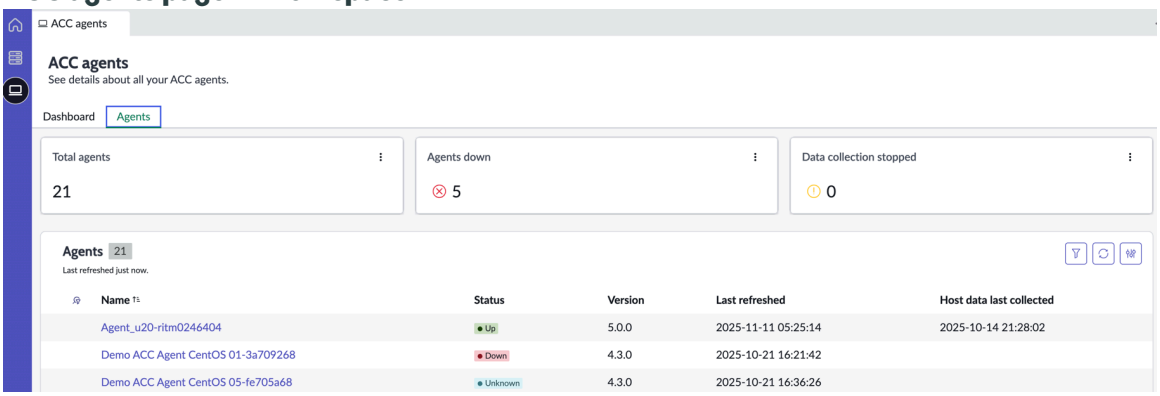
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC agents dashboard



3. Select the **Agents** tab to view a list of the agents.

ACC agents page in Workspace

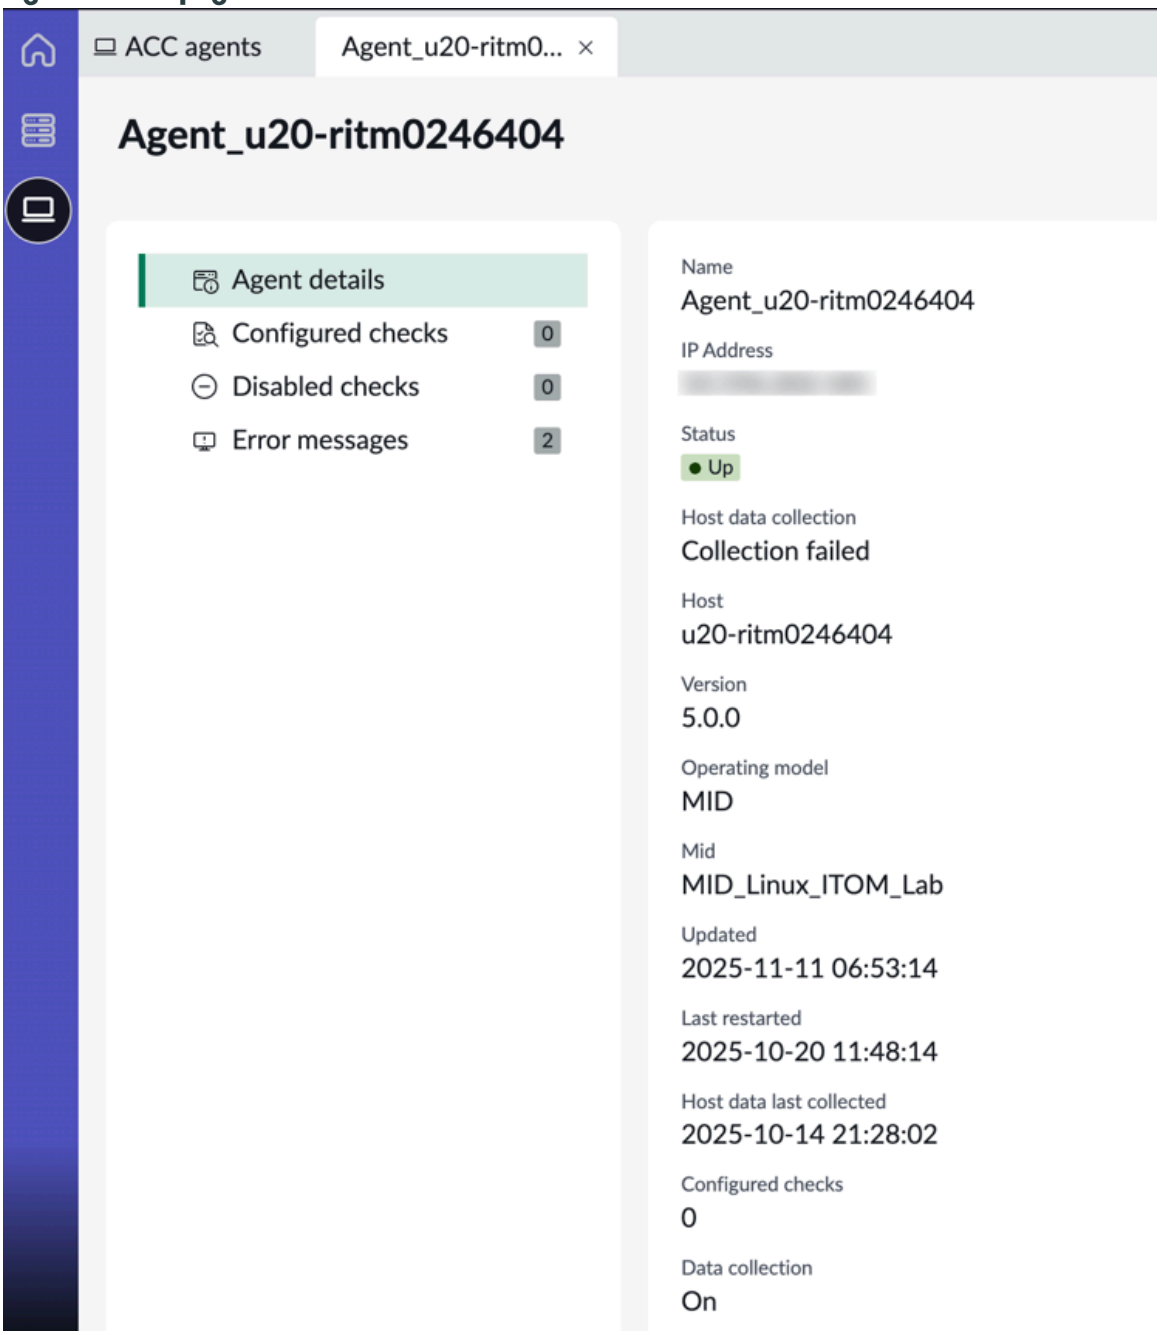


You can filter the displayed agents by selecting one of the boxes at the top of the page. For example, select **Agents down** to filter the list by agents that are currently down.

4. Select an agent in the agents list to view details of the agent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent details page



5. Select the Now Assist icon ( ).
6. In the Now Assist panel, enter prompts to invoke the ACC diagnostic workflow and perform remediation actions on the agent.
   Possible prompts include:
   - Diagnose issues with ACC agent <agent name>
   - Multiple errors on <agent name>, diagnose them
   - Provide suggestions to remediate ACC error code <error code number>
7. **Optional:** Select the **Agent actions** button and select from actions to perform on the agent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent actions

Agent action	Description
Test Check	On the resulting pop-up window, select a check definition that you want to check on the agents.
Validate ACC plugins	Validate plugins on the selected agent.
Pause data collection	Pause data collection run on the agent when CPU consumption is getting too high.
Upgrade	Upgrade the agent to a more recent version.
Clear ACC plugins	Clear plugins on the agent to remove unwanted plugins.
Collect host data	Manually refresh host data.

Perform Zscaler remediation

If the Zscaler application installed on your Windows or macOS agent is not running efficiently, you can stop and start the app. This process is called *remediation*. Running remediation automatically creates an incident on the agent. You can also view Zscaler statuses on the Zscaler dashboard as a graph.

By default, the **Zscaler Monitoring Policy** monitoring check runs every 30 minutes to check the status of the Zscaler app running on your agent. The Zscaler monitoring policy contains the following checks:

- *zscaler-monitoring-check*: Checks the status of the Zscaler app running on your agent.
- *zscaler-remediation-check*: Invoked only when the Zscaler app is not running efficiently. This check shuts down and restarts the app, and automatically creates an incident.

  Only one incident is created every 24 hours for a Zscaler app that does not remediate properly. For example, if the remediation check runs multiple times on an agent, new remediation records are created which are associated with the same incident until 24 hours have passed, at which time a second incident is created. When the Zscaler app restarts successfully, the incident closes.

  Zscaler remediation produces the following output:

  - Amount of data produced per remediation: 2KB
  - Maximum number of remediations that can run in a day: 48 (one every 30 minutes)
  - Maximum amount of data produced by a single agent, per day: 96KB
  - Maximum amount of data produced by a 20K agents, per day: 1.92GB

Check Zscaler monitoring

Check the monitoring status of your Zscaler app, to verify that it is running properly.

Before you begin
Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If the monitoring app is down, the Zscaler tunnel status is either *51 (SERVICE - DOWN - ERROR)* or *56 (SYSTEM_SOCKETS_EXHAUSTED_ERROR)*. When that happens, a remediation check runs, which shuts down and then starts the Zscaler app.

By default, the Zscaler monitoring check (*zscaler - monitoring - check*) runs automatically every 30 minutes. If you are experiencing problems with your Zscaler app, you may want to run the check more often or immediately. For details, see Customize the Zscaler monitoring check.

Procedure

1. Navigate to **All** > **Remediate Zscaler VPN** > **Monitoring Status**.
   The **Application Monitoring Status** page appears.

Application Monitoring Status page

   - If the Zscaler app is running properly, the **Application Status** column displays the **Up** value.
   - If the Zscaler app is not running properly, the **Application Status** column displays the **Down** value.
2. If the **Application Status** column displays the **Down** value, the remediation check (*zscaler - remediation - check*) runs.
   - For details on customizing the amount of time after which the system verifes the Zscaler status, see Customize the Zscaler remediation wait time.
   - For details on monitoring Zscaler remediation checks, see Check Zscaler remediation.

Customize the Zscaler remediation wait time

Configure the amount of time (in seconds) by which the Zscaler remediation check verifies the Zscaler status. This amount of time indicates how often the system checks the Zscaler status after the remediation check runs.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **Agent Client Collector** > **Agents** > **Configuration** > **Check Definition**.
2. Select *zscaler - remediation - check*.
3. In the **Command** field, modify the value to: `zscaler_app_remediator.rb --wait_time=<time_in_sec>`, where `<time_in_sec>` is the number of seconds the system waits before checking the Zscaler status.
   By default, the system waits 30 seconds.
4. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the Zscaler app is running within the configured `wait_time`, the remediation result is **Success**.
- If the Zscaler app is not running within the configured `wait_time`, the remediation result is **Failed**.

Customize the Zscaler monitoring check

Customize the frequency by which the Zscaler monitoring check runs. By default, the Zscaler monitoring check runs every 30 minutes. If your Zscaler app is not working efficiently, you can set the check to run more frequently.

Before you begin

Role required: agent_client_collector_admin

About this task

For details on customizing the Zscaler monitoring check, see Perform Zscaler remediation.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies**.
2. Select the **Zscaler Monitoring Policy** entry.
3. Select the **Scheduling** tab.
4. In the **Interval (sec)** field, modify the value to the number of seconds for the monitoring check to wait in between executions.
   The default value is 1800.

   To run the monitoring check immediately, enter a value of **1**.

Result

Zscaler monitoring checks run according to the frequency specified in the **Interval (sec)** field.

Check Zscaler remediation

Verify that Zscaler remediation stops and starts the Zscaler app after the remediation monitoring check fails.

Before you begin

Verify that the Zscaler monitoring check returns an **Application Status** value of **Down**, indicating that the Zscaler app isn't working properly.

Role required: agent_client_collector_admin

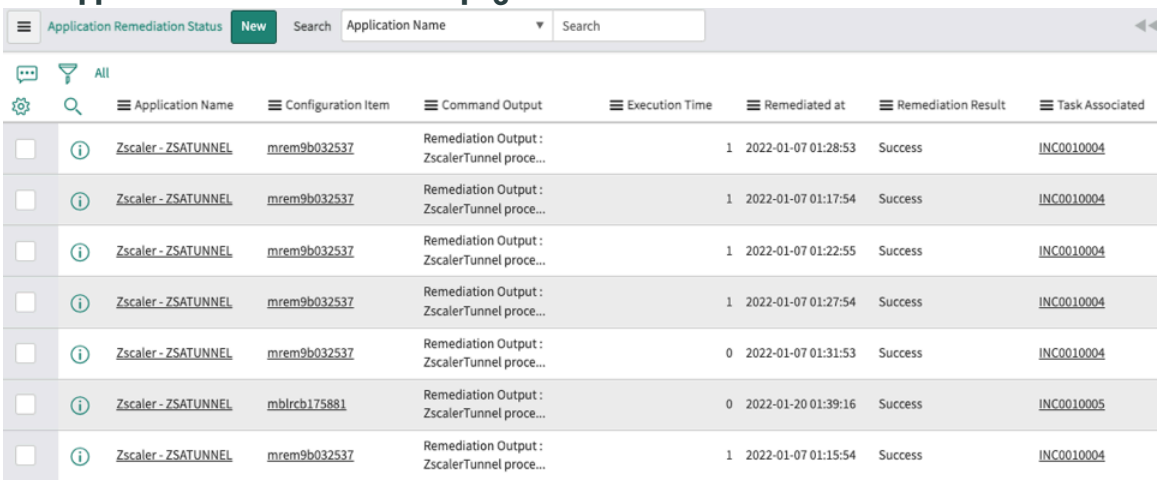
Procedure

Navigate to **All** > **Remediate Zscaler VPN** > **Remediation Result**.

The **Application Remediation Status** page appears.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application remediation status page



Application Name	Configuration Item	Command Output	Execution Time	Remediated at	Remediation Result	Task Associated
Zscaler - ZSATUNNEL	mrem9b032537	Remediation Output : ZscalerTunnel proce...	1	2022-01-07 01:28:53	Success	INC0010004
Zscaler - ZSATUNNEL	mrem9b032537	Remediation Output : ZscalerTunnel proce...	1	2022-01-07 01:17:54	Success	INC0010004
Zscaler - ZSATUNNEL	mrem9b032537	Remediation Output : ZscalerTunnel proce...	1	2022-01-07 01:22:55	Success	INC0010004

Zscaler - ZSATUNNEL	mrem9b032537	Remediation Output : ZscalerTunnel proce...	0	2022-01-07 01:31:53	Success	INC0010004
Zscaler - ZSATUNNEL	mblrcb175881	Remediation Output : ZscalerTunnel proce...	0	2022-01-20 01:39:16	Success	INC0010005
Zscaler - ZSATUNNEL	mrem9b032537	Remediation Output : ZscalerTunnel proce...	1	2022-01-07 01:15:54	Success	INC0010004

When remediation successfully shuts down and restarts Zscaler, the **Remediation Result** column has a value of **Success**. The **Task Associated** column displays a link to the incident created on remediation. When remediation is successful, the incident closes automatically.

Use the Zscaler dashboard

Use the Zscaler dashboard to view Zscaler monitoring and remediation statuses in graph format.

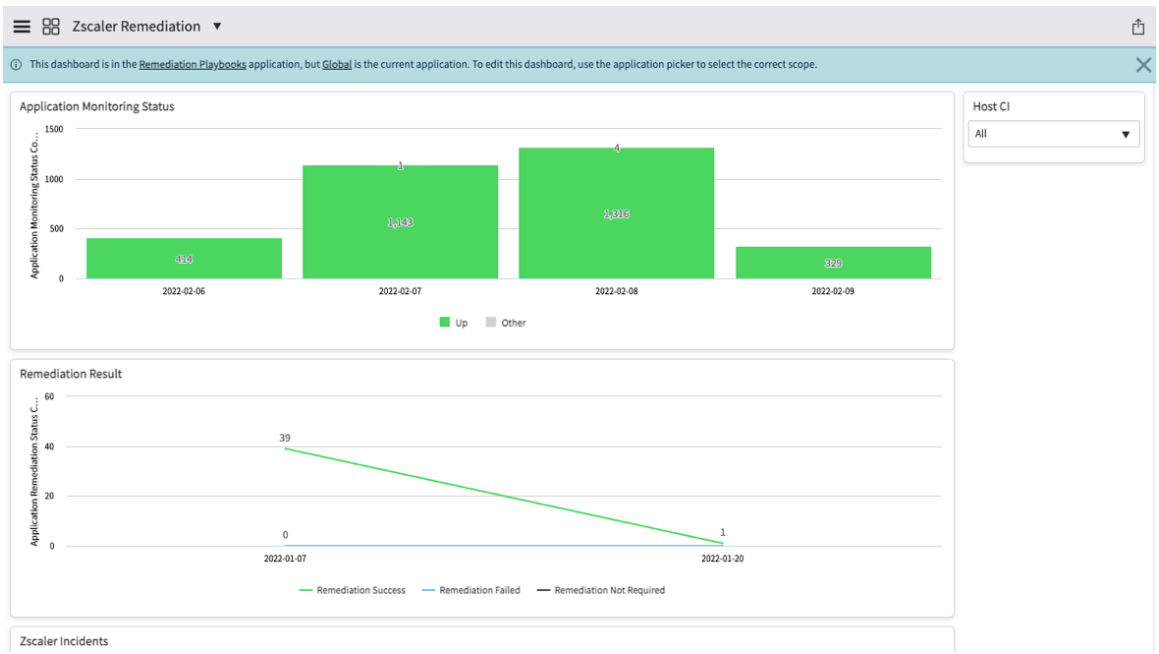
Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Remediate Zscaler VPN** > **Dashboard**.
   The Zscaler Remediation Dasbhoard appears.

Zscaler Dashboard



The dashboard displays graphs divided according to the following sections:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zscaler Remediation Dashboard sections

Section	Description
Application Monitoring Status	Displays a bar graph of the number of Zscaler apps by date, and their statuses (Up, Down, Unknown, Other).
Remediation Result	Displays a line graph of the number of Zscaler remediations, and their statuses (Success, Failed, Not Required).
Zscaler Incidents	Displays a line graph of the number of Zscaler incidents created, and their statuses (Opened, Closed).

2. **Optional:** In the **Host CI** window on the upper right side of the page, select the CI whose data you want to view.
   The default value is All, indicating that the dashboard displays data from all of the CIs on the host.

Collecting data from your system devices

Run a check command on your server or database to gather data from those devices. Depending on the check that is invoked, collected data may be monitoring data, visibility data, log data, or user metrics.

Policies

A policy consists of the Configuration Items (CIs) monitored by the Agent Client Collector, and the checks that run on those CIs. Policies define which checks to run, as well as when and on which CIs to run them.

Checks

A policy runs a set of checks. Each check is defined with the following attributes:

- Command to run
- Check type
- Command timeout
- Plugins to be used (`tar.gz` files that are securely and automatically downloaded to the agent)

Determining when checks run

Policy checks run based on one of the following scheduling models:

- Interval-based scheduling: The minimum number of seconds between each check run. For example:
  - An interval value is at least once per hour (at least once every 3,600 seconds).
  - The agent was down during the scheduled interval when the check was to run.
  When the agent is back up, it runs the check within one hour.

  If a check interval is less than one hour, the check is executed based on the indicated amount of time since the check's most recent run. For example, for a check scheduled to run once every eight hours:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The check runs at 00:00 (midnight)
- The check runs again at 08:00 (8 AM)

However, if the agent is down at 8:00 and is back up at 09:03, the check runs within an hour; that is, between 09:03 and 10:03. If the check runs at 09:57, the next run is at 17:57 (5:57 PM). In these cases, the check picks the running time at random to ensure running of once every eight hours.

A check completes its run when the results are sent to the MID Server (in a MID deployment) or ITOM Cloud Services (ICS) Pod (in a MID-less deployment).

- Cron-based scheduling: Runs at fixed times or intervals (for example, every day at 6:00 PM or every two hours).

Determining where checks run

Policies monitor the configuration items (CIs) that are mapped to the agent hosts. To determine the specific CI types to be monitored, you can create filters. For details on configuring policy filters, see Create a service filter for a policy.

Updating policy mappings

When activating a policy, Agent Client Collector Framework maps monitored CIs to a policy. This policy mapping repeats every seven days after the initial mapping. Every 15 minutes (by default), the Agent Client Collector monitors the CMDB for any changes matching the filter conditions, and updates the mapping accordingly. To modify the frequency by which mapping between the CMDB and CI is updated, modify the sn_agent_sync_filters_interval_min property on the System Properties page (**All** > **System Properties** > **All Properties**).

Create a new Agent Client Collector policy

Policies consist of the CIs monitored by the Agent Client Collector and the checks that run on those CIs. When creating a policy, you configure a filter which determines the CIs on which the checks are to run. For example, a policy to run checks on all Apache web servers. You can create new policies or edit the default policies.

Before you begin

Role required: agent_client_collector_admin

About this task

When associating a check definition with a policy, a copy of the definition is created as a check instance. These values appear on the **Check Instances** tab on the bottom of the **Policy** form. Any changes you make to a check instance affect only the instance in the policy; the original check definition remains unchanged. When changing the original check definition, the changes do not apply to already created check instances. It is recommended you make a copy of a check definition if you are changing its default parameters after having initiated one or more check definitions in a policy.

Some policy checks require credentials, while others do not. For example:

- The Agent Client Collector does not require credentials for checks that run on its own server. However, when accessing software requiring root or administrator access (such as MySQL), credentials are required.
- When the Agent Client Collector is used as a proxy:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Credentials must be invoked to allow the agent to connect to the remote device over SNMP or other protocols.
- Increase the agent's *cpu_percentage_limit* value in the `acc.yml` file, as indicated in the blue box on the **Proxy Settings** tab.

- When the Agent Client Collector uses the HTTP endpoint:
  - If the URL does not require logging in (such as with a public website), no credentials are required.
  - If the URL does require logging in (such as with an API endpoint), credentials are required.

You assign a credential alias in the policy's **Credentials** tab, as described in the following procedure.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Click **New**.
   The **Policy** page appears.
3. Enter values in the fields on the page, as described in the following table:

Policy Definition Form

Field	Description
Name	A descriptive name for the policy.
Description	Description of the policy.
Publish status	Hard coded as **Draft**, which means that the policy has not yet been published. You cannot edit this field.
Hierarchy	Hard coded as **None**. When a child policy is added to the policy, the value changes to **Parent**. Child policies have a value of **Child**.

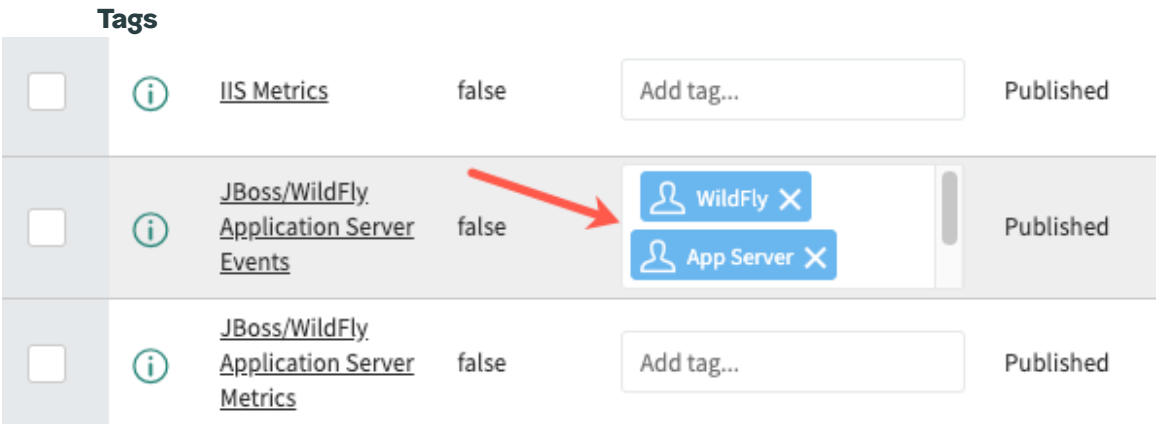
4. On the **Monitored CIs** tab, select one of the following options:
   - **Manual calculation**: Select to exclude the policy from scheduled policy calculation, ignoring any changes to the policy's impacted CIs.

     Select this option when the policy monitors a single CI. Otherwise, the Refresh and Publish Monitoring Policies scheduled job takes an abnormally long time to complete.

   - **Monitored CI type by filter**: Configure the following sub-fields:

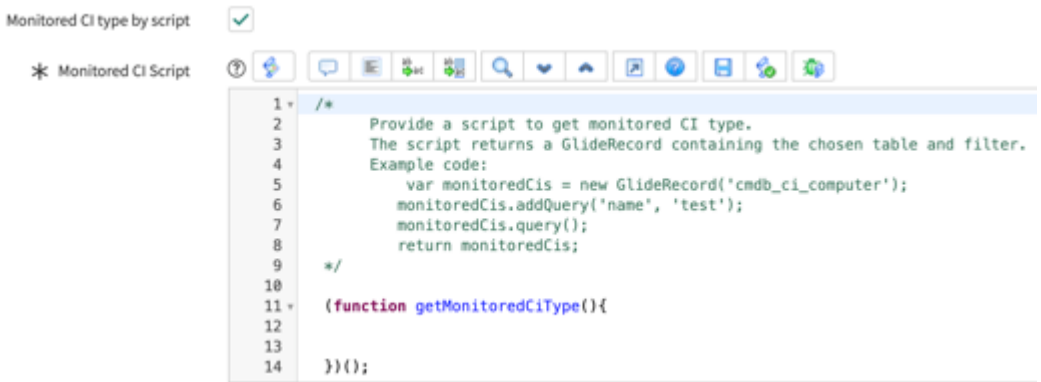
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Monitored CI type**: Select the CI type which you want the policy's checks to monitor.
- **Filter**: Configure a filter so that the policy's checks monitor only CI types meeting the specified criteria. Included in the available criteria are a CI's **tags**.



- **Monitored CI type by script**: Enables you to specify the monitored CIs using a script. Using a script allows you to create a CI filter for tables related to each other, and not just for a single table. For example, you can set a filter in both a Linux servers table and an Oracle table when searching for a CI. You return an object containing the table and filter at the end of the script.

  An example of a script appearing in the **Monitored CI Script** field is:



- **Monitored CI type by CMDB Group**: Enables you to specify the monitored CIs by using CMDB group queries. When selecting this option, the **Monitored CMDB group** field appears, where you select a CMDB group to associate with the policy.
  - For details on CMDB groups, see CMDB groups.
  - For details on building a CMDB query using the CMDB query builder, see Build a CMDB query using the CMDB query builder.

5. Select checks in the **Available** cell on the **Checks** tab, and move them to the **Selected** cell for them to be included in the policy.
   Checks can be selected multiple times, when you are monitoring more than one process. You can also select a group of checks in the **Filter checks by groups** field, which presents checks of the selected group in the **Available** cell.
6. **Optional:** Configure a proxy server on the **Proxy Settings** tab.

   (Optional) Configure a proxy server only when using the agent as a proxy to report data on remote machines. For details, see Configure an agent on a proxy server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the **Scheduling** tab, select one of the following:
   - **Interval-based scheduling**: Configure the time interval (in seconds) to indicate the frequency with which the policy's checks will run.
   - **Cron-based scheduling**: Enables configuring the policy to be active only during a specific time or time frames.
     a. Select the unlock icon ( ) to enable selecting cron expressions.
     b. Select the search icon ( ) to select a cron expression. Select **New** to create a new cron expression, or select one of the cron expressions that come with the base system, which are:
        - Every hour nightly 5:00pm-7:00am
        - Every minute daily 8:00am-4:59pm
        - Every minute Mon-Fri 8:00am-4:59pm

        When creating a new cron expression, you must enter it in valid cron format.

        The specified cron expression operates in the time zone of the machine hosting the agent.

   Note:
   If an **Interval** or **Cron** value was specified for the check definition, that value overrides the value configured in either of these fields.

8. In the **How to send the check results** field, select the frequency with which check results are to be sent.
   - When event severity changes (default for event checks)
   - Always send check results (default for non-event checks)
   - Do not send check results
   - When the check results change
   - (Advanced) Based on exit codes of the check: Send results only if the exit code is 240 (OK), 241 (Warning), or 242 (Critical). However, if the command output is empty, then even if one of these codes are part of the exit code, check results are not sent.
9. On the **Credentials** tab, select one of the following:
   - **Credential name**: Select credentials to be assigned to the policy. The available credentials are those displayed on the associated check definition's **Check Secure Parameter Definitions** tab.
   - **Credential alias**: Select the search icon to select a credential alias to be used by the policy's checks to connect to the monitored CI. The available options are those created on the **Connection & Credential Aliases** page. For details on credential aliases, see Credential aliases for Discovery.
10. Click **Save**.
    The following buttons appear:
    - **Publish**: Publishes the Draft policy, moving its **Publish status** to **Queued**. A queued policy is processed by the policy publishing job. The job calculates which agents run the policy and then sends the policy to the relevant MID Servers. The job then moves the policy's **Publish status** to **Published**. A published policy is active on the agent.
    - **Delete**: Deletes the policy.

Related topics

Create a policy hierarchy

Create a policy hierarchy

Policies are attached to groups of related CIs. If you have a subgroup of related CIs, you can attach a new policy to the subgroup using a policy hierarchy, without creating the new policy from scratch.

Before you begin

Role required: agent_client_collector_admin

About this task

Policy hierarchy enables you to use a policy as a template to create a new policy, which is then attached to a subgroup of the original policy's CIs. The original policy is the **parent** policy, and the new policy is the **child** policy.

Note:
You cannot create a child policy when a proxy agent is in place for the parent policy.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. On the **Policies** page, select a published policy with a Hierarchy value of either **None** or **Parent**.
3. Select the **Create Child** button at the top of the page or underneath the **Monitored CIs** tab.
   A new (child) policy opens with the same parameters as the original policy. The name of the policy is *<Policy name><date and time created>*.

   Note:
   The child policy inherits the parent policy's parameters only when it is first created; there is no continuous inheritance from the parent to the child.

   The following fields appear hard-coded with the indicated values:

   ### Child policy fields

Field	Value
Publish status	Draft
Hierarchy	Child
Parent	<Name of the parent policy>

   The **Order** field value indicates the priority by which the agent attaches itself to the policy. A lower number indicates higher priority, and each created child policy takes on a higher value than the policy preceding it. You can modify this value, as needed.

4. Modify the policy's parameters, as needed.
   The following buttons appear on the child policy page:

Button	Description
Compare to Parent	Select to display the differences between the child policy and its parent policy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Button	Description
Return to Parent	Select to leave the child policy page (without saving) and return to the parent policy.

The following buttons appear on the parent policy page:

Button	Description
Deactivate	Appears for an active policy. Enables you to select from the following: ○ Deactivate the parent policy and all of its child policies ○ Deactivate only the parent policy
Activate	Appears for an inactive policy. Enables you to select from the following: ○ Activate the parent policy and all of its child policies ○ Activate only the parent policy
Delete	Enables you to select from the following: ○ Delete the parent policy and all of its child policies ○ Delete only the parent policy

5. Select **Save**.
   Child policies appear on the **Child Policies** tab of the parent policy.

Edit a published policy

A policy with a status of **published** has been passed through the MID Server and sent to the agent. To edit a published policy, you must enable editing.

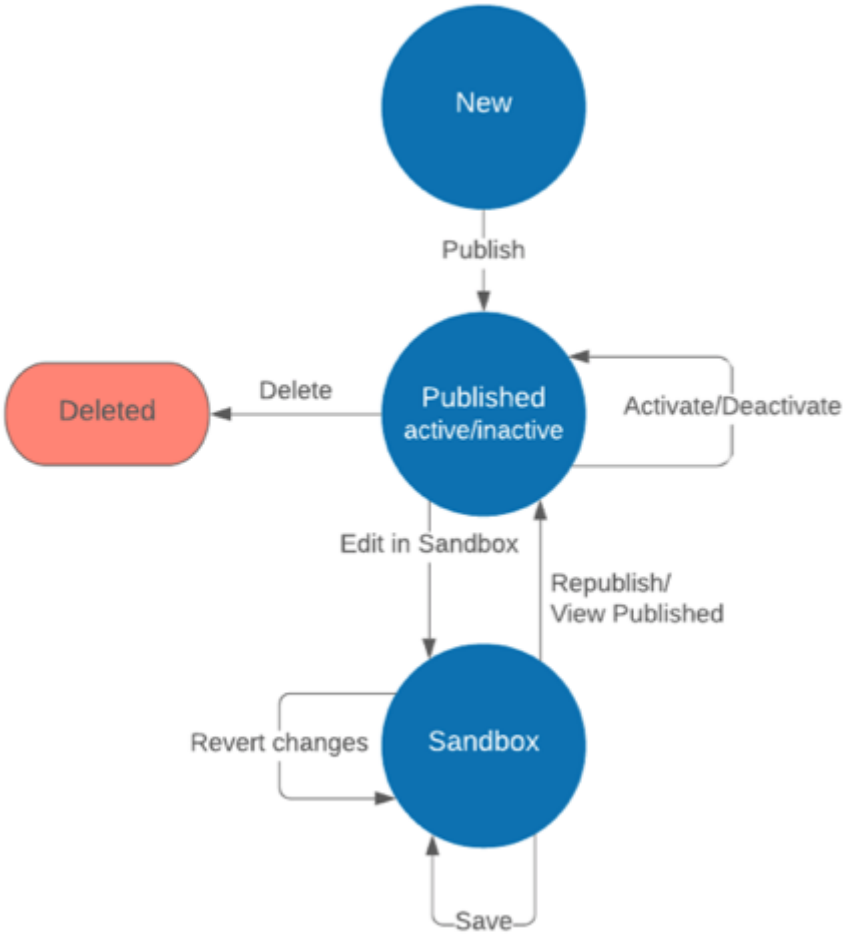
Before you begin

Role required: agent_client_collector_admin

About this task

You select a Published policy and then select the **Edit in Sandbox** option to enable editing of the policy. You edit the policy in the sandbox and then save, republish, or delete the policy, as needed. The following diagram illustrates the flow of editing a published policy:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

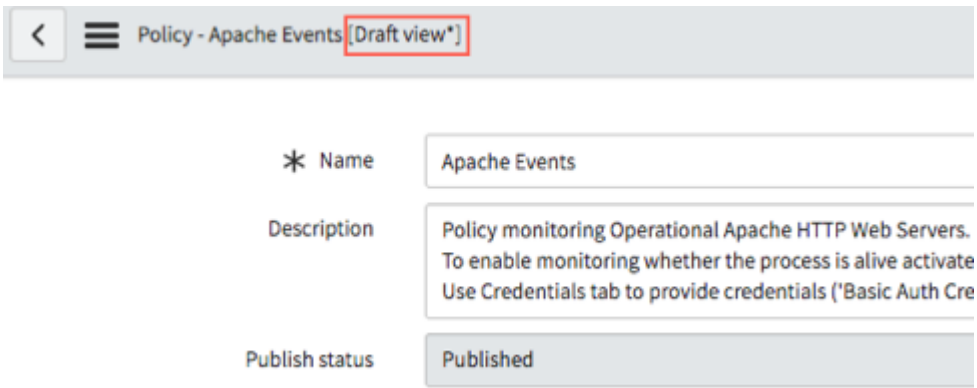


Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Click a policy for which the **Publish status** is **Published**.
3. Activate or deactivate the policy, as needed, by clicking the **Activate** or **Deactivate** button.
4. Select the **Edit in Sandbox** button.
   The policy is now in **Draft view**, and its fields are editable.

Note:

- When you select this option, the policy's check instances are also editable.
- Although the policy is in **Draft view**, its **Publish status** remains **Published**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

While editing the policy's fields, you can select the following options, as needed:

Edit policy buttons

Button	Description
Revert All Changes	Reverts the changes you entered into the Sandbox policy fields to the most recently published values. The policy's **Publish status** returns to **Published**, and remains in **Draft view** for editing. This button appears only after entering updates into the Sandbox policy fields.
View Published	Returns to the most recently published policy. The policy returns to **Published** view.
Save	Saves the changes you entered into the Sandbox policy fields. The policy remains in **Draft view**, and the **Publish status** is **Published***. The asterisk indicates that the current published version is not the most up to date, since there are changes that have not yet been published.
Republish	Publishes the updates you entered into the Sandbox policy fields. The policy is saved with your updates and opens as the published policy. ○ The published policy's **Publish status** is set to **Queued** if the policy changes result in either: ▪ A change in which agents are running the policy (that is, a change to the monitored CI filter). ▪ A change in the policy's check instances. The policy's publishing job recalculates Queued policies and sends them to the relevant MID Servers. ○ The published policy's **Publish status** is set to **Ready to publish** if the changes to the policy do not require any agent recalculation (that is, a change to the policy interval). The policy's publishing job sends Ready to publish policies to the relevant MID Servers, without recalculating those policies. After the policy publishing job processes a policy, the policy **Publish status** moves to **Published**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Button	Description
	This button appears only after entering updates into the policy fields, for a policy whose **Publish status** is **Published***.
Delete	Deletes the policy. This button appears only when viewing the published policy, and deletes both the Published and Sandbox policies.

5. Select checks in the **Available** cell of the Checks tab, and move them to the **Selected** cell for them to be included in the policy.
   Checks can be selected multiple times, when you are monitoring more than one process. You can also select a group of checks in the **Filter checks by groups** field, which presents checks of the selected group in the **Available** cell.
6. In the **Check Instances** table, view the check instances that are configured for the policy, or select a check instance to edit it.
7. On the **Agents** tab, view the agents that are executing the policy.

   The list of agents is calculated based on the monitored CIs.

   This tab appears only when viewing a published policy.

Create a service filter for a policy

Configure a service filter so that the policy monitors only those services that match the filter.

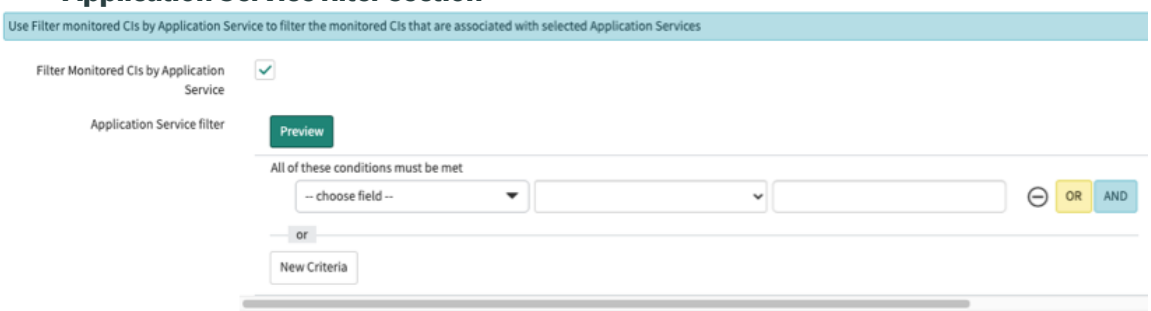
Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
   The **Policies** page appears.
2. Select a policy.
   The details page of the policy appears.
3. Select the **Edit in Sandbox** button to enable editing the form.
4. On the Monitored CIs tab, select the **Filter Monitored CIs by service** check box.
   The **Application Service filter** section appears.

Application Service filter section



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure conditions in the fields and select **Save** at the bottom of the page.
   The policy is configured with the indicated service filter. Only CIs matching the service filter are included in the policy's logs.

Export and import an Agent Client Collector policy

You can move a single or multiple Agent Client Collector policies from one ServiceNow instance to another by exporting the policy and then importing it into the target instance. Only published policies can be exported.

Before you begin

Ensure that you published the policies you want to export on the source instance.

Note:
When working in a domain separated environment, imported policies are moved from the source instance domain to the identical domain on the target instance. Therefore, you must ensure that you have defined the same domains on the target instance as you have on the source instance, either by cloning the source instance or by exporting and importing domains from the source to the target instance.

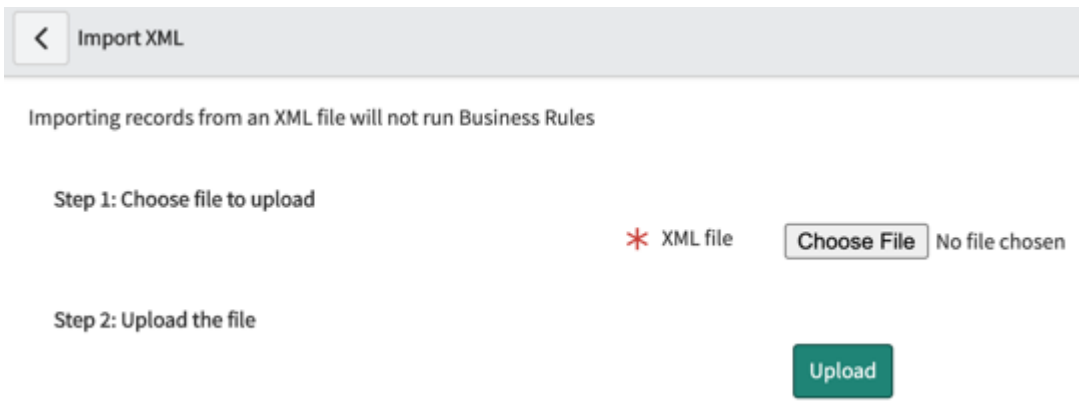
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the check box of the published policies you want to export.
3. In the **Actions on selected rows...** list underneath the list of policies, select **Export policies**.
   A confirmation dialog box appears.
4. Click **Yes**.
   The selected policies are exported as an update set file in XML format, which is downloaded to your browser. The generated update set has the following name convention: `AccPolicyExport <Current Date and Time>`. For example, `AccPolicyExport 2020-08-11 15:35:05`.
5. Import the policy to the target instance.

   a. Navigate to **System Update Sets** > **Retrieved Update Sets**.
   The **Retrieved Update Sets** page appears.

   b. Right-click on one of the table headers and select **Import XML**.
   The **Import XML** page appears.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Click the **Choose File** button and select the previously downloaded update set to import.

d. Click **Upload**.

> **Note:**
> When the exported content is in a scope, the imported update set appears on the **Retrieved Update Sets** page as multiple records. The **Global** scope record is the parent, and the other records appear with the Global record as their parent update set. Only the Global update set record can initiate the import process.

e. Select the **Global** update set.

f. On the **Retrieved Update Sets** page, click **Preview Update Set Batch** to verify whether there are any conflicts with existing policies on the target instance.
Resolve any conflicts, as needed.

g. If no conflicts exist, click **Commit Update Set Batch** to validate and commit the update set.

h. Navigate to **Agent Client Collector** > **Policies** and verify that the imported policies appear on the Policies list.
The imported policies are synchronized with the relevant MID Servers on the target instance and are ready for immediate use.

> **Note:**
> The import process overrides any existing policies on the target instance and sets the imported policies to **Published**. However, draft copies of policies created on the target instance are not modified. Therefore, delete draft records of the imported policies after completing the import process, as these records are not synchronized with the published policies on the target instance.

Create and edit checks

You can select a check based on the type of entity (such as a server or an application) you want to monitor. You can view and edit the default checks or create new checks, as needed.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Click **New**.
   The **Check Definition** page appears.

   > **Note:**
   > Using Ruby scripts in a Windows environment causes high CPU consumption.

3. Enter values in the fields on the page, as described in Agent Client Collector check definition page.
4. On the **Parameters** tab, enter parameter definitions, as needed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters are used for the **Command** field when the Simple template is used, as described in Agent Client Collector check definition page.

The information you can add for parameters is described in Check definition form parameters tab.

Test a check definition or check instance

When working with a check definition or check instance, you can test the check against its assigned agent to ensure that the check is configured properly.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Select a check definition from the list.

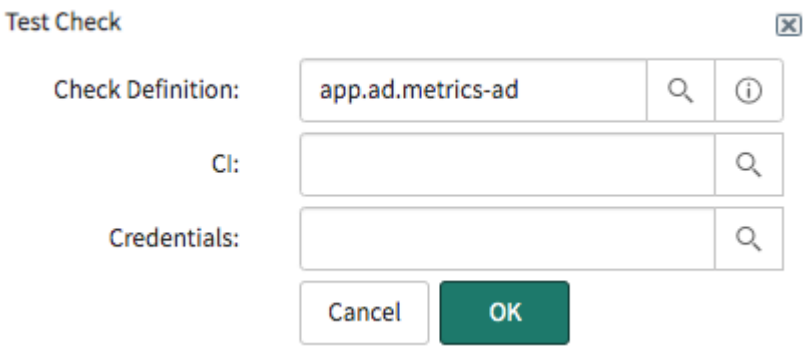
   Note:
   When running a Test Check in a check instance:

   a. Navigate to **Agent Client Collector** > **Policies**.

   b. Select a policy.

   c. Select a check instance in the policy.
   Continue with the following steps in this procedure.

3. In the **Related Links** section, click **Test Check**.
   The **Test Check** dialog box appears.



4. Configure the fields in the dialog box.

Test Check dialog box fields

Field	Description
Check Definition	Displays the name of the selected check definition.
CI	Select the CI on which to run the check. The available options are those CIs which meet both of the following criteria:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Belong to the group specified in the **Check group** field. ○ Belong to an agent with **Up** status. If the **Check group** field is empty, the value defaults to **cmdb_ci_computer**.
Credentials	Select the credentials of the user whom you want the agent to connect with. This field appears only if you have configured secure check parameters on the **Check Secure Parameter Definitions** tab in the Check Definition.
Proxy agent	Select a proxy agent to be associated with the check. This field appears only when working with a check instance and when one of the options has been selected on the **Proxy Settings** tab in the instance's policy.

Create secure parameters for a check

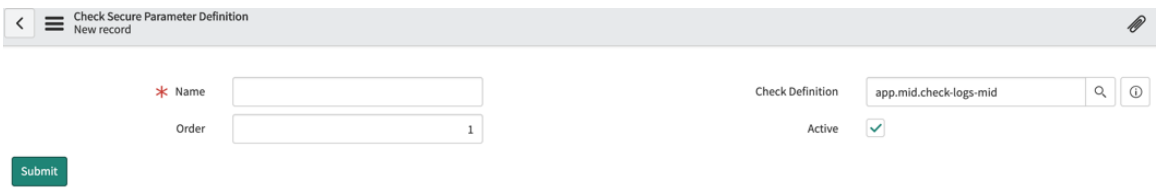
When creating a check definition or check instance, you can configure the parameters you want to be secured when the agent executes the check. During check execution, the secured parameters are obfuscated, securing their information. Only credential information is obfuscated.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Select a check definition from the displayed list.
   The **Check Definition** page for the selected check appears.
3. Scroll to the bottom of the page and select the **Check Secure Parameter Definitions** tab.
4. Click **New**.
   The **Check Secure Parameter Definition New Record** page appears.



5. Configure the fields on the page.
6. Click **Submit**.
   The configured parameter appears in the table on the **Check Secure Parameter Definitions** tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Repeat this procedure to enter multiple secure parameters.

7. Enter the secure parameters into the **Command prefix** field of the check definition.

Create a check type

Create a check type to execute the `osquery` command on the Agent.

Before you begin

Role required: agent_client_collector_integration or agent_client_collector_admin

Procedure

1. In an Event Management instance, enter `sn_agent_check_type.list` into the navigation bar.
   The **Check Types** page appears.
2. Click **New**.
   The `Check Type - New Record` page appears.
3. In the **Name** field, enter `osquery`.
4. In the **Instance Script** field, enter the following script:

```
for (var index = 0; index < checkResults.length; index++) {
var check = checkResults[index].check;
gs.info('result ' +
index + ': requestId: ' +
check.requestId + ' agent_name: ' +
checkResults[index].agent_id +
' ci_id: ' + check.ci_id +
' status: ' + check.status +
' output: ' + check.output);

}
```

   You can modify this script, as needed, but this initial script helps you to verify that your setup was successful.
5. Click **Submit**.

Create a check definition

Create a check definition to execute the `osquery` command on the Agent.

Before you begin

Role required: agent_client_collector_integration or agent_client_collector_admin

Procedure

1. In an Event Management instance, navigate to **Agent Client Collector** > **Check Definitions**.
2. Click **New**.
3. In the **Name** field, enter `util.osquery`.
4. In the **Check type** field, enter `osquery`.
5. In the **Command** field, enter the following script:

```
osqueryi  --logger_min_status 1 --json
 "{{.labels.params_query}} "
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the **Plugins** field, enter the `osquery` plugin.
7. In the **Parameters** section, enter the following values for a check parameter definition.
8. Click **Test check** and select one of the available agents.
   The test result appears, indicating its success or failure.

Run host data collection for an agent

Collect data on the host being monitored by an agent. Manually collecting host data ensures that the host's files are up to date.

Before you begin
Role required: agent_client_collector_admin

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Underneath the check box icon ☐, hover next to an agent and select the check box that appears.
   Repeat this step for all agents for which you want to collect data.
3. Select the arrow next to the **Actions on selected rows...** drop-down and select **Collect host data**.

Result
Data is collected for the specified agents. The collection status is indicated in the page's **Host data collection** column.

Enable checks from the community for Agent Client Collector

You can take checks from the github community and customize them for use in the Agent Client Collector (ACC), or you can compose your own scripts. Create a plugin with the customized Sensu check and install it on a ServiceNow instance.

Before you begin
Role required: agent_client_collector_admin

Procedure
1. Copy a check from the github community to your local machine.
2. Create a `tar.gz` file to be appended to your plugin:
   a. Create a folder on your local machine.
   b. Create a sub-folder called `bin`.
   c. Place the checks you want to run (scripts and executables) in the `bin` folder.
   d. In a Linux environment, give executable permissions to the checks by running *`chmod +x filename`* on each of the checks.
   e. Navigate to the parent folder (above the bin folder).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. In a Linux environment, run the *tar -C <parent_folder_name> --zcvf <my_plugin_name>.tar.gz *** command.
In a Windows environment, use an archiving utility that supports the `tar.gz` format.

g. In a Windows environment, ensure that you include the following scripts in the `bin` folder:

- A batch script configured to run on the check command and initiate the run. For example, *powershell <%~dp0>\test.ps1*

  The *<%~dp0>* variable directs to the drive (*d*) and path (*p*) of the batch file.

- The relevant script (for example, `test.ps1`) to be executed in the batch script.

3. Create a new ACC plugin, as described in Create and edit Agent Client Collector plugins.
4. Test the new plugin.

a. Create a new check definition for the customized Sensu check.
For details, see Create and edit checks.

b. On the **Check Definition** page, navigate to the **Related Links** section and select **Generate allow list content**.

c. Copy the entries you want to include in the allow list and add them to the agent's `check-allow-list.json` file, either manually or using an automation tool.
The location of this file is indicated in the `allow-list` parameter of the agent's `acc.yml` file.

d. Create a new policy and add the newly created check definition.
For details on creating a policy, see Create a new Agent Client Collector policy.

e. Select the check definition and in the **Related Links** section, select **Test check**.

5. Enable credentials when testing a check:

a. Navigate to **Connections & Credentials** > **Credentials**.

b. Click **New**.

c. Select the type of credentials you want to create.
For details on creating credentials, see Create a Connection and Credential alias.

d. Enter values in the fields on the page to assign credentials to your selected credential type.

e. Click **Submit**.

6. Create secure parameters for your check, as described in Create secure parameters for a check.

Enabling Agent Client Collector data collection

You can perform actions which enhance data collection from the hosts on which Agent Client Collector is running.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a call API to send an osquery request

Create a background script to send an `osquery` request. The `osquery` request enables data collection from your host's operating system.

Before you begin
Role required: administrator

Procedure

1. Create the following background script:
   - `"MTLV9DE22016"` is the name of the server running an agent
   - `"c8bf9072539333003e76ddeeff7b12c5"` is the sys_id of the previously created check definition

```
cis = new GlideRecord("cmdb_ci_server");
    cis.addQuery("name", "MTLV9DE22016");
    cis.query();
    check = {
        "checkDefId": "c8bf9072539333003e76ddeeff7b12c5",
        "params": {
            "query": "select pid,cmdLine from processes limit
 4"
        }
    };
    var agentNow = new sn_agent.AgentNowHandler();
    gs.info('request_id: ' +
 agentNow.runCheckForCis(cis,check,'1',60000));
```

2. Run the script to print the request ID:
   request_id: `eefbff7ab75733003e766068de11a981`
3. Check the system logs for messages coming from the instance script.

```
result 0 requestId: 06c6c887b79733003e766068de11a912
 agent_name: MTLV9DE22016 ci_id:
00726c36539333003e76ddeeff7b12db status: 0 output: [
{"cmdline":"","pid":"0"},
{"cmdline":"","pid":"1"},
{"cmdline":"","pid":"45"},
{"cmdline":"","pid":"46"}
]
```

View host data collection for an agent

Run data collection on an agent's host to discover the components that are running on the host.

Before you begin
Role required: agent_client_collector_admin

About this task
The Refresh Host Data for Agents scheduled job collects host data and runs every hour on the following:

- Hosts which have not been discovered in the past 12 hours.
- Host for which Discovery failed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   In the **Host data collection** column, view the status of data collection on the agent's host. The possible statuses are:

Host data collection statuses

Status	Description
<empty>	Indicates that the agent has been added within the past minute and the Refresh and Publish Monitoring Policies scheduled job has not yet run to initiate data collection. The job runs every minute.
Collected (green)	Host data collection is complete.
Collecting (yellow)	Host data collection is in progress.
Collection failed (red)	Host data collection failed.

2. **Optional:** Locate the **Host data last collected** column to view when data collection was last performed on the host.

Generate an Agent Client Collector allow list

Specify the checks to be included in the list of checks that are enabled to run on the agent.

Before you begin

Role required: agent_client_collector_admin

About this task

The default allow list includes all validated checks, and is included in the base system policies. If the allow list cannot be read correctly, no checks run on the agent.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
   The **Check Definitions** page appears.
2. In the **Related Links** section at the bottom of the page, click **Generate allow list**.

> **Note:**
> Alternatively, you can click a check definition or check instance record and click **Generate allow list** to generate a complete allow list.

The **Agent Client Collector Command Allow-list Generator** page appears, with the list of checks scanned from the **Command** field of the check instance records.

The values appear with the following attributes:

Command attributes

Attribute	Description
exec	The executing command.
args	Possible argument strings.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
skip_arguments	Boolean. Determines whether to verify that the argument was added to the allow list. ○ **true**: Skips argument validation and checks only for illegal characters, specifically |; \<>&'$() ○ **false**: Executes argument validation to ensure that the argument is included in the allow list. If it is not, the command cannot execute.

3. Copy the entries you want to include in the allow list and add them to the agent's `check-allow-list.json` file, either manually or using an automation tool.
   The location of this file is indicated in the *`allow-list`* parameter of the agent's `acc.yml` file.

Run host data collection on demand

You can perform host data collection on demand, if you need to perform data collection before the job is scheduled to run.

Before you begin
Ensure that you have sufficient permissions to create CIs.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears.
2. Select an agent with **Status = Alive**.
3. On the agent form, click the **Collect Host Data** button.

Pause Agent Client Collector data collection

If CPU consumption on your server is getting too high, you can manually turn off the Agent Client Collector data collection to pause all checks performed by the agent, except for the agent's keep alive messages.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears, displaying the list of configured agents.
2. Select the checkbox next to the relevant agents.
3. In the **Actions on selected rows...** dropdown, select **Pause data collection** to pause data collection on the agents (**Data Collection = Off (manual)**).

   Select **Resume data collection** to resume data collection on the agents.

   Alternatively, you can set the status of an agent by selecting the agent and in the **Related Links** section, select the **Pause data collection** link to pause data collection on the agent. To resume data collection on the agent, select the **Resume data collection** link.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Validate assets on the MID Server

Validate assets on your MID Server to ensure that they match the assets on your ServiceNow instance. Validating assets ensures that the instance provides accurate data on all of your MID Server assets.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select a MID Server entry on the MID Servers page.
3. Select the **Validate Assets** link.
   The **Queues** page appears, displaying the ECC queue.
4. Refresh the queue to view the new input record.
5. Select the record to view its results.

   Validation status is visible in the **Payload** section of the form.

   If assets aren't validated, restart the MID Server. Assets sync automatically when the MID Server restarts.

Validate assets on agents

Validate assets on your agents to ensure that they match the assets on your ServiceNow instance. Validating assets ensures that the instance provides accurate data on all of your agents' assets.

Before you begin
Role required: agent_client_collector_admin

About this task
Only assets that are able to be executed are validated. For example, if you're running an agent on a macOS, only macOS assets on your instance are validated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent on the **Agent Client Collectors** page.
3. Select the **Validate Assets** link.
   The **Queues** page appears, displaying the ECC queue.
4. Refresh the queue to view the new input record.
5. Select the record to view its results.

   Validation status is visible in the **Payload** section of the form.

   If assets aren't validated, navigate back to the **Agent Client Collectors** page and select the **Clear Assets** link.

   The assets automatically re-sync the next time a command runs which requires the asset.

Using Agent Client Collector logs

Use Agent Client Collector logs to track events in your system. Log levels indicate the severity of each event.

© 2025 ServiceNow, Inc. All rights reserved.

Configure Agent Client Collector log levels

You configure the log levels that you want the Agent Client Collector logs to contain. All events that match or exceed the specified log level display in the Agent Client Collector logs.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Specify the desired log level in the `acc.yml` configuration file.
   Alternatively, you can specify the log level as an argument in the `--loglevel` command-line flag, as follows:

   ```
   acc start --log level debug
   ```

2. Restart the agent using the service manager:
   - **Linux**:

     ```
     sudo service acc restart
     ```

   - **Windows**:

     ```
     sc.exe stop AgentClientCollector
     sc.exe start AgentClientCollector
     ```

   - **macOS**:

     ```
     sudo launchctl load
      -w /Library/LaunchDaemons/com.sn.acc.plist
     ```

   Note:
   You must restart the service after changing the log level.

View the Agent Client Collector logs

You can view the activity logs for an Agent Client Collector.

About this task

Agent Client Collector logs are accessible from:

- **Linux**: `/var/log/servicenow/agent-client-collector/acc.log`
- **Windows**: The location specified by the `log-file` configuration flag. The default location is: `C:/ProgramData/ServiceNow/agent-client-collector/log/acc.log`

  If the `C:/ProgramData` directory is hidden (such as on older Windows versions), change the Explorer filter to show hidden elements.

- **macOS**: The default location is: `/Library/Application\ Support/servicenow/agent-client-collector`

Before you begin

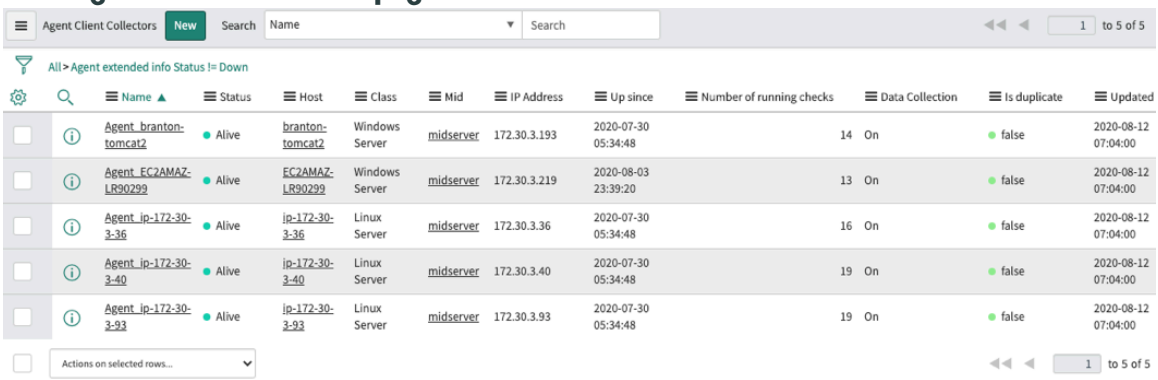
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page opens.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collectors page



The displayed columns are those selected when clicking the Settings icon .

The **Host** column indicates the host name of the agent.

The **Class** column indicates the agent's CI type.

2. Select an agent.
   The **Agent Client Collector** page opens.
3. In the **Related Links** section, click **Grab Agent Log**.
   The **Queues** page opens for the selected Agent.
4. Refresh the page and click the relevant entry with the value **Queue = input**.
   The **Payload** section on the **Queue** form displays the log for the Agent Client Collector.

Related topics

Enable log monitoring in a Linux environment

Enable log monitoring in a Windows environment

Set the agent log level

Configure the agent log level directly from your ServiceNow® instance, without needing to access the `acc.yml` configuration file.

About this task

Configuring the agent log level from the instance changes the log level temporarily, and doesn't update the log level in the `acc.yml` configuration file. When restarting the agent, the log level reverts to its status as set in the `acc.yml` configuration file.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. In the related links, select **Set Log Level**.
4. In the Set Log Level dialog box, select the log level to invoke for the agent, and select **OK**.
5. Reset the log level to its originally configured level by doing one of the following actions:
   - In the related links, select **Reset Log Level**.
   - Restart the agent.

Clear Agent Client Collector assets

Clear the asset and configuration file cache folder and control plugin downloads. Clearing the cache folder removes unwanted plugins that have synced to the agent.

Before you begin

Ensure that the following are installed on your system:

- Agent Client Collector Framework (ACC-F), starting with version 3.5.5
- MID Server
- CMDB
- Agent Client Collector agent, starting with version 3.5.5
- ACC Global Utilities

Ensure that the **disable_assets** system property in the `acc.yml` configuration file is set to **false**.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. In the **Related Links** section, select **Clear Assets**.
4. In the confirmation dialog box, select **Clear Agent Assets**.
5. **Optional:** Select **Collect host data** to re-download your plugins from the instance.
   Plugins download automatically when used by their respective checks/policies.

Verify agent functionality

Verify that an agent is running properly by performing a self-test on the agent. If one or more of the tests fail, you can diagnose the agent problem and view a potential resolution.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent that is running (**Status = Up**).
3. In the **Related Links** section, select **Run self-test**.
4. The **Agent Self Test Runs** page appears, displaying the previous self-tests run on the agent.
   If the current test doesn't appear, refresh the page.
5. Hover next to the entry for the current test and select the info icon .
   The **Agent Self Test Run** pop-up window appears.
6. Select **Open Record**.
   The Agent Self Test Run page appears, displaying information on the self test.
7. In the **Agent Self Test Results** table at the bottom of the page, locate a test with **Status = Fail**.
8. Hover next to the entry for the failed test and select the info icon .
   The **Agent Self Test Results** pop-up window appears.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select **Open Record**.
   The Agent Self Test Results page appears, displaying information on the failed test.

Result

In the **Agent Self Test Logs** table on the bottom of the page, you can view the level of the failed test (ERROR or WARNING), and a resolution for the failed test.

Use the Agent Client Collector Health Dashboard

The Agent Health Dashboard enables you to monitor the status of the agents in your system.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Health Dashboard**.
   The **Agent Health Dashboard** page appears and displays information about the configured agents in the dashboard widgets.

   In the **Agents by Data Collection Status** widget, **Off (manual)** indicates agents manually turned off (for maintenance or troubleshooting), and **Off (auto)** indicates agents automatically turned off (after crossing the CPU usage threshold).

2. Click the refresh arrow icon on the top right corner of a widget to refresh its data, as needed.

   You can refresh all widgets on the dashboard by selecting the form header icon and then selecting **Refresh**.

View the Agent feature matrix

The Agent Client Collector Agent feature matrix displays the availability of Agent Client Collector features. The matrix displays data in a graph and a table.

Before you begin

Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

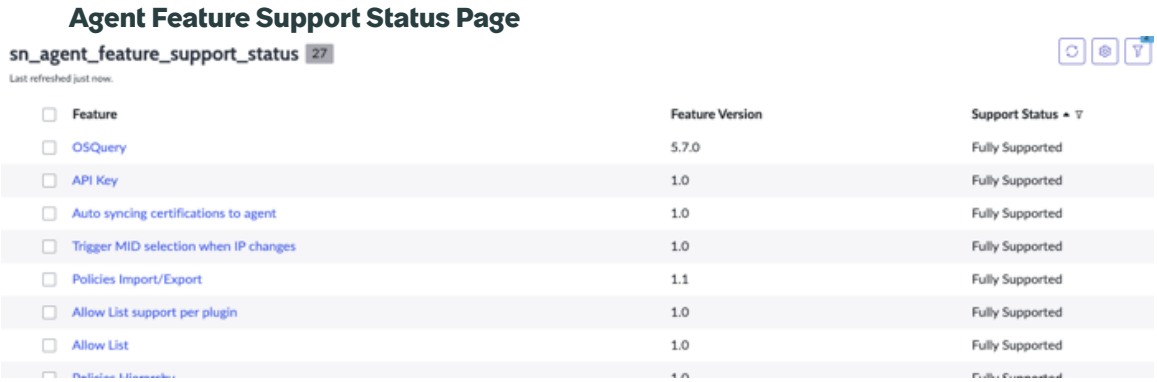
The Agent feature matrix displays the granularity of Agent Client Collector features that are fully supported, partially supported, and not supported. A partially supported feature may have instance and framework requirements met, but runs on at least one agent version which does not meet the feature requirements.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Feature Matrix**.
   The **Agent feature matrix** appears.

   The matrix shows the support status of Agent Client Collector features that are fully supported, partially supported, and not supported (Unsupported).

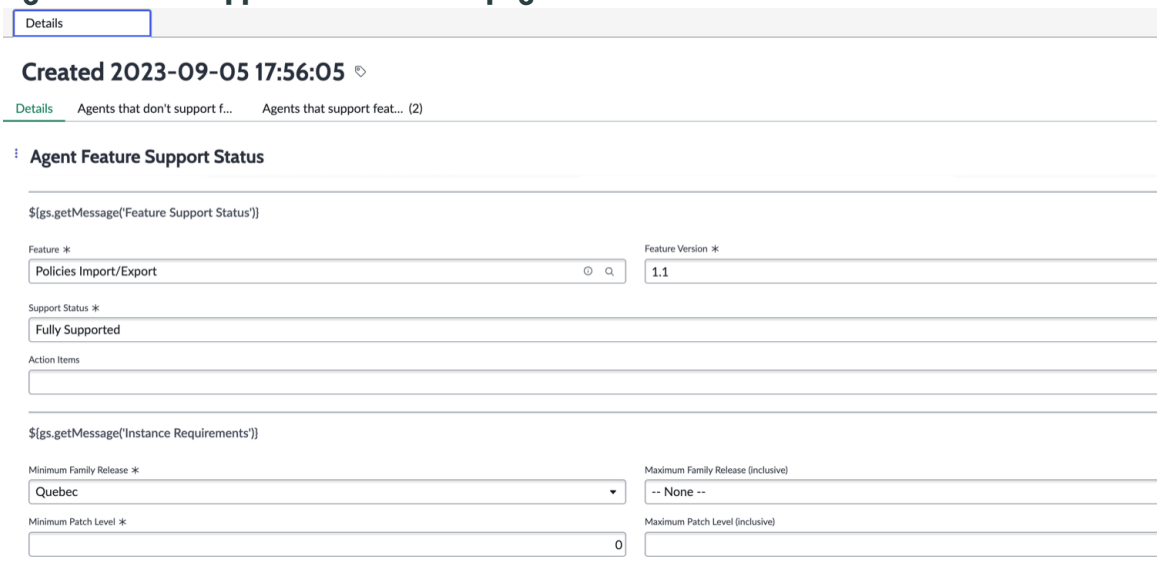
2. Select one of the categories on the graph.
   A list of all features in the category appears on the **Agent Feature Support Status** page.



3. Select one of the features.
   The **Agent Feature Support Status** page for the specific feature appears:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Feature Support Status Details page



The page displays the following:

- Sections indicating the support status of the feature, and the various instance requirements of the feature. The **Action Items** field displays the actions you need to take to fully support a feature that is either partially supported or unsupported.
- Instance requirements and agent framework version requirements that have been met by the agent feature.

View agent errors

Agent Client Collector (ACC) errors are visible in logs related to the agent and the ServiceNow instance. This feature provides improved visibility of agent errors, enabling faster error resolution.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Issues**.
   The **ACC Error Messages** page appears and lists the agents containing errors.

   The following columns display the indicated information about the errors.

ACC Error Messages page

Column	Description
CI ID	The name of the agent containing the error, or a configuration item (CI) with an issue.
Code	Error code assigned to the issue.
Message	A message describing the error.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

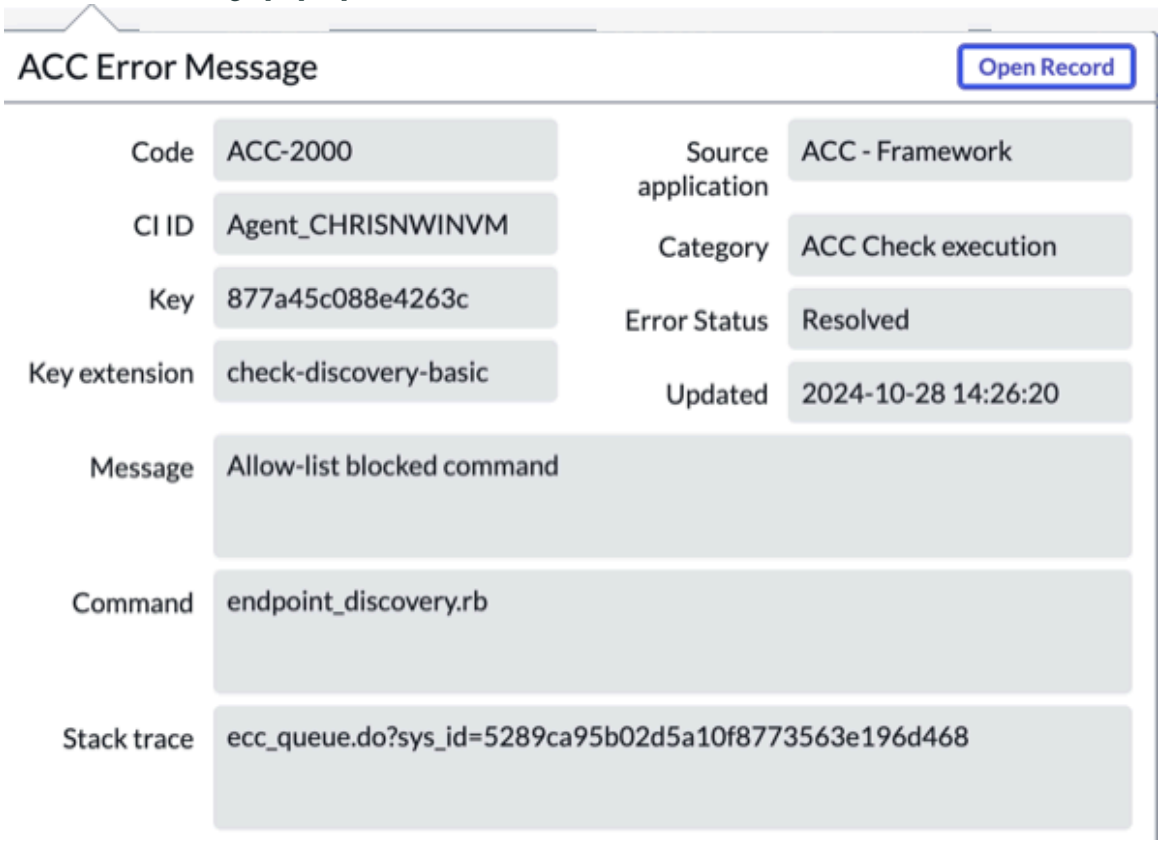
Column	Description
Source application	The application triggering the error.
Error status	Indicates the state of the error: **Active** or **Resolved**.
Category	The error category which the error is classified under.
Key	Internal value used to identify the error. For data collection errors, specifies the **agent_id** value.
Key extension	Internal value used to identify the error. For check execution errors, specifies the check name.
Command	The command executed when the error occurred (if applicable).
Stack trace	A reference to the **ecc_queue** record that was processed and triggered the error (if applicable).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Not all columns are visible by default on the page.
- Select the info icon (ⓘ) next to an error to view a pop-up window with full information about the error.

ACC Error Message pop-up window



The info icon is visible when hovering under the search icon (🔍) next to the error entry.

2. **Optional:** To view errors for a specific agent:

   a. Select **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** table appears.

   b. Select an agent.

   c. Select the **Automation Error Messages** tab at the bottom of the page to view errors relating to the agent.

Result
If an error causes an agent's registration to fail, the agent's **Status** column displays **Registration Failure** on the Agent Client Collectors page (**All** > **Agent Client Collector** > **Agents**).

Agent Client Collector Framework reference

Reference topics provide additional information about mapping and fine-tuning application services using Agent Client Collector Framework lists and forms.

Agent Client Collector user roles

Administrators can assign user roles to grant access to the Agent Client Collector. The following standard roles for the Agent Client Collector Framework (ACC-F) are included in the ServiceNow system with the Agent Client Collector installed on it.

Agent Client Collector user roles

Role	Description
agent_client_collector_admin	All permissions on Agent Client Collector, including: • Access to REST API • Add, edit, and delete policies, checks, agents, web sockets • MID Server management
agent_client_collector_integration	Access to REST API
agent_client_collector_user	• View checks and policies • Access to some REST APIs
evt_mgmt_admin	Starts the ACC listener.

Agent Client Collector Framework default checks

Agent Client Collector Framework provides default checks with the base system.

Checks

The following table lists the default checks that come with the Agent Client Collector Framework base system.

Type	Name	Description	Command
Restart	restart	Restarts the agent. Check is active by default	Restart agent
Discovery	check-discovery-basic	Performs basic discovery of the agent's host to discover: • Host CI, including IP address, serial number, and hostname. • Running processes (cmdb_running_process) of the host • TCP ports (cmdb_tcp)	endpoint_discovery.rb

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Name	Description	Command
		The check is performed by default every 12 hours (43200 seconds), and times out after 600 seconds of inactivity. Plugins: osquery, acc-f-commons, acc-f-modules	

Note:
The *check-read-log* and *config-file-reader* checks are for internal use only.

Agent Client Collector performance and footprint for URL monitoring

The following tables display the agent performance KPIs and its footprint on the host during URL monitoring data collection execution on different operation systems.

URL monitoring checks on a Linux system

Linux Cent OS 8, 2 CPUs, 4GB RAM					
Checks per minute	100	250	500	1000	1500
Metrics (expected/ actual)	700/700	1750/1750	3500/3500	7000/7000	10500/10500
Network utilization - Tx (MID > Agent)	35 KB/s	78 KB/s	146 KB/s	286 KB/s	430 KB/s
Network utilization - Rx (MID < Agent)	15 KB/s	27 KB/s	51 KB/s	107 KB/s	116 KB/s
Network utilization - Tx (Agent > MID)	8 KB/s	23 KB/s	37 KB/s	89 KB/s	113 KB/s
Network utilization - Rx (Agent < MID)	28 KB/s	72 KB/s	142 KB/s	285 KB/s	426 KB/s
Memory consumption	22 MB	25 MB	26 MB	34 MB	39 MB
CPU of all checks	~3%	~7%	~11%	~21%	~24%
Process CPU utilization	1% - 1.5%	1.5% - 2.5%	5% - 6%	6% - 7%	12% - 13%
Host CPU utilization	~10%	~19%	~23%	~45%	~53%

Agent Client Collector certificate revocation reasons

The following table lists and describes the possible reasons for revoking an Agent Client Collector certificate to stop communication between the agent and ITOM cloud services.

Certificate revocation reasons

Reason	Description
Unspecified	Revoke a certificate without providing a specific revocation code. **Note:** This reason code doesn't provide an audit trail identifying why a certificate was revoked.
Key Compromise	You suspect that the private key associated with a certificate is compromised. For example, if a laptop belonging to a user in your organization is stolen, any private keys stored on the laptop may be compromised.
CA Compromise	You suspect that a Certificate Authority's (CA) private key has been compromised and is in the hands of an unauthorized individual. If a CA's private key is revoked, the CA hierarchy considers all certificates below that CA revoked as well.
Affiliation Changed	An individual is no longer working in the organization, or the computer account to which the certificate was issued is no longer in use. Can also be used if a person changes roles within an organization and no longer requires using the certificate associated with their previous role. For example, an employee could move from the purchasing department and no longer require a certificate to authorize purchase requests.
Superseded	Indicates that a new certificate must be issued in place of a previously issued certificate. For example, if you update a certificate template and reissue certificates, you could revoke the previous certificate with this reason code.
Cessation of Operation	A server or workstation is decommissioned, and all certificates issued to the server are no longer required. You can use this revocation reason when decommissioning a CA.
Certificate Hold	A temporary revocation indicating that a CA won't validate a certificate at that specific time.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certificate revocation reasons (continued)

Reason	Description
	Note: Using this reason code makes it difficult to determine whether a certificate was valid at a specific time.
Remove from CRL	Enables future unrevoking of the certificate, removing the certificate from the certificate revocation list (CRL).
Privilege Withdrawn	The certificate holder no longer has the privileges required to continue using the certificate.
AA Compromise	Indicates suspected or actual compromise of the authentication authority (AA) validated in the certificate.

Agent Client Collector check definition page

The fields to be configured on the Check Definition page, when creating a check definition.

Check Definition Form

Field	Description
Name	A descriptive name for the check.
Check Type	Select the type of check. The available monitoring options are: • Events • Metrics
Active	Select to activate the check.
Is Proxy Valid	Select to indicate that the check's policy is set to work as a proxy. When viewing this option in the check instance, it is read-only.
Command Auto Generation	Select to automatically generate the command with the **Command Prefix** value and the **Parameters** tab values.
Command Prefix	The command that is used for automatic generation when the **Command Auto Generation** check box is selected. The prefix consists of any portion of the command which is static (does not change), such as the script name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Definition Form (continued)

Field	Description
Command	• Enter the command that the Agent Client Collector executes. **Note:** When the **Command Auto Generation** check box is selected, this field is automatically populated with the prefix and flags of the active parameters specified in the **Parameters** tab. • The field contains parameters taken from one or more of the following: ○ Simple template: `{{.labels.params_field_name}}`: Takes values from entries in the **Parameters** tab. For example, a string of `{{.labels.params_warning}}` means that the value of the *warning* parameter is used (provided it has been configured on the **Parameters** tab). ○ Monitored CI: `{{.labels.params_ci_field_name}}`: Takes values automatically from the monitored CI, where `field_name` is replaced with the exact name of the required field in the CI table.
Configuration Data Files	Select the configuration data files to be downloaded when the check runs.
Description	Description of the check.
Exec Mode	The execution mode of the check. Available options are: • *shell*: To be used for checks which do not support *execv*. • *execv*: Provides enhanced security during check execution. The default execution modes are: • Existing check definitions: *shell* • New check definitions: *execv* • If no value is entered in the field: *shell* When upgrading to version 2.9.0, if this field is read-only, ensure that you disable the read-only status, as described in the (KB1122498) article in the Now Support Knowledge Base.
Interval	The amount of time, in seconds, to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Definition Form (continued)

Field	Description
	Specified value must be an integer.
Timeout	The amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops.
Event status change threshold	The number of consecutive times that a check's response status must happen before a new event is sent. For example, if this value is set to 5, a check whose response status changes from **OK** to **Error** generates a new event with an **Error** status only after the fifth consecutive occurrence of the status change. After an agent restart, an initial event is always sent. Default value: 5 (except for AWS event policies)
Event status repair threshold	The number of consecutive times that a check's response status must improve to close the previous event. For example, if this value is set to 3, a check whose response status changes from **Error** to **OK** closes the previous event and generates a new event with an **OK** status only after the third consecutive occurrence of the status change. Default value: 1 (except for AWS event policies)
Credential failure regex	The string from the check's output indicating that the check failed due to a credentials error. The agent then continues searching credentials that are part of the credential alias until it finds the correct one. This field is relevant (and mandatory) when the check's policy uses a credential alias. When creating a new check, enter the string manually.
Plugins	Select the plugins to be associated with the check. Once this is done, the plugins download before the check executes.

Check definition form parameters tab

The Parameters tab definitions for the **Command** field on the check definition form.

Parameters Tab

Field	Description
Name	A descriptive name for the parameter.
Default value / value	Default value / value of the parameter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters Tab (continued)

Field	Description
Active	Boolean. When set to **true**, the parameter is taken to the **Command** field when the **Command Auto Generation** check box is selected.
Mandatory	Boolean. When set to **true**, a parameter value must be specified for the command to run.
Flag	String. Prefix that is added before the parameter value in the **Command** field when the **Command Auto Generation** check box is selected.
Value required	Boolean. When set to **true** and when the **Command Auto Generation** check box is selected, the value of this parameter is added to the **Command** field after the **Flag** value.

Test check dialog box fields

The dialog box fields when testing a check definition.

Test Check dialog box fields

Field	Description
Check Definition	Displays the name of the selected check definition.
CI	Select the CI on which to run the check. The available options are those CIs which meet both of the following criteria: • Belong to the group specified in the **Check group** field. • Belong to an agent with **Up** status. If the **Check group** field is empty, the value defaults to **cmdb_ci_computer**.
Credentials	Select the credentials of the user whom you want the agent to connect with. This field appears only if you have configured secure check parameters on the **Check Secure Parameter Definitions** tab in the Check Definition.
Proxy Agent	Select a proxy agent to be associated with the check. This field appears only when working with a check instance and when one of the options has been selected on the **Proxy Settings** tab in the instance's policy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector data collection properties

Description of the properties that determine the behavior of Agent Client Collector data collection.

Data collection properties

Property	Description
sn_agent.host-data_collection_refresh_duration	The amount of time (in seconds) between agent data collections on the host. Applicable only when no host CI is assigned to the agent. Default: 43200 (12 hours)
sn_agent.disco_minimum_threshold_for_endpoint_discovery	The minimum number of minutes since the last endpoint Discovery on a given IP before Discovery can be triggered again. This property prevents running endpoint Discovery too often, such as in cases where a network intermittently has a break or a laptop is repeatedly rebooted. Default: 60
sn_agent.disco_disable_ci_clobber	When set to **true**, indicates that data collected by the ServiceWatch or ServiceNow Discovery sources takes precedence over Agent Client Collector when the threshold in the *sn_agent.disco_ci_clobber_of_agentless_disc* property hasn't been exceeded. Default: true
sn_agent.disco_ci_clobber_of_agentless_threshold_days	Maximum number of days since an existing CI has been discovered using agentless Discovery where the existing CI is linked instead of being rediscovered by the agent. Takes effect when *endpoint_disco_disable_ci_clobber_of_agentl* = **true** and over 14 days (by default) have passed since a non-ACC Discovery source (such as ServiceWatch or ServiceNow) has discovered the CI. After this threshold has been exceeded, agent Discovery can execute and overwrite an existing CI regardless of whether the CI has been previously discovered by a non-ACC Discovery source. This process presents the most recently discovered data in the CMDB. Default: 14
sn_agent.ci_prefers_ip_version	Indicates whether IPv4 or IPv6 is the preferred version when saving an IP Address value in the IP Address field of the CI record.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection properties (continued)

Property	Description
	Default: 4
sn_agent.ci_serial_number.pref_order	Specify the order of the fields to locate a serial number value to be saved to the host CI's *serial_number* field during agent data collection. Values must be comma-separated, without spaces, and in lowercase. Default: bios,system,uuid,baseboard,chassis
sn_agent.mac_ci_name_pref_order	Specify the order of the values by which the CI record's *Name* field is populated during macOS data collection. Values must be comma-separated, without spaces, and in lowercase. Default: name,hostname,computer_name,local_hostname
sn_agent.host_data_collection.disable_for_container	When set to *true*, indicates that data collection is disabled for containerized agents. Default: true

Agent Client Collector policy collection properties

Description of the properties that determine the behavior of Agent Client Collector policy collection.

Policy collection properties

Property	Description
sn_agent.full_policy_calculation_cycle_days	The number of days for a policy to reach a full calculation cycle. If the policy's last full calculation cycle was more than 7 days ago, the policy is queried to fully calculate its calculation cycle. Default: 7
sn_agent.max_number_of_monitored_cis_per_policy	The maximum number of monitored CIs that can be processed per policy. Default: 400000
sn_agent.max_num_of_monitored_cis_unassociation	The maximum number of monitored CIs unassociated with agents that can be processed per policy. Default: 1000

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy collection properties (continued)

Property	Description
sn_agent.policy_force_recalc_interval_min	The interval limit, in minutes, used to determine whether forced recalculation is required for any policies. Forced recalculation redistributes both a policy's monitored CIs and the corresponding agent. Default: 10
sn_agent.policy_force_recalc_required	When set to *true*, checks whether forced recalculation is required for policies. Forced recalculation redistributes a policy's monitored CIs and the corresponding agent. Default: true
sn_agent.populate_proxy_agent_monitored_cis	When set to *true*, populates the monitored CIs for given policies to show the distribution of CIs among proxy agents. Default: false

Agent Client Collector Framework configuration properties

Description of the properties that determine the behavior of Agent Client Collector Framework configuration.

Framework configuration properties

Property	Description
sn_agent.agent_static_import_chars_per_record	The character limit for a given payload item. Relates only to the configuration item being processed and not the total attachment size. Default: 1000000
sn_agent.agent_upgrade_wait_time	Maximum number of minutes for an agent to successfully upgrade before entering *Warning* status. Default: 30
sn_agent.agent_version	The current ACC-F release version installed on the instance. Type: String
sn_agent.appl_classification_behavior	The characteristics and behaviors for applications during Agent Discovery. When set to *simple*, creates a shell CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
	Default: simple
sn_agent.auto_upgrade.enabled	When set to true, the instance automatically upgrades existing Agent Client Collector installations to the version set in the sn_agent.agent_version property, if the agent version is lower than the property's version. Type: Boolean Default: false
sn_agent.auto_upgrade.max_upgrades_per_mid_per_hour	The maximum number of Agent Client Collector upgrades possible per MID Server every hour. Type: Integer Default: 50 **Note:** Modifying this value may negatively affect system performance.
sn_agent.auto_upgrade.max_upgrades_per_hour	The maximum number of Agent Client Collector upgrades possible for all agents on all MID Servers. Type: Integer Default: 1000 **Note:** Modifying this value may negatively affect system performance.
sn_agent.config_publish.max_payload_size	The size, in bytes, that the config_publish_payload can reach on the MonitoringProbe ECC queue topic before an error is logged and the payload is skipped. Default: 15000000
sn_agent.ecc_queue.max_payload_size	The maximum allowable payload size for an ECC queue record to be processed by the agent. Default: 5000000
sn_agent.enable_auto_mid_selection	When set to **true**, the instance sends a list of MID Servers to the agents. To enable automatic selection of a MID Server from the list, set the *auto-mid-selection* property to true in the agents' acc.yml file.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
	Automatic selection of MID Servers ensures that each agent uses the most efficient available MID Server. Default: false **Note:** This property determines only whether a list of MID Servers is sent to the agent. • If this property was previously set to **true** and is then set to **false**, automatic MID selection is performed on the previously sent MID Server list if the *auto-mid-selection* property is set to **true** in the acc.yml file. • If this property is set to **true** and the *auto-mid-selection* property in the acc.yml file is set to **false**, no automatic MID Server selection is performed.
sn_agent.installer_max_endpoints	Maximum number of MID Web Server endpoint URLs to be selected during agent single line installation. Default: 3
sn_agent.keep_alive.alive_duration	The amount of time, in seconds, within which the agent's last_refreshed timestamp must be updated. After this time period, the agent status moves from *Up* to *Warning*. If the indicated time period passes again, the status moves from *Warning* to *Down*. Default: 120
sn_agent.keep_alive.disconnected_duration	The amount of time, in seconds, within which the last_keepalive timestamp must be updated. After this time period, the agent status changes from *Up* to *Disconnected*. Default: 600
sn_agent.logging.verbosity	The minimum level of messages that are logged for Agent Client Collector Framework. Messages with the indicated status and anything more severe are logged. Options: • error • warn

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
	• info • debug Default: info
sn_agent.max_sys_ids_in_query	The maximum number of sys IDs to return during GlideRecord queries. Default: 400000
sn_agent.maximum_mids_to_select	The maximum number of MID Servers that can be selected for agent setup. Default: 20
sn_agent.min_upgrade_history_per_agent	The minimum number of upgrades saved per agent. Default: 2
sn_agent.registration_key_validity_days	The number of days after creation of a registration key that the key is valid before it is deleted. Default: 90
sn_agent.registration_key_notification_days	The number of days before registration key deletion that an email notification is sent to the key's ownership group, informing of pending deletion. Default: 14
sn_agent.sync_filters_interval_min	The number of minutes after which CMDB changes are detected and then synched to the MID Server. Default: 10
sn_agent.time_ago_in_seconds_to_query_process_queue	When processing the sn_queues, only query those created within the indicated time (in seconds). Default: 43200 (12 hours)

Agent Client Collector data collection tables

Agent Client Collector performs data collection based on the scoped apps that you've installed. Agent Client Collector Framework performs basic data collection, and Agent Client Collector for Visibility - Content performs enhanced data collection.

The Refresh Host Data for Agents scheduled job collects host data every hour on hosts that haven't had data collection run in the past 12 hours. The job collects the data described in the following tables.

Data	CMDB field
Running Processes	cmdb_running_process

Account commands for LocalService, LocalSystem, and gMSA during Windows installation

When installing an agent on a Windows host using a LocalService, LocalSystem, or gMSA account, you must run msi commands to enable the accounts.

Account type commands

Account type	Command
LocalSystem	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="SYSTEM"`
LocalService	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="LOCALSERVICE"`
gMSA	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="DOMAIN\gMSA$"`

Verify API is associated with a live agent

Call the *`AgentNowHandler.hasAgent`* API to determine if the CI is associated with a live agent. The API gets a sys_id of the CI and returns a true/false result.

The *`hasAgent()`* method takes a sys_id of the CI as a string parameter and returns **true** when the CI fulfills one of the following conditions:

- The CI is `sn_agent_cmdb_ci_agent` and this agent is alive.
- The CI is a host (extends `cmdb_ci_hardware`) and is associated with a live agent.
- The CI is an application (extends `cmdb_ci_appl`) and has a runs-on relation to a host associated with a live agent.

For example:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var agentNow = new sn_agent.AgentNowHandler();
gs.info('Agent assocation with CI? ' +
agentNow.hasAgent('158279505372b30034b8ddeeff7b1270'); // sys_id
 of agent
```

Configuration file options

Options available in the `acc.yml` configuration file.

Basic configuration options for acc.yml configuration file

Option	Type	Default	Description	Example
name	String	Agent_<value of the *hostname* command>	Agent name registered on the SN instance can be specified by the user. The result of the 'hostname' command is used as the default.	`name: <name of agent>`
backend-url	List	`wss://127.0.0.1:8800/ws/events`	List of MID Webserver endpoint URLs to communicate with. If communication cannot be configured with the first URL, the system moves to the ensuing URLs until it establishes a connection. Works when `enable-auto-mid-selection=true`	`backend-url: <mid server ip>:<websocket port>`
api-key	String	<None>	API key used by the MID Server to authenticate incoming agent connections. Value is encrypted on initial agent startup.	`api-key: <mid web server api key>`
user	String	admin	Username used for basic authentication. If this parameter is empty, the	`user: "agent-01"`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			agent does not start.	
password	String	admin	Password used for basic authentication. Value is encrypted on initial agent startup. If this parameter is empty, the agent does not start.	`password: <secure-password>`
log-level	String	Info	Amount of logging to appear in the acc.log file. Values: • Panic • Fatal • Error • Warn • Info • Debug	`log-level: debug`
allow-list	String	/etc/servicenow/agent-client-collector/check-allow-list.json	Path to the JSON file that contains the list of check commands the agent can execute. Comment out this parameter to disable the allow-list. If this parameter is empty, the allow-list is disabled.	`allow-list: /etc/agent/check-allow-list.json`
appl_classification_behavior	list	simple	Indicates whether to enable shell CI creation on the agent.	`appl_classification_beha off`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			Possible values are: • simple: Indicates that shell CI creation is enabled. • off: Indicates that no shell CIs are created for the application. • full: Indicates that complete Discovery of the application CIs is performed using patterns.	

Advanced configuration options for acc.yml configuration file

Option	Type	Default	Description	Example
verify-plugin-signature	Boolean	True	Verifies the plugin signature prior to execution. Disable when using self-signed or developmental plugins.	`verify-plugin-signature: true`
insecure-skip-tls-verify	Boolean	True	Determines whether the verify the certificate when connecting to the MID Server.	`insecure-skip-tls-verify: true`
enable-auto-mid-selection	Boolean	True	Controls the Auto MID Selection feature to connect to the optimal MID Web Server provided by the instance.	`enable-auto-mid-selection: true`
check-command-prefer-installed	Boolean	False	Indicates the preference of executables provided within	`check-command-prefer-`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			ACC plugins or executables available in the host system's PATH variable. • false = ACC plugins • true = Executables in the host system's PATH variable	`installed: false`
powershell_installed	Boolean	False	Disables powershell command execution on agents.	`powershell-installed: true`
allow-list-global-only	Boolean	False	Set to **true** to enhance security by relying only on the allow list defined in the *`allow-list`* parameter you specify during configuration, ignoring allow lists bundled with ACC plugins.	`allow-list-global-only: false`
disable-assets	Boolean	false	Indicates whether a check running with an asset (plugin) dependency fetches ACC plugins from the ServiceNow® instance, or uses a copy of the plugins in its cache folder. When set to **false**, additional assets can be downloaded during check execution.	`disable-assets: false`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			Set to **true** to enhance security and ensure that no new plugins are downloaded during check execution.	
agent-upgrade-url-path	String	`https://install.servicenow.com/glide/distribution/builds/package/app-signed/`	Indicates an alternate web server URL endpoint for downloading ACC installer packages when performing selective upgrade.	`agent-upgrade-url-path: https://<ip address>:<port>/acc_installers`
certificate-rotation-days-out	Integer	28	Indicates the number of days before certificate expiration that an agent attempts to rotate its certificate.	`certificate-rotation-days-out=28`
enable-patterns-on-agent	Boolean	false	Enables gathering details on the applications which run on the Agent Client Collector. This parameter is required only when using the Agent Client Collector for pattern execution.	`enable-patterns-on-agent: true`
keepalive-filter-nics	Boolean	true	Indicates whether Network Interface Controllers (NICs) are filtered on the agent (**true**) or the MID Server (**false**) during keepalive action.	`keepalive-filter-nics: true`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
keepalive-number_nics_per_ip_type	Integer	1	Indicates the maximum number of Network Interface Controllers (NICs) per IP type (IP4, IP6) sent with a keepalive action. The indicated number is sent for each IP type. For example, if the value is 1, a maximum of 2 NICs are sent (0-1 each for IP4 and IP6). If the value is 4, a maximum of 8 NICs are sent (0-4 each for IP4 and IP6).	`keepalive-number_nics_per_ip_type 4`

Proxy Auto-Configuration (PAC) file parameters

Option	Type	Default	Description	Example
pac-file	String (Required)	"" (empty)	Specifies the location of the PAC file to use for proxy configuration. Can be either: • A local file path (such as: `file:///etc/proxy/proxy.pac`) • A remote URL (such as: `https://proxy.company.com/proxy.pac`)	`pac-file: "https://proxy.company.com/proxy.pac"`
pac-cache-ttl	Duration (Optional)	30m (30 minutes)	Determines how long proxy rules from the PAC file are cached in memory.	`pac-cache-ttl: "1h" # Cache for 1 hour`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proxy Auto-Configuration (PAC) file parameters (continued)

Option	Type	Default	Description	Example
			Setting this to 0 disables caching.	
pac-refresh-interval	Duration (Optional)	30m (30 minutes)	Specifies how often the agent is to check for updates to the PAC file. Useful when the PAC file is hosted remotely and may be updated periodically.	`pac-refresh-interval: "15m" # Check for updates every 15 minutes`
pac-dial-timeout	Duration (Optional)	30s (30 seconds)	Indicates the amount of time to wait when establishing a connection through a proxy server before timing out.	`pac-dial-timeout: "10s" # 10 second timeout`
pac-reset-on-connect-failure	Boolean (Optional)	true	When set to true, the agent clears the PAC cache and attempts to refresh the PAC file if a proxy connection proxy fails. This helps recover from proxy configuration changes or temporary proxy issues.	`pac-reset-on-connect-failure: true`

Synchronization properties for validating Agent Client Collector plugins

Use the following properties when synchronizing public certificates from the MID Server to the Agent Client Collector.

Certificate synchronization - MID properties

Property	Description
mid.acc.cert_monitor_disable	Ability to disable the monitor from synchronizing the public certificates. Default value: False

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certificate synchronization - MID properties (continued)

Property	Description
mid.acc.cert_monitor_interval	Interval (in seconds) at which the monitor synchronizes public certificates from a configured endpoint URL. Default value: 86400
mid.acc.cert_monitor_target_url	Endpoint URL prefix (minus the filename) from which the monitor synchronizes public certificates. Default value: ServiceNow Install server
mid.acc.cert_monitor_target_filename	Endpoint URL target filename from which the monitor synchronizes public certificates. Default value: SNCertificates.zip

Certificate synchronization - Agent properties

Property	Description
fetch-certificates-from-mid	Status of whether the public certificates are retrieved from the MID Server for plugin asset validation. Default value: True

Agent Client Collector statuses

The following table lists and describes the Agent Client Collector statuses.

Agent Client Collector statuses

Status	Description
Up	Agent is connected and working properly.
Warning	Agent has not been refreshed in over 2 minutes (based on the value of the sn_agent.keep_alive.alive_duration property).
Down	Agent is shut down.
Restarting	Agent restart is in progress.
Upgrading	Agent upgrade is in progress.
Disconnected	Agent's MID Server is down.
Unknown	Agent’s MID Server has not sent a keepalive communication for over 10 minutes (based on the value of the sn_agent.keep_alive.disconnected_duration system property).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector log levels

The following table displays the available log levels which indicate the severity of Agent Client Collector events.

Log level	Description
Panic	Severe errors that cause the service to shut down unexpectedly.
Fatal	Fatal errors that cause the service to shut down (status 0).
Error	Non-fatal service error messages.
Warn	Warning messages indicating potential issues.
Info	Information messages representing service actions.
Debug	Detailed service operation messages which help troubleshoot issues.

Agent Client Collector log rotation parameters

If Agent Client Collector logs get too large, they can drain system resources. To ensure system efficiency, configure parameters in the `acc.yml` file by which to rotate logs out of the system's storage (Windows default location = `C:\ProgramData\ServiceNow\agent-client-collector\config\acc.yml`. Linux default location = `/etc/servicenow/agent-client-collector/acc.yml`).

Log rotation parameters

Parameter	Definition
log-file-and-stdout	Write logs to the `stdout` file. Default: **false**
log-retention-duration	Maximum age, in days, of the log file before it is rotated out of the system's storage. Default: **3**
log-retention-files	Maximum number of log files that can be stored before being rotated out of the system. Default: **3**
log-max-size	Maximum size, in MB, of the log file before it is rotated out of the system's storage. Default: **10**
log-level	The log level to be measured by the logs. Available options are: **Panic, Fatal, Error, Warn, Info, Debug**. Default: **Info**

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log rotation parameters (continued)

Parameter	Definition
	The specified log level represents the lowest level of events displayed in the log. For example, a user who specifies **Error** sees all Error events, as well as Fatal and Panic events.

Agent Client Collector CPU protection thresholds

When an agent meets the configured thresholds specified in the agent's `acc.yml` file, it enters CPU protection mode, either for an individual check or for all checks. Agents in CPU protection mode appear in the agent logs with the syntax `Agent Protection`.

Parameter	Description
agent_cpu_threshold_disabled	To prevent the agent from shutting itself off when CPU memory reaches a certain threshold, set value to **True**. Default=False
cpu_percentage_limit	The percentage of the agent's CPU usage that sends the agent into CPU protection mode. Default=5%
cpu_protection_behavior	Assign **individual** for the system to disable only the individual check that passed the *cpu_percentage_limit* value. If multiple checks crossed the threshold, the check with the highest CPU is disabled. Assign **all** to disable all checks and pause data collection. Possible values: all, individual Default: all
repeated_high_cpu_num	The number of consecutive times CPU consumption exceeds the *cpu_percentage_limit* for the agent to enter CPU protection mode. Default=3
monitor_interval_sec	Indicates the frequency, in seconds, that the agent monitor runs to check if the *cpu_percentage_limit* is exceeded. Default=60
proxy_cpu_percentage_limit	The percentage of the agent's CPU usage when the agent is running proxy checks too frequently, that sends the agent into CPU protection mode.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Default=80

Agent Client Collector Monitoring

Agent Client Collector Monitoring enables you to monitor your service availability, examine the health and performance of your environment, and ensure that your infrastructure and its applications are running properly.

Get started

Note:

If checks are not running on the agent's devices, your agent may be in CPU protection mode. CPU protection mode is activated automatically when a device's CPU consumption is too high for one of two reasons: either the user is running too many checks, or the machine is under-resourced. When it happens, the agent's Data Collection status turns to Off. ACC-F generates an event and records it in a log. To manually resume data collection by the ACC agent, see Pause Agent Client Collector data collection.

The user needs to monitor the activity of the ACC to resolve the issue through manual intervention and then re-enable ACC collection. To setup the ACC monitoring, see Enable Agent Client Collector monitoring on the MID Server.

Explore

Exploring Agent Client Collector Monitoring

Agent Client Collector Monitoring is built on a Sensu framework which enables you to adopt and extend monitoring checks from the community. Agent Client Collector Monitoring collects data on your company's infrastructure and installed applications.

Agent Client Collector Monitoring overview

Checks and policies run on the agent's client to retrieve the relevant data, which is transformed into events or metrics, as appropriate. Events and metrics are sent from the agent to your ServiceNow instance through a Metric Intelligence MID Server and are stored in the relevant database. A single MID Server can support multiple agents (such as ACC-M and ACC-L). For details on configuring the MID Server for Metric Intelligence, see MID Server and MID Server distributed cluster for Metric Intelligence.

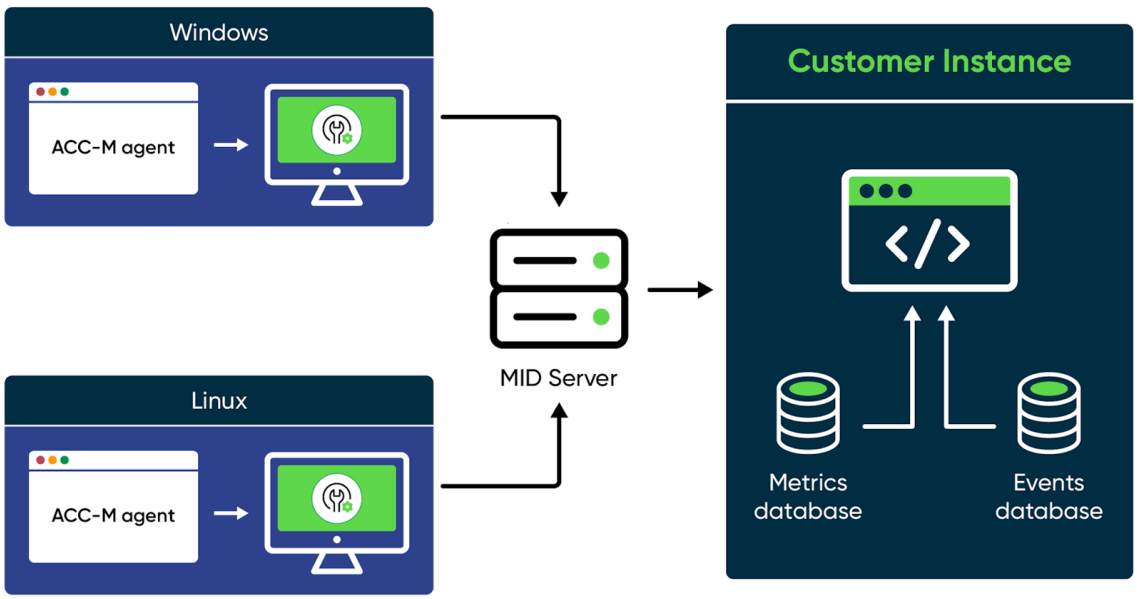
Agent Client Collector Monitoring comes with the Event Management plugin and also requires installing the request Metricbase (Clotho DB), as described in How to request Metricbase (Clotho DB) configuration (KB0816088).

For details on the plugins installed with Agent Client Collector Monitoring, see Plugins or applications installed with ITOM AIOps.

Agent Client Collector Monitoring workflow

The following illustration describes the layout and data flow within the Agent Client Collector Monitoring application.

Monitoring service health and availability with ACC-M



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Monitoring benefits

Benefit	Feature	Users
Monitor logs which track events occurring in a Windows environment	Windows event log monitoring	Agent Client Collector administrator
Monitor operating systems and applications	Operating system and application monitoring using Agent Client Collector	Agent Client Collector administrator
Gather metrics on host data	Metric Intelligence	Agent Client Collector administrator

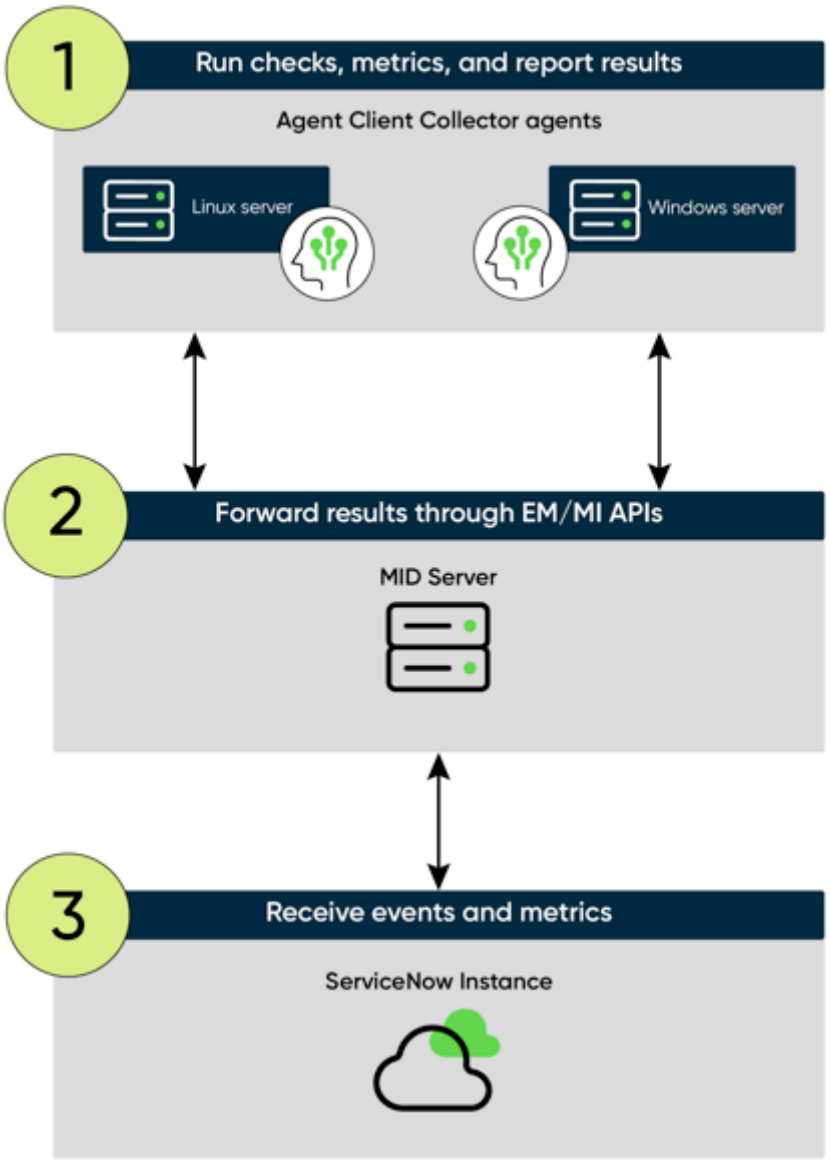
Agent-based data flow

The Agent Client Collector gathers information on the health of the CI that the Agent is installed on, and the applications that run on the hosts. The Agent runs several checks and pushes the checks' results to the MID Server, where they are converted into events or metrics.

Events are stored in the instance's Events database, while metrics are stored in the Metrics database.

The following image displays the data flow from the Agent Client Collector to the instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The numbered entries in the flow indicate the following:

1. Specified checks run on the agent. Data, including metrics, is pushed to the MID Server.
2. The MID Server analyzes the data and classifies the results as events or metrics. MID Server uses REST API to send the results to the instance.
3. The instance receives the data and stores it in the relevant database.

Agent Client Collector Monitoring use case

The Agent Client Collector Monitoring use case demonstrates how organizations can achieve unified monitoring across hybrid IT environments.

Use case overview

Many enterprises today operate in a hybrid IT environment, where some resources are hosted on-premises, while others reside in the cloud. This complexity often leads to fragmented monitoring, making it difficult to obtain a unified view of IT service health. Agent Client Collector Monitoring (ACC-M) bridges this gap by providing a comprehensive and converged picture

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

of the organization's services, regardless of where they're hosted. ACC-M is a lightweight monitoring solution that integrates seamlessly into its existing ServiceNow platform.

Challenge

An IT operations team struggled to cohesively monitor service health, due to the disparate nature of its infrastructure. On-premises resources, such as databases and ERP systems, were monitored using traditional methods, while cloud services had separate monitoring tools. This fragmentation resulted in:

- A lack of real-time visibility into overall service health.
- Delayed issue identification and troubleshooting.
- Multiple monitoring dashboards, increasing complexity for the IT team.
- Difficulty in correlating on-premises and cloud alerts, leading to inefficiencies.

Solution

ACC-M enables real-time, unified visibility across a hybrid IT environment. It improves operational efficiency, reduces downtime, and creates a more resilient IT infrastructure capable of supporting both on-premises and cloud-based services.

ACC-M streamlines the monitoring of on-premises and cloud resources into a single, unified display by offering the following solutions:

Solutions implemented by ACC-M

Solution	Description	Outcome
Unified monitoring across environments	ACC-M collects health metrics, performance data, and alert statuses from both on-premises and cloud infrastructure components. ACC-M uses lightweight agents installed on servers, VMs, and cloud resources to gather relevant data, providing: • CPU and memory utilization for on-premises servers. • Network performance metrics. • Availability and performance metrics for cloud services, such as databases and storage.	Improved response: With a unified view of all resources, the IT operations team can quickly identify where issues are occurring and prioritize them based on overall service impact, reducing their mean-time-to-resolution (MTTR).
Converged health view	ACC-M provides the company's IT team with a converged health dashboard within the ServiceNow platform, providing:	Proactive monitoring and maintenance: ACC-M's real-time health metrics enable proactive monitoring of services, avoiding outages by

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solutions implemented by ACC-M (continued)

Solution	Description	Outcome
	• A unified view of both on-premises and cloud resources. • Real-time updates on service health, ensuring that hybrid services are monitored together and not in isolation. • Integrated insights into service dependencies, correlating incidents that impact both on-premises and cloud systems.	identifying and resolving issues before they escalate.
Hybrid Alerting and Automation	ACC-M enables setting up automated alerts for both on-premises and cloud environments, streamlining their incident response processes. When a service in the hybrid environment experiences an issue, ACC-M does the following: • Automatically generates alerts with enriched context, identifying whether the issue originated from the on-premises infrastructure or cloud services. • Triggers automated workflows for remediation based on the alert type, reducing manual intervention.	Operational efficiency: The convergence of on-premises and cloud monitoring into a single platform eliminates the need for multiple monitoring tools. This reduces complexity and frees IT resources to focus on more strategic tasks.
Service Health Visualization	Using the ServiceNow Service Map enables visualizing how services are performing across the entire hybrid infrastructure. ACC-M feeds this with continuous, real-time data, helping the IT team do the following:	Enhanced Business Continuity: With a full view of the hybrid infrastructure health, IT can ensure that critical business services are up and running, improving overall business continuity.

Solutions implemented by ACC-M (continued)

Solution	Description	Outcome
	• Track dependencies between on-premises and cloud services. • Identify potential points of failure before they impact the business. • See at a glance which services are healthy, degraded, or at risk, wherever they're hosted.	

Windows event log monitoring

Windows event log monitoring tracks, analyzes, and manages event logs generated by various Windows OS components.

The Windows OS Events policy includes the os.windows.check-event-log check, which measures the Windows event log against thresholds specified in the check's parameters. For details on the configurable check parameters, see Windows event log filter parameters.

Operating system and application monitoring using Agent Client Collector

IT Operations Management (ITOM) monitoring for the Agent Client Collector is installed on the ServiceNow® instance. It monitors the specific operating system and applications that are installed on the host machine.

The Agent Client Collector monitors the following applications.

ACC Applications

Operating System/Application	Configuration description
Windows	No special configuration required.
Linux	No special configuration required.
Apache HTTP Server	See Configure Agent Client Collector Apache HTTP server monitoring.
Apache Tomcat	See Configure Agent Client Collector Apache Tomcat monitoring.
IBM WebSphere	No special configuration required. Accessed through JMX. Default management port is **9100**.
IIS	No special configuration required.
JBoss/WildFly	No special configuration required. Default port is **9990**. For troubleshooting information, see Monitoring performance in the Red Hat customer portal.
Microsoft SQL Server	No special configuration required. Ensure that the instance name is populated in the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Applications (continued)

Operating System/Application	Configuration description
	CI record, either by running Discovery or by manually populating the record.
My SQL	No special configuration required. Default port is **3306**.
Oracle Database	No special configuration required. Ensure that the SID and Oracle Home path are populated in the CI record, either by running Discovery or by manually populating the record. Default port is **1521**.
Oracle WebLogic	No special configuration required. Accessed via a JMX port. Default port is **7001**. Ensure that the WebLogic home (wls_home) parameter is populated in the CI record, either by running Discovery or by manually populating the record. Ensure that the user running the agent has sufficient permissions to access the JAR files in the **Weblogic** installation directories.

When using the **Microsoft SQL Server**, **Oracle Database**, and **Oracle WebLogic** applications, you must run Discovery to configure CI fields on the instance. Ensure that the Discovery plugin (com.snc.discovery) is installed to enable running Discovery.

When the application is running on a port other than the default, ensure that you update the port number in the check instance's parameters.

Configure Agent Client Collector Apache HTTP server monitoring

To configure the Agent Client Collector to perform Apache HTTP server monitoring, set the following configurations in the Apache HTTP server application.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. On the Apache HTTP Server host, navigate to one of the following locations:
   - In a Linux environment:
     - `/etc/httpd`
     - `/etc/httpd/conf`
     - `/etc/apache2`
     - `/etc/apache2/conf`
   - In a Windows environment: The `conf` directory in the Apache installation location.
2. Locate either the `httpd.conf` or `apache2.conf` file.
3. Ensure that the following line is uncommented:
   `LoadModule status_module modules/mod_status.so`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure the check instance port to be identical to the port on which Apache is listening (default for both is **80**).
5. To ensure a secure connection, configure SSL, as follows:

   a. Ensure that the following line is uncommented:
   `LoadModule ssl_module modules/mod_ssl.so`

   b. Activate the *ssl_secure_connection* parameter in the check instance.

   c. Configure the check instance port to be identical to the port on which Apache is listening to secure connections (default is **443**).

Configure Agent Client Collector Apache Tomcat monitoring

To configure the Agent Client Collector to perform Apache Tomcat monitoring, set the following configurations in the Apache Tomcat application.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Open a management JMX port when starting the server:

   a. In a Linux environment:

      i. In `bin` directory in the Tomcat home directory, create a `setenv.sh` file.

      ii. Ensure that the file contains the following:

```
export CATALINA_OPTS=$CATALINA_OPTS"
-Dcom.sun.management.jmxremote=true
-Dcom.sun.management.jmxremote.port={PORT NUMBER}
-Dcom.sun.management.jmxremote.rmi.port={PORT NUMBER}
-Dcom.sun.management.jmxremote.ssl=false
-Dcom.sun.management.jmxremote.authenticate=false
-Djava.rmi.server.hostname=127.0.0.1"
```

      iii. Run `chmod 755 setenv.sh` to give the `setenv.sh` file executable permissions.

   b. In a Windows environment:

      i. In `bin` directory in the Tomcat home directory, create a `setenv.bat` file.

      ii. Ensure that the file contains the following:

```
@echo=off
if defined CATALINA_OPTS (
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote=true
) else (
set CATALINA_OPTS=-
Dcom.sun.management.jmxremote=true
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
)
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.port={PORT NUMBER}
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.rmi.port={PORT NUMBER}
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.authenticate=false
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.ssl=false
set CATALINA_OPTS=%CATALINA_OPTS% -
Djava.rmi.server.hostname=127.0.0.1
```

{PORT NUMBER} represents the number of the port you open for JMX RMI monitoring. The default value created by the check definition is **9000**.

2. Restart Tomcat.
   a. In a Linux environment: Run the `shutdown.sh` script, followed by the `startup.sh` script.
   b. In a Windows environment: Run the `shutdown.bat` script, followed by the `startup.bat` script.

Monitor HTTP points

Use the **Monitoring HTTP Entry Points** and **Monitoring HTTP Entry Points Metrics** policies that come with the ITOM Monitoring scoped app to monitor `http` and `https` entry points and entry points metrics. You can customize these policies as needed, or you can configure a new policy to monitor service entry points.

Before you begin

Role required: agent_client_collector_admin

About this task

An entry point is the access point for a service. In an Agent Client Collector policy, you specify the service you want to monitor, and the policy monitors the service's entry points.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select either the **Monitoring HTTP Entry Points** or **Monitoring HTTP Entry Points Metrics** policy.
   The relevant **Policy - Monitoring HTTP Entry Points** page opens.
3. On the **Monitored CIs** tab:
   a. In the **Table** field, ensure that the **sn_itmon_http_entrypoint** database view table is selected for the Agent Client Collector to retrieve http and https entry points for monitoring.
   b. In the **Filter** section, configure a filter for the services and entry points to be taken from the **sn_itmon_http_entrypoint** database view table.
4. Click the **Proxy Settings** tab and select the type of proxy you want to enable for the entry point monitoring.
   - **Single proxy agent**: Select to enable monitoring a single agent, which you select in the **Proxy agent** field that appears after selecting this option.
   - **Multi-proxy agents by filter**: Select to enable monitoring multiple agents. Configure a filter in the **Proxy filter** section that appears after selecting this option to monitor only the agents that match the filter's conditions.
   - **Script based proxy**: Select to enable monitoring an agent based on a script.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must configure a proxy to run an HTTP policy.

5. Click the **Checks** tab and in the **Filter checks by groups** field, select **HTTP** to display all of the http checks in the **Available** cell.
6. Select the relevant checks and click the right arrow button to move them to the **Selected** cell.
7. Select the **Active** check box at the top of the page to activate the policy.
8. Click **Update**.
   The policy monitors the entry points specified by the policy's configurations.

Configuring Agent Client Collector Monitoring

Plan and configure your Agent Client Collector Monitoring implementation.

To configure Agent Client Collector Monitoring, follow these steps:

1. Configure a MID Server to work with Agent Client Collector Monitoring.
2. Choose and configure metrics to monitor.
3. Configure the action level for anomaly detection.
4. Create a configuration settings rule.
5. Enable metrics collection and evaluation.

Depending on the checks and metrics you want to monitor, perform the following actions to enable full check activation and metrics collection:

1. Enable viewing HAProxy metrics.
2. Enable running of Varnish checks.
3. Select the Azure policies to activate for metric collection.
4. Create Azure policies for metric collection.

Configure a MID Server to work with Agent Client Collector Monitoring

Connect agents to a MID Server to enable Agent Client Collector Monitoring functionality.

Before you begin

Role required: agent_client_collector_admin

About this task

For details on configuring Agent Client Collector for log monitoring, see Agent Client Collector Log Analytics.

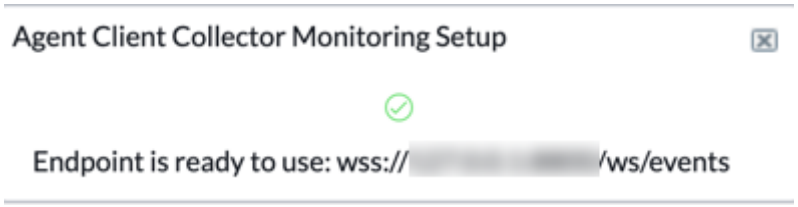
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select the MID Server that you want to connect to the agent.
3. In the **Related Links** section, select **Setup ACC Monitoring**.

Result

A confirmation window appears, indicating that the MID Server is connected to the agent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Related topics

Configure multiple MID Servers to work with Agent Client Collector Monitoring

Configure multiple MID Servers to work with Agent Client Collector Monitoring

Connect agents to multiple MID Servers to enable Agent Client Collector Monitoring functionality. Multiple MID Servers can support each other with load balancing and domain separation.

Before you begin

Role required: agent_client_collector_admin

About this task

When configuring multiple MID Servers, use the same port for all MID Servers. Using different ports requires you to add each MID Server individually, as described in Configure a MID Server to work with Agent Client Collector Monitoring.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. Select the check boxes corresponding to the MID Servers you want to connect to your agent.
3. In the **Actions on selected rows...** window, select **Setup ACC Monitoring**.
   The option includes the number of MID Servers selected out of the number of available MID Servers. For example: **Setup ACC Monitoring (7 of 8)** indicates that 7 MID Servers were selected out of 8 available MID Servers.

Result

A confirmation window appears, indicating that the selected MID Servers are connected to the agent.

Choose and configure metrics to monitor

Metric Intelligence uses data sources that can be monitoring hundreds of metrics for all CIs. Choose for each data source type which details are important for which CIs, and then activate or deactivate the respective monitor type to control the amount of data that is being processed.

Before you begin

See Get started with Metric Intelligence for the high level steps of setting up Metric Intelligence.

Role required: evt_mgmt_admin

About this task

The SCOM data source, available by default, collects about 400 metric types from discovered devices such as '% Available Memory' and '% of Free Space'. Processing data from all metric types can overload the system and impact performance. It might be necessary to deactivate selected metric types for selected CIs to reduce that load.

The overall number of metrics that can be processed, depends on the number of MID Servers and their hardware configuration. For details about hardware requirements and metrics scalability, see MID Server and MID Server distributed cluster for Metric Intelligence.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The *Active* setting (true or false) for a metric in the Monitoring System Metric Types [sa_source_metric_type] table takes precedence over the setting for the corresponding metric in the Metric To CI Mappings [sa_metric_map] table. If a metric type in the Monitoring System Metric Types [sa_source_metric_type] table is disabled, all records related to the corresponding metrics are removed from the Metric To CI Mappings [sa_metric_map] table.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Metric Types**.
   The **Monitoring System Metric Types** displays the metric types that are being collected per data source, per CI type.
2. Review the **Monitoring System Metric Types** list, and set the value in the **Active** column to **false** or **true**, as necessary.

Column	Description
Source	Data source monitoring the metric type.
Source Metric Type	Metric such as '% Free Space' that is being monitored for the CI type.
Anomaly Detection Action Level	The level of anomaly detection processing and analysis applied to CIs and metrics. The available options are: ○ **Metrics Only**: Only gather metrics from the data source without any further processing. ○ **Bounds**: Includes the Metrics Only processing level, and also creates a statistical model and shows bounds in Insights Explorer. ○ **Anomaly Scores**: Includes the Bounds processing level, and also calculates and displays anomaly scores. ○ **Anomaly Alerts**: Includes the Anomaly Scores processing level, and also creates anomaly alerts, as applicable. ○ **IT Alerts**: Includes the Anomaly Alerts processing level, and also creates IT alerts which are based on anomaly alerts, as applicable.
Monitored Object Type	CI type that is being monitored.
Active	Determines whether the metric data is processed by Event Management alert aggregation and RCA metrics.
Unit	Unit type that is associated with the source metric type, displayed in the Metric Intelligence reports.

Configure the action level for anomaly detection

Create a configuration setting rule that refines the level of anomaly detection processing and analysis that is applied to specific CIs and metrics. Set a processing level that reflects the importance of metrics at different stages of implementation, to reduce data load if needed.

Anomaly detection consists of multiple levels of processing. At the lowest level, metric data is gathered from data sources. At the highest level, statistical models are created, anomaly scores are calculated, and anomaly alerts and IT alerts are created. You can apply the full anomaly detection process or a reduced level of processing, for specific data series.

Use the *anomaly_detection_action_level* configuration setting in a configuration setting rule to set the level of processing for specific CIs and metrics. For example, you can initially set only a small percentage of CIs and metrics to generate anomaly alerts, and later increase that percentage.

Action levels

The *anomaly_detection_action_level* configuration setting provides action levels starting at 'Metrics only' for basic anomaly processing, and ending at 'IT Alerts' for full processing and analysis.

Action levels from lowest to highest:

Metrics Only

Only gather metrics from the data source without any further processing.

Bounds

'Metrics Only' processing level and in addition creates statistical model and show bounds in Insights Explorer.

Anomaly Scores

'Bounds' processing level and in addition calculates and display anomaly scores.

Anomaly Alerts

'Anomaly Scores' processing level and in addition creates anomaly alerts as applicable.

IT Alerts

'Anomaly Alerts' processing level and in addition creates IT alerts which are based on anomaly alerts, as applicable.

Related topics

Create a configuration settings rule

Create a configuration settings rule

Configuration settings affect how metric data is processed. Configuration settings rules override the default metric processing behavior to determine the system actions when an anomaly is detected.

Before you begin

Role required: evt_mgmt_admin

About this task

A number of configuration settings determine the behavior of Metric Intelligence MID Servers. In the base system, these configuration settings are configured with default values, data types, and range of valid values. You cannot directly modify these configuration settings or add new ones. However, you can create a metric configuration rule with new configuration settings that override the default values on the MID Servers.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Then, manually apply these rules to all Metric Intelligence MID Servers in a single synchronization operation, or rely on an hourly system job to perform the synchronization.

To take effect, Metric Intelligence MID Servers must be synchronized with the updates to the configuration settings rules.

It is valid to have multiple rules for a setting that affect the same CIs, in which case:

- Rules in which a filter is defined take precedence over a global rule in which no filter has been defined.
- If multiple rules that affect the same set of CIs have the same priority, then only the latest rule to be defined is applied.
- If multiple rules with different priorities affect the same set of CIs, then rules with the highest priority are applied.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric Config Rules**.
2. On the Metric Configuration Rules pane, click **New**, and fill out the form.

Metric Configuration Rules form

Field	Description
Name	Rule name.
Order	Rule priority within all other rules. Higher numbers represent higher priorities.
Filter by	Check box for displaying the **Rule** field, where you can specify conditions that CIs must meet for the rule to apply. For example, in the **choose field** list, select **Add Related Fields** and then add the filter **[class][is][Linux Server]**. If clear, the rule applies globally to all CIs in the Metric To CI Mapping [sa_metric_map] table.

3. Right-click the form title, and click **Save**.
4. In the Metric overridden configurations form section click **New**, fill out the form, and then click **Submit**.

Metric overridden configurations form

Field	Description
Name	Configuration setting for which to override its value. Click the icon to display the list of all configuration settings. Click the icon to display the **Metric Settings** dialog with details such as range of possible values. See the following tables (Configuration Settings and Internal Configuration Settings) for details about configuration settings.

© 2025 ServiceNow, Inc. All rights reserved.

Number of smoothed data points to set to the mean of double the smoothing length.				
dynamic_threshold_error_buffer_minutes Number of data points around each outlier to group together.	1 – 1000	30	integer	CI/Metric
dynamic_threshold_search_start Start value at which the optimal control factor is looked for.	0.5 – 20.0	3.0	double	CI/Metric
dynamic_threshold_search_interval Interval between search values of optimal control factor.	0.1 – 5.0	0.5	double	CI/Metric
dynamic_threshold_search_count Number of values required for searching for optimal control factor.	1 – 50	19	integer	CI/Metric
dynamic_threshold_error_sequence_limit Maximum number of error groups for a particular control factor value when searching.	1 – 20	5	integer	CI/Metric
dynamic_threshold_minimum_data_count Minimum number of raw data points needed before attempting dynamic thresholding.	1 – 10000	5000	integer	CI/Metric
linear_seasonal_log_likelihood_threshold Threshold used in deciding whether to prefer a fitted model with linear seasonality over a model with a periodic component.	10-5000	1000	integer	CI/Metric

Configure multiple MID Servers to work with Agent Client Collector Monitoring

Synchronize configuration settings rules

Metric Intelligence configuration settings rules contain user specified values that override default values that currently exist on Metric Intelligence MID Servers. To take effect, the Metric

Intelligence MID Servers must be synchronized with the updated set of configuration settings rules.

Before you begin
Role required: evt_mgmt_admin

About this task
You can manually initiate a synchronization to immediately apply the updates on all Metric Intelligence MID Servers. Or, you can rely on a system job, that runs on an hourly recurring schedule, checking for updates to the metric configuration rules. If it is determined that there are updates, the system job sends these updates to the Metric Intelligence MID Servers.

Procedure
1. Navigate to **All** > **Event Management Rules** > **Anomaly Detection** > **Metric Config Rules**.
2. On the Metric Configuration Rules pane, click **Sync to MID**.

What to do next
Verify that all Metric Intelligence MID Servers have been synchronized with the updated set of configuration settings rules:

1. Navigate to **Output and Artifacts** > **ECC Queue**.
2. In the **Queues** pane, search the **Topics** column for `MetricConfigProbe`.
3. Check the **Agent** column and verify that all MID Servers are updated.

Enable metrics collection and evaluation

To enable a ServiceNow instance to collect and evaluate metrics, you must create a distributed MID Server cluster, associate MID Servers with the cluster, and enable Metric Intelligence for your MID Server.

Before you begin
Ensure that the following plugins are installed on your instance:

- Event Management (com.glideapp.itom.snac)
- Metric Intelligence - com.snc.sa.metric plugin
- MetricBase

To verify that the MetricBase plugin has been installed correctly:

1. Enter `stats.do` in the instance navigation pane.
2. Search for the **MetricBase Statistics** section and verify that the following appears:
   - Status: ONLINE
   - Name: clotho

Role required: agent_client_collector_admin

Procedure
1. Create a distributed MID Server cluster in your instance:

   a. Navigate to **MID Server** > **Clusters**.
   The MID Server Clusters page opens, displaying the list of configured MID Server clusters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Click **New**.
The **MID Server Cluster - New record** page opens.

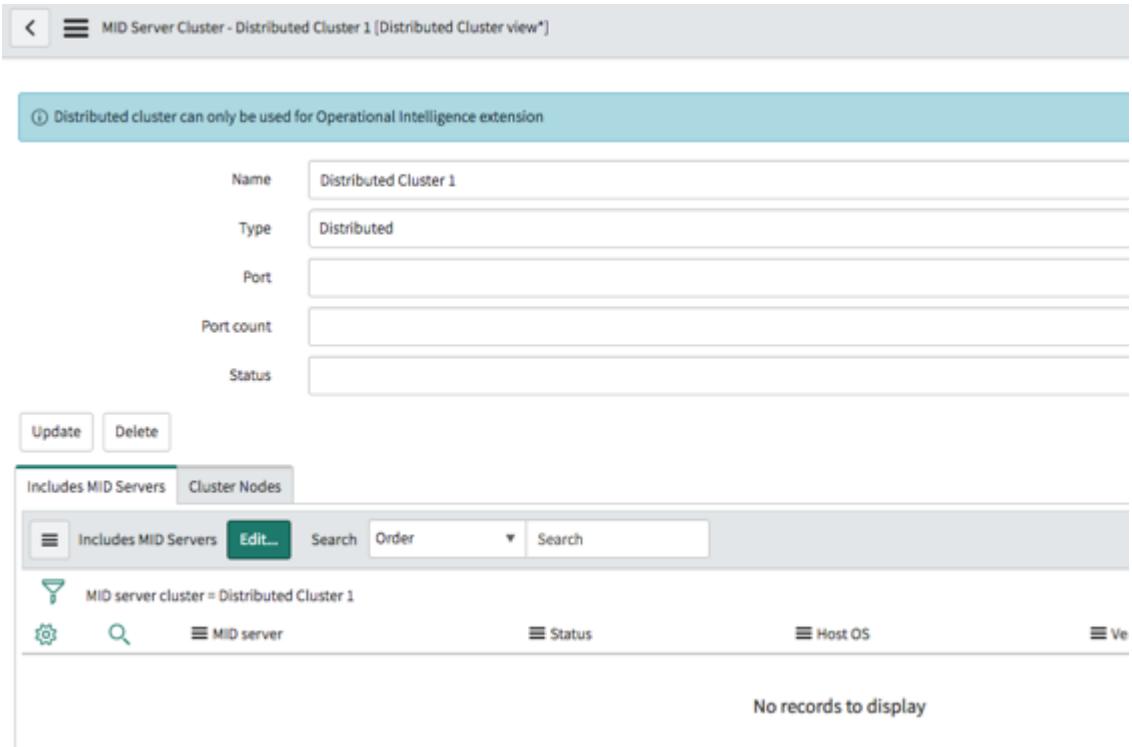
c. In the **Name** field, assign a descriptive name for the cluster.

d. In the **Type** field, select **Distributed**.

e. Click **Submit**.
The distributed MID Server appears on the MID Server Clusters page.

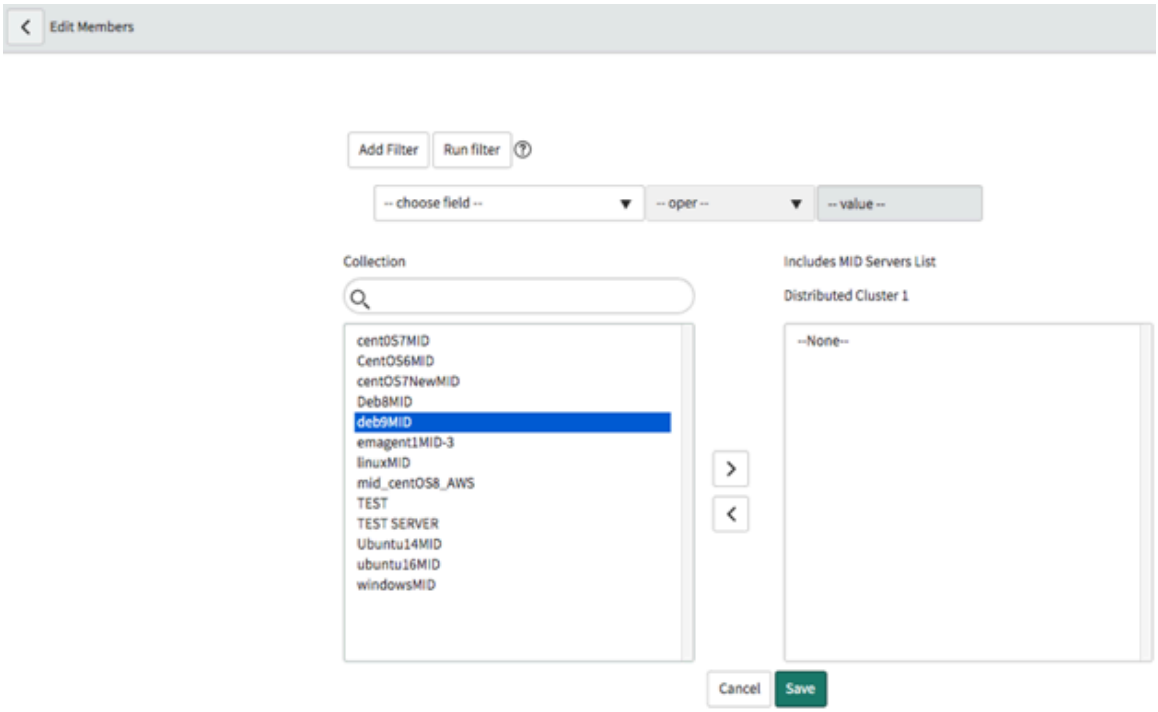
2. Assign MID Servers to the distributed MID Server cluster:

a. On the MID Server Clusters page, select the distributed MID Server cluster.
The following page appears:



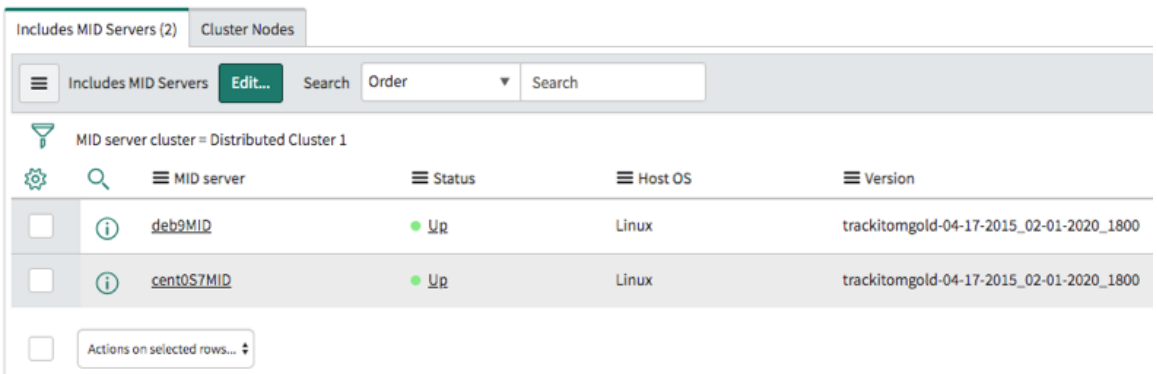
b. On the **Includes MID Servers** tab, click **Edit**.
The **Edit Members** page appears.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select the relevant MID Servers from the left cell and click the right arrow button to move them to the right cell.
In a staging environment, it is acceptable to have only one MID Server in the cluster.

d. Click **Save**.
The **Includes MID Servers** tab displays the MID Servers that are part of the cluster.

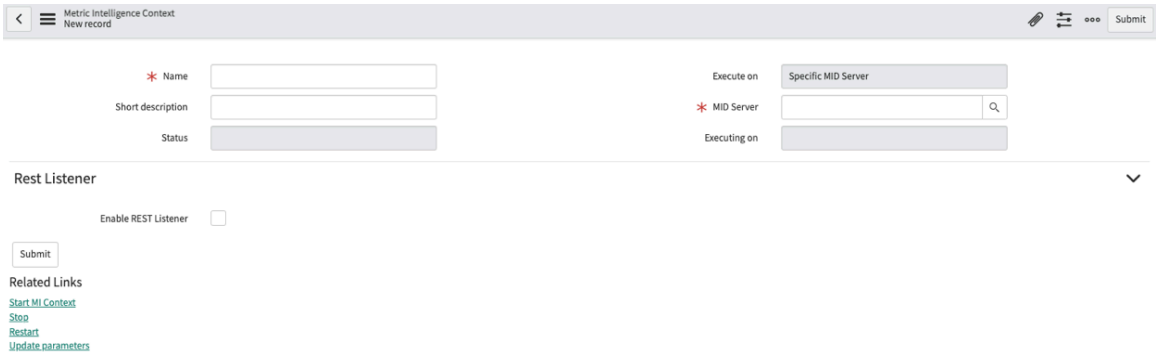


3. Enable Metric Intelligence for your MID Server:

a. Navigate to **MID Server** > **Extensions** > **Metric Intelligence**.
The **Metric Intelligence Metrics Contexts** page appears.

b. Click **New**.
The **Metric Intelligence Contexts - New record** page appears.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. In the **Name** field, enter a descriptive name for the Metric Intelligence metrics extension.

d. In the **MID Server** field, select the MID Server to which you want to associate the Metric Intelligence metrics extension.

e. Select the **ACC Dedicated MID** check box to assign the specified MID Server as the only MID Server in the distributed cluster.
Selecting this option helps conserve system resources and memory.

f. In the **Related Links** section at the bottom of the page, click **Start**.
A message appears, indicating the status of the extension.

g. Click **Submit**.

h. Click **Start**.

Limit metrics collection and evaluation

Limit metrics collection and evaluation

You can limit the metrics you send from the MID Server to the instance, either by de-activating a specific CI or an entire CI type.

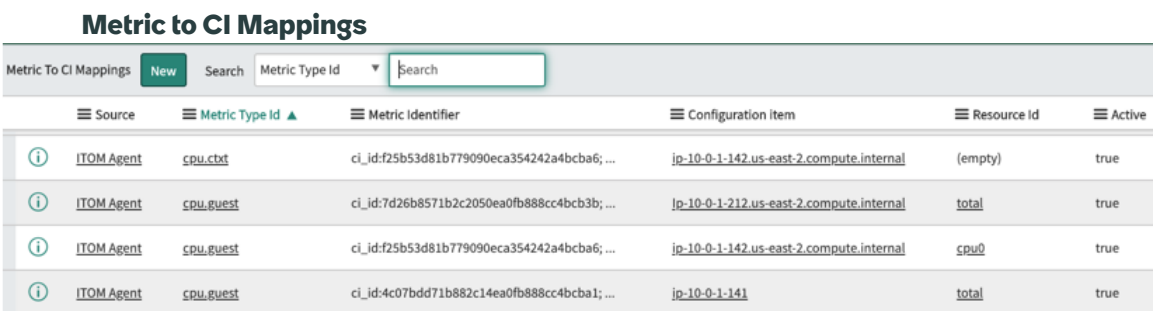
Before you begin

Role required: agent_client_collector_admin

Procedure

1. To limit metrics collection and evaluation for specific CIs:

a. Navigate to **Event Management** > **Anomaly Detection** > **Metric to CI**.
The **Metric to CI Mappings** page appears.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

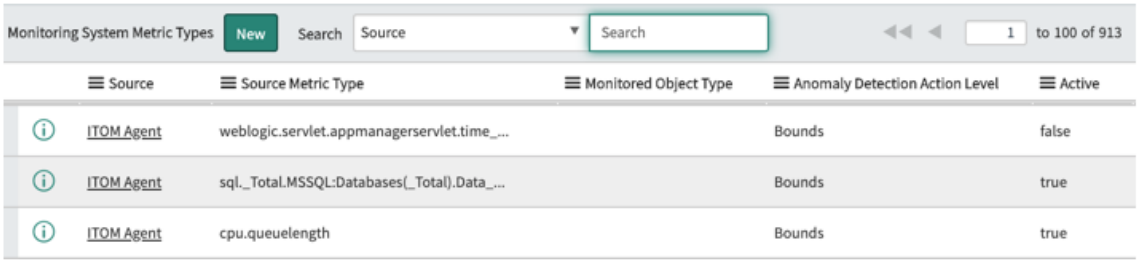
Note:
The Metric to CI Mapping is identified by both its metric identifier and its configuration item.

b. To prevent sending metrics for a specific metric and CI, set the value of the **Active** column to **false**.

2. To limit metrics collection and evaluation for an entire CI type:

a. Navigate to **Event Management** > **Anomaly Detection** > **Metric Types**.
The **Monitoring System Metric Types** page appears.

Monitoring System Metric Types



b. To prevent sending metrics for a metric type, set the value of the **Active** column to **false**.

Block event creation for non-existent entities

Invoke the *skip_events_for_nonexistent* parameter to block event creation when specific process, service, or log does not exist. Invoke this parameter if you do not want to be notified about these non-existent entities.

Before you begin

Role required: agent_client_collector_admin

About this task

A process, service, or log does not exist when the following checks do not contain valid values for the indicated parameters:

Check parameters

Check	Parameter
os.linux.check-process	*file_pid*, *daemon_name*
util.check-windows-service	*service*
os.windows-check-log	*file*
util.checks-logs	*file*
util.checks-logs-sudo	*file*

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Check Definitions**.
2. Locate the check definition for which you want to block events.
3. On the **Check Parameter Definitions** tab, select *skip_events_for_nonexistent*.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the **Active** check box to enable the parameter and prevent alert creation when the process, service, or log isn't located for the specified check.
   If you want to receive notification about the missing process or service, leave the *skip_events_for_nonexistent* parameter with its default value of **false**.

Enable viewing HAProxy metrics

Configure the HAProxy metrics stats page to enable monitoring your system devices by viewing HAProxy metrics.

Before you begin

Role required: agent_client_collector_admin

About this task

HAProxy provides load balancing and reverse proxy capabilities for both HTTP and TCP requests. The HAProxy checks remove backend servers that fail several health checks in a row, and transfer incoming traffic to backend servers as part of load balancing.

Procedure

1. Access the HAProxy configuration file, located at: `/etc/haproxy/haproxy.cfg`.
2. Add the following to the bottom of the file:

```
listen frontend *:8080       #Haproxy
Monitoring run on port 8080
mode http
option forwardfor
option httpclose
stats enable
stats show-legends
stats refresh 5s
stats uri /stats        #URL for HAProxy monitoring
stats realm Haproxy\Statistics.   #Title for pop up window
stats auth admin:admin     #User and Password for login to the
 monitoring dashboard
stats admin if TRUE
default_backend backend       #This is optional for monitoring
 backend
```

3. Run the following command to restart the HAProxy:
   `sudo service haproxy restart`
4. View the HAProxy metrics on your system by viewing the HAProxy metrics stats page, accessible from the following URL:
   `http://<HAProxyServer>:8080/stats`

HAProxy default checks and policies

Enable Apache Kafka health monitoring

Set configurations in the Apache HTTP server application to enable the Agent Client Collector to perform Apache Kafka HTTP server monitoring.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Enable Java Management Extensions (JMX) for Kafka metric collection by running the following command:

```
Environment="JMX_PORT=9999"
```

- Role required: agent_client_collector_admin

Procedure

1. Enable collecting Apache Kafka performance metrics using Java Management Extensions (JMX) by running the following command:

```
JMX_PORT=9999#bin/kafka-server-start.sh#config/server.properties
```

2. Configure the admin server port by modifying the port number of the admin.serverPort property in the zookeeper.properties file.
   The default port is 8080.

Enable running of Varnish checks

Use application fingerprints to discover the Varnish CI, to enable running Varnish checks.

Before you begin

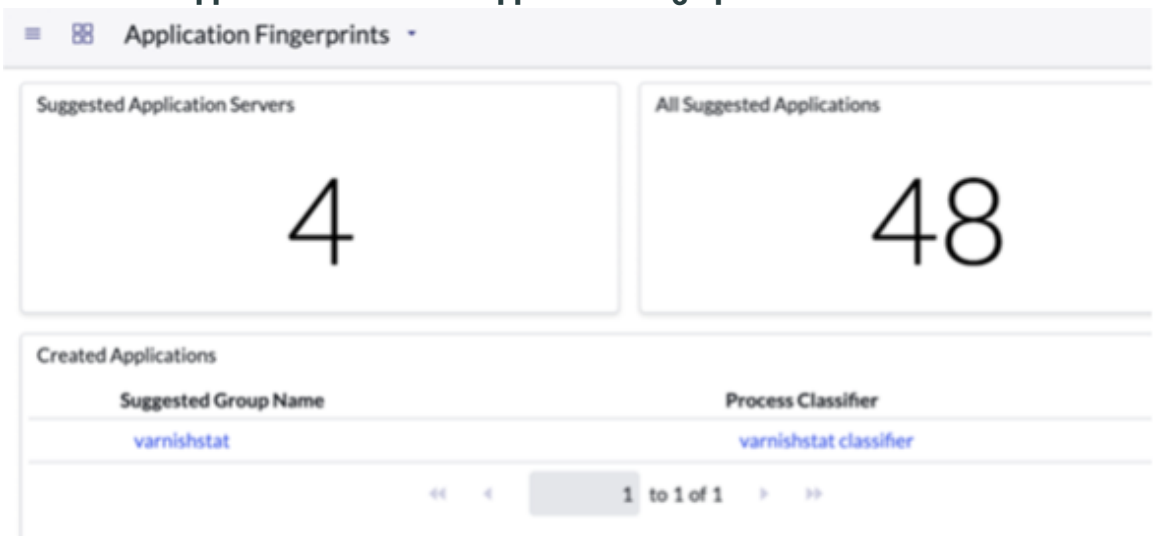
Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Home**.
2. Select the **Application Fingerprints** tile.
   The **Application Fingerprints** dashboard appears.
3. Select the **All Suggested Applications** tile.
4. On the Application Suggestions page, select the **varnishstat** entry in the **Suggested Group Name** column.
   The varnishstat details appear on the Application Suggestion page.
5. Select Discover Application.
   Discovery locates an application CI for the varnishstat entry. The CI appears on the Application Fingerprints dashboard in the **Created Applications** section.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Created applications section of Application Fingerprints dashboard



6. Run basic Discovery on the host machine.

Result

The varnishstat CI is discovered and a record is created in the u_cmdb_ci_varnishtat table.

The Varnish policies and checks are available to run.

Enable log monitoring in a Linux environment

To enable monitoring logs in a Linux environment, select the relevant policy and assign specific check parameters to the policy. When log monitoring is enabled and a specified string is discovered in the log being monitored, the system creates an event.

Before you begin

Ensure that the servicenow user has access to the log file being monitored, or that the specified user can run the `sudo` command.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the **Linux log monitoring** policy.
3. On the **Check Instances** tab, select **util.check-logs** to enable monitoring log files not owned by the *`root`* user.
   Ensure that the Agent Client Collector *`servicenow`* user has read permissions for the log file being monitored.
4. Specify the log file to be searched by the check:
   a. In the **Check Parameter Definitions** tab at the bottom of the page, select the **file** entry in the **Name** column.
   b. In the **Default value** field, enter the path of the log file you want to search.
5. Specify the string you want to locate in the log:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Check Parameter Definitions** tab at the bottom of the page, select the **pattern** entry in the **Name** column.

b. In the **Default value** field, enter the search pattern strings that you want to search for in the log file, such as 404, `Error`, and so forth. The default values are SEVERE and `Exception`.

   Ensure that you separate multiple patterns with a pipe (|) and pass it as a parameter inside quotes. For example: `"SEVERE|404"`.

6. Click **Update** to save your check instance and return to the **Policy - Linux Log Monitoring** page.
7. Select the **util.check-logs-sudo** check to monitor logs owned by the root user.
8. Repeat steps 4 and 5 to monitor logs owned by the root user.
9. For the **util.check-logs-sudo** check, modify the `/etc/sudoers` file on the host or Linux virtual machine, as follows:
   When the agent is installed on the host's default location (`/usr/share/servicenow/agent-client-collector`) or on a Linux virtual machine, add the following string to the `/etc/sudoers` file:

```
servicenow ALL=
 SETENV: /
var/cache/servicenow/agent-client-collector/monitoring-plugin-l
inux/bin/check-log.rb *
Defaults:servicenow !requiretty
Defaults exempt_group += servicenow
```

10. On the **Policy** page, click **Save** and then click **Publish** to activate the policy to monitor the log file.

Enable log monitoring in a Windows environment

To enable monitoring logs in a Windows environment, select the relevant policy and assign specific check parameters to the policy. When log monitoring is enabled and a specified string is discovered in the log being monitored, the system creates an event.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the **Windows log monitoring** policy.
3. On the **Check Instances** tab, select **os.windows.check-log** to enable monitoring Windows log files.
4. On the **Check Parameters** tab, specify the log parameters to be monitored by the check, as described in the following table:

Check parameters

Name	Value
warning	Number of times the specified pattern strings are found in the log which generates a *`warning`* event. Default = 1.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value
	For example, if the *pattern* value is **Exception** and one Exception event is located in the log, a *warning* event is generated.
critical	Number of times the specified pattern strings are found in the log which generates a *critical* event. Default = 2. For example, if the *pattern* value is **Exception** and two Exception events are located in the log, a *critical* event is generated.
file	Location of the log file.
pattern	Strings which are being searched for in the log. Default values are **Severe** and **Exception**. Other possible values include **404** and **Error**. Ensure that you separate multiple patterns with a pipe (|) and pass it as a parameter inside quotes. For example: `"SEVERE|404"`.

Select the Azure policies to activate for metric collection

Activate the Azure policies that come with the Agent Client Collector base system so that Azure virtual machines can collect metrics. These metrics help you monitor the configuration items (CIs) in the CMDB.

Before you begin

- Prepare an instance with an active MID Server and metric base.
- Install Agent Client Collector Framework and Agent Client Collector Monitoring.
- Run Discovery on the Azure cloud account to populate the CMDB with CIs to be monitored.

Role required: agent_client_collector_admin

Procedure

1. Prepare and configure the proxy agent to be used by the policy.
   For details on configuring a proxy agent, see Using proxy agents in Agent Client Collector.
2. Assign the credentials to the Azure policy.
   a. Navigate to **All** > **Agent Client Collector** > **Policies**.
   b. Select the relevant policy.
      For details on the policies that are available with the base system, see Azure cloud metrics.
   c. Select the **Credentials** tab.
   d. In the **Credential name** field, select the credentials to be invoked for the policy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To see the available credentials, go to the Credentials page by navigating to **All** > **Discovery** > **Credentials**.

Ensure that you select the **Type=Azure** credentials. If you need to create credentials, select **New** and select **Azure Service Principal** credentials.

e. In the **Credential alias** field, assign an alias to the credentials.

3. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies** and select the relevant policy to activate.
4. Select the application scope icon and verify that you are in the Agent Client Collector Monitoring scope to edit the policy.
5. Enable the policy in Edit mode by selecting **Edit in Sandbox**.
6. Enable the proxy agent to be used to execute the check.
   a. Select the **Proxy Settings** tab.
   b. Select **Single proxy agent** and select the proxy agent to be used to execute the check from the **Proxy agent** field.
7. Select **Save**.
8. Republish the policy by selecting **Republish**.

Create Azure policies for metric collection

Create your own policies to enable Azure to collect the metrics for the resources that have policies that don't come with the base system. The Azure Metrics Collector check brings the metrics to the agent through the Azure Metrics Batch API.

Before you begin

- Ensure that the configuration Items (CIs) that you want to collect the metrics for are included in the CMDB. CIs are typically populated during Discovery.
- Ensure that the *sn_agent.multi_ci_dev_mode* property is set to **true** on the **System Properties** page (**All** > **System Properties** > **All Properties**).

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select **New**.
3. Select the application scope icon and verify that you are in the Agent Client Collector Monitoring scope.
4. In the **Name** field, enter a name for the policy.
5. Configure a filter that determines which CIs are to be monitored by the policy by selecting the **Monitored CIs** tab and the **Monitored CI type by filter** check box, as described in the following table.

Monitored CIs filter

Option	Action
Monitored CI type	Select the CI type to be monitored.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	The CI type must match the resource that you entered in the .json script file that contains the metrics to be monitored.
<Filter fields>	Configure the conditions that must be met for the resources in the specified Monitored CI type to be monitored. Ensure that you set the following conditions: ○ **Object ID** = <name of the resource entered in the .json script file that contains the metrics to be monitored> ○ **State** = Available The Available state indicates that resources must be available to be monitored.
Preview	Select to view the number of resources that match the specified condition. The number of matching results appears next to the **Preview** button. Select the result to view all CI records that match the condition.

6. Add the Azure Metrics Collector check to the policy.
   a. On the **Checks** tab, locate the **Azure Metrics Collector** check in the **Available** cell.
   b. Select the right arrow button to move the check to the **Selected** cell.
7. Configure a proxy server to access the Azure metrics.
   a. On the **Proxy Settings** tab, select **Single proxy agent**.
   b. In the **Proxy agent** field, select the proxy agent to execute the policy and retrieve the Azure metrics.
8. Configure the credentials for the policy.
   a. Select the **Credentials** tab.
   b. In the **Credential name** field, select the **azure_metrics_collector**.
9. Select **Save**.
10. Add secure parameters to the check instance.
    a. In the policy's **Check Instances** section, select the **Azure Metrics Collector** check instance.
    b. On the **Check Secure Parameters** tab, select **New**.
    c. Add the secure check parameters that are described in the following table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Secure check parameters

Name	Order value
cred_tenant_id	1
cred_client_id	2
cred_secret_key	3

Ensure that the **Active** check box is selected for each parameter.

d. Select **Update**.

11. Add the `.json` configuration file to the check instance.
The file sends the list of Azure resources to the agent.

a. Select the Azure Metrics Collector check instance.

b. Select the **Check Parameters** subtab.

c. Select **New**.

d. On the form, fill in the fields.

Check Parameter form

Field	Description
Name	Descriptive name for the `.json` file to be added to the instance's configuration files (**Agent Client Collector** > **Configuration Files**).
Value	String that indicates the name of the `.json` file. For example: `acc_azure_vm_metrics_config.json`
Flag	Value that you enter (**-c**) to indicate that the check retrieves the name of the configuration file. The configuration file contains a namespace and a list of metrics. The value must indicate the name of the file that was uploaded to the list of configuration files (**Agent Client Collector** > **Configuration Files**), in `.json` format. For example: `acc_azure_vm_metrics_config.json`.

Ensure that the **Active**, **Mandatory**, and **Value required** check boxes are selected.

e. Select **Submit**.

12. Create a `.json` file that indicates the metrics that you want your policy to monitor.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example displays a `.json` file for retrieving load-balancer metrics.

acc_azure_static_ms_lb_config.json

```
{
  "namespace": "Microsoft.Network/loadBalancers",
  "metrics": [
        "AllocatedSnatPorts",
        "ByteCount",
        "DipAvailability",
        "PacketCount",
        "SnatConnectionCount",
        "SYNCount",
        "UsedSnatPorts",
        "VipAvailability"
  ],
  "time_grain": "PT1M"
}
```

Add the `.json` file to the list of configuration files at **Agent Client Collector** > **Configuration Files**.

13. Create a .json file to indicate the resources that you want your policy to monitor.

    a. On the **Proxy Settings** tab, select **Multi-CI Mode**.

    b. Copy a script from one of the Azure cloud policies that comes with the base system.
    - Cloud policies that come with the base system are described in Create Azure policies for metric collection.
    - The script is located in the **Config file creation script** field of the policy's **Proxy Settings** tab.

    c. Paste the script into the **Config file creation script** field of your policy.

    d. At the end of the script, configure the *resource_id*, *region*, and *sys_id* parameters with the values of the CI that you want the policy to monitor.

14. Select **Save** and then publish the policy by selecting **Publish**.

Result
The configured policy retrieves the resources and their metrics from the specified Azure CI and sends them to the agent.

Understanding the Monitoring Technology Dashboard

The Monitoring Technology Dashboard enables you to monitor server resources for the platform you select. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and the most recent active alerts.

You can customize the appearance of individual widgets on the Monitoring Technology Dashboard. For example, you could change the data parameters displayed for the CPU Utilization (Linux) metric, like the date range. You can include the customized widgets when creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

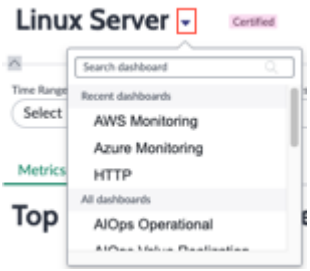
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours, and the 50 most recent active alerts on your OS's servers.

To enable viewing the Monitoring Technology Dashboard, ensure that you have installed clotho version 23.1.0.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select the OS whose metrics you want to view.

Select the arrow next to the dashboard name to enabled choosing a different dashboard to view:



Monitoring Technology Dashboard for Linux

With the Linux Monitoring Technology Dashboard, you can monitor the health and performance of your Linux infrastructure. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and also the most recent active alerts.

Overview of the dashboard

The Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on your OS's servers.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Linux Server**.

Using the Monitoring Technology Dashboard for Linux

Before using the Monitoring Technology Dashboard for Linux:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Linux OS Events** and **Linux OS Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

Point to the relevant widget to view a specific point of data and all of its details in a pop-up window. Select the Alerts tab to view the 50 most recent active alerts for CIs.

You can filter the dashboard data according to the following filters:

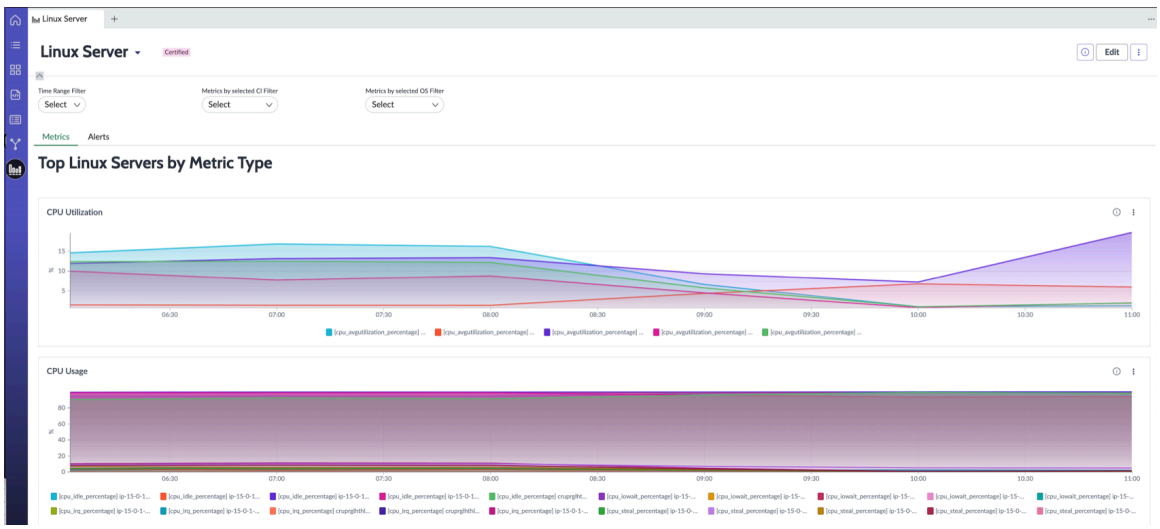
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.
Metrics by selected OS filter	The OS for which you want metric data to display on the dashboard.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Linux server dashboard



The Metrics subtab displays the top five performing CIs and servers over the past six hours, according to the following metrics.

- CPU Utilization
- System Uptime
- CPU Usage
- Load Average
- Memory
- Memory Distribution
- Processes
- Network Utilization
- Swap
- Disk Usage

You can customize the appearance of the individual widgets on the Linux Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring Technology Dashboard for Windows

With the Windows Monitoring Technology Dashboard, you can monitor the health and performance of your Windows infrastructure. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and also the most recent active alerts.

Overview of the dashboard

The Monitoring Technology Dashboard for Windows shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on your OS's servers.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Windows Server**.

Using the Monitoring Technology Dashboard for Windows

Before using the Monitoring Technology Dashboard for Windows:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Windows OS Events** and **Windows OS Metrics** policies are enabled:

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Windows Server**.

Point to the relevant widget to view a specific point of data and all of its details in a pop-up window. Select the Alerts tab to view the 50 most recent active alerts for CIs.

You can filter the dashboard data according to the following filters:

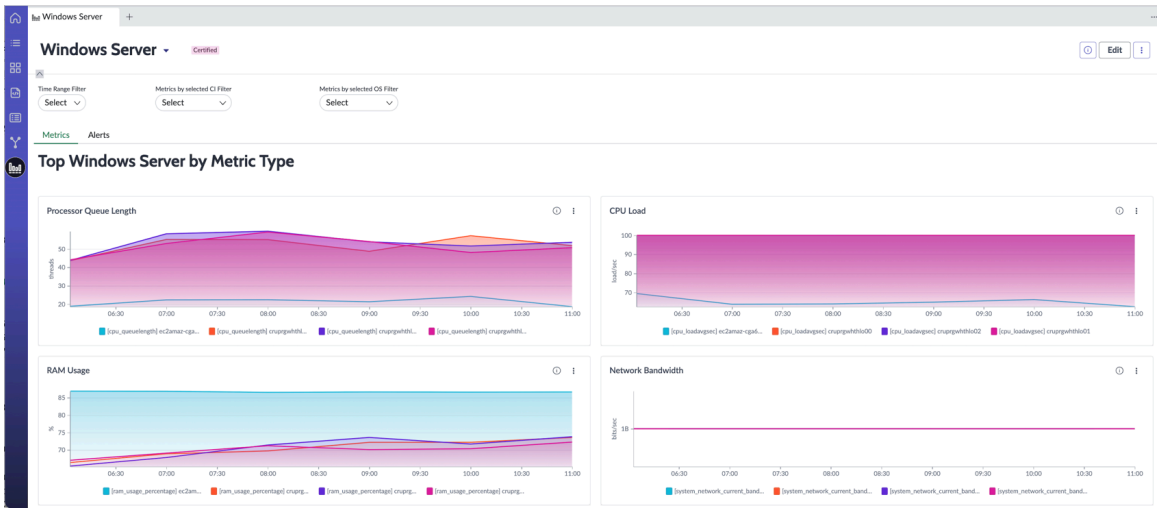
Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.
Metrics by selected OS filter	The OS for which you want metric data to display on the dashboard.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category that you want to view the metric by: Host name, Class, Operating System, or OS Version.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows server dashboard



The Metrics subtab displays the top five performing CIs and servers over the past six hours, according to the following metrics.

- Processor Queue Length
- CPU Load
- System Uptime
- CPU Core
- RAM Usage
- Network Bandwidth
- Memory Distribution
- Network Flow
- Disk Usage
- Disk Read/Write
- Disk Distribution

You can customize the appearance of the individual widgets on the Windows Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for HTTP

With the HTTP Monitoring Technology Dashboard you can monitor the response time of your `http` and `https` URLs. By using the dashboard, you can identify the URLs with the highest metric readouts in your system's infrastructure, and view the most recent active alerts on those URLs.

Overview of the dashboard

The HTTP Monitoring Technology Dashboard shows the five URLs with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on those URLs.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **HTTP**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Monitoring Technology Dashboard for HTTP

Before using the Monitoring Technology Dashboard for HTTP:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **HTTP Entry Points Events** and **HTTP Entry Points Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The Azure Monitoring Technology Dashboard contains the tabs that are listed in the following table.

HTTP Monitoring Technology Dashboard tabs

Tab	Description
Metrics	Displays the top 5 performing metrics that are associated with the URLs in your system.
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the HTTP Monitoring Technology Dashboard. For example, you could change the data parameters that display for the Response Time metric, like the time range that the response time is displayed. You can also include the customized widgets when you're creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for Azure

With the Azure Monitoring Technology Dashboard, you can monitor the health and performance of your Azure infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of the dashboard

The Azure Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your Azure environment. Based on the dashboard metrics, you might want to resize your CIs and servers to improve your system performance and efficiency.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Azure Monitoring**.

Using the Monitoring Technology Dashboard for Azure

Before using the Monitoring Technology Dashboard for Azure:

- Create an Azure credential. For details on creating Azure credentials, see Create Azure cloud credentials.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for Microsoft Azure Cloud.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Azure VM Metrics**, **Azure Storage Account Metrics**, **Azure Load Balancer Metrics**, **Azure Gateway Metrics**, and **Azure Redis Cache Metrics** policies are enabled
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.

The Azure Monitoring Technology Dashboard contains the tabs that are listed in the following table.

Azure Monitoring Technology Dashboard tabs

Tab	Description
Virtual Machines	Displays the metric data from the virtual machines in the Azure environment.
Storage Accounts	Displays the metric data from the storage accounts in the Azure environment.
Load Balancer	Displays the metric data from the load balancers in the Azure environment.
Application Gateway	Displays the metric data from the application gateway in the Azure environment.
Redis	Displays the metric data from the Redis cache in the Azure environment.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

You can filter the dashboard data according to the following filters:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the Azure Monitoring Technology Dashboard. For example, you could change the time that the CPU usage on virtual machines is displayed. You can also include the customized widgets when you're creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for AWS

With the AWS Monitoring Technology Dashboard, you can monitor the health and performance of your AWS infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs and servers.

Overview of the dashboard

The AWS Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your AWS environment.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **AWS Monitoring**.

Using the Monitoring Technology Dashboard for AWS

Before using the Monitoring Technology Dashboard for AWS:

- Create an AWS credential. For details on creating AWS credentials, see Setting up AWS service accounts.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Access setup for AWS service accounts.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **AWS Metrics**, **AWS EC2 Metrics**, and **AWS DynamoDB Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The AWS Monitoring Technology Dashboard contains the tabs that are listed in the following table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWS Monitoring Technology Dashboard tabs

Tab	Description
EC2	Displays the metric data from the EC2 (virtual machines) in the AWS environment.
EC2 Alerts	Displays the active EC2 (virtual machine) alerts in the AWS environment.
EBS	Displays the metric data from the EBS (storage volume) in the AWS environment.
S3	Displays the metric data from the S3 (cloud object storage) in the AWS environment.
RDS	Displays the metric data from the RDS (cloud database) in the AWS environment.
ELB	Displays the metric data from the ELB (cloud load balancing) in the AWS environment.
Dynamo DB	Displays the metric data from the Dynamo DB (cloud database) in the AWS environment.
ECS Cluster	Displays the metric data from the ECS cluster in the AWS environment.
ECS Service	Displays the metric data from the ECS service in the AWS environment.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window. Select the **Alerts** tab to view the 50 most recent active alerts in your environment. Alerts help you to remediate your system by providing the information on problematic behavior.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

Use the **Metrics by selected CI filter** to select the CIs for which you want to view metrics.

You can customize the appearance of the individual widgets on the AWS Monitoring Technology Dashboard. For example, you could change the time that the EC2 metrics appear. You can also include the customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for GCP

With the GCP Monitoring Technology Dashboard, you can monitor the health and performance of your GCP infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs and servers.

Overview of the dashboard

The GCP Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your GCP environment.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **GCP Monitoring**.

Using the Monitoring Technology Dashboard for GCP

Before using the Monitoring Technology Dashboard for GCP:

- Create a GCP credential and use it to create a Discovery schedule. For details on creating GCP credentials, see Discovery for Google Cloud Platform.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for Google Cloud Platform.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **GCP GCE Metrics** policy is enabled.

  Enabling this policy activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The GCP Monitoring Technology Dashboard contains the tabs listed in the following table.

GCP Monitoring Dashboard tabs

Tab	Description
GCP	Displays graphs of the top 14 performing OS resources, such as CPU, Memory, Disk Operations and Network.
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

Use the **Metrics by selected CI filter** to select the CIs for which you want to view metrics.

You can customize the appearance of the individual widgets on the GCP Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for VMware vSphere

With the VMware vSphere Monitoring Technology Dashboard, you can monitor the health and performance of your VMware vSphere infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs and servers.

Overview of the dashboard

The VMware vSphere Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your VMware vSphere environment.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **VMWare vSphere Monitoring**.

Using the Monitoring Technology Dashboard for VMware vSphere

Before using the Monitoring Technology Dashboard for VMware vSphere:

- Create a VMware vSphere credential and use it to create a Discovery schedule. For details on creating VMware vSphere credentials, see Discovery for VMware Cloud.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for VMware virtualization.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **VSphere Datacenter Metrics**, **VSphere Datastore Metrics**, **VSphere ESX Server Metrics** and **VSphere VirtualMachine Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.1.0 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The VMware vSphere Monitoring Technology Dashboard contains the tabs listed in the following table.

VMware vSphere Monitoring Dashboard tabs

Tab	Description
VirtualMachine	Displays graphs of the top VMware vSphere VMs by metric type.
ESX Server	Displays graphs of the top VMware vSphere ESX servers by metric type.
Datacenter	Displays graphs of the top VMware vSphere datacenters by metric type.
Datastore	Displays graphs of the top VMware vSphere datastores by metric type.

VMware vSphere Monitoring Dashboard tabs (continued)

Tab	Description
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

You can filter the dashboard data according to the following filters:

Dashboard filters

Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the VMware vSphere Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Customize the Monitoring Technology Dashboard

Customize the Monitoring Technology Dashboard widgets in the Data Visualizations library so your dashboard displays information exactly as you want to see it.

Before you begin

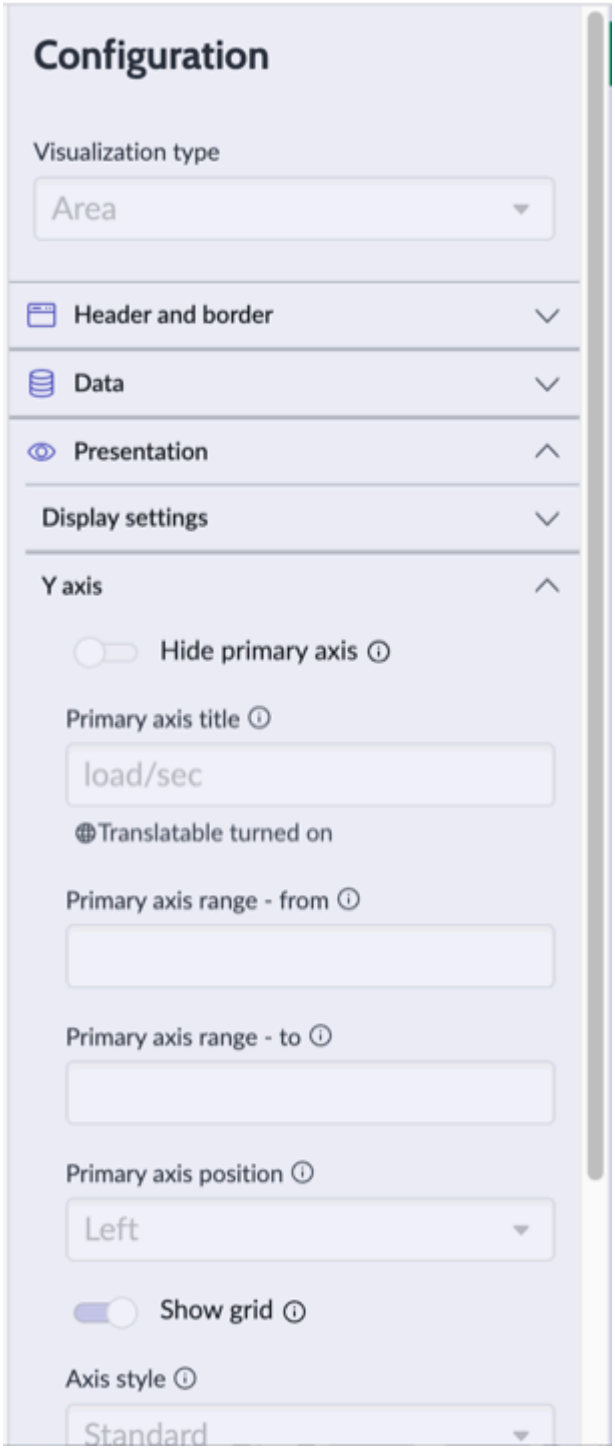
Role required: agent_client_collector_admin

Procedure

1. Navigate to the OS dashboard whose widgets you want to customize.
   - To access the Windows Server Dashboard, navigate to **All** > **AIOps** > **Monitoring Technology Dashboard** > **Windows Server**.
   - To access the Linux Server Dashboard, navigate to **All** > **AIOps** > **Monitoring Technology Dashboard** > **Linux Server**.
2. Select **Analytics Center** > **Data Visualizations**.
3. View all available widgets by selecting the **All** tab.
4. Select the widget that you want to change.
5. Select the (☰) icon, and select **Duplicate**.
6. In the **New name** field in the dialog box, enter a name for your duplicated widget, and select **Duplicate**.
7. In the widget's **Configuration** tab on the right, expand the relevant options and customize the information for the widget to display.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration tab



For details on working with data visualizations, see Data visualizations in the Analytics Center Data visualizations in the Analytics Center.

8. Select **Save and close**.

Result

Your customized widgets are saved in the Data Visualizations library, and can be used to configure a customized dashboard (see Create a dashboard with the In-line editor).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using proxy agents in Agent Client Collector

You can use a proxy agent to monitor the health and performance of your configuration items (CIs) even if the agent is in the cloud or any place that is external to your host server.

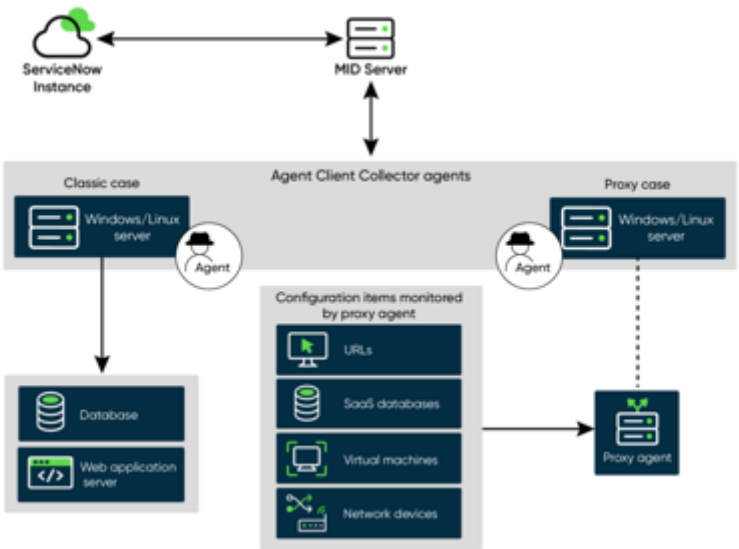
Proxy agents are used to monitor:

- URLs (to ensure that the URLs are available and accessible)
- Services that don't have a host server
- Closed services on which you can’t configure an agent
- External databases in the cloud

One agent can monitor multiple entities and their CIs.

The following diagram shows the connection between a ServiceNow instance, the MID Server, and Agent Client Collector agents, as well as proxy agents that monitor CIs that are external to the agent.

Proxy agent configuration



You can configure the proxy agent to do a custom check when it is monitoring external entities. To learn how to create custom checks, see Create and edit checks.

You can create a cluster of proxy agents on multiple proxy servers to monitor the services that are external to the host server. To learn how to create a proxy agent cluster, see Create a proxy agent cluster.

Use a Proxy Auto-Configuration (PAC) file to dynamically determine the appropriate proxy server to use. PAC files provide flexible and automated proxy configuration, enabling the agent to use different proxies for different destinations, connect directly to internal resources, implement complex proxy routing logic, and to automatically handle proxy failover. For details on the parameters used for PAC file configuration, see Configuration file options.

Following is a sample PAC file:

```
function FindProxyForURL (url, host) {

   // Connect directly to internal hosts
   if (isPlainHostName(host) ||
      shExpMatch(host, "*.internal.company.com")) {
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        return "DIRECT";
    }

    // use proxy for all other hosts
    return "PROXY proxy.company.com:8080:
}
```

Related topics

Checks and policies

Agent Client Collector Monitoring default checks and policies

Configure an agent on a proxy server

Configure an Agent Client Collector on a proxy server when monitoring services external to the host server, such as URLs or external databases in the cloud.

Before you begin

Role required: agent_client_collector_admin

About this task

Proxy agents should be dedicated agents, as running other apps on a proxy agent is likely to cause performance degradation.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents** > **Policies**.
2. Select the policy containing the checks that you want to run on a proxy server.
   You must configure a proxy server for checks and policies that monitor external services. For details on these checks and policies, see Agent Client Collector Monitoring default checks and policies.
3. Select the **Proxy Settings** tab.
4. Select from the following fields.

Field	Description
Single proxy agent	Select to display the **Proxy agent** field, where you select a single proxy agent.
Multi-proxy agents by cluster	Select to enable a group of proxy agents to monitor the policy CIs. When selecting this check box, the **Agent cluster name** field appears.
Agent cluster name	Select an agent cluster to monitor the policy CIs.
Multi-proxy agents by filter	Select to filter multiple proxy agents from the agent list. When selecting this option, all proxy agents monitor the same services. For example, you may want to use this option for multiple proxy servers in different geographic locations.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ This field appears only when the **Hide Multi Proxy Agent by filter, if its not selected** property (*sys_ui_policy*) is set to **active=false**. ○ This field appears only for existing policies where this option was previously selected. If you remove the filter in an existing policy, the option disappears.
Multi-proxy agents by script	Select to configure a JavaScript for selecting proxy agents. When selecting this option, you can assign services to different proxy agents, which can serve as a form of load balancing.
Run checks on all proxy agents (No load balancing)	Clear this option to load balance the selected multi proxy agents that monitor the matching CIs in the policy's **Monitored CIs** tab. Select this option for each agent to monitor all matching CIs in the policy's **Monitored CIs** tab. For example, if you have five agents in a cluster or five agents using the filter/script option and 10 matching CIs in the policy, when you clear this option, each agent monitors two CIs. When selecting this option, each agent monitors all 10 of the matching CIs in the policy. For existing or active policies, this option is enabled by default. For new and inactive policies, this option is turned off by default. Select this option only in a case where you have an external endpoint for which you want to measure how quickly it is accessed from different locations.

5. Select **Activate**.

Create a proxy agent cluster

Create a cluster of agents on multiple proxy servers to monitor services external to the host server. Creating a cluster of agents enables you to assign that cluster to multiple policies instead of having to assign the agents individually to every policy.

Before you begin

Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
A proxy agent cluster monitors the CIs that match the filter specified on the policy's **Monitored CIs** tab.

A proxy agent cluster must contain at least one agent. All of the cluster's agents monitor the CIs specified in its assigned policy. No special configuration is necessary on the policy level to enable proxy cluster monitoring.

The default CPU threshold value when working with proxy agent clusters is 80%. You can modify this value in the *proxy_cpu_percentage_limit* property.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Proxy Agent Cluster**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the cluster.
4. Add an agent to the cluster.
   a. In the **Agents in cluster** section, locate the **Agent** column and select **Insert a new row**.
   b. Select the search icon ( ) and select an agent to add to the cluster.
   c. Select the check icon ( ) to add the agent to the cluster.
   Repeat this step for each agent that you want to add to the cluster.
5. Select **Submit**.

Result
The **Proxy Agent Clusters** page appears and displays the agent added to the cluster.

What to do next
Select this proxy cluster to monitor CIs specified in an agent policy. For details, see Configure an agent on a proxy server.

Assign a proxy agent cluster to a policy

Assign a proxy agent cluster to a policy when monitoring services external to the host server, such as URLs or external databases in the cloud. The agents in the cluster monitor all of the policy's CIs.

Before you begin
Ensure that you have a policy containing the checks that monitor external services. For details on these checks and policies, see Agent Client Collector Monitoring default checks and policies.

Role required: agent_client_collector_admin

About this task
Only one app should be run on a given proxy agent because running multiple apps is likely to cause performance degradation.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Agents** > **Policies**.
2. Select the policy containing the checks that you want to run on a proxy server.
3. Select the **Proxy Settings** tab.
4. Select **Edit in Sandbox** to enable modifying fields on the form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Indicate whether you are assigning a single proxy agent or a proxy agent cluster to monitor the policy CIs.
   - Assign a single proxy agent by selecting **Single proxy agent** and selecting an agent.
   - Enable a proxy agent cluster by selecting **Multi-proxy agents by cluster**. Provide the name of the cluster in the field that appears.
6. Determine whether to select multiple proxy agents from the agents list through a filter or a script.
   - To select agents through a filter, configure a filter or retain or modify an existing filter when the **Multi-proxy agents by filter** option is selected.

     Note:
     - This field appears only when the **Hide Multi Proxy Agent by filter, if its not selected** property (*sys_ui_policy*) has been set to **active=false**.
     - If you remove the filter in an existing policy, the option disappears.

   - To select agents through a script:
     a. Select **Edit in Sandbox**.
     b. Clear any selected proxy options in the **Proxy Settings** tab.
     c. Select **Multi-proxy agents by script**.
     d. In the **Proxy script** field that appears, enter a script to assign services to different proxy agents as a form of load balancing.
7. Determine whether to load-balance the selected multi-proxy agents that monitor the matching CIs in the policy's **Monitored CIs** tab or have each agent monitor the matching CIs.
   - To load balance the selected multi-proxy agents that monitor the matching CIs, clear the **Run checks on all proxy agents (No load balancing)** option.

     For example, if you have five agents in a cluster or five agents using the filter/script option and 10 matching CIs in the policy, each agent would monitor two CIs.

     You can also enable load balancing at a later time, as described in Enable load balancing between proxy agents in a cluster.

   - To have each agent monitor all matching CIs, select the **Run checks on all proxy agents (No load balancing)** option.

     If there are 10 matching CIs in the policy, each agent would monitor all 10. For example, you might want to use this option for multiple proxy servers in different geographic locations.

     If an agent is not functioning properly, the monitored CIs are redistributed to another agent.

   Note:
   For existing or active policies, the **Run checks on all proxy agents (No load balancing)** option is enabled by default. For new and inactive policies, this option is turned off by default.

8. Select **Activate**.

Enable load balancing between proxy agents in a cluster

Enable load balancing between proxy agents in a cluster so that if an agent is not functioning properly, monitored CIs are redistributed to another agent. After enabling load balancing, you can view the CIs monitored by each proxy agent in a policy.

Before you begin

Ensure that you have upgraded to Tokyo patch 1 or San Diego patch 7.

Role required: agent_client_collector_user

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies**.
2. Select the policy containing the CIs you want the proxy agents to monitor.
3. Select the **Proxy Settings** tab.
4. Enable load balancing for the proxy agents by clearing the **Run checks on all proxy agents (No load balancing)** check box.
   Load balancing is enabled for the proxy agents monitoring the CIs. For example, if you have five agents and 10 matching CIs in the policy, each agent monitors two CIs.
5. In the **Related Links** section, select **Show distribution of proxy agent's CIs**.
   A pop-up window displays the distribution of monitored CIs among agents within the policy.

Configure the Google Cloud Platform (GCP) configuration data file

Add a Google Cloud Platform (GCP) configuration data file to a check definition or check instance. The GCP configuration data file enables you to monitor additional metrics than those that come with the base system.

Before you begin

Role required: agent_client_collector_admin

About this task

The GCP configuration data file is a .json file which contains all of the metrics to be sent to the Agent Client Collector (ACC) configuration file. Metrics that you upload to the *acc_grp_metrics_list.json* file are monitored by the check to which the file is attached.

Procedure

1. Create a .json file assign it the name, *acc_grp_metrics_list.json*.
2. Add the GCP metrics that you want the ACC check to monitor.
   For details on the available GCP metrics, see Google Cloud Platform (GCP) metrics.
3. Add the *acc_grp_metrics_list.json* file to a check definition or check instance.
   - When adding to a check definition: Add the file to the **Configuration Data Files** field.
   - When adding to a check instance: Add the file to the **Config Data Files** tab.

Agent Client Collector Monitoring reference

Reference topics provide additional information about Agent Client Collector Monitoring checks and policies.

Agent Client Collector Monitoring Footprint

The following table describes Agent Client Collector resource consumption.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters	Linux	Windows
Machine spec	Cent OS 8, 4 CPU Core, 8GB Memory	Windows Server 2019, 2 CPU, 4GB Memory
Network - (Agent > MID)	10.64 KB/s	350-400 byte/s
Network - (MID > Agent)	48 byte/s	5-15 byte/s
Average CPU Utilization	~1%	~3.89%
Max CPU per check	10 to 15%	15 to 20%
Memory overhead (avg)	~13.88 MB	~31.15 MB

Agent Client Collector Monitoring default checks and policies

Agent Client Collector Monitoring provides various default checks and policies.

Provided checks

The following tables list the default checks. You can edit these checks as needed. For more information about a specific check, see its Check Definitions page, as described in Checks and policies.

Linux

Type	Name	Description
Event	os.linux.check-process	Counts the number of running processes. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Event	os.linux.check-system-cpu	Checks the CPU usage percentage.
Event	os.linux.check-system-cpu-load	Checks the CPU data load percentage against the configured thresholds.
Event	os.linux.metrics-system-disk-usage	Checks the file system's mount points and metrics.
Event	os.linux.check-system-memory-percentage	Checks the memory usage percentage.
Event	os.linux.check-system-memory-swap	Checks the memory swap usage.
Event	os.linux.check-threads-count	Counts the number of threads running on the system. Sends an alert if that number is greater than the Warning or Critical threshold values.
Metric	os.linux.metrics-memory-vmstat	Collects vmstat memory metrics.
Metric	os.linux.metrics-process-status	Collects process status metrics provided to the metrics parameter.
Metric	os.linux.metrics-system-cpu	Collects CPU metrics, including cores.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux (continued)

Type	Name	Description
Metric	os.linux.metrics-system-cpu-load	Uses uptime to collect CPU load metrics.
Metric	os.linux.metrics-system-cpu-percentage	Collects CPU usage percentage metrics, including average CPU utilization percentage.
Metric	os.linux.metrics-system-disk	Collects disk metrics.
Metric	os.linux.metrics-system-disk-capacity	Collects disk capacity metrics.
Metric	os.linux.metrics-system-disk-usage	Collects disk usage metrics, providing total, used, and available disk memory, as well as the disk's percentage of memory used.
Metric	os.linux.metrics-system-memory	Collects memory metrics, providing data in KB.
Metric	os.linux.metrics-system-memory-percent	Collects memory percentage metrics.
Metric	os.linux.metrics-system-uptime	Collects system uptime in seconds.
Metric	os.linux.metrics-reboot-count-today	Collects the number of reboots performed today.

Linux Log Monitoring

Type	Name	Description
Event	util.check-logs	Enables monitoring log files owned by a regular user. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Event	util.check-logs-sudo	Enables monitoring log files owned by a root user. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.

Linux Network Monitoring

Type	Name	Description
Metric	os.linux.metrics-network-interface	Retrieves all network interface related metrics for Linux servers.
Metric	os.linux.metrics-netstat.tcp	Retrieves metrics on TCP socket states from netstat. Useful on high-traffic web or proxy servers with large numbers of short-lived TCP connections coming and going.

© 2025 ServiceNow, Inc. All rights reserved.

Windows Log Monitoring

Type	Name	Description
Event	os.windows.check-log	Enables monitoring log files on a Windows server.

Windows

Type	Name	Description
Event	os.windows.check-disk-name	Takes the storage drive name as input and verifies if the drive is present. Returns a CRITICAL\WARNING\OK value based on the parameter provided.
Event	os.windows.check-event-log	Measures the Windows event log against parameter thresholds and returns a CRITICAL\WARNING\OK event.
Event	os.windows.check-event-log-count	Measures the Windows event log against parameter thresholds and returns a CRITICAL\WARNING\OK event. Provides information on the number of events that have occurred within a specified duration for a single log file and a single ID. Also indicates the filters to be applied to retrieve events for a specific single-valued windows event level and provider name. Retrieving events from multiple log files is not supported. The number of events is provided, without details of each and every event.
Event	os.windows.check-event-log-details	Collects and filters Windows event logs based on the `duration_hour`, `event_log_level` and `log_file` values. Retrieves and filters Windows event logs according to the provided parameters. It returns details about the events with CRITICAL, WARNING, or OK status, based on the specified severity level. Supported on Windows version 7 and higher.
Event	os.windows.check-env-variables	Checks the environmental variables using a regular expression and returns either a *WARNING* or *OK* value. If a new system variable is created after agent installation, you must restart the agent. This check can access only those user variables that are associated with the current user (used during agent installation).
Event	os.windows.check-file-hashcode-update	Takes the file's path and MD5 hashcode as an input and verifies whether file content has been modified. Returns a *CRITICAL*, *WARNING*, or *OK* value. Read permissions are required on the monitored file.
Event	os.windows.check-file-update	Takes the file's path and interval as an input and verifies whether file content has been modified. Returns a *CRITICAL*, *WARNING*, or *OK* value.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows (continued)

Type	Name	Description
		Read permissions are required on the monitored file.
Event	os.windows.check-modules	Verifies whether the list of modules is present.
Event	os.windows.check-processor-queue-length	Checks Processor Queue Length.
Event	os.windows.check-system-cpu-load	Checks the CPU load by using the *typeperf* command.
Event	os.windows.check-system-disk	Checks disk usage under specific parameters.
Event	os.windows.check-system-memory	Collects RAM usage.
Event	os.windows.check-system-patch	Verifies system patch installation. Returns either a *WARNING* or *OK* value. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.
Event	os.windows.check-system-process	Checks the user's task list to find running processes.
Event	os.windows.check-user-account	Takes the list of user names as an input and verifies whether the user account is active. Returns a *CRITICAL*, *WARNING*, or *OK* value.
Event	os.windows.check-windows-directory	Checks if a directory exists.
Event	os.windows.check-windows-pagefile	Collects page file usage and compares it to the Warning and Critical thresholds. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.
Event	os.windows.check-windows-process	Checks if a user input process is running. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.
Event	util.check-windows-service	Checks if a user-supplied service is running on Windows. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Metric	os.windows.metrics-process-status	Retrieves the number of running instances, the percentage of CPU utilization, and the memory usage (in kilobytes) of the specified Windows process.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows (continued)

Type	Name	Description
		If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.
Metric	os.windows.metrics-processor-queue	Collects Processor Queue Length.
Metric	os.windows.metrics-system-cpu-load	Collects the average CPU load per second.
Metric	os.windows.metrics-system-disk-usage	Collects disk usage metrics. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.
Metric	os.windows.metrics-system-memory-percent	Collects RAM usage per second, providing free physical, free virtual, total physical and total virtual memory percentage. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.
Metric	os.windows.metrics-system-network	Collects network metrics.
Metric	os.windows.metrics-system-uptime	Collects system uptime.
Metric	util.metrics-windows-perf-counters	(No description)

MID Server

Type	Name	Description
Event	app.mid.check-active	Checks if the MID Server is active, based on the occurrence of LogStatusMonitor in the MID log.
Events	app.mid.check-logs-mid	Checks the MID logs for errors.
Metric	app.mid.metrics-stats	Collects MID Server information from the log and returns metrics.

HAProxy monitoring

Type	Name	Description
Event	check-haproxy	Retrieves the HAProxy load balancer details to determine whether it is running.
Metric	metrics-check-haproxy	Retrieves the HAProxy load balancer metrics to determine whether it is running.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP (to be run in proxy mode)

Type	Name	Description
Event	util.check-http-response	Takes a URL or a combination of host/path/port/ssl, and checks for a 200 response that matches a pattern, if provided. Can use client certificates.
Event	util.check-http-follow-redirect	Checks that the URL doesn't exceed the maximum number of redirects.
Metric	util.metrics-http-curl	Retrieves HTTP endpoint metrics using curl.

Additional HTTP checks (no policy)

Type	Name	Description
Event	util.check-http-response-code	Raises a critical event if the URL response code does not match the regex.

Active Directory Metrics

Type	Check	Description	Command
Metric	metrics.windows.active-directory	Collects Active Directory metrics on the Windows host. Usage: winchecks metric-windows-active-dir -s hostname	`winchecks metric-windows-active-dir {{if .labels.params_scheme}} -S {{.labels.params_scheme}} {{end}}`

Apache

Type	Event/Metric	Description	Minimum version
Metric	app.apache.metrics-apache	Retrieves Apache HTTP server metrics.	2.4.x

Apache Kafka

Type	Event/Metric	Description	Minimum version
Event	kafka.check-zookeeper-status	Raises a critical event if the hosted Kafka Zookeeper is down.	ZooKeeper 3.1.2
Event	kafka.check-topic-replicas	Raises a critical event if any topic has partitions with unknown replicas.	ZooKeeper 3.1.2
Event	kafka.check-topic-replication-factor	Raises a critical event if replication factor of at least one topic is above or below provided replication factor parameter.	ZooKeeper 3.1.2

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache Kafka (continued)

Type	Event/Metric	Description	Minimum version
Event	kafka.check-topic-leader	Raises a critical event if any topic has partitions with unknown leaders or unpreferred replica as leader.	ZooKeeper 3.1.2
Event	kafka.check-topic-partitions	Raises a critical event if the number of partitions for a topic is less the min_partitions param.	ZooKeeper 3.1.2
Event	kafka.check-broker-status	Raises a critical event if Kafka Broker on the host is down.	Kafka 0.10.1.0
Metric	kafka.metrics.broker	Collects Kafka Broker Metrics from the host.	Kafka 0.10.1.0
Metric	kafka.metrics.zookeeper	Collects Zookeeper Metrics from the host.	ZooKeeper 3.5.0-alpha

Azure k8s Metrics

Type	Event/Metric	Description	Command
Metric	azure.metrics-k8s-service	Provides pod, nodes, and cluster level metrics from all Azure Kubernetes services in metric form. Usage: metrics-azure-k8s-service.rb Command example: `metrics-azure-k8s-service.rb -S {{.labels.params_subscription_id}} -r westus2`	`metrics-azure-k8s-service.rb -r {{.labels.params_ci_region}} {{-s {{if.labels.params_subscrip -S {{.labels.params_subscripti {{end}}`

Azure VM Metrics

Type	Event/Metric	Description	Command
Metric	azure.metrics-vm-cpu	Provides CPU-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T cpu`	`metrics-azure-vm.rb -r {{.labels.params_ci_region}} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-disk	Provides disk-related metrics of each VM	`metrics-azure-vm.rb -r`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Metrics (continued)

Type	Event/Metric	Description	Command
		instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T disk`	`{{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-memory	Provides memory-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T memory`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-network	Provides network-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T network`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-flows	Provides flows-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T flows`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`

GCP GCE metrics

Type	Event/Metric	Description
Metric	gcp.metrics.GCE	Retrieves metrics from GCP for Google Compute Engine.
Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP GCE metrics (continued)

Type	Event/Metric	Description
Metric	glassfish.metric-server-resources	Provides metrics of the resources deployed on the Glassfish server.
Metric	glassfish.metric-transaction-service	Provides metrics for all transactions on applications deployed on the Glassfish server.
Metric	glassfish.metric-deployed-apps	Provides metric output of the applications deployed on the Glassfish server.
Metric	glassfish.metric-deployment-lifecycle	Provides lifecycle metrics applications deployed on the Glassfish server.

Glassfish

Type	Name	Description
Metric	glassfish.metric-jvm-level	Retrieves JVM metrics on the Glassfish server.
Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.
Metric	glassfish.metric-server-resources	Provides metrics of the resources deployed on the Glassfish server.
Metric	glassfish.metric-transaction-service	Provides metrics for all transactions on applications deployed on the Glassfish server.
Metric	glassfish.metric-deployed-apps	Provides metric output of the applications deployed on the Glassfish server.
Metric	glassfish.metric-deployment-lifecycle	Provides lifecycle metrics applications deployed on the Glassfish server.

IBM WebSphere AS

Type	Event/Metric	Description	Minimum version
Metric	app.websphere.metrics-websphere	Returns IBM WebSphere application server metrics. Ensure that the user running the agent has sufficient permissions to access the required	9

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM WebSphere AS (continued)

Type	Event/Metric	Description	Minimum version
		files in the `IBM Websphere AS` installation directories.	

IIS

Type	Event/Metric	Description	Minimum version
Event	app.iis.check-iis-alive	Checks if IIS is running.	-
Event	app.iis.check-iis-current-connections	Checks the number of current connections to the IIS server and their status, depending on the input. By default, all sites are connected to the IIS server.	-
Metric	app.iis.metrics-iis	Returns IIS metrics.	-

JBoss/WildFly

Type	Event/Metric	Description	Minimum version
Metric	app.jboss.metrics-jboss	Retrieves JBoss/WildFly server metrics. Ensure that the user running the agent has sufficient permissions to access the required files in the`JBoss/WildFly` installation directories.	16, 17

Kubernetes

Type	Event/Metric	Description	Command
Event	k8s.check-kube-apiserver-available	Checks if Kubernetes API server is up.	`check-kube-apiserver-available.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Event	k8s.check-kube-nodes-ready	Checks whether Kubernetes nodes are in ready-to-use state.	`check-kube-nodes-ready.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Event	k8s.check-kube-pods-pending	Measures the threshold by which pods are in the Pending state. Determine the threshold by setting the *`pending_timeout`* check parameter	`check-kube-pods-pending.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kubernetes (continued)

Type	Event/Metric	Description	Command
		value (default = 300 seconds).	
Event	k8s.check-kube-pods-restarting	Checks the pods that are restarting. Determine the threshold by setting the check parameter value (default = 10).	`check-kube-pods-restarting.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}} {{if .labels.params_restart}} -r {{.labels.params_restart}} {{end}}`
Event	k8s.check-kube-pods-running	Checks the pods that are in the running state. Configure the threshold in the *not_ready_time* check parameter, in seconds (default = 0).	`check-kube-pods-running.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}} {{if .labels.params_not_ready_time}} -time {{.labels.params_not_ready_time}} {{end}}`
Event	k8s.check-kube-pods-runtime	Checks whether pods are running longer than expected. Configure threshold in the check parameter (in seconds). You can configure both WARNING and CRITICAL thresholds.	check-kube-pods-runtime.rb {{if .labels.params_critical}} -c {{.labels.params_critical}} {{end}} {{if .labels.params_warning}} -w {{.labels.params_warning}} {{end}} {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}
Event	k8s.check-kube-service-available	Checks whether Kubernetes services are up and running. Add the list of services to be monitored in the services' *check_param* field as comma-separated values (without spaces). If you enter services that are not valid, the check fails.	`check-kube-pods-runtime.rb {{if .labels.params_critical}} -c {{.labels.params_critical}} {{end}} {{if .labels.params_warning}} -w {{.labels.params_warning}} {{end}} {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Metric	k8s.metrics-pods	Provides a pod count from all of the exposed services.	`metrics-pods.rb {{if .labels.params_api_server}} -s {{.labels.params__api_server }} {{end}}`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MsSQL

Type	Event/Metric	Description	Minimum version
Metric	app.msssql.metrics-mssql	Retrieves MSSQL database metrics.	2016
Metric	app.metrics-mssql-query	Generic MSSQL query class which accepts a query and dumps metrics.	2016

MySQL

Type	Event/Metric	Description	Minimum version
Event	app.mysql.check-mysql-alive	Checks if the MySQL database is running.	5.7, 8
Event	app.mysql.check-mysql-threads	Checks the number of running threads on the MySQL database. Depending on the input, it determines the status: OK, Warning, or Critical.	5.7, 8
Event	util.check-mysql-query	Checks the length of a MySQL query result set. Ensure that you use the native_password authentication method on the MySQL server when utilizing this check.	5.7, 8
Metric	app.mysql.metrics-mysql	Returns MySQL database metrics.	5.7, 8
Metric	app.mysql.metrics-mysql-processes	Returns MySQL database process metrics.	5.7, 8
Metric	util.metrics-mysql-query	Creates a formatted metric for the length of a MySQL query result set.	5.7, 8

MongoDB

Type	Event/Metric	Description	Minimum version
Event	app.mongodb.check-mongodb-alive	Monitors whether the MongoDB server is alive and creating alerts for the MongoDB server health status.	
Event	app.mongodb.check-mongodb-metrics	Creates alerts for any of the MongoDB metrics, based on the threshold limit.	
Metric	app.mongodb.metrics-mongodb	Returns metrics of the MongoDB server and all databases.	

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Oracle

Type	Event/Metric	Description	Minimum version
Event	app.oracle.check-oracle-alive	Checks if the Oracle database is running.	12c, 18c
Metric	app.oracle.metrics-oracle	Returns Oracle database metrics.	12c, 18c
Metric	util.metrics-oracle-query	Generic Oracle query class that accepts a query and dumps metrics.	12c, 18c

Oracle WebLogic AS

Type	Event/Metric	Description	Minimum version
Metric	app.weblogic.metrics-weblogic	Returns Oracle WebLogic application server metrics. Ensure that the user running the agent has sufficient permissions to access the required files in the `WebLogic` installation directories.	12cR2

Tomcat

Type	Event/Metric	Description	Minimum version
Metric	app.tomcat.metrics-tomcat	Returns Apache Tomcat server metrics.	8.5.27, 9.x

App

Type	Name	Description
Event	util.check-snmp	SNMP check that compares the metric value to the default. Requires input such as server, port, SNMP community, and limits.
Metric	util.metrics-snmp	Collects metrics from an SNMP OID value.
Metric	util.metrics-snmp-bulk-sn	Collects metrics from an SNMP Table OID and returns the result as a table.

Service enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Metric (Windows)	os.windows.metrics-service-status	Collects Windows service status, providing metric of number of services running.	`winchecks metric-windows-service-status -S Wcmsvc --scheme hostname.proc`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Varnish

Type	Name	Description
Metric	app.varnish.metrics-varnish	Collects Varnish metrics from the host.

vSphere

Type	Name	Description
Metric	vsphere.metric-VirtualMachine	Retrieves metrics for the vSphere Virtual Machine.
Metric	vsphere.metric-Datastore	Retrieves metrics for the vSphere Datastore.
Metric	vsphere.metric-Datacenter	Retrieves metrics for the vSphere Datacenter.
Metric	vsphere.metric-ESX_Server	Retrieves metrics for the vSphere ESX Server or HostSystem

Zscaler

Type	Name	Description
Metric	zscaler-monitoring-check	Verifies whether the Zscaler app is running properly.
Metric	zscaler-remediation-check	Shuts down and restarts the Zscaler app, and creates an incident. Runs only when the zscaler-monitoring-check fails.

CPU enhancements

Type	Event/Metric	Description	Command
Metric	os.windows.metrics-system-cpu	Collects CPU core metrics. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	`winchecks metric-windows-cpu --scheme hostname.proc`

Disk enhancements - Linux events (can be associated with any policy)

Event/Metric	Description	Command
os.linux.check-disk-ioTimeWeighted	Measures the `disk ioTimeWeighted` value, returning a **CRITICAL**	`check-disk-ioTimeWeighted.rb`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disk enhancements - Linux events (can be associated with any policy) (continued)

Event/Metric	Description	Command
	\WARNING\OK message, according to the thresholds specified in the parameters.	
os.linux.check-disk-sectorsWritten	Measures the total number of sectors written successfully, returning a **CRITICAL \WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-sectorsWritten.rb`
os.linux.check-disk-sectorsRead	Measures the disk's total number of sectors read successfully, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-sectorsRead.rb`
os.linux.check-disk-readTime	Measures the total number of milliseconds spent by all read- against thresholds, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-readTime.rb`
os.linux.check-disk-writes	Measures the total number of writes completed successfully, returning a **CRITICAL \WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writes.rb`
os.linux.check-disk-reads	Measures the total number of reads completed successfully, returning a **CRITICAL \WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-reads.rb`
os.linux.check-disk-writesMerged	Measures the `disk writesMerged` value, returning a **CRITICAL \WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writesMerged.rb`
os.linux.check-disk-readsMerged	Measures the `disk readsMerged` value, returning a **CRITICAL \WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-readsMerged.rb`

Disk enhancements - Linux events (can be associated with any policy) (continued)

Event/Metric	Description	Command
os.linux.check-disk-writeTime	Measures the total number of milliseconds spent by all write operations, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writeTime.rb`
os.linux.check-disk-ioInProgress	Measures the `disk ioInProgress` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioInProgress.rb`
os.linux.check-disk-iotime	Measures the `disk ioTime` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioTime.rb`

Disk enhancements - Windows events (can be associated with any policy)

Event/Metric	Description	Command
os.windows.check-disk-AvgSecWrite	Measures average disk writes per second, returning a **CRITICAL\WARNING\OK** message, according to the specified in the parameters. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	`winchecks check-windows-AvgDisksec-write -w 1 -c 0`
os.windows.check-disk-ReadBytes-sec	Measures the `disk ReadBytes` value per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	`winchecks check-windows-DiskReadBytes-sec -w 1 -c 0`
os.windows.check-disk-WriteBytes-sec	Measures the `disk WriteBytes` value per second, returning a **CRITICAL\WARNING\OK** message,	`winchecks check-windows-DiskWriteBytes-sec -w 1 -c 0`

Disk enhancements - Windows events (can be associated with any policy) (continued)

Event/Metric	Description	Command
	according to the thresholds specified in the parameters. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	
os.windows.check-disk-AvgSecRead	Measures the average disk reads per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	`winchecks check-windows-AvgDisksec-read -w 1 -c 0`

Disk enhancements - Windows metrics (can be associated with any policy)

Event/Metric	Description	Command
os.windows.metrics-system-disk	Collects the following disk metrics: • AvgDiskSecPerRead • AvgDiskSecPerWrite • DiskReadBytesPerSec • DiskWriteBytesPerSec If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	`winchecks metric-windows-disk`

Memory enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Event (Linux)	os.linux.check-free-physical-memory	Measures the free physical memory percentage of the Linux system, returning a **CRITICAL\WARNING\OK** event message, according	`check-free-physical-memory -w 10 -c 5`

Memory enhancements (can be associated with any policy) (continued)

Type	Event/Metric	Description	Command
		(WMIC), this check does not run.	
Metric (Windows)	os.windows.metrics-system-memory	Collects the following memory metrics: • FreePhysicalMemory • TotalPhysicalMemory • FreeVirtualMemory • TotalVirtualMemorySize • AvailableMemory • TotalVisibleMemorySize	`winchecks metric-windows-memory --scheme hostname.proc`

Process enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Event (Linux)	os.linux.check-process-cpu	Measures the Linux process CPU usage, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-process-cpu.rb -p acc -c 95 -w 85`
Event (Linux)	os.linux.check-process-memory	Measures the Linux process memory usage, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-process-memory.rb -p acc -c 95 -w 85`
Metric (Linux)	os.linux.metrics-process-usage	Collects the Linux process status, including the CPU and memory data used by the process.	`metrics-process-usage.rb -p acc -s hostname.proc`
Event (Windows)	os.windows.check-process-cpu	Measures the Windows process CPU usage, returning a **CRITICAL\WARNING\OK** message according to the thresholds specified in the parameters.	`winchecks check-windows-process-cpu-p acc -c 95 -w 85`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process enhancements (can be associated with any policy) (continued)

Type	Event/Metric	Description	Command
		If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	
Event (Windows)	os.windows.check-process-memory	Measures the Windows process memory usage, returning a **CRITICAL\WARNING\OK** message according to the thresholds specified in the parameters. If the Windows server in use does not support Windows Management Instrumentation Command-line (WMIC), this check does not run.	`winchecks check-windows-process-memory-p acc -c 95 -w 85`
Metric (Windows)	os.windows.metrics-process-usage	Collects the Windows process status, including the CPU and memory data used by the process.	`winchecks metric-windows-process-status -n Svchost -s hostname.proc`

Supported Agent policies

This table lists the supported Agent Client Collector for Monitoring policies that the check definitions are associated with. The policies consist of the monitored CIs and the checks that run on them.

Name	Description	Checks
Apache Events	Monitors operational Apache HTTP web servers. To enable monitoring if the process is alive, activate the relevant check: • For Linux: os.linux.check-process • For Windows: os.windows.check-windows-process	• os.linux.check-process • os.windows.check-windows-process

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	On the **Credentials** tab, specify Basic Auth Credentials.	
Apache Metrics	Monitors operational Apache HTTP web servers. On the **Credentials** tab, specify Basic Auth Credentials.	app.apache.metrics-apache
Apache Kafka Events	Monitors the status of Kafka Broker, Kafka topics, partictions, replicas and Zookeeper.	
Apache Kafka Metrics	Monitors and collects metrics from Kafka Broker and Kafka Zookeeper.	

Azure DB Metrics	Monitors Azure databases on an Azure datacenter.
	
	To enable the policy's checks:
	• Configure a proxy agent.
	• Add the following Azure service principal credentials:
	  ○ Tenant ID
	  ○ Client ID
	  ○ Secret Key
	• Configure the Authentication Method as **Client secret**.
	• Add Azure credentials in the policy.
	• Provide the *subscription_id* value in each check instance.
	
	The default monitored CI Type is cmdb_ci_azure_datacenter, but the binding occurs on the Cloud Database (cmdb_ci_cloud_database).
	
	For details on configuring a policy, see Create a new Agent Client Collector policy.	

Azure k8s Service Metrics	Monitors the Azure CI, *cmdb_ci_azure_datacenter*. Binds with the Kubernetes data cluster, *cmdb_ci_kubernetes_cluster*.	azure.metrics-k8s-service For details, see Azure Health Monitoring default checks and policies.
Azure VM Metrics	Monitors the Azure CI, *cmdb_ci_azure_datacenter*. Binds with the virtual machine instance, *cmdb_ci_vm_instance*.	• azure.metrics-vm-cpu • azure.metrics-vm-disk • azure.metrics-vm-memory • azure.metrics-vm-network • azure.metrics-vm-flows

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
		For details, see Azure Health Monitoring default checks and policies.
Basic Discovery	Runs basic ServiceNow Discovery on all agents, every 12 hours. This check extracts basic information about the host and its running processes. The host information is used to create the corresponding host in the CMDB, while the running processes create the classified application CIs. You need advanced OS privileges to use the Net stat command to discover ports. The command that you run depends on your OS, as follows: • Linux: `sudo -n netstat -antp` • Windows: `netstat -anop TCP`	check-discovery-basic
Docker Container Metrics	Collects performance metrics for Docker containers. Provide the credentials of users who are Docker user group members or have sudo rights. Provide these credentials on the **Credentials** tab of the policy form.	container.docker.metrics-docker
Docker Engine Metrics	Collects general metrics for the Docker engine. Provides the credentials of a user which is either a member of the Docker user group or has been assigned sudo rights on the **Credentials** tab. To enable running checks through this policy, add the servicenow user to the Docker user group on the machine where the agent is running.	container.docker.metrics-docker-info
F5 SNMP Events	Example for using SNMP checks. Because the Agent doesn't run on SNMP devices, provide the following to complete this policy: • A Proxy Agent and credentials. • The host of the Proxy Agent. On the **Credentials** tab, specify the SNMP Community Credentials for connecting to the server.	util.check-snmp

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
F5 SNMP Metrics	Example for using SNMP metrics. Because the Agent doesn't run on SNMP devices, provide the following to complete this policy: • Proxy Agent and credentials. • The host of the Proxy Agent. On the**Credentials** tab, specify the SNMP Community Credentials for connecting to the server.	• util.metrics-snmp • util.metrics-snmp-bulk-sn
Glassfish Metrics	Runs metric checks on the Glassfish server. Glassfish metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HAProxy Events	Retrieves the HAProxy load balancer details to determine whether it is running. HAProxy events are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HAProxy Metrics	Retrieves the HAProxy load balancer metrics to determine whether it is running. HAProxy metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HTTP Entry Points Events	Runs the util.check-http-follow-redirect check on all HTTP entry points that belong to application business services. The policy filter chooses the services. The services define the entry points. • To enable this check, there is a new database view which combines the application services table with the entry points table. • You can filter the services and receive the entry points. • When you receive an alert, it is automatically bound to the entry points. This alert affects the impact calculation, because entry points are considered. • This policy requires a Proxy Agent.	util.check-http-follow-redirect
HTTP Entry Points Metrics	For example, when the alert is bound to the entry point, the service map identifies an entry point problem.	util.metrics-http-curl

Name	Description	Checks
	• The metric binds to the entry point CI. In previous releases, the metric was bound to the service and the entry point was the resource. • This policy requires a Proxy Agent.	
IIS Events	Monitors operational IIS servers.	• app.iis.check-iis-alive • app.iis.check-iis-current-connections
IIS Metrics	Monitors operational IIS servers.	app.iis.metrics-iis
JBoss/WildFly Application Server Events	Monitoring operational JBoss/WildFly application servers. To enable monitoring if the JBoss process is alive, activate os.linux.check-process. The *jboss_home* parameter in the check instance is specified as the location where JBoss is installed.	os.linux.check-process
JBoss/WildFly Application Server Metrics	Monitors operational JBoss/WildFly application servers.	app.jboss.metrics-jboss
Kubernetes	Monitors health of Kubernetes infrastructure, such as clusters, nodes, pod status, API, and service availability. When running Kubernetes checks: • Proxy agent must be enabled. • Enter Kubernetes credentials, either a username/password combination or a bearer token (but not both). • To activate and publish the policy, configure the *api_server* value in the check parameter definitions of each check, as one of the following: ◦ `https://127.0.0.1:<portnumber>/api` (If the API server and agent are running on the same server) ◦ `https://<api_server_url>/api` (Whether the API server and agent are running on the same or different servers).	• k8s.check-kube-apiserver-available • k8s.check-kube-nodes-ready • k8s.check-kube-pods-pending • k8s.check-kube-pods-restarting • k8s.check-kube-pods-running • k8s.check-kube-pods-runtime • k8s.check-kube-service-available • k8s.metrics-pods

Name	Description	Checks
	To use the localhost as your api_server, run the following command: `"kubectl proxy -port=8081 &"` • Run Discovery to discover all Kubernetes CIs. For details, see Kubernetes discovery.	
Linux log monitoring	Monitors logs on operational Linux servers.	• util.check-logs • util.check-logs-sudo
Linux OS Events	Runs Linux checks on operational Linux servers.	• os.linux.check-process • os.linux.check-system-cpu • os.linux.check-system-cpu-load • os.linux.check-system-disk-usage • os.linux.check-system-memory-percentage • os.linux.check-system-memory-swap • os.linux.check-threads-count
Linux OS Metrics	Collects Linux metrics on operational Linux servers.	• os.linux.metrics-memory-vmstat • os.linux.metrics-process-status • os.linux.metrics-system-cpu • os.linux.metrics-system-cpu-load • os.linux.metrics-system-disk • os.linux.metrics-system-disk-capacity • os.linux.metrics-system-disk-usage • os.linux.metrics-system-memory • os.linux.metrics-system-memory-percentage • os.linux.metrics.reboot_count_today

Name	Description	Checks
MSSQL Events	Monitors the operational MSSQL server process. Runs os.windows.check-windows-process to monitor when the server process is alive.	os.windows.check-windows-process
MSSQL Metrics	Monitors operational MSSQL server process. Runs app.mssql.metrics-mssql to gather metrics.	app.mssql.metrics-mssql
MySQL DB Events	Monitors operational MySQL instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.mysql.check-mysql-alive • app.mysql.check-mysql-threads • util.check-mysql-query
MySQL DB Metrics	Monitors operational MySQL instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.mysql.metrics-mysql • app.mysql.metrics-mysql-processes • util.metrics-mysql-query
Network ping metrics	Monitors the ip address discovered in the ServiceNow instance. The cmdb_ci_hardware monitored CI type is bound to the relevant server: This policy requires a proxy agent.	util.metrics-ping
Oracle DB Events	Monitors operational Oracle Database instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	app.oracle.check-oracle-alive
Oracle DB Metrics	Monitors operational Oracle Database instances.	• app.oracle.metrics-oracle • util.metrics-oracle-query

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	
Self-Healing Events	Runs a ping command to another host. Ensure that you run this check in proxy mode.	util.check-ping
Tomcat Events	Monitors operational Apache Tomcat servers. To enable monitoring if the Tomcat process is alive, activate the relevant check: • For Linux: os.linux.check-process • For Windows: util.check-windows-service If the Tomcat service is running under a different name, update the value of the check instance's *service* parameter to the correct value.	• os.linux.check-process • util.check-windows-service
Tomcat Metrics	Monitors operational Apache Tomcat servers. If Tomcat Metrics are running on a port other than the default port (9000), update the value of the check instance's *port* parameter to the correct port value.	app.tomcat.metrics-tomcat
Varnish Metrics	Monitors and collects metrics from Varnish. Varnish metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store. You must perform discovery using application fingerprints before running Varnish checks. For details, see Enable running of Varnish checks.	
vSphere Metrics	Monitors and collects metrics from vSphere. vSphere metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store. This policy requires a proxy agent.	
WebLogic Application Server Events	Monitors operational Oracle WebLogic application servers. This policy monitors if the WebLogic process running on Linux is alive.	os.linux.check-process

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	
WebLogic Application Server Metrics	Monitors operational Oracle WebLogic application servers. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server. Ensure that the user running the agent has sufficient permissions to access the required files in the `WebLogic` installation directories.	app.weblogic.metrics-weblogic
WebSphere Application Server Events	Monitors operational IBM WebSphere servers. This policy monitors if the WebSphere process running on Linux is alive. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	os.linux.check-process
WebSphere Application Server Metrics	Monitors operational IBM WebSphere servers. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	app.websphere.metrics-websphere
Windows Log Monitoring	Monitors logs on operational Windows servers.	os.windows.check-log You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Windows OS Events	Runs Windows checks on operational Windows servers.	• os.windows.check-processor-queue-length • os.windows.check-system-cpu-load • os.windows.check-system-disk • os.windows.check-system-memory • os.windows.check-system-process • os.windows.check-windows-directory

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
		• os.windows.check-windows-directory • os.windows.check-windows-directory • os.windows.check-windows-pagefile • os.windows.check-windows-process
Windows OS Events - Extended	Runs Windows checks to monitor directories and files on Windows servers.	• check-directory-file-count • check-directory-integrity • check-file-age • check-file-response-time • check-file-size • check-file-space • os.windows.check-directory-space
Windows OS Metrics	Collects Windows metrics on operational Windows servers.	• os.windows.metrics-processor-queue-len • os.windows.metrics-system-cpu-load • os.windows.metrics-system-disk-usage • os.windows.metrics-system-memory-percent • os.windows.metrics-system-network • os.windows.metrics-system-uptime
Zscaler Monitoring Policy	Executes Zscaler monitoring on all of a machine's CIs.	• zscaler-monitoring-check • zscaler-remediation-check

Active Directory metrics

The following table lists the metrics that are gathered as output from Active Directory checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active Directory metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
active_dir.DRA_Inbound_Bytes_after_compressed/sec			Shows the compressed size of inbound compressed replication data (size after compression, from DSAs in other sites).
active_dir.DRA_Inbound_Bytes_before_compressed/sec			Shows the original size of inbound compressed replication data (size before compression, from DSAs in other sites).
active_dir.DRA_Inbound_Bytes_not_compressed/sec			Shows the number of incoming bytes replicated that were not compressed at the source (that is, from DSAs in the same site).
active_dir.DRA_Inbound_Bytes_Total/sec (featured metric)			Shows the total number of bytes replicated in. This counter is the sum of the number of uncompressed bytes (never compressed) and the number of compressed bytes (after compression).
active_dir.DRA_Inbound_Full_Sync_Objects_Remaining (featured metric)			Shows the number of objects remaining until the full synchronization is completed (when set).
active_dir.DRA_Inbound_Object_Updates_Remaining_in_Packet			Shows the number of object updates received in the current directory replication update packet that have not yet been applied to the local server.
active_dir.DRA_Inbound_Objects/sec			Shows the rate at which replication updates received from

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			replication partners are applied by the local directory service. This counter excludes changes that are received but not applied (because, for example, the change has already been made). This indicates how much replication update activity is occurring on the server as a result of changes generated on other servers.
active_dir.DRA_Inbound_Objects_Applied/sec			Shows the number of objects received from inbound replication partners that contained no updates that needed to be applied.
active_dir.DRA_Inbound_Objects_Filtered/sec			Shows the number of objects received from neighbors through inbound replication. A neighbor is a domain controller from which the local domain controller replicates locally.
active_dir.DRA_Inbound_Properties_Applied/sec			Shows the number of properties that are updated due to the incoming property's winning the reconciliation logic that determines the final value to be replicated.
active_dir.DRA_Inbound_Properties_Filtered/sec			Shows the number of property changes that are received during the replication that we have already seen.
active_dir.DRA_Inbound_Properties_Total/sec			Shows the total number of object

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			properties received from inbound replication partners.
active_dir.DRA_Inbound_Values_DNs/sec			Shows the number of object property values received from inbound replication partners that are distinguished names (DNs) that reference other objects. DN values, such as group or distribution list memberships, are generally more expensive to apply than other kinds of values.
active_dir.DRA_Inbound_Values_Total/sec			Shows the total number of object property values received from inbound replication partners. Each inbound object has one or more properties, and each property has zero or more values. Zero values indicate property removal.
active_dir.DRA_Outbound_Bytes_after_compressed/sec			Shows the compressed size of outbound compressed replication data (size after compression, from DSAs in other sites).
active_dir.DRA_Outbound_Bytes_before_compressed/sec			Shows the original size of outbound compressed replication data (size before compression, from DSAs in other sites).
active_dir.DRA_Outbound_Bytes_not_compressed/sec			Shows the number of bytes replicated

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			out that were not compressed (that is, from DSAs in the same site).
active_dir.DRA_Outbound_Bytes_Total/sec (featured metric)			Shows the total number of bytes replicated out. This counter is the sum of the number of uncompressed bytes (never compressed) and the number of compressed bytes (after compression).
active_dir.DRA_Outbound_Objects/sec			Shows the number of objects that were determined by outbound replication to have no updates that the outbound partner did not already have.
active_dir.DRA_Outbound_Objects_Filtered/sec			Shows the number of objects replicated out.
active_dir.DRA_Outbound_Properties/sec			Shows the number of properties replicated out.
active_dir.DRA_Outbound_Values_DNs/sec			Shows the number of object property values containing DNs sent to outbound replication partners. DN values, such as group or distribution list memberships, are generally more expensive to read than other kinds of values.
active_dir.DRA_Outbound_Values_Total/sec			Shows the number of object property values sent to outbound replication partners.
active_dir.DRA_Pending_Replication_Synchronizations			Shows the number of directory synchronizations that are queued for this

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			server but not yet processed.
active_dir.DRA_Sync_Requests_Made			Shows the number of synchronization requests made to neighbors.
active_dir.DS_Threads_in_Use (featured metric)			Shows the current number of threads in use by the directory service (which is different from the number of threads in the directory service process). This is the number of threads currently servicing client API calls; it can be used to indicate whether additional processors should be used.
active_dir.LDAP_Bind_Time (featured metric)			Shows the time, in milliseconds, taken for the last successful LDAP bind.
active_dir.LDAP_Client_Sessions (featured metric)			Shows the number of currently connected LDAP client sessions.
active_dir.LDAP_Searches/sec (featured metric)			Shows the rate at which LDAP clients perform search operations.
active_dir.LDAP_Successful_Binds/sec (featured metric)			Shows the number of LDAP binds per second.

Apache Kafka default checks and policies

Agent Client Collector provides the following policies for Apache Kafka health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

Apache Kafka Topic Events

Check	Description	Usage	Output
kafka.check-zookeeper-status	Raises a critical event if the hosted Kafka Zookeeper is down.	`commonchecks check-kafka-zk-status` [flags] Where the flags are: `-p, --port =` Zookeeper Port (default "2181"). Usage example: `commonchecks check-kafka-zk-status -p 2181`	Kafka Zookeeper Status OK: Kafka Zookeeper is Up!
kafka.check-topic-replicas	Raises critical event if any topic has partitions with unknown replicas.	`commonchecks check-kafka-replicas` [flags] Where the flags are: • `-p, --port =` Zookeeper Port (default "2181"). • `-d, --detailed` = Lists unknown replicas in each partition of a topic. • `-i, --include_list` = Comma seperated list to include topics (allows * wild character) • `-e, --exclude_list` = Comma seperated list to exclude topics (allows * wild character) Usage example: commonchecks check-kafka-replicas -H localhost -p 2181 -i "test*" -e "accTopic,*offsets" -d	<topic> has partitions with unknown replicas. Unknown replicas are: {"0":["0"],"1":["0"],"2":["0"]}. <topic> has partitions with unknown replicas. Unknown replicas are: {"0":["0"]}.
kafka.check-topic-replication-factor	Raises critical event if replication factor of at least one topic is above or below	`commonchecks check-kafka-rf` [flags]	TestTopic has replication factor 1,

Check	Description	Usage	Output
	provided replication factor param.	Where the flags are: • `-p, --port =` Zookeeper Port (default "2181"). • `-d, --detailed` = Lists unknown replicas in each partition of a topic. • `-i, --include_list` = Comma separated list to include topics (allows * wild character) • `-e, --exclude_list` = Comma separated list to exclude topics (allows * wild character) • `-r, --replication factor` = Expected replication factor for a topic (default 1) Examples: `commonchecks check-kafka-partitions -H localhost -p 2181 -r 2 -i "accMetrics,*Topic" -e "testTopic"`	which is less than expected: 2. accMetrics has replication factor 1, which is less than expected: 2.
kafka.check-topic-leader	Raises critical event if any topic has partitions with unknown leaders or unpreferred replica as leader.	`commonchecks check-kafka-leader` [flags] Where the flags are • `-p, --port` = Zookeeper Port (default "2181"). • `-d, --detailed` = A list of partitions in each topic with	<topic> contains, partitions with unpreferred replica as leader.(partitions with unpreferred replicas are [0]). <topic> contains, partitions with unpreferred replica as leader.(partitions with

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache Kafka Topic Events (continued)

Check	Description	Usage	Output
		list to exclude topics (allows * wild character)	
		Usage example 1: `commonchecks check-kafka-partitions -H localhost -p 2181 -P 3`	<topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3.
		Usage example 2: commonchecks check-kafka-partitions -H localhost -p 2181 -P 3 -i "accMetrics,*Topic" -e "testTopic"	<topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3.

Note:
Values for include_list and exclude_list parameters have to be wrapped between double quotes. For example: "test1,*topic".

Apache Kafka Broker Events

Check	Description	Usage	Output
kafka.check-broker-status	Raises critical event if Kafka Broker on the host is down.	`commonchecks check-kafka-broker-status` [flags] Where the flags are: `-p, --port` = Kafka Broker port (default "9092"). Usage example: `commonchecks check-kafka-broker-status -p 9092`	Kafka Broker Status OK: Kafka Broker ubuntu20:9092 is Up!

Apache Kafka Broker Metrics

Check	Description	Usage	Output
kafka.metrics.broker	Collects Kafka Broker Metrics from the host.	`commonchecks metric-kafka-broker` [flags] Where the flags are: • `-J, --javapath` = Java executable path (default "java"). • `-j, --jmxport` = JMX Port (default "9999") Usage example: `commonchecks metric-kafka-broker -J "/usr/bin/java" -j 9999`	hostname.Kafka.Broker.ReplicaManage 0.000 hostname.Kafka.Broker.DelayedOperati 627.000 hostname.Kafka.Broker.ControllerStats. 0.000 hostname.Kafka.Broker.RequestMetrics 0.000

Apache Kafka Zookeeper Metrics

Check	Description	Usage	Output
kafka.metrics.zookeeper	Collects Zookeeper Metrics from the host.	`commonchecks metric-kafka-zookeeper` [flags] Where the flag is: `-p, --adminserverport` = Admin Server Port (default "8085") Usage example: `commonchecks metric-kafka-zookeeper -p 8085`	hostname.Kafka.Zookeeper.outstanding 2.000 1648183249 hostname.Kafka.Zookeeper.avg_latency 1.05 1648183249 hostname.Kafka.Zookeeper.num_alive_ 1.000 1648183249 hostname.Kafka.Zookeeper.open_file_d 124.000 1648183249

Apache Kafka metrics

The following table lists the metrics that are gathered as output from Kafka checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Broker metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Broker.RequestMetrics.TotalTimeMs.FetchConsumer.Mean (featured metric)			Total time (in ms) to serve the Consumer request.
Kafka.Broker.RequestMetrics.TotalTimeMs.FetchFollower.Mean (featured metric)			Total time (in ms) to serve the Follower request.
Kafka.Broker.RequestMetrics.TotalTimeMs.Produce.Mean (featured metric)			Total time (in ms) to serve the Producer request.
Kafka.Broker.BrokerTopicMetrics.BytesOutPerSec.OneMinuteRate (featured metric)			Aggregate outgoing byte rate.
Kafka.Broker.BrokerTopicMetrics.BytesInPerSec.OneMinuteRate (featured metric)			Aggregate incoming byte rate.
Kafka.Broker.ReplicaManager.UnderReplicatedPartitions.Value			Number of unreplicated partitions.
Kafka.Broker.ReplicaManager.IsrExpandsPerSec.OneMinuteRate			Rate at which the pool of in-sync replicas (ISRs) shrinks.
Kafka.Broker.ReplicaManager.IsrShrinksPerSec.OneMinuteRate			Rate at which the pool of in-sync replicas (ISRs) shrinks.
Kafka.Broker.KafkaController.ActiveControllerCount.Value (featured metric)			Number of active controllers in cluster.
Kafka.Broker.KafkaController.OfflinePartitionsCount.Value			Number of offline partitions.
Kafka.Broker.ControllerStats.LeaderElectionRateAndTimeMs.OneMinuteRate (featured metric)			Leader election rate and latency.
Kafka.Broker.ControllerStats.UncleanLeaderElectionsPerSec.OneMinuteRate			Number of unclean elections per second.
Kafka.Broker.DelayedOperationPurgatory.PurgatorySize.Fetch.Value			Number of requests waiting in fetch purgatory.
Kafka.Broker.DelayedOperationPurgatory.PurgatorySize.Produce.Value			Number of requests waiting in producer purgatory.
Kafka.Broker.RequestMetrics.RequestsPerSec.Produce.OneMinuteRate (featured metric)			Number of producer requests per second.
Kafka.Broker.RequestMetrics.RequestsPerSec.FetchConsumer.OneMinuteRate (featured metric)			Number of consumer requests per second.

Broker metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Broker.RequestMetrics.RequestsPerSec.FetchFollower.OneMinuteRate (featured metric)			Number of follower requests per second.

Zookeeper metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Zookeeper.outstanding_requests (featured metric)			Number of requests queued.
Kafka.Zookeeper.avg_latency (featured metric)			Average amount of time it takes to respond to a client request (in ms).
Kafka.Zookeeper.num_alive_connections (featured metric)			Number of clients connected to ZooKeeper.
Kafka.Zookeeper.open_file_descriptor_count			Number of file descriptors in use.
Kafka.Zookeeper.pending_syncs			Number of pending syncs from followers.
Kafka.Zookeeper.followers			Number of active followers.

AWS Health Monitoring default checks and policies

Agent Client Collector provides the following default checks and policies for AWS monitoring.

AWS Metrics policy

Type	Check	Description	Usage	Usage example
Metric	aws.metrics-ec2	Returns metrics of all EC2 instances in a AWS Datacenter.	metrics-ec2.rb (options) -F, --filter FILTER String representation of the filter to filter EC2 instances by tags. -b, --batch_size BATCH_SIZE Batch size. Number of instances to	`./metrics-ec2.rb -F "{name:tag:environment,v [ENV1,ENV2]} {name:tag:Name,values: [Instance1,Instance2]}"` Provide the filter string along with double quotes ("") around the filter parameter. Set the *batch_size*

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
			fetch metrics in parallel. (Default value: 10)	parameter according to the agent environment.
Metric	aws.metrics-ebs	Returns metrics of all EBS volumes in an AWS datacenter.	metrics-ebs.rb (options) -F, --filter FILTER String representation of the filter to filter EBS Volumes by Tags. -b, --batch_size BATCH_SIZE Batch size. Number of volumes to fetch metrics parallelly. (Default value: 10)	`./metrics-ebs.rb -F "{name:tag:environment,values:[ENV1,ENV2]} {name:tag:Name,values:[Volume1,Volume2]}"` Provide filter string along with double quotes ("") for the filter parameter. Set the *batch_size* parameter according to the agent environment.
Metric	aws.metrics-s3	Returns metrics of all S3 buckets in an AWS datacenter.	metrics-s3.rb (options) -b, --batch_size BATCH_SIZE Batch size. Number of S3 buckets to fetch metrics in parallel. (Default value: 10)	`./metrics-s3.rb -b 5` Set the *batch_size* parameter according to the agent environment.
Metric	aws.metrics-rds	Returns metrics of all RDS buckets in an AWS datacenter.	metrics-rds.rb (options) -F, --filter FILTER String representation of the filter to filter RDS Instances by tags. -b, --batch_size BATCH_SIZE Batch size. Number of	`./metrics-rds.rb -F "{name:tag:environment,values:[ENV1,ENV2]} {name:tag:engine,values:[MariaDB]}"` Provide the filter string with double quotes ("") around the filter parameter. Set the *batch_size*

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
			databases to fetch metrics in parallel. (Default value: 10)	parameter according to the agent environment.
Metric	aws.metrics-classic-elb	Returns metrics of all classic elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains one of the comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t classic -e "classic,itom,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment.
Metric	aws.metrics-network-elb	Returns metrics of all network elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains any of the comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t network -e "vpc,itom,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment. Do not change the command prefix.

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
Metric	aws.metrics-application-elb	Returns metrics of all application elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains any one of the string from comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t application -e "classic,app,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment. Do not change the command prefix.

Metric	aws.metrics-ec2-count	Returns count of EC2 instances by instance_type or status in an AWS datacenter.	metrics-ec2-count.rb (options)
			
			-s, --scheme SCHEME Metric naming scheme, text to prepend to metric. Default: aws.ec2
			
			-t, --type METRIC type Count by type: status, instance. Default: instance
				`./metrics-ec2-count.rb -t status`
				
				`./metrics-ec2-count.rb -t status -s metric.aws.ec2`

AWS DynamoDB metrics

Type	Check	Description	Usage	Command
Metric	aws.metrics-dynamodb	Monitors the health of DynamoDB tables in an AWS datacenter.	e, --exclude_tb EXCLUDE_TB Exclude metrics from tables whose name	`metrics-dynamodb.rb -r {{.labels.params_ci_reg` `{{.labels.params_exclud` `-f`

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWS DynamoDB metrics (continued)

Type	Check	Description	Usage	Command
		Binds to the DynamoDB table (cmdb_ci_dynamodb_table)	contains a string from comma separated strings. b, --batch_size BATCH_SIZE Batch size. Number of tables to fetch metrics in parallel. (Default value: 10)	{{.labels.params_exclud {{end}} {{.labels.params_batch_ -b {{.labels.params_filter {{end}}

AWS EC2 metrics

Type	Check	Description	Usage	Command
Metric	aws.metrics-ecs-cluster	Monitors ECS clusters in an AWS datacenter. Binds to the AWS ECS Cluster CI type (cmdb_ci_cloud_ecs_cluster)	-F, --filter FILTER String representation of the filter to filter ECS clusters by tags. b, --batch_size BATCH_SIZE Batch size. Number of clusters to fetch metrics in parallel. (Default value: 10)	metrics-ecs-cluster.rb -r {{.labels.params_ci_reg {{.labels.params_filter -f {{.labels.params_filter {{end}} {{.labels.params_batch_ -b {{.labels.params_filter {{end}}
Metric	aws.metrics-ecs-service	Monitors ECS services in an AWS datacenter. Binds to the AWS ECS Service CI type (cmdb_ci_cloud_ecs_service)	-F, --filter FILTER String representation of the filter to filter ECS clusters by tags. b, --batch_size BATCH_SIZE Batch size. Number of clusters to fetch metrics in parallel. (Default value: 10)	metrics-ecs-service.rb -r {{.labels.params_ci_reg {{.labels.params_filter -f {{.labels.params_filter {{end}} {{.labels.params_batch_ -b {{.labels.params_filter {{end}}

AWS metrics

AWS metrics

The following tables list and describe the metrics that are gathered as output from the specified AWS checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

aws.metrics-ec2 metrics

Metric Name	Description
aws.ec2.CPUCreditBalance.Average	Number of earned CPU credits that an instance has accrued since it was launched or started.
aws.ec2.CPUUtilization.Average	Average percentage of allocated EC2 compute units that are currently in use on the instance.
aws.ec2.DiskReadOps.Average (Featured metric)	Average of completed read operations from all instance store volumes available to the instance in a specified time period.
aws.ec2.DiskWriteOps.Average (Featured metric)	Completed write operations to all instance store volumes available to the instance in a specified time period.
aws.ec2.DiskReadBytes.Average (Featured metric)	Average number of bytes read from all instance store volumes available to the instance.
aws.ec2.DiskWriteBytes.Average (Featured metric)	Average number of bytes written to all instance store volumes available to the instance.
aws.ec2.NetworkIn.Average (Featured metric)	Average number of bytes received by the instance on all network interfaces. This metric identifies the volume of incoming network traffic to a single instance.
aws.ec2.NetworkOut.Average (Featured metric)	Average number of bytes sent out by the instance on all network interfaces. This metric identifies the volume of outgoing network traffic from a single instance.
aws.ec2.NetworkPacketsIn.Average	Average number of packets received by the instance on all network interfaces. This metric identifies the volume of incoming traffic in terms of the number of packets on a single instance.
aws.ec2.NetworkPacketsOut.Average	Average number of packets sent out by the instance on all network interfaces. This metric identifies the volume of outgoing traffic in terms of the number of packets on a single instance.

aws.metrics-ec2 metrics (continued)

Metric Name	Description
aws.ec2.MetadataNoToken.Average	Average number of times the instance metadata service was successfully accessed using a method that does not use a token.
aws.ec2.CPUCreditUsage.Average	Average number of CPU credits spent by the instance for CPU utilization.
aws.ec2.CPUSurplusCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *CPUCreditBalance* value is zero.
aws.ec2.CPUSurplusCreditsCharged.Average	Average number of spent surplus credits that are not paid down by earned CPU credits, and which thus incur an additional charge.
aws.ec2.StatusCheckFailed_Instance.Average	Reports whether the instance has passed the instance status check in the last minute.
aws.ec2.StatusCheckFailed_System.Average	Reports whether the instance has passed the system status check in the last minute.
aws.ec2.StatusCheckFailed.Average	Reports whether the instance has passed both the instance status check and the system status check in the last minute.

aws.metrics-ebs metrics

Metric Name	Description
aws.ebs.VolumeReadBytes.Average (Featured metric)	Average total number of bytes transferred during the period while reading.
aws.ebs.VolumeWriteBytes.Average (Featured metric)	Average total number of bytes transferred during the period while writing.
aws.ebs.VolumeReadOps.Average (Featured metric)	Average total number of read operations in a specified time period.
aws.ebs.VolumeWriteOps.Average (Featured metric)	Average total number of write operations in a specified time period.
aws.ebs.VolumeTotalReadTime.Average (Featured metric)	Average total number of seconds spent by all read operations completed in a specified time period.
aws.ebs.VolumeTotalWriteTime.Average (Featured metric)	Average of total number of seconds spent by all write operations completed in a specified time period.
aws.ebs.VolumeIdleTime.Average	Average of total number of seconds in a specified time period when no read or write operations were submitted.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-ebs metrics (continued)

Metric Name	Description
aws.ebs.VolumeQueueLength.Average	Average number of read and write operation requests waiting to be completed in a specified time period.
aws.ebs.VolumeThroughputPercentage.Average	Average percentage of I/O operations per second (IOPS) delivered of the total IOPS provisioned for an Amazon EBS volume.
aws.ebs.VolumeConsumedReadWriteOps.Average	Average total amount of read and write operations (normalized to 256K capacity units) consumed in a specified time period.
aws.ebs.BurstBalance.Average	Average percentage of I/O credits (for gp2) or throughput credits (for st1 and sc1) remaining in the burst bucket.

aws.metrics-s3 metrics

Metric Name	Description
aws.s3.NumberOfObjects.Average (Featured metric)	Average total number of objects stored in a bucket for all storage classes. Collected every 12 hours.
aws.s3.BucketSizeBytes.Average (Featured metric)	Average amount of data in bytes stored in a bucket in the STANDARD storage class. Collected every 12 hours.

aws.metrics-rds metrics

Metric Name	Description
aws.rds.BinLogDiskUsage.Average	Average amount of disk space occupied by binary logs on the primary. Applies to MySQL read replicas.
aws.rds.BurstBalance.Average	Average percent of General Purpose SSD (gp2) burst-bucket I/O credits available.
aws.rds.CPUUtilization.Average (Featured metric)	Average percentage of CPU utilization.
aws.rds.CPUCreditUsage.Average	Average number of CPU credits spent by the instance for CPU utilization.
aws.rds.CPUCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *`CPUCreditBalance`* value is zero.
aws.rds.DatabaseConnections.Average (Featured metric)	Average number of database connections in use.

aws.metrics-rds metrics (continued)

Metric Name	Description
aws.rds.DiskQueueDepth.Average (Featured metric)	Average number of outstanding I/Os (read/write requests) waiting to access the disk.
aws.rds.EBSByteBalance%.Average	Average percentage of throughput credits remaining in the burst bucket of your RDS database.
aws.rds.EBSIOBalance%.Average	Average percentage of I/O credits remaining in the burst bucket of your RDS database.
aws.rds.FailedSQLServerAgentJobsCount.Average (Featured metric)	Average number of failed Microsoft SQL Server Agent jobs during the last minute.
aws.rds.FreeableMemory.Average (Featured metric)	Average amount of available random access memory.
aws.rds.FreeStorageSpace.Average	Average amount of available storage space.
aws.rds.MaximumUsedTransactionIDs.Average	Average amount of maximum transaction IDs that have been used. Applies to PostgreSQL.
aws.rds.NetworkReceiveThroughput.Average (Featured metric)	Average incoming (receive) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.
aws.rds.NetworkTransmitThroughput.Average (Featured metric)	Average outgoing (transmit) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.
aws.rds.OldestReplicationSlotLag.Average	Average lagging size of the replica lagging the most in terms of write-ahead log (WAL) data received. Applies to PostgreSQL.
aws.rds.ReadIOPS.Average	Average number of disk read I/O operations per second.
aws.rds.ReadLatency.Average (Featured metric)	Average amount of time taken per disk I/O operation.
aws.rds.ReadThroughput.Average	Average number of bytes read from disk per second.
aws.rds.ReplicaLag.Average	Average amount of time a read replica DB instance lags behind the source DB instance. Applies to MySQL, MariaDB, Oracle, PostgreSQL, and SQL Server read replicas.
aws.rds.ReplicationSlotDiskUsage.Average	Average amount of disk space used by replication slot files. Applies to PostgreSQL.

aws.metrics-rds metrics (continued)

Metric Name	Description
aws.rds.SwapUsage.Average	Average amount of swap space used on the DB instance. This metric is not available for SQL Server.
aws.rds.TransactionLogsDiskUsage.Average	Average disk space used by transaction logs. Applies to PostgreSQL.
aws.rds.TransactionLogsGeneration.Average	Average size of transaction logs generated per second. Applies to PostgreSQL.
aws.rds.WriteIOPS.Average	Average number of disk write I/O operations per second.
aws.rds.WriteLatency.Average (Featured metric)	Average amount of time taken per disk I/O operation.
aws.rds.WriteThroughput.Average	Average number of bytes written to disk per second.
aws.rds.CPUSurplusCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *`CPUCreditBalance`* value is zero.
aws.rds.CPUSurplusCreditsCharged.Average	Average number of spent surplus credits that are not paid down by earned CPU credits, and which therefore incur an additional charge.

aws.metrics-classic-elb metrics

Metric Name	Description
aws.classicElb.EstimatedALBActiveConnectionCount.Average (Featured metric)	Average estimated number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.
aws.classicElb.EstimatedALBConsumedLCUs.Average	Average estimated number of load balancer capacity units (LCU) used by an Application Load Balancer. You pay for the number of LCUs that you use per hour.
aws.classicElb.EstimatedALBNewConnectionCount.Average (Featured metric)	Average estimated number of new TCP connections established from clients to the load balancer and from the load balancer to targets.
aws.classicElb.EstimatedProcessedBytes.Average	Estimated number of bytes processed by an Application Load Balancer.
aws.classicElb.DesyncMitigationMode_NonCompliant_Request_Count.Sum	Number of requests that do not comply with RFC 7230.
aws.classicElb.HTTPCode_ELB_5XX.Sum (Featured metric)	Number of HTTP 4XX client error codes generated by the load balancer.

© 2025 ServiceNow, Inc. All rights reserved.

aws.metrics-classic-elb metrics (continued)

Metric Name	Description
aws.classicElb.HTTPCode_ELB_4XX.Sum (Featured metric)	Number of HTTP 5XX server error codes generated by the load balancer.
aws.classicElb.SurgeQueueLength.Maximum	Maximum total number of requests (HTTP listener) or connections (TCP listener) that are pending routing to a healthy instance. The maximum size of the queue is 1,024. Additional requests or connections are rejected when the queue is full.
aws.classicElb.SpilloverCount.Sum (Featured metric)	Total number of requests rejected because the surge queue is full.
aws.classicElb.RequestCount.Sum	Total number of requests completed or connections made during the specified interval.
aws.classicElb.Latency.Average (Featured metric)	Average total time elapsed, in seconds, from the time the load balancer sent the request to a registered instance until the instance started to send the response headers.
aws.classicElb.BackendConnectionErrors.Sum (Featured metric)	Total number of connections that were not successfully established between the load balancer and the registered instances.
aws.classicElb.HealthyHostCount.Average	Average number of healthy instances registered with your load balancer. A newly registered instance is considered healthy after it passes the first health check.
aws.classicElb.UnHealthyHostCount.Average	Average of number of unhealthy instances registered with your load balancer. An instance is considered unhealthy after it exceeds the unhealthy threshold configured for health checks.

aws.metrics-network-elb

Metric Name	Description
aws.networkElb.ActiveFlowCount.Average (Featured metric)	Average total number of concurrent flows (or connections) from clients to targets. This metric includes connections in the SYN_SENT and ESTABLISHED states.
aws.networkElb.ActiveFlowCount_TCP.Average (Featured metric)	Average total number of concurrent TCP flows (or connections) from clients to targets. This metric includes only connections in the ESTABLISHED state.
aws.networkElb.ActiveFlowCount_TLS.Average	Average total number of concurrent TLS flows (or connections) from clients to targets.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

aws.metrics-network-elb (continued)

Metric Name	Description
(Featured metric)	This metric includes only connections in the ESTABLISHED state.
aws.networkElb.ActiveFlowCount_UDP.Average (Featured metric)	Average total number of concurrent UDP flows (or connections) from clients to targets.
aws.networkElb.ClientTLSNegotiationErrorCount.Sum (Featured metric)	Average total number of TLS handshakes that failed during negotiation between a client and a TLS listener.
aws.networkElb.ConsumedLCUs.Average	Average number of load balancer capacity units (LCU) used by your load balancer.
aws.networkElb.ConsumedLCUs_TCP.Average	Average number of load balancer capacity units (LCU) used by your load balancer for TCP.
aws.networkElb.ConsumedLCUs_TLS.Average	Average number of load balancer capacity units (LCU) used by your load balancer for TLS.
aws.networkElb.ConsumedLCUs_UDP.Average	Average number of load balancer capacity units (LCU) used by your load balancer for UDP.
aws.networkElb.HealthyHostCount.Maximum (Featured metric)	The maximum number of targets that are considered healthy.
aws.networkElb.NewFlowCount.Sum (Featured metric)	Total number of new flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_TCP.Sum (Featured metric)	Total number of new TCP flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_TLS.Sum (Featured metric)	Total number of new TLS flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_UDP.Sum (Featured metric)	Total number of new UDP flows (or connections) established from clients to targets in the time period.
aws.networkElb.PeakBytesPerSecond.Maximum (Featured metric)	Maximum average throughput (bytes per second), calculated every 10 seconds during the sampling window. This metric includes health check traffic.
aws.networkElb.PeakPacketsPerSecond.Maximum (Featured metric)	Maximum average packet rate (packets processed per second), calculated every 10 seconds during the sampling window. This metric includes health check traffic.
aws.networkElb.ProcessedBytes.Sum	Total number of bytes processed by the load balancer, including TCP/IP headers. This count

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-network-elb (continued)

Metric Name	Description
	includes traffic to and from targets, minus health check traffic.
aws.networkElb.ProcessedBytes_TCP.Sum	Total number of bytes processed by TCP listeners.
aws.networkElb.ProcessedBytes_TLS.Sum	Total number of bytes processed by TLS listeners.
aws.networkElb.ProcessedBytes_UDP.Sum	Total number of bytes processed by UDP listeners.
aws.networkElb.ProcessedPackets.Sum	Total number of packets processed by the load balancer. This count includes traffic to and from targets, including health check traffic.
aws.networkElb.TargetTLSNegotiationErrorCount.Sum (Featured metric)	Total number of TLS handshakes that failed during negotiation between a TLS listener and a target.
aws.networkElb.TCP_Client_Reset_Count.Sum	Total number of reset (RST) packets sent from a client to a target. These resets are generated by the client and forwarded by the load balancer.
aws.networkElb.TCP_ELB_Reset_Count.Sum	Total number of reset (RST) packets generated by the load balancer.
aws.networkElb.TCP_Target_Reset_Count.Sum	Total number of reset (RST) packets sent from a target to a client. These resets are generated by the target and forwarded by the load balancer.
aws.networkElb.UnHealthyHostCount.Maximum (Featured metric)	Maximum number of targets that can be considered unhealthy.

aws.metrics-application-elb metrics

Metric Name	Description
aws.applicationElb.ActiveConnectionCount.Sum (Featured metric)	Total number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.
aws.applicationElb.ClientTLSNegotiationErrorCount.Sum (Featured metric)	Total number of TLS connections initiated by the client that did not establish a session with the load balancer due to a TLS error.
aws.applicationElb.ConsumedLCUs.Average	The average number of load balancer capacity units (LCU) used by your load balancer. You pay for the number of LCUs that you use per hour. For more information, see Elastic Load Balancing pricing.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-application-elb metrics (continued)

Metric Name	Description
aws.applicationElb.DesyncMitigationMode_NonCompliant_Request_Count.Sum (Featured metric)	Total number of requests that do not comply with RFC 7230.
aws.applicationElb.DroppedInvalidHeaderRequestCount.Average (Featured metric)	Average of requests where the load balancer removed HTTP headers with header fields that are not valid before routing the request. The load balancer removes these headers only if the routing.http.drop_invalid_header_fields.enabled attribute is set to true.
aws.applicationElb.ForwardedInvalidHeaderRequestCount.Average (Featured metric)	Average of requests routed by the load balancer that had HTTP headers with header fields that are not valid. The load balancer forwards requests with these headers only if the routing.http.drop_invalid_header_fields.enabled attribute is set to false.
aws.applicationElb.GrpcRequestCount.Sum	Total number of gRPC requests processed over IPv4 and IPv6.
aws.applicationElb.HTTP_Fixed_Response_Count.Sum	Total number of fixed-response actions that were successful.
aws.applicationElb.HTTP_Redirect_Count.Sum	Total number of redirect actions that were successful.
aws.applicationElb.HTTP_Redirect_Url_Limit_Exceeded_Count.Sum (Featured metric)	Total number of redirect actions that couldn't be completed because the URL in the response location header is larger than 8K.
aws.applicationElb.HTTPCode_ELB_3XX_Count.Sum (Featured metric)	Total number of HTTP 3XX redirection codes that originate from the load balancer. This count does not include response codes generated by targets.
aws.applicationElb.HTTPCode_ELB_4XX_Count.Sum (Featured metric)	Total number of HTTP 4XX client error codes that originate from the load balancer. This count does not include response codes generated by targets.
aws.applicationElb.HTTPCode_ELB_5XX_Count.Sum (Featured metric)	Total number of HTTP 5XX server error codes that originate from the load balancer. This count does not include any response codes generated by the targets.
aws.applicationElb.HTTPCode_ELB_500_Count.Sum (Featured metric)	Total number of HTTP 500 error codes that originate from the load balancer.
aws.applicationElb.HTTPCode_ELB_502_Count.Sum (Featured metric)	Total number of HTTP 502 error codes that originate from the load balancer.

© 2025 ServiceNow, Inc. All rights reserved.

aws.metrics-application-elb metrics (continued)

Metric Name	Description
aws.applicationElb.HTTPCode_ELB_503_Count.Sum (Featured metric)	Total number of HTTP 503 error codes that originate from the load balancer.
aws.applicationElb.HTTPCode_ELB_504_Count.Sum (Featured metric)	Total number of HTTP 504 error codes that originate from the load balancer.
aws.applicationElb.IPv6ProcessedBytes.Sum	Total number of bytes processed by the load balancer over IPv6.
aws.applicationElb.IPv6RequestCount.Sum	Total number of IPv6 requests received by the load balancer.
aws.applicationElb.NewConnectionCount.Sum	Total number of new TCP connections established from clients to the load balancer and from the load balancer to targets.
aws.applicationElb.NonStickyRequestCount.Sum	Total number of requests where the load balancer chose a new target because it couldn't use an existing sticky session.
aws.applicationElb.ProcessedBytes.Sum (Featured metric)	Total number of bytes processed by the load balancer over IPv4 and IPv6.
aws.applicationElb.RejectedConnectionCount.Sum (Featured metric)	Total number of connections that were rejected because the load balancer had reached its maximum number of connections.
aws.applicationElb.RequestCount.Sum	Total number of requests processed over IPv4 and IPv6.
aws.applicationElb.RuleEvaluations.Sum	Total number of rules processed by the load balancer given a request rate averaged over an hour.

aws.metrics-ec2-count metrics

Metric Name	Description
aws.ec2.types.<type_name>	Count of EC2 instances for the specified type in AWS Datacenter.
aws.ec2.status.running	Count of EC2 instances in Active state in an AWS Datacenter.
aws.ec2.status.stopped	Count of EC2 instances in Stopped state in an AWS Datacenter.
aws.ec2.status.total	Count of all EC2 instances in an AWS Datacenter.

aws.metrics-dynamodb metrics

Metric Name	Description
aws.dynamodb.ConsumedWriteCapacityUnits.Average (Featured metric)	Number of write capacity units consumed over the specified time period, for tracking how much provisioned throughput is used.
aws.dynamodb.ConsumedReadCapacityUnits.Average (Featured metric)	Number of read capacity units consumed over the specified time period, for tracking how much provisioned throughput is used.
aws.dynamodb.ProvisionedWriteCapacityUnits.Average (Featured metric)	Number of provisioned write capacity units for a table.
aws.dynamodb.ProvisionedReadCapacityUnits.Average (Featured metric)	Number of provisioned read capacity units for a table.
aws.dynamodb.SuccessfulRequestLatency.GetItem.Average (Featured metric)	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a GetItem operation.
aws.dynamodb.SuccessfulRequestLatency.BatchGetItem.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a BatchGetItem operation.
aws.dynamodb.SuccessfulRequestLatency.PutItem.Average (Featured metric)	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a PutItem operation.
aws.dynamodb.SuccessfulRequestLatency.BatchPutItem.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a BatchPutItem operation.
aws.dynamodb.SuccessfulRequestLatency.Query.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a Query operation.
aws.dynamodb.SuccessfulRequestLatency.Scan.Average	Successful requests to DynamoDB or Amazon DynamoDB Streams during the specified time period. Run by a Scan operation.
aws.dynamodb.ReturnedItemCount.Scan.Average	Number of items returned by Scan operations during the specified time period.
aws.dynamodb.ReturnedItemCount.Query.Average	Number of items returned by Query operations during the specified time period.
aws.dynamodb.UserErrors.Average (Featured metric)	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 400 status code during the specified time period. An HTTP 400 usually indicates a client-side error, such as an invalid combination of parameters, an attempt to update a nonexistent table, or an incorrect request signature.
aws.dynamodb.SystemErrors.GetItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
(Featured metric)	500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a GetItem operation.
aws.dynamodb.SystemErrors.Scan.Average	The requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a Scan operation.
aws.dynamodb.SystemErrors.Query.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a Query operation.
aws.dynamodb.SystemErrors.BatchGetItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a BatchGet operation.
aws.dynamodb.SystemErrors.PutItem.Average (Featured metric)	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a PutItem operation.
aws.dynamodb.SystemErrors.UpdateItem.Average	The requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by an UpdateItem operation.
aws.dynamodb.SystemErrors.DeleteItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a DeleteItem operation.
aws.dynamodb.SystemErrors.BatchWriteItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a BatchWrite operation.
aws.dynamodb.ConditionalCheckFailedRequests.Average (Featured metric)	Number of failed attempts to perform conditional writes.

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
aws.dynamodb.TimeToLiveDeletedItemCount.Average	Number of items deleted by Time to Live (TTL) during the specified time period. This metric helps you monitor the rate of TTL deletions on your table.
aws.dynamodb.TransactionConflict.Average	Rejected item-level requests due to transactional conflicts between concurrent requests on the same items.
aws.dynamodb.ReadThrottleEvents.Average (Featured metric)	Requests to DynamoDB that exceed the provisioned read capacity units for a table.
aws.dynamodb.WriteThrottleEvents.Average (Featured metric)	Requests to DynamoDB that exceed the provisioned write capacity units for a table.
aws.dynamodb.ThrottledRequests.GetItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a GetItem operation.
aws.dynamodb.ThrottledRequests.PutItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a PutItem operation.
aws.dynamodb.ThrottledRequests.DeleteItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a DeleteItem operation.
aws.dynamodb.ThrottledRequests.UpdateItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for an UpdateItem operation.
aws.dynamodb.ThrottledRequests.BatchGetItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a BatchGetItem operation.
aws.dynamodb.ThrottledRequests.Scan.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a Scan operation.
aws.dynamodb.ThrottledRequests.Query.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a Query operation.
aws.dynamodb.ThrottledRequests.BatchWriteItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a BatchWriteItem operation.
aws.dynamodb.SuccessfulRequestLatency.GetRecords.Average	The successful requests to DynamoDB or Amazon DynamoDB Streams during the specified time period. Run by a GetRecords operation.
aws.dynamodb.ReturnedBytes.GetRecords.Average	The number of bytes returned by GetRecords operations (Amazon DynamoDB streams) during the specified time period.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
aws.dynamodb.ReturnedRecordsCount.GetRecords.Average	The average of stream records returned by GetRecords operations (Amazon DynamoDB streams) during the specified time period.

aws.metrics-ecs-cluster metrics

Metric	Description
aws.ecs.cluster.CPUReservation.Average (Featured metric)	Percentage of CPU units reserved by running tasks in the cluster.
aws.ecs.cluster.CPUUtilization.Average (Featured metric)	Percentage of CPU units used in the cluster.
aws.ecs.cluster.MemoryReservation.Average (Featured metric)	Percentage of memory reserved by running tasks in the cluster.
aws.ecs.cluster.MemoryUtilization.Average (Featured metric)	Percentage of memory used in the cluster.
aws.ecs.cluster.CpuReserved.Average	CPU units reserved by tasks in the cluster.
aws.ecs.cluster.CpuUtilized.Average	CPU units used by tasks in the cluster.
aws.ecs.cluster.NetworkRxBytes.Average (Featured metric)	Number of bytes received by the cluster.
aws.ecs.cluster.NetworkTxBytes.Average (Featured metric)	Number of bytes transmitted by the cluster.
aws.ecs.cluster.EphemeralStorageReserved.Average	Ephemeral storage is the volatile temporary storage attached to your instances, present only during the running lifetime of the instance.
aws.ecs.cluster.MemoryUtilized.Average (Featured metric)	Memory being used by tasks in the cluster.
aws.ecs.cluster.MemoryReserved.Average (Featured metric)	Memory reserved by tasks in the cluster.
aws.ecs.cluster.StorageReadBytes.Average (Featured metric)	Number of bytes read from storage in the cluster.
aws.ecs.cluster.StorageWriteBytes.Average	Number of bytes written to storage in the cluster.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

aws.metrics-ecs-cluster metrics (continued)

Metric	Description
(Featured metric)	
aws.ecs.cluster.ContainerInstanceCount.Average (Featured metric)	Number of EC2 instances running the Amazon ECS agent that are registered with a cluster.
aws.ecs.cluster.ServiceCount.Average (Featured metric)	Number of services in the cluster.
aws.ecs.cluster.TaskCount.Average	Number of tasks running in the cluster.

aws.metrics-ecs-service metrics

Metric	Description
aws.ecs.service.CPUUtilization.Average (Featured metric)	Percentage of CPU units used in the service.
aws.ecs.service.MemoryUtilization.Average (Featured metric)	Percentage of memory used in the service.
aws.ecs.service.CpuReserved.Average	CPU units reserved by tasks in the service.
aws.ecs.service.CpuUtilized.Average	CPU units used by tasks in the service.
aws.ecs.service.NetworkRxBytes.Average (Featured metric)	Number of bytes received by the service.
aws.ecs.service.NetworkTxBytes.Average (Featured metric)	Number of bytes transmitted by the service.
aws.ecs.service.EphemeralStorageReserved.Average	Ephemeral storage is the volatile temporary storage attached to your instances which is present only during the running lifetime of the instance.
aws.ecs.service.MemoryUtilized.Average	Memory being used by tasks in the service.
aws.ecs.service.MemoryReserved.Average	Memory reserved by tasks in the service.
aws.ecs.service.StorageReadBytes.Average (Featured metric)	Number of bytes read from storage in the service.
aws.ecs.service.StorageWriteBytes.Average (Featured metric)	Number of bytes written to storage in the service.
aws.ecs.service.RunningTaskCount.Average	Number of tasks currently in the RUNNING state.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-ecs-service metrics (continued)

Metric	Description
(Featured metric)	
aws.ecs.service.DeploymentCount.Average	Number of deployments in an Amazon ECS service.
aws.ecs.service.DesiredTaskCount.Average (Featured metric)	Desired number of tasks for an Amazon ECS service.
aws.ecs.service.TaskSetCount.Average (Featured metric)	Number of task sets in the service.
aws.ecs.service.PendingTaskCount.Average (Featured metric)	Number of tasks currently in the PENDING state.

Azure Health Monitoring default checks and policies

Agent Client Collector provides the following default checks and policies for Azure health monitoring.

Azure k8s Metrics

Type	Check	Description	Command

Metric	azure.metrics-k8s-service	Provides pod, nodes, and cluster level metrics from all Azure Kubernetes services in metric form.
		
		Usage: metrics-azure-k8s-service.rb
		
		`-S, --subscription ID ARM Subscription ID`
		`-r, Region`
		
		Example: `metrics-azure-k8s-service.rb -S {{.labels.params_subscription_id}} -r westus2`
			`metrics-azure-k8s-service.rb -r {{.labels.params_ci_region}} {{-s {{if.labels.params_subscrip -S {{.labels.params_subscripti {{end}}`

Azure metrics

The following tables list and describe the metrics that are gathered as output from Azure checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Kubernetes Service check metrics

Metric Name	Description
apiserver_current_inflight_requests (Featured metric)	Maximum number of currently used inflight requests on the API server per request kind in the past second.
cluster_autoscaler_cluster_safe_to_autoscale	Determines whether cluster autoscaler takes action on the cluster.
cluster_autoscaler_scale_down_in_cooldown	Determines if the scale down is in cooldown; no nodes are removed during this timeframe.
cluster_autoscaler_unschedulable_pods_count	Number of pods that are currently not able to be scheduled in the cluster.
kube_node_status_allocatable_cpu_cores (Featured metric)	Total number of available CPU cores in a managed cluster.
kube_node_status_allocatable_memory_bytes (Featured metric)	Total amount of available memory in a managed cluster.
kube_node_status_condition (Featured metric)	Statuses for various node conditions.
kube_pod_status_phase (Featured metric)	Number of pods by phase.
kube_pod_status_ready (Featured metric)	Number of pods in Ready state.
node_cpu_usage_millicores (Featured metric)	Aggregated measurement of CPU utilization in millicores across the cluster.
node_cpu_usage_percentage (Featured metric)	Aggregated average CPU utilization measured in percentage across the cluster.
node_disk_usage_bytes	Number of disk space bytes in use by device.
node_disk_usage_percentage (Featured metric)	Percentage of disk space used by device.
node_memory_rss_bytes	Number of container RSS memory bytes in use.
node_memory_rss_percentage (Featured metric)	Percentage of container RSS memory in use.
node_memory_working_set_bytes	Number of container working set memory bytes in use.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Kubernetes Service check metrics (continued)

Metric Name	Description
node_memory_working_set_percentage (Featured metric)	Percentage of container working set memory in use.
node_network_in_bytes (Featured metric)	Network received bytes.
node_network_out_bytes (Featured metric)	Network transmitted bytes.

Azure VM CPU metrics

Metric Name	Description
Percentage CPU (Featured metric)	The percentage of allocated compute units that are currently in use by the Virtual Machine(s).
CPU Credits Remaining	Total number of credits available to burst. Only available on B-series burstable VMs.
CPU Credits Consumed	Total number of credits consumed by the Virtual Machine. Only available on B-series burstable VM.

Azure VM Network metrics

Metric Name	Description
Network In (Featured metric)	The number of billable bytes received on all network interfaces by the Virtual Machines (Incoming Traffic) (Deprecated).
Network Out (Featured metric)	The number of billable bytes out on all network interfaces by the Virtual Machines (Outgoing Traffic) (Deprecated).
Network In Total (Featured metric)	The number of bytes received on all network interfaces by the Virtual Machines (Incoming Traffic).
Network Out Total (Featured metric)	The number of bytes out on all network interfaces by the Virtual Machines (Outgoing Traffic).

Azure VM Disk metrics

Metric Name	Description
Disk Read Bytes	Bytes read from disk during monitoring period.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Disk metrics (continued)

Metric Name	Description
(Featured metric)	
Disk Write Bytes (Featured metric)	Bytes written to disk during monitoring period.
Disk Read Operations/Sec (Featured metric)	Disk Read IOPS.
Disk Write Operations/Sec (Featured metric)	Disk Write IOPS.
Data Disk Read Bytes/sec (Featured metric)	Bytes per second read from a single disk during monitoring period.
Data Disk Write Bytes/sec (Featured metric)	Bytes per second written to a single disk during monitoring period.
Data Disk Read Operations/Sec (Featured metric)	Read IOPS from a single disk during monitoring period.
Data Disk Write Operations/Sec (Featured metric)	Write IOPS from a single disk during monitoring period.
Data Disk Bandwidth Consumed Percentage (Featured metric)	Percentage of data disk bandwidth consumed per minute.
Data Disk IOPS Consumed Percentage (Featured metric)	Percentage of data disk I/Os consumed per minute.
Data Disk Target Bandwidth (Featured metric)	Baseline bytes per second throughput Data Disk can achieve without bursting.
Data Disk Target IOPS (Featured metric)	Baseline IOPS Data Disk can achieve without bursting.
Data Disk Max Burst Bandwidth (Featured metric)	Maximum bytes per second throughput Data Disk can achieve with bursting.
Data Disk Max Burst IOPS (Featured metric)	Maximum IOPS Data Disk can achieve with bursting.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Disk metrics (continued)

Metric Name	Description
Data Disk Used Burst BPS Credits Percentage	Percentage of Data Disk burst bandwidth credits used so far.
Data Disk Used Burst IO Credits Percentage	Percentage of Data Disk burst I/O credits used so far.
Premium Data Disk Cache Read Hit (Featured metric)	Premium Data Disk Cache Read Hit.
Premium Data Disk Cache Read Miss (Featured metric)	Premium Data Disk Cache Read Miss.
Premium OS Disk Cache Read Hit (Featured metric)	Premium OS Disk Cache Read Hit.
Premium OS Disk Cache Read Miss (Featured metric)	Premium OS Disk Cache Read Miss.

Azure VM Flow metrics

Metric Name	Description
Inbound Flows (Featured metric)	Inbound Flows are number of current flows in the inbound direction (traffic going into the VM).
Outbound Flows (Featured metric)	Maximum creation rate of outbound flows (traffic going out of the VM).
Inbound Flows Maximum Creation Rate (Featured metric)	Maximum creation rate of inbound flows (traffic going into the VM).
Outbound Flows Maximum Creation Rate (Featured metric)	Maximum creation rate of outbound flows (traffic going out of the VM).

Azure VM Memory metrics

Metric Name	Description
VM Cached Bandwidth Consumed Percentage (Featured metric)	Percentage of cached disk bandwidth consumed by the VM.
VM Cached IOPS Consumed Percentage	Percentage of cached disk IOPS consumed by the VM.
VM Uncached Bandwidth Consumed Percentage	Percentage of uncached disk bandwidth consumed by the VM.

Azure VM Memory metrics (continued)

Metric Name	Description
(Featured metric)	
VM Uncached Bandwidth Consumed Percentage	Percentage of uncached disk IOPS consumed by the VM.
Available Memory Byte (Featured metric)	Amount of physical memory, in bytes, immediately available for allocation to a process or for system use in the Virtual Machine.

Azure VM Metrics policy - Azure Metrics Collector check metrics

Metric name	Units	Description
Percentage CPU (featured metric)	%	The percentage of allocated compute units that are currently in use by the Virtual Machine.
CPU Credits Remaining		Number of earned CPU credits that have not been consumed by the Virtual Machine.
CPU Credits Consumed		Total number of CPU credits that have been consumed by the Virtual Machine.
Network In		Number of bytes received on all network interfaces by the instance.
Network Out		Number of bytes sent out on all network interfaces by the instance.
Network In Total (featured metric)	Bytes	The number of bytes received on all network interfaces by the Virtual Machine(s) (Incoming Traffic).
Network Out Total (featured metric)	Bytes	The number of bytes out on all network interfaces by the Virtual Machine(s) (Outgoing Traffic).
Available Memory Bytes (featured metric)	Bytes	Amount of physical memory in bytes immediately available for allocation to a process or for system use in the Virtual Machine.
VM Cached Bandwidth Consumed Percentage		Percentage of cached disk bandwidth consumed by the VM.

Azure VM Metrics policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
VM Cached IOPS Consumed Percentage		Percentage of cached disk IOPS consumed by the VM.
VM Uncached Bandwidth Consumed Percentage		Percentage of uncached disk bandwidth consumed by the VM.
VM Uncached IOPS Consumed Percentage		Percentage of uncached disk IOPS consumed by the VM.
Disk Read Bytes (featured metric)	Bytes	Bytes read from disk during monitoring period.
Disk Write Bytes (featured metric)	Bytes	Bytes written to disk during monitoring period.
Disk Read Operations/Sec (featured metric)	CountPerSecond	Disk Read IOPS.
Disk Write Operations/Sec (featured metric)	CountPerSecond	Disk Write IOPS.
OS Disk Read Bytes/sec		Bytes/Sec read from disk during monitoring period.
OS Disk Write Bytes/sec		Bytes/Sec written to disk during monitoring period.
OS Disk Read Operations/Sec		Read IOPS from disk during monitoring period.
OS Disk Write Operations/Sec		Write IOPS from disk during monitoring period.
OS Disk Queue Depth		Average number of read and write requests that were queued for the selected disk during the sample period.
OS Disk Bandwidth Consumed Percentage		Percentage of data disk bandwidth consumed per minute.
OS Disk IOPS Consumed Percentage		Percentage of data disk I/Os consumed per minute.
OS Disk Target Bandwidth		Baseline bytes per second throughput data disk can achieve without bursting.
OS Disk Target IOPS		Baseline IOPS data disk can achieve without bursting.
OS Disk Max Burst Bandwidth		Maximum bytes per second throughput data disk can achieve with bursting.
OS Disk Max Burst IOPS		Maximum IOPS data disk can achieve with bursting.

Azure VM Metrics policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
OS Disk Used Burst BPS Credits Percentage		Percentage of data disk burst bandwidth credits used so far.
OS Disk Used Burst IO Credits Percentage		Percentage of data disk burst I/O credits used so far.
Premium OS Disk Cache Read Hit		Premium OS disk cache read hit.
Premium OS Disk Cache Read Miss		Premium OS disk cache read miss.
Inbound Flows		Number of current flows in the inbound direction (traffic going into the VM).
Outbound Flows		Number of current flows in the inbound direction (traffic going out of the VM).
Inbound Flows Maximum Creation Rate		Maximum creation rate of inbound flows (traffic going into the VM).
Outbound Flows Maximum Creation Rate		Maximum creation rate of outbound flows (traffic going out of the VM).

Azure Load Balancer metrics policy - Azure Metrics collector check metrics

Metric name	Units	Description
AllocatedSnatPorts (featured metric)		Total number of SNAT ports allocated within the time period specified by the metric definition's *PT* (Period of Time) value.
ByteCount (featured metric)	bytes	Total number of bytes transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
DipAvailability (featured metric)	count	Average load balancer health probe status per time duration.
BlockedCount (featured metric)		Total number of packets transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
SnatConnectionCount (featured metric)	count	Total number of new SNAT connections created within the time period specified by

Azure Load Balancer metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
		the metric definition's *PT* (Period of Time) value.
SYNCount (featured metric)		Total number of SYN packets transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
UsedSnatPorts (featured metric)		Total number of SNAT ports used within the time period specified by the metric definition's *PT* (Period of Time) value.
VipAvailability (featured metric)	count	Average load balancer data path availability per time duration.

Azure Redis Cache policy - Azure Metrics Collector check metrics

Metric name	Units	Description
connectedclients		Number of client connections to the cache.
totalcommandsprocessed		Total number of commands processed by the cache server.
cachehits (featured metric)	count	Number of successful key lookups.
cachemisses (featured metric)	count	Number of failed key lookups.
cachemissrate		Rate of failed key lookups.
getcommands		Number of get operations from the cache.
setcommands (featured metric)	count	Number of set operations to the cache.
operationsPerSecond		Number of instantaneous operations per second executed on the cache.
evictedkeys		Number of items evicted from the cache.
totalkeys		Number of keys in the cache.
expiredkeys		Number of items expired from the cache.
usedmemory	bytes	Amount of cache memory used for key/value pairs in the cache.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Redis Cache policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
usedmemoryRss	bytes	Amount of cache memory used during the specified reporting interval, including fragmentation and metadata
serverLoad (featured metric)	Percent	Percentage of cycles in which the Redis server is busy processing and not waiting idle for messages
cacheWrite (featured metric)	BytesPersSecond	Amount of data written to the cache.
cacheRead (featured metric)	BytesPerSecond	Amount of data read from the cache.
allConnectionsCreatedPerSecond		Number of instantaneous connections created per second on the cache via port 6379 or 6380 (SSL).
allConnectionsClosedPerSecond		Number of instantaneous connections closed per second on the cache via port 6379 or 6380 (SSL).
allconnectedclients (featured metric)	count	Number of currently connected clients to the system.
alltotalcommandsprocessed		The cumulative count of all commands processed by the system.
alloperationsPerSecond		Total number of operations (such as read or write commands) performed per second across all instances.
allusedmemory (featured metric)	bytes	Total amount of memory being used across the system.
allusedmemoryRss (featured metric)	bytes	The total Resident Set Size (RSS), which reflects the amount of memory physically present in RAM across all instances, including swap.

Azure Gateway Metrics policy - Azure Metrics collector check metrics

Metric name	Units	Description
ApplicationGatewayTotalTime (featured metric)	MilliSeconds	Time that it takes for a request to be processed and its response to be sent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Gateway Metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
AvgRequestCountPerHealthyHost		Average request count per minute per healthy backend host in a pool.
AzwafBotProtectionMatches		Matched Bot Rules.
AzwafCustomRuleMatches		Matched Custom Rules.
AzwafSecRuleMatches		Matched Managed Rules.
AzwafTotalRequests		Total number of requests evaluated by WAF.
BackendConnectTime		Time spent establishing a connection with a backend server.
BackendFirstByteResponseTime		Time interval between start of establishing a connection to backend server and receiving the first byte of the response header, approximating processing time of backend server.
BackendLastByteResponseTime		Time interval between start of establishing a connection to backend server and receiving the last byte of the response body.
BackendResponseStatus		Number of HTTP response codes generated by the backend members. This does not include any response codes generated by the Application Gateway.
BlockedCount		Total number of blocked operations or requests
BytesReceived (featured metric)	bytes	Total number of bytes received by the Application Gateway from the clients.
BytesSent (featured metric)	bytes	Total number of bytes sent by the Application Gateway to the clients.
CapacityUnits		Capacity units consumed.
ClientRtt		Round trip time between clients and Application Gateway. Indicates how long it takes to establish connections and return acknowledgments.
ComputeUnits		Compute units consumed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Gateway Metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
CpuUtilization		Current CPU utilization of the Application Gateway.
CurrentConnections (featured metric)	count	Count of current connections established with Application Gateway.
EstimatedBilledCapacityUnits		Estimated capacity units that will be charged.
FailedRequests (featured metric)	count	Count of failed requests that Application Gateway has served.
FixedBillableCapacityUnits		Fixed Billable Capacity Units.
HealthyHostCount (featured metric)	count	Number of healthy backend hosts.
NewConnectionsPerSecond		New connections per second established with Application Gateway.
ResponseStatus		HTTP response status returned by Application Gateway.
Throughput (featured metric)	bytesPerSecond	Number of bytes per second the Application Gateway has served.
TotalRequests (featured metric)	count	Count of successful requests that Application Gateway has served.
UnhealthyHostCount (featured metric)	count	Number of unhealthy backend hosts.

Azure Storage Account policy - Azure Metrics Collector check metrics

Metric name	Units	Description
Transactions (featured metric)	count	Total number of requests made to the storage account.
Ingress (featured metric)	bytes	Amount of ingress data. This number includes ingress from an external client into Azure Storage as well as ingress within Azure.
Egress (featured metric)	bytes	Amount of egress data. This number includes egress from an external client into Azure Storage as well as egress within Azure. As a result,

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Storage Account policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
		this number does not reflect billable egress.
SuccessServerLatency (featured metric)	milliseconds	Average latency used by Azure Storage to process a successful request.
SuccessE2ELatency (featured metric)	milliseconds	The average end-to-end latency of successful requests made to a storage service or the specified API operation.
Availability (featured metric)	percent	The percentage of availability for the storage service or the specified API operation.

Azure Blob Services metrics

Metric Name	Description
Availability	Percentage of availability for the storage service or the specified API operation. Availability is calculated by taking the TotalBillableRequests value and dividing it by the number of applicable requests, including those that produced unexpected errors. All unexpected errors result in reduced availability for the storage service or the specified API operation.
BlobCapacity (Featured metric)	Amount of storage used by the storage account's Blob service, in bytes.
BlobCount	Number of Blobs in the storage account's Blob service
Container Count	Number of containers in the storage account's Blob service.
Egress (Featured metric)	Amount of Egress data, in bytes. Includes egress from an external client into Azure Storage as well as Egress within Azure. As a result, this number does not reflect billable Egress.
Index Capacity (Featured metric)	Amount of storage used by ADLS Gen2 (Hierarchical) Index, in bytes.
Ingress (Featured metric)	The amount of Ingress data, in bytes. Includes Ingress from an external client into Azure storage, as well as ingress within Azure.
SuccessE2ELatency	End-to-end latency of successful requests made to a storage service or the specified

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Blob Services metrics (continued)

Metric Name	Description
(Featured metric)	API operation, in milliseconds. Includes the required processing time within Azure storage to read the request, send the response, and receive acknowledgment of the response.
SuccessServerLatency (Featured metric)	Latency used by Azure storage to process a successful request, in milliseconds. This value does not include the network latency specified in **SuccessE2ELatency**.
Transactions	Number of requests made to a storage service or the specified API operation. Includes successful and failed requests, as well as requests which produced errors. Use the *ResponseType* dimension for the number of different types of responses.

Azure cloud metrics

Azure cloud metrics are gathered from Azure virtual machines (VMs) and Azure storage account policies. Collecting the cloud metrics enables you to monitor the performance of your Azure resources.

Azure cloud metrics collection - Overview

To begin collecting Azure cloud metrics, you must select the metrics that you want to add to the CMDB and set the relevant system configurations. For example, you can monitor the number of bytes sent and received from Azure resources. For details, see Agent Client Collector for Visibility - Content reference.

Using Azure policies

You can use preconfigured Azure policies for metric collection, or you can create your own Azure policies.

When using a preconfigured policy, you do the following tasks:

- Prepare an instance with an active MID Server and metric base.
- Install Agent Client Collector Framework and Agent Client Collector Monitoring.
- Run Discovery on the Azure cloud account to populate the CMDB with the configuration items (CIs) to be monitored.
- Configure a proxy agent and assign credentials to the policy. Proxy agents monitor CIs for agents that are in the cloud. Credentials enable the agent to access the Azure policy.

The policies available with the base system for you to activate and configure are described in the following table.

Azure policies available with base system

Policy name	Description	Link to supported metrics
Azure Load Balancer metrics	Collects the metrics for the Azure load balancers.	Supported metrics for Microsoft Load Balancers

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure policies available with base system (continued)

Policy name	Description	Link to supported metrics
Azure Gateway metrics	Collects the metrics for the Azure network gateway.	Supported metrics for Microsoft Network Gateways
Azure Redis Cache metrics	Collects the metrics for the Azure Redis cache.	Supported metrics for Microsoft Redis cache
Azure Storage Account metrics	Collects the metrics for the Azure storage accounts.	Supported metrics for Microsoft storage accounts
Azure Virtual Machine (VM) metrics	Collects the metrics for the VMs, which help you monitor Azure VMs.	Supported metrics for Microsoft virtual machines

Specifying the CIs for metric collection

When creating policies, you must include the CIs that you want to collect the metrics for in the CMDB. The CIs are typically populated during Discovery, which finds applications and devices on your network and updates the CMDB accordingly.

When creating a policy, you must decide which CIs you want the policy to monitor. To enable monitoring CIs, you do the following tasks:

1. Configure the Azure Metrics Collector check in the policy.
2. Set the credentials for the Azure Metrics Collector check to enable retrieving metrics from Azure to the Agent Client Collector agent.
3. Generate a .json file that specifies the list of resources to be monitored.
4. Generate a .json file that specifies the list of metrics to be retrieved from monitored resources.

For details on the Azure policies, see Create Azure policies for metric collection.

For details on the Azure Metrics Batch API, see the Metrics Batch API page.

Cassandra default checks and policies

Agent Client Collector provides the following policies for Cassandra health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for Linux only.

Cassandra Metrics

Check	Description	Usage	Command	Output
app.cassandra.metrics-cassandra	Returns metrics of a Cassandra database.	`metrics-cassandra-graphite.rb` Options: **-h host** Hostname where the Cassandra	`metrics-cassandra-graphite.rb --cfstats -P {{.labels.params_port}} -h {{.labels.params_host}}`	`<host>.cassandra.load 132270.08 1645107221`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cassandra Metrics (continued)

Check	Description	Usage	Command	Output
		database is running **-P port** Cassandra JMX port		

Cassandra metrics

The following table lists the metrics that are gathered as output from Cassandra checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-cassandra metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.load (featured metric)		byte	The disk space used by live data on a node.
cassandra.uptime (featured metric)		seconds	
cassandra.heap.used (featured metric)		byte	
cassandra.heap.total (featured metric)		byte	
cassandra.exceptions		count	Number of internal exceptions caught. Under normal exceptions this should be zero.
cassandra.key_cache.size		byte	Total size of occupied cache, in bytes.
cassandra.key_cache.capacity		byte	Cache capacity in bytes.
cassandra.key_cache.hits		count	Total number of cache hits.
cassandra.key_cache.requests (featured metric)		count	Total number of cache requests.
cassandra.key_cache.hit_rate (featured metric)		count	All time cache hit rate.
cassandra.compactionstats.pending_tasks		count	The number of pending compactions.

© 2025 ServiceNow, Inc. All rights reserved.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.ReadStage.active		count	Number of tasks being actively worked on by this pool. Local reads run on this thread pool on this ReadStage.
cassandra.threadpool.ReadStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ReadStage.completed		count	Number of tasks completed.
cassandra.threadpool.ReadStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MiscStage.active		count	Number of tasks being actively worked on by this pool. Miscellaneous tasks run on this stage.
cassandra.threadpool.MiscStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MiscStage.completed		count	Number of tasks completed.
cassandra.threadpool.MiscStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CompactionExecutor.active		count	Number of tasks being actively worked on by this pool. Compactions are run on these threads.
cassandra.threadpool.CompactionExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CompactionExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.CompactionExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for all other writes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.MutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MutationStage.completed		count	Number of tasks completed.
cassandra.threadpool.MutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtableReclaimMemory.active		count	Number of tasks being actively worked on by this pool. Memtable recycling.
cassandra.threadpool.MemtableReclaimMemory.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtableReclaimMemory.completed		count	Number of tasks completed.
cassandra.threadpool.MemtableReclaimMemory.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.PendingRangeCalculator.active		count	Number of tasks being actively worked on by this pool. Calculates token range.
cassandra.threadpool.PendingRangeCalculator.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.PendingRangeCalculator.completed		count	Number of tasks completed.
cassandra.threadpool.PendingRangeCalculator.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.GossipStage.active		count	Number of tasks being actively worked on by this pool. Handles gossip requests.
cassandra.threadpool.GossipStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.GossipStage.completed		count	Number of tasks completed.

© 2025 ServiceNow, Inc. All rights reserved.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.GossipStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.SecondaryIndexManagement.active		count	Number of tasks being actively worked on by this pool. Performs updates to secondary indexes.
cassandra.threadpool.SecondaryIndexManagement.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.SecondaryIndexManagement.completed		count	Number of tasks completed.
cassandra.threadpool.SecondaryIndexManagement.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.HintsDispatcher.active		count	Number of tasks being actively worked on by this pool. Performs hinted hand off.
cassandra.threadpool.HintsDispatcher.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.HintsDispatcher.completed		count	Number of tasks completed.
cassandra.threadpool.HintsDispatcher.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.RequestResponseStage.active		count	Number of tasks being actively worked on by this pool. Coordinator requests to the cluster run on this thread pool.
cassandra.threadpool.RequestResponseStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.RequestResponseStage.completed		count	Number of tasks completed.
cassandra.threadpool.RequestResponseStage.blocked		count	Number of tasks that were blocked due to queue saturation.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.ReadRepairStage.active		count	Number of tasks being actively worked on by this pool. Read repair happens on this thread pool.
cassandra.threadpool.ReadRepairStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ReadRepairStage.completed		count	Number of tasks completed.
cassandra.threadpool.ReadRepairStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CounterMutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for counter writes.
cassandra.threadpool.CounterMutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CounterMutationStage.completed		count	Number of tasks completed.
cassandra.threadpool.CounterMutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MigrationStage.active		count	Number of tasks being actively worked on by this pool. Runs schema migrations.
cassandra.threadpool.MigrationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MigrationStage.completed		count	Number of tasks completed.
cassandra.threadpool.MigrationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtablePostFlush.active		count	Number of tasks being actively worked on by this pool. Cleans up commit log after memtable is written to disk.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.MemtablePostFlush.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtablePostFlush.completed		count	Number of tasks completed.
cassandra.threadpool.MemtablePostFlush.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.active		count	Number of tasks being actively worked on by this pool. Responsible for writing a spec (there is one of these per disk 0-N).
cassandra.threadpool.PerDiskMemtableFlushWriter_0.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.completed		count	Number of tasks completed.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.ValidationExecutor.active		count	Number of tasks being actively worked on by this pool. Performs validation compaction or scrubbing.
cassandra.threadpool.ValidationExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ValidationExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.ValidationExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.Sampler.active		count	Number of tasks being actively worked on by this pool. Responsible for re-sampling the index summaries of *`SStables`*.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.Sampler.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.Sampler.completed		count	Number of tasks completed.
cassandra.threadpool.Sampler.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtableFlushWriter.active		count	Number of tasks being actively worked on by this pool. Writes memtables to disk.
cassandra.threadpool.MemtableFlushWriter.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtableFlushWriter.completed		count	Number of tasks completed.
cassandra.threadpool.MemtableFlushWriter.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.InternalResponseStage.active		count	Number of tasks being actively worked on by this pool. Responsible for intra-cluster callbacks.
cassandra.threadpool.InternalResponseStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.InternalResponseStage.completed		count	Number of tasks completed.
cassandra.threadpool.InternalResponseStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.ViewMutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for materialized view writes.
cassandra.threadpool.ViewMutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ViewMutationStage.completed		count	Number of tasks completed.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.ViewMutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.AntiEntropyStage.active		count	Number of tasks being actively worked on by this pool. Builds merkle tree for repairs.
cassandra.threadpool.AntiEntropyStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.AntiEntropyStage.completed		count	Number of tasks completed.
cassandra.threadpool.AntiEntropyStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CacheCleanupExecutor.active		count	Number of tasks being actively worked on by this pool. Cache maintenance performed on this thread pool.
cassandra.threadpool.CacheCleanupExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CacheCleanupExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.CacheCleanupExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.message_type.READ.dropped		count	Number of dropped messages. Regular reads.
cassandra.message_type.RANGE_SLICE.dropped		count	Number of dropped messages. Token range read.
cassandra.message_type._TRACE.dropped		count	Number of dropped messages. Tracing writes.
cassandra.message_type.HINT.dropped		count	Number of dropped messages. Hint replay.
cassandra.message_type.MUTATION.dropped		count	Number of dropped messages. Regular writes.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.message_type.COUNTER_MUTATION.dropped		count	Number of dropped messages. Counter writes.
cassandra.message_type.BATCH_STORE.dropped		count	Number of dropped messages. Batchlog write.
cassandra.message_type.BATCH_REMOVE.dropped		count	Number of dropped messages. Batchlog cleanup (after successfully applied).
cassandra.message_type.REQUEST_RESPONSE.dropped		count	Number of dropped messages. RPC Callbacks.
cassandra.message_type.PAGED_RANGE.dropped		count	Number of dropped messages. Paged read.
cassandra.message_type.READ_REPAIR.dropped		count	Number of dropped messages. Read repair.
cassandra.system_traces.read_count		count	Number of read for this table.
cassandra.system_traces.read_latency			Local read latency for this table.
cassandra.system_traces.write_count		count	Number of writes for this table.
cassandra.system_traces.write_latency			Local write latency for this table.
cassandra.system_traces.pending_flushes		count	Estimated number of flush tasks pending for this table.
cassandra.system.read_count (featured metric)		count	
cassandra.system.read_latency (featured metric)		microseconds	
cassandra.system.write_count (featured metric)		count	
cassandra.system.write_latency (featured metric)		microseconds	
cassandra.system.pending_flushes		count	
cassandra.system_distributed.read_count		count	
cassandra.system_distributed.read_latency

cassandra.system_schema.read_count		count	
cassandra.system_schema.read_latency			
cassandra.system_schema.write_count		count	
cassandra.system_schema.write_latency			
cassandra.system_schema.pending_flushes		count	
cassandra.system_auth.read_count		count	
cassandra.system_auth.read_latency			
cassandra.system_auth.write_count		count	
cassandra.system_auth.write_latency			
cassandra.system_auth.pending_flushes		count	

Directory Scan monitoring default checks and policies

The Agent Client Collector provides the following default checks and policies for Directory Scan monitoring.

Windows OS Events - Extended policy

Type	Check	Description	Usage and Usage Example	Output
Event	check-directory-file-count	Checks the number of files present in a given directory and compares it to the provided warning and critical thresholds. Returns a CRITICAL, WARNING, or OK event based on the critical and warning thresholds.	check-directory-file-count.rb (options) -d, --dir Absolute path to the directory to count the files (required) -w, --warning Warning threshold (required) -c, --critical Critical threshold (required)	DirectoryFileCount CRITICAL: <path to dir> has 165 files.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
		Note: • Counts the number of files inside the directory, not including files in subdirectories. • The agent requires read and execute permissions on the directory being monitored.	-H, include_hidden_files Set active to **true** to include hidden files while counting (default is **false**) **Usage Example:** `check-directory-file-count.rb -d /path/to/directory -w 50 -c 100`	
Event	check-directory-integrity	Compares the last modified time of the directory with the current time to determine if any updates have occurred within a defined time interval. Based on this comparison, the check returns a CRITICAL or OK event. **Note:** The agent requires read and execute permissions on the directory being monitored.	commonchecks check-directory-integrity (options) -d, --dirpath DIRPATH: Absolute path to the directory to check (required). -i, --interval INTERVAL: Time interval in seconds to check for recent updates (required). Default value can be set to 180 seconds. **Usage example:** `commonchecks check-directory-update -d /path/`	Common Checks CRITICAL: Directory Integrity: CHANGES DETECTED for <path to file> within the last 180 seconds (Last Modified: Wed, 04 Dec 2024 12:18:55 EST).

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			`to/directory -i 180`	
Event	check-file-age	Evaluates the age of a specified file by comparing its last modification time with the current time. Raises an alert if the file exceeds the defined critical or warning age thresholds. **Note:** The agent requires read and execute permissions on the file being monitored.	commonchecks check-file-age (options) -f, --filepath FILEPATH: Absolute path to the file to check (required). -c, --critical CRITICAL: Critical age threshold in minutes for the file (required). -w, --warning WARNING: Warning age threshold in minutes for the file (required). **Usage example:** `commonchecks check-file-age -f /path/to/file.txt -c 120 -w 60`	Common Checks OK: File <path to file> age: 30 minutes.
Event	check-file-response-time	Compares the time needed to read a specified file and compares it with the critical and warning thresholds. Based on this comparison, the check returns a CRITICAL or OK event.	commonchecks check-file-response-time (options) -f, --filepath FILEPATH: Absolute path to the file to check (required). -c, --critical CRITICAL: Critical threshold in seconds for file	Common Checks OK: File read response time: 0.0020 seconds for the file_name: /var/log/servicenow/agent-client-collector/acc.log.

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
		Note: The agent requires read and execute permissions on the file being monitored.	response time (required). -w, --warning WARNING: Warning threshold in seconds for file response time (required). -t, --timeout TIMEOUT: Maximum time allowed for reading the file content, specified in seconds. Time out value must be greater than the critical threshold value. **Usage example:** `commonchecks check-file-response-time -f /var/log/servicenow/agent-client-collector/acc.log -c 10 -w 5 -t 20`	
Event	check-file-size	Measures the size of a file (the actual amount of data it contains) and compares it against specified thresholds. Returns a CRITICAL, WARNING, or OK event based on the comparison of	commonchecks check-file-size (options) -f, --filepath FILEPATH Absolute path to the required file (required). -c, --critical CRITICAL. Critical threshold in kilobytes. Provide as a number	Common Checks OK: For File <path to file> size: 4.72 KB is within thresholds

Google Cloud Platform (GCP) metrics

The following table lists and describes the metrics that are gathered by the *acc_grp_metrics_list.json* configuration data file. The file is uploaded to a check definition or check instance, and the metrics in the file are monitored by the check for its agent.

GCP metrics

Metric name	Metric type	Service	Description
CPU utilization	appengine.googleapis.com/flex/cpu/utilization	app engine	Fractional utilization of allocated CPU across an App Engine flexible environment version.
Response count	appengine.googleapis.com/http/server/response_count		Delta HTTP response count
Free disk space percent	file.googleapis.com/nfs/server/free_bytes_percent	file	Free disk space as a percentage of the total space.
Circuit Operational Status	interconnect.googleapis.com/network/interconnect/link/operational	interconnect	Whether the operational status of the circuit is 'up'. This metric is specific to individual physical circuits
Operational Status	interconnect.googleapis.com/network/interconnect/operational		Whether the operational status of the interconnect is 'up'. This metric is specific to the aggregate LACP bundle.
Instance group size	compute.googleapis.com/instance_group/size	compute	The number of VMs in the instance group.
CPU limit utilization	kubernetes.io/anthos/container/cpu/limit_utilization	anthos	The fraction of the CPU limit that is

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
			currently in use on the instance.
Memory limit utilization	kubernetes.io/anthos/container/memory/limit_utilization		The fraction of the memory limit that is currently in use on the instance.
Executions	cloudfunctions.googleapis.com/function/execution_count	cloudfunctions	Count of function executions broken down by status.
Tunnel established	n.googleapis.com/tunnel_established	vpn	Indicates successful tunnel establishment if > 0.
RTT latencies per internal TCP/UDP load balancer	loadbalancing.googleapis.com/l3/internal/rtt_latencies	loadbalancing	A distribution of RTT measured over TCP connections for internal TCP/UDP load balancer flows.
Unacked messages by region	pubsub.googleapis.com/subscription/num_unacked_messages_by_region	pubsub	Number of unacknowledged messages in a subscription, broken down by Cloud region.
Disabled for network	firebasedatabase.googleapis.com/network/disabled_for_overages	firebasedatabase	Indicates if the Firebase database has been disabled for network overages.
Disabled for storage	firebasedatabase.googleapis.com/storage/disabled_for_overages		Indicates if the Firebase database has been disabled for storage overages.
Database load	firebasedatabase.googleapis.com/io/database_load		Fraction of database load, grouped by type.
CPU utilization	cloudsql.googleapis.com/database/cpu/utilization	cloudsql	Current CPU utilization represented as a percentage of the reserved CPU that is currently in use.
Disk utilization	cloudsql.googleapis.com/database/disk/utilization		The fraction of the disk quota that is currently in use.
Instance state	cloudsql.googleapis.com/database/instance_state		The current serving state of the Cloud SQL instance.
Memory utilization	cloudsql.googleapis.com/database/memory/utilization		The fraction of the memory quota that is currently in use.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Server up	cloudsql.googleapis.com/database/up		Indicates if the server is up.
CPU utilization by priority	spanner.googleapis.com/instance/cpu/utilization_by_priority	spanner	Percent utilization of provisioned CPU, by priority.
Smoothed CPU utilization	spanner.googleapis.com/instance/cpu/smoothed_utilization		24-hour smoothed utilization of provisioned CPU.
Storage used	spanner.googleapis.com/instance/storage/used_bytes		Storage used in bytes. Sampled every 60 seconds.
CPU usage percent	memcache.googleapis.com/node/cpu/utilization	memcache	CPU usage percent by Memcached node.
Cache memory usage	memcache.googleapis.com/node/cachememory		Bytes allotted for the Memcached cache in this node, grouped by whether that memory is used.
Used memory	redis.googleapis.com/redis.googleapis.com/stats/memory/usage_ratio	redis	Total number of bytes allocated by Redis.
Memory usage ratio	redis.googleapis.com/stats/memory/usage_ratio		Memory usage as a ratio of maximum memory.
CPU load	bigtable.googleapis.com/cluster_cpu_load	bigtable	CPU load of a cluster.
Disk load	bigtable.googleapis.com/cluster_disk_load		Utilization of HDD disks in a cluster.
Storage utilization	bigtable.googleapis.com/cluster_storage_utilization		Storage used as a fraction of total storage capacity.
HDFS storage utilization	dataproc.googleapis.com/cluster/hdfs/storage_utilization	dataproc	The percentage of HDFS storage currently used.
Unhealthy HDFS blocks by status	dataproc.googleapis.com/hdfs/unhealthy_blocks		Indicates the number of unhealthy blocks inside the cluster.
Processes	agent.googleapis.com/processes/count_by_state	processes	Count of processes in the given state. Relevant for Linux only.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Process CPU	agent.googleapis.com/processes/cpu_time		Time taken by CPU to complete a given process.
TCP connections	agent.googleapis.com/processes/network	network	Current count of TCP connections.

Glassfish default checks and policies

Agent Client Collector provides the following default checks and policies for Glassfish monitoring.

Glassfish metrics policy

Type	Check	Description	Usage and usage example	Output

Metric	glassfish.metric-jvm-level	Retrieves the Glassfish server's JVM metrics.
		
		Requires basic authentication credentials.
			`-i, --instance Glassfish Monitoring Instance Name (required)`
			`-p, --password Glassfish password`
			`-P, --port Glassfish API port`
			`--ssl Enable secure connnection to Glassfish`
			`-u –username Glassfish username`
			
			Usage example:
			`metric-glassfish-jvm-level.rb {{if .labels.params_port}}`
				`glassfish.jvm.garbage-collectors.Scavenge.Col 200 0 1652959788`

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glassfish metrics policy (continued)

Type	Check	Description	Usage and usage example	Output
			`-P {{.labels.params_port}} {{end}} -i {{.labels.params_glassfish_server_ins`	

Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.
		
		Requires basic authentication credentials.
			`-i, --instance Glassfish Monitoring Instance Name (required) -p, --password Glassfish password -P, --port Glassfish API port --ssl Enable secure connnection to Glassfish -u -username Glassfish username`
			
			Usage example:
			`metric-glassfish-server-requests.rb -i {{.labels.params_glassfish_server_ins {{if .labels.params_port}} -P {{.labels.params_port}} {{end}}`
				`glassfish.http-service.server.request.C 200 0 1652959788`

Metric	glassfish.metric-server-resources	Provides metrics of the resources	`-i, --instance`	`glassfish.resources.{{PoolName}}.AverageCon 0 1652959936`

GlassFish metrics

The following table lists the metrics that are gathered as output from GlassFish checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

© 2025 ServiceNow, Inc. All rights reserved.

glassfish.metrics-deployed-apps metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.TotalServletsLoaded	Deployed Application	count	Total number of Servlets loaded so far.
glassfish.applications.{Deployed Application}.ServletProcessingTimes	Deployed Application	ms	Cumulative Servlet processing times.
glassfish.applications.{Deployed Application}.ActiveServletsLoaded	Deployed Application	count	Number of Servlets loaded.
glassfish.applications.{Deployed Application}.ExpiredSessionsTotal (featured metric)	Deployed Application	count	Total number of sessions expired so far.
glassfish.applications.{Deployed Application}.PassivatedSessionsTotal	Deployed Application	count	Total number of sessions passivated so far.
glassfish.applications.{Deployed Application}.ActivatedSessionsTotal	Deployed Application	count	Total number of sessions activatedso far.
glassfish.applications.{Deployed Application}.SessionsTotal	Deployed Application	count	Total number of sessions created so far.
glassfish.applications.{Deployed Application}.RejectedSessionsTotal (featured metric)	Deployed Application	count	Total number of sessions rejected so far.
glassfish.applications.{Deployed Application}.PersistedSessionsTotal	Deployed Application	count	Total number of sessions persisted so far.
glassfish.applications.{Deployed Application}.ActiveSessions (featured metric)	Deployed Application	count	Number of active sessions.
glassfish.applications.{Deployed Application}.RequestCount	Deployed Application	count	Cumulative number of requests processed so far
glassfish.applications.{Deployed Application}.MaxTime (featured metric)	Deployed Application	ms	Longest response time for a request; not a cumulative value, but the largest response time from among the response times.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metrics-deployed-apps metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.ErrorCount (featured metric)	Deployed Application	count	Cumulative value of the error count, with error count representing the number of cases where the response code was greater than or equal to 400.
glassfish.applications.{Deployed Application}.ProcessingTime	Deployed Application	ms	Average request processing time.
glassfish.applications.{Deployed Application}.TotalJspCount	Deployed Application	count	Total number of JSP pages loaded so far.
glassfish.applications.{Deployed Application}.JspCount	Deployed Application	count	Number of active JSP pages.
glassfish.applications.{Deployed Application}.JspErrorCount (featured metric)	Deployed Application	count	Total number of errors triggered by JSP page invocations.
glassfish.applications.{Deployed Application}.JspReloadedCount	Deployed Application	count	Total number of reloaded JSP pages.

glassfish.metrics-deployment-lifecycle metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.deployment.lifecycle.ActiveApplications (featured metric)	Deployed	count	Total number of applications deployed so far.
glassfish.deployment.lifecycle.TotalApplications (featured metric)	Deployed	count	Number of applications deployed.

glassfish.metric-server-requests metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.Count200		count	Number of responses with a status code equal to 200.
glassfish.http-service.server.request.Count2xx		count	Number of responses with a status code in the 2xx range.
glassfish.http-service.server.request.Count302		count	Number of responses with a status code equal to 302.
glassfish.http-service.server.request.Count304		count	Number of responses with a status code equal to 304.
glassfish.http-service.server.request.Count3xx		count	Number of responses with a status code equal in the 3xx range.
glassfish.http-service.server.request.Count400		count	Number of responses with a status code equal to 400.
glassfish.http-service.server.request.Count401		count	Number of responses with a status code equal to 401.
glassfish.http-service.server.request.Count403		count	Number of responses with a status code equal to 403.
glassfish.http-service.server.request.Count404		count	Number of responses with a status code equal to 404.
glassfish.http-service.server.request.Count4xx		count	Number of responses with a status code equal in the 4xx range.
glassfish.http-service.server.request.Count503		count	Number of responses with a status code equal to 503.
glassfish.http-service.server.request.Count5xx		count	Number of responses with a status code equal in the 5xx range.
glassfish.http-service.server.request.MaxTime		ms	Longest response time for a request; not a cumulative value, but the largest response time from among the response times.

glassfish.metric-server-requests metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.CountBytesReceived (featured metric)		count	Number of bytes received.
glassfish.http-service.server.request.CountBytesTransmitted (featured metric)		count	Number of bytes transmitted.
glassfish.http-service.server.request.RequestCount (featured metric)		count	Cumulative number of requests processed so far.
glassfish.http-service.server.request.CountOpenConnections		count	Number of open connections.
glassfish.http-service.server.request.ProcessingTime (featured metric)		ms	Average request processing time.

glassfish.metric-jvm-level metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.jvm.garbage-collectors.Scavenge.CollectionCount		count	Total number of collections that have occurred.
glassfish.jvm.garbage-collectors.Scavenge.CollectionTime		ms	Approximate accumulated collection elapsed time in milliseconds.
glassfish.jvm.garbage-collectors.MarkSweepCompact.CollectionCount		count	Total number of collections that have occurred.
glassfish.jvm.garbage-collectors.MarkSweepCompact.CollectionTime		ms	Approximate accumulated collection elapsed time in milliseconds.
glassfish.jvm.memory.CommittedHeapSize		bytes	Amount of memory in bytes that is committed for the Java virtual machine to use.
glassfish.jvm.memory.CommittedNonHeapSize		bytes	Amount of memory in bytes that is committed for the Java virtual machine to use.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-jvm-level metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.jvm.memory.InitHeapSize		bytes	Amount of memory in bytes that the Java virtual machine initially requests from the operating system for memory management.
glassfish.jvm.memory.InitNonHeapSize		bytes	Amount of memory in bytes that the Java virtual machine initially requests from the operating system for memory management.
glassfish.jvm.memory.MaxHeapSize (featured metric)		bytes	Maximum amount of memory in bytes that can be used for memory management.
glassfish.jvm.memory.MaxNonHeapSize		bytes	Maximum amount of memory in bytes that can be used for memory management.
glassfish.jvm.memory.ObjectPendingFinalizationCount		Count	Approximate number of objects for which finalization is pending.
glassfish.jvm.memory.UsedHeapSize		bytes	Amount of used memory in bytes.
glassfish.jvm.memory.UsedNonHeapSize		bytes	Amount of used memory in bytes.

glassfish.metric-transaction-service metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.transaction-service.ActiveCount (featured metric)		count	Provides the number of transactions that are currently active.
glassfish.transaction-service.CommittedCount (featured metric)		count	Provides the number of transactions that have been committed.
glassfish.transaction-service.RolledBackCount (featured metric)		count	Provides the number of transactions that have been rolled back.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-server-resources metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfis.resources.{PoolName}.AverageConnWaitTime	PoolName	ms	Average wait-time-duration per successful connection request.
glassfis.resources.{PoolName}.ConnRequestWaitTime	PoolName	ms	The longest and shortest wait times of connection requests. The current value indicates the wait time of the last request that was serviced by the pool.
glassfis.resources.{PoolName}.NumConnAcquired	PoolName	count	Number of logical connections acquired from the pool.
glassfis.resources.{PoolName}.NumConnCreated	PoolName	count	The number of physical connections that were created since the last reset.
glassfis.resources.{PoolName}.NumConnDestroyed	PoolName	count	Number of physical connections that were destroyed since the last reset.
glassfis.resources.{PoolName}.NumConnfailedValidation	PoolName	count	The total number of connections in the connection pool that failed validation from the start time until the last sample time.
glassfis.resources.{PoolName}.NumConnFree	PoolName	count	The total number of free connections in the pool as of the last sampling.
glassfis.resources.{PoolName}.NumConnnotSuccessfullyMatched	PoolName	count	Number of connections rejected during matching.
glassfis.resources.{PoolName}.NumConnReleased	PoolName	count	Number of logical connections released to the pool.
glassfis.resources.{PoolName}.NumConnSuccessfullyMatched	PoolName	count	Number of connections successfully matched.
glassfis.resources.{PoolName}.NumConnTimedOut	PoolName	count	The total number of connections in the pool that timed out

glassfish.metric-server-resources metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			between the start time and the last sample time.
glassfis.resources.{PoolName}.NumConnUsed	PoolName	count	Provides connection usage statistics. The total number of connections that are currently being used, as well as information about the maximum number of connections that were used (the high water mark).
glassfis.resources.{PoolName}.NumPotentialConnLeak (featured metric)	PoolName	count	Number of potential connection leaks.
glassfis.resources.{PoolName}.WaitQueueLength (featured metric)	PoolName	count	Number of connection requests in the queue waiting to be serviced.

HAProxy default checks and policies

Agent Client Collector provides the following default checks and policies for HAProxy monitoring.

HAProxy events policy

Type	Check	Description	Usage	Output
Event	check-haproxy	Retrieves the details of the HAProxy load balancer to determine whether it is running.	`commonchecks check-haproxy (options) -h host host -P port Port on which the HAProxy server is running -A all services all services -q Path on which HAProxy`	`CheckHAProxy OK: UP: 50% of 4 // services, DOWN: backend/nginx1[L4CON], backend/BACKEND`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HAProxy events policy (continued)

Type	Check	Description	Usage	Output
			Stats URI is configured -use ssl ssl Usage example: check-haproxy.rb -h localhost -P 8080 -A true -q stats -use_ssl false	

HAProxy metrics policy

Type	Check	Description	Usage	Output
Metric	metrics-check-haproxy	Retrieves the HAProxy load balancer metrics to determine whether it is running.	commonchecks metrics-check-haproxy (options) -q host Path on which HAProxy Stats URI is configured -P port Port on which the HAProxy server is running -c host host name Usage example: metrics-check-haproxy.rb	<hostname>.haproxy.frontend.session_current 0 1652265603 <hostname>.haproxy.frontend.session_total 0 1652265603 <hostname>.haproxy.backend.session_current 0 1652265603 <hostname>.haproxy.backend.session_total 1 1652265603

HAProxy metrics policy (continued)

Type	Check	Description	Usage	Output
			`-q stats -P 8080 -c localhost`	

HAProxy metrics

The following table lists the metrics that are gathered as output from HAProxy checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Front-end metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.frontend.session_current (featured metric)		count	The current number of sessions being used to issue requests.
haproxy.frontend.session_total (featured metric)		count	Total number of sessions
haproxy.frontend.bytes_in (featured metric)		count	The total number of bytes recieved by the server in the last second from the client.
haproxy.frontend.bytes_out (featured metric)		count	The total number of bytes sent by the server in the last second.
haproxy.frontend.connection_errors (featured metric)		count	The number of requests that encountered an error trying to connect to a server.
haproxy.frontend.warning_retries		count	The number of times a connection to a server was retried.
haproxy.frontend.warning_redispatched		count	The number of times a request was redispatched to another server.
haproxy.frontend.response_1xx		count	HAProxy exposes the number of responses by HTTP status code - 1xx

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Front-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.frontend.response_2xx		count	HAProxy exposes the number of responses by HTTP status code - 2xx
haproxy.frontend.response_3xx		count	HAProxy exposes the number of responses by HTTP status code - 3xx
haproxy.frontend.response_4xx		count	HAProxy exposes the number of responses by HTTP status code - 4xx
haproxy.frontend.response_5xx		count	HAProxy exposes the number of responses by HTTP status code - 5xx
haproxy.frontend.response_other		count	HAProxy exposes the number of responses by non-HTTP application
haproxy.frontend.queue_time		count	The average queue time over the last 1024 requests.
haproxy.frontend.connect_time		count	The average connect time over the last 1024 requests.
haproxy.frontend.response_time (featured metric)		count	The response time to the client
haproxy.frontend.average_time (featured metric)		count	The average time taken for the sessions.

Back-end metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.session_current (featured metric)		count	The current number of sessions being used to issue requests.
haproxy.backend.session_total (featured metric)		count	Total number of sessions
haproxy.backend.bytes_in (featured metric)		count	The total number of bytes recieved by the server in the

Back-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.queue_time		count	The average queue time over the last 1024 requests.
haproxy.backend.connect_time		count	The average connect time over the last 1024 requests.
haproxy.backend.response_time (featured metric)		count	The response time to the client
haproxy.backend.average_time (featured metric)		count	The average time taken for the sessions.
haproxy.backend.num_up		count	

HTTP default checks and policies

Agent Client Collector provides the following policies for HTTP health monitoring. Policies come with the checks specified in the tables below.

HTTP entry point events policy

Type	Check	Description	Usage and Usage Example	Output
Event	util.check-http-follow-redirect	Verifies that redirection links can be followed in a set number of requests.	Usage check-head-redirect.rb (options): • -A, --auth-first-only: Use basic auth on first request only. • -aws-access-key-id: AWS Access Key. Either set ENV["AWS_ACCESS_KEY_ID"] or provide it as an option on agent. • -r -aws-region: AWS Region (defaults to us-east-1). • --aws-secret-access-key: AWS Secret Access Key. Either set	Check Head Redirect OK

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			ENV["AWS_SECRET_ACCESS_KEY"] or provide it as an option on agent. • -R --redirect: Follow first <N> redirects • -g --get-redirects: Follow first <N> redirects with GET requests. • -s, --s3-config-bucket: S3 config bucket to get configuration. • -k, --s3-config-key: S3 config key to get configuration. • -u, --url: URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. The Aws-region, aws-secret-key, aws-access-key ,s3-config, s3-config-key parameters are useful if you do not want to configure connection information in other check parameters. If a bucket and key have access to the environment in which the Sensu check executes in,

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			provide an AWS key and token and the checks pull the specified JSON file from S3 and merge the JSON config into the current check configuration. Usage example: `command:check-head-redirect.rb -R 10 -u 'https://servicenow.com'`	
Event	util.check-http-response	Verifies URL response time and raises a CRITICAL/WARNING event if elapsed time exceeds provided CRITICAL/WARNING thresholds. Otherwise, it raises an OK event.	Usage: check-head-redirect.rb (options) • -R, --redirect: Follow first <N> redirects. • -w --timeout_warning: Set the timeout threshold for warning in milliseconds. • -c --timeout_critical: Set the timeout threshold for critical in milliseconds. • -u, --url URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. Usage example: `command:check-head-redirect.rb`	Check Head Redirect OK

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			`-R 10 -u 'https://servicenow.com' -w 3000 -c 5000`	

HTTP entry point metrics policy

Type	Check	Description	Usage and Usage Example	Output
Metric	util.metrics-http-curl	Retrieves metrics on HTTP endpoints using curl. This check requires a proxy agent.	Usage: • -a, --curl_args "CURL ARGS": Additional arguments to pass to curl. • s, --scheme SCHEME: Metric naming scheme, text to append to metric (Default: hostname). • -u, --url: URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. Usage example: `metrics-curl.rb -u myURL.com -a -Lk`	Check run successfully. Output: ws10.curl_timings.time_total 0.219622 1642749209 ws10.curl_timings.time_namelooku 0.145494 1642749209 ws10.curl_timings.time_connect 0.151103 1642749209 ws10.curl_timings.time_pretransfe 0.168569 1642749209 ws10.curl_timings.time_redirect 0.095899 1642749209 ws10.curl_timings.time_starttransfe 0.219351 1642749209 ws10.curl_timings.http_code 200 1642749209

HTTP entry point metrics

The following table lists the metrics that are gathered as output from HTTP entry point checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
http_code (featured metric)			Status code of the request.
time_total (featured metric)		milliseconds	The total time the operation lasted.
time_namelookup (featured metric)		seconds	Time to resolve the name in the URL.
time_connect (featured metric)		seconds	Time to complete the connection to the remote host or proxy.
time_pretransfer (featured metric)		seconds	Time between start and beginning of file transfer. Includes all pre-transfer commands and negotiations.
time_starttransfer (featured metric)		seconds	Time between the start and the transfer of the first byte. Includes *time_pretransfer* and the time the server used to calculate the result.
time_redirect (featured metric)		seconds	Time for all redirection steps including: • name lookup • connect • pretransfer • transfer Shows the complete execution time for multiple redirections.

HTTP response code check

Agent Client Collector provides the following additional check for HTTP response code. This check is not associated with any policy.

HTTP response code check

Type	Name	Description	Usage and usage example	Output

Event	util.check-http-response-code	Raises a critical event if the URL response code doesn't match the regex.
		
		Pass credentials (username and password) using secure parameters.
			`-u, --url URL needs to be updated in the Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do for the CI`
			`-r, --response-code Regex string to match the response code. Otherwise, a critical event is raised. Default: 200`
			`-f, --follow_redirects Follows redirect URLs`
			
			Usage example:
			`command: check-response-code.rb -u 'https://servicenow.com' -r 2.. -f`
				`CheckResponseCode OK : URL is in OK state. HTTP Response code is 200, matches regex`

Internet Information Services (IIS) metrics

The following table lists the metrics that are gathered as output from IIS checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
iis._Total.Web_Service(_Total).Current_Connections (featured metric)		count	Total number of current connections to IIS.
iis._Total.Web_Service(_Total).Total_Get_Requests (featured metric)		count	Total of HTTP GET requests received by the IIS server.
iis._Total.Web_Service(_Total).Total_Post_Requests (featured metric)		count	Total of HTTP POST requests received by the IIS server.
iis._Total.Web_Service(_Total).Get_Requests/sec (featured metric)		count per second	Rate of all HTTP GET requests received by the IIS server.
iis._Total.Web_Service(_Total).Post_Requests/sec (featured metric)		count per second	Rate of all HTTP POST requests received by the IIS server.

Linux default checks and policies

Agent Client Collector provides the following default checks and policies for Linux Metrics monitoring.

Linux monitoring metrics checks

Linux metrics policy

Check	Metric Name	Resource	Description	Units	Featured Metric	Anomaly Detection
os.linux.metrics.process-usage	proc.acc.running	process-name	Number of processes running with this name(acc)	count		
	proc.acc.cpuPercent	process-name	Percentage of cpu taken by the process.	percent		
	proc.acc.memPercent	process-name	Percentage of memory taken by the process.	percent		
os.linux.metrics.reboot-count-today	reboot.count.today	empty	Number of reboot done on today	count		

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux metrics policy (continued)

Check	Metric Name	Resource	Description	Units	Featured Metric	Anomaly Detection
os.linux.metrics-system-cpu	cpu.total.user	total	Normal processes executing in user mode; cpu.total.user is the total of the cpuN.user metrics.	count		
	cpu.total.nice	total	Niced processes executing in user mode; cpu.total.nice is the total of the cpuN.nice metrics.	count		
	cpu.total.system	total	Time the CPU spent running the kernel; cpu.total.system is the total of the cpuN.system metrics.	sec		
	cpu.total.idle	total	Total time the CPU spent in an idle state.; cpu.total.idle is the total of the cpuN.idle metrics.	sec		
	cpu.total.iowait	total	Total time the CPU spent waiting for IO operations to complete.;	sec		

© 2025 ServiceNow, Inc. All rights reserved.

			huge zero page and falls back to using small pages.			
	vmstat.balloon_inflate	empty				
	vmstat.balloon_ deflate	empty				
	vmstat.balloon_ migrate	empty				
os.linux.metrics-process-status	proc.<process>.VmSize	process-name	The total amount of virtual memory used by the process	KB		
	proc.<process>.VmRSS	process-name	The non-swapped physical memory a process has used	KB		
	proc.<process>.VmSwap	process-name	The total amount of swap space used.	KB		

Linux network monitoring checks

Note:
When upgrading from an earlier version, manually add the checks in this table to the Linux metrics policy.

Linux metrics policy

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
Metric	os.linux.metrics-network-interface	Retrieves all network interface related metrics for Linux servers.	Usage: • -x, excludeinterface: List of interfaces to exclude	• rxBytes (featured metric) • rxPackets (featured metric)	yes

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux metrics policy (continued)

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
			(comma separated) • -i, includeinterface: List of interfaces to include (comma separated) • -I, includeinterfaceregex: Regex matching interfaces to include • -X, excludeinterfaceregex: Regex matching interfaces to exclude Usage example: `command: metrics-network-interface.rb`	• rxErrors • rxDrops (featured metric) • rxFifo • rxFrame • rxCompressed • rxMulticast • rxBytes (featured metric) • rxPackets (featured metric) • rxErrors • rxDrops (featured metric) • rxFifo • rxColls • rxCarrier • rxCompressed	
Metric	os.linux.metrics-netstat-tcp	Retrieves metrics on TCP socket states from netstat. Useful on high-traffic web or proxy servers with large numbers of short-lived TCP connections coming and going.	Usage: • -p, port: The port from which you want to receive metrics. Value range = 1-65535. • -t, type: The port type from which to receive metrics. Values=local or remote. Default = local	• tcp.UNKNOWN • tcp.ESTABLISHED • tcp.SYN_SENT • tcp.SYN_RECV • tcp.FIN_WAIT1 • tcp.FIN_WAIT2 • tcp.TIME_WAIT • tcp.CLOSE • tcp.CLOSE_WAIT • tcp.LAST_ACK • tcp.LISTEN • tcp.CLOSING	no

Linux metrics policy (continued)

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
			• -d, disabletcp6: Disables the tcp6 check. Enter a value to set disabletcp6 = true. Usage example: `metrics-netstat-tcp.rb`		

Linux log monitoring default checks and policies

Agent Client Collector provides the following policy for Linux log monitoring.

Type	Check	Description	Usage and Usage Example	Output
Event	util.check-logs	Enables monitoring log files owned by a regular user.	Usage: • -i --icase: Run a case insensitive match. • -c, --crit N: Critical level (if pattern has a group). • --encode-utf16u: Encode line with utf16 before matching. • -e, --encoding ENCODING-PAGE: Specific encoding page to read log file with. • -E, --exclude PAT: Pattern to exclude from matching.	CheckLog CRITICAL: 0 warnings, 8 criticals for pattern SEVERE|Exception in log file /var/log/servicenow/agent-client-collector/acc.log

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Check	Description	Usage and Usage Example	Output
			• -F, --filepattern FILE: Check a pattern of files, instead of one file. For REGEX, first test it on `https://rubular.com/` to get the expected outcomes and then pass it inside quotes as a parameter. For example, to get all *`.log`* extension files, pass `"(.)*\.log$"` as REGEX. • -f, --log-file FILE: Path to log file. • -l, --log-pattern PAT: Log format of each log entry: • -o, --warn-only Warn instead of critical on match. • -q, --pattern PAT Pattern to search for.To search for multiple patterns, separate each pattern with pipe(|) and put inside quotes (For example: "SEVERE|404"). • -r, --return: Return matched line. • -L, --return-length N:

			specified path. Default = False. • -w, --warn N: Warning level if pattern has a groupWarning level if pattern has a group. • must_sudo: Enables the servicenow user to run the command with sudo permissions. Usage example: `command: check-log.rb -c 2 -w 1 -q "SEVERE|Exception" -s /tmp/cache/check-log -f /var/log/servicenow/agent-client-collector/acc.log`	

Linux metrics

The following table lists the metrics that are gathered as output from Linux checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

os.linux.metrics-process-usage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.acc.running			Number of processes running with this name (acc).
proc.acc.cpuPercent			Percentage of CPU taken by the process.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-process-usage metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.acc.memPercent			Percentage of memory taken by the process.

os.linux.metrics-reboot-count-today metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
reboot.count.today			Number of reboots today.

os.linux.metrics-system-cpu metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.total.user			Normal processes executing in user mode; *cpu.total.user* is the total of the *cpuN.user* metrics.
cpu.total.nice			Niced processes executing in user mode; *cpu.total.nice* is the total of the *cpuN.nice* metrics.
cpu.total.system			Time the CPU spent running the kernel; *cpu.total.system* is the total of the *cpuN.system* metrics.
cpu.total.idle			Total time the CPU spent in an idle state; *cpu.total.idle* is the total of the *cpuN.idle* metrics.
cpu.total.iowait			Total time the CPU spent waiting for IO operations to complete; *cpu.total.iowait* is the total of the

os.linux.metrics-system-cpu metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			cpuN.iowait metrics.
cpu.total.irq			Total time that the processor is spending on Interrupts; *cpu.total.irq* is the total of the *cpuN.irq* metrics.
cpu.total.softirq			Time spent servicing soft interrupt requests; *cpu.total.softirq* is the total of the *cpuN.softirq* metrics.
cpu.total.steal			Total time the virtual CPU spent waiting for the Hypervisor to service another virtual CPU. Applies only to virtual machines.
cpu.total.guest			Total time the CPU spent running the virtual processor. Applies only to Hypervisors.
cpu.total.guest_nice			Total time the CPU spent running as nice guest OS; *cpu.total.guset_nice* is the total of the *cpuN.guest_nice* metrics
cpu.<cpu-core>.user			Time spent with normal processing in user mode.
cpu.<cpu-core>.nice			Time spent with niced processing in user mode.
cpu.<cpu-core>.system			Time spent running in kernel mode.
cpu.<cpu-core>.idle			Time spent idle.
cpu.<cpu-core>.iowait			Time spent waiting for I/O to complete. Also considered idle time.

os.linux.metrics-system-cpu metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.<cpu-core>.irq			Time spent serving hardware interrupts.
cpu.<cpu-core>.softirq			Time spent serving software interrupts.
cpu.<cpu-core>.steal			Time stolen by other operating systems running in a virtual environment.
cpu.<cpu-core>.guest			Time spent running a virtual CPU or guest OS under the control of the kernel.
cpu.<cpu-core>.guest_nice			Total time the CPU spent running as nice guest OS.
cpu.intr			Interrupts serviced since boot time.
cpu.ctxt			Total number of context switches across all CPUs.
cpu.btime			Boot time.
cpu.processes			The number of processes and threads created, which includes (but is not limited to) those created by calls to the fork() and clone() system calls.
cpu.procs_running			The total number of processes running on all CPUs.
cpu.procs_blocked			The number of processes currently blocked and waiting for I/O to complete.
cpu.cpu_count			The number of CPUs on the system.
cpu.<cpu-core>.cores			The number of CPU cores.

os.linux.metrics-system-cpu-load metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
load_avg.one (featured metric)			The average system load over one minute.
load_avg.five (featured metric)			The average system load over five minutes.
load_avg.fifteen (featured metric)			The average system load over fifteen minutes.
load_avg.norm.one			The average system load over one minute normalized by the number of CPUs.
load_avg.norm.five			The average system load over five minutes normalized by the number of CPUs.
load_avg.norm.fifteen			The average system load over fifteen minutes normalized by the number of CPUs.

os.linux.metrics-system-cpu-percentage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.avgutilization_percentage			The average percentage of CPU used.
cpu.user_percentage (featured metric)			Percentage of time total CPU was used by normal processes in user mode.
cpu.nice_percentage (featured metric)			Percentage of time all CPUs used by niced processes in user mode.
cpu.system_percentage (featured metric)			Percentage of time the CPU spent running the kernel.
cpu.idle_percentage (featured metric)			Percentage of time all CPIUs were idle.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-cpu-percentage metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.iowait_percentage (featured metric)			Percentage of time all CPUs waited for I/O to complete.
cpu.irq_percentage (featured metric)			Percentage of time all CPUs serviced interrupts.
cpu.softirq_percentage (featured metric)			Percentage of time all CPIs serviced software interrupts.
cpu.steal_percentage (featured metric)			Percentage of time all CPUs serviced virtual-host operating systems.
cpu.guest_percentage (featured metric)			Percentage of time all CPUs serviced guest operating systems.

os.linux.metrics-system-disk metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<disk-name>.reads (featured metric)			Total number of reads completed successfully.
disk.<disk-name>.readsMerged			Total number of reads merged.
disk.<disk-name>.sectorsRead			Total number of sectors read successfully.
disk.<disk-name>.readTime		milliseconds	Total number of milliseconds spent by all reads.
disk.<disk-name>.writes (featured metric)			Total number of writes completed successfully.
disk.<disk-name>.writesMerged			Total number of writes merged.
disk.<disk-name>.sectorsWritten			Total number of sectors written successfully.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-disk metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<disk-name>.writeTime		milliseconds	Total number of milliseconds spent by all writes.
disk.<disk-name>.ioInProgress			Total number of I/Os currently in progress.
disk.<disk-name>.ioTime (featured metric)			Total time spent on I/Os.
disk.<disk-name>.ioTimeWeighted			Total time spent on I/Os. This can provide a measure of both I/O completion time and the backlog that might be accumulating.

os.linux.metrics-system-disk-capacity metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<file-system-name>.total			The total size of the file system.
disk.<file-system-name>.used			The total amount of space allocated to existing files in the file system.
disk.<file-system-name>.avail			The total amount of space available within the file system.
disk.<file-system-name>.used_percentage			The percentage of the available space that is currently allocated to all files on the file system.
disk.<file-system-name>.itotal			The total number of *inodes* on the file system.
disk.<file-system-name>.iused			The number of used *inodes*.
disk.<file-system-name>.iavail			The number of free (unused) *inodes*.
disk.<file-system-name>.iused_percentage			The percentage of used *inodes*.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-disk-usage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk_usage.<disk>.total			Total amount of space available on the disk.
disk_usage.<disk>.used			Total amount of space used in the disk.
disk_usage.<disk>.avail			Total amount of space available on the disk.
disk_usage.<disk>.used_percentage (featured metric)			The percentage of space used on the disk.

os.linux.metrics-system-memory metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory.total			Total usable RAM.
memory.free			Total free RAM.
memory.available			An estimate of how much memory is available for starting new applications without swapping.
memory.buffers			Temporary storage used for raw disk blocks.
memory.cached			In-memory cache for files read from disk (the page cache). Does not include *mem_swapcached*.
memory.swapTotal (featured metric)			Total amount of swap space available.
memory.swapFree (featured metric)			Amount of swap space that is currently unused.
memory.dirty			Memory which is waiting to be written back to the disk.
memory.swapUsed (featured metric)			The amount of swap space in use.
memory.used			The amount of RAM in use.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

os.linux.metrics-system-memory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory.usedWOBuffersCaches			The amount of memory in use.
memory.freeWOBuffersCaches			Value of *`MemAvailable`* from */proc/meminfo* if present, but falls back to free + buffered + cached memory if not.
memory.swapUsedPercentage			Percent of swap space used.

os.linux.metrics-system-memory-percent metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory_percent.free (featured metric)			Percentage of free RAM.
memory_percent.available (featured metric)			Percentage of memory available
memory_percent.buffers (featured metric)			Percentage of memory used for raw disk blocks.
memory_percent.cached (featured metric)			Percentage of memory used with in-memory cache for files read from disk.
memory_percent.dirty (featured metric)			Percentage of memory waiting to be written back to the disk.
memory_percent.swapUsed (featured metric)			Percentage of swap space used.
memory_percent.usedWOBuffersCaches (featured metric)			Percentage of memory used.
memory_percent.freeWOBuffersCaches (featured metric)			Percentage of memory available.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-uptime metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
system.uptime(sec)			The amount of time the system has been working and available.

os.linux.metrics-memory-vmstat metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.nr_free_pages			Pages that are currently unused by the system.
vmstat.nr_alloc_batch			Pages allocated to other domains due to insufficient memory in each domain of each non-uniform memory access (NUMA) node.
vmstat.nr_inactive_anon			Memory pages in each domain of each NUMA node that have not been accessed.
vmstat.nr_active_anon			Anonymous virtual memory pages that have been recently used.
vmstat.nr_inactive_file			The memory page corresponding to the file that has not been accessed in each domain of each NUMA.
vmstat.nr_active_file			The memory page corresponding to the file that has been recently accessed.
vmstat.nr_unevictable			The number of pages in the unevictable (non-)LRU list.
vmstat.nr_mlock			Pages mapped into a VM_LOCKED VMA that are a class of unevictable pages.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.nr_anon_pages			Memory mapped pages that are not part of a file.
vmstat.nr_mapped			The number of memory mapped pages.
vmstat.nr_file_pages			
vmstat.nr_dirty			Pages waiting to be written to disk.
vmstat.nr_writeback			Pages currently being written to disk.
vmstat.nr_slab_reclaimable			Pages from the kernel slab memory usage that can be reclaimed.
vmstat.nr_slab_unreclaimable			Pages from the kernel slab memory usage that cannot be reclaimed.
vmstat.nr_page_table_pages			Pages allocated to page tables.
vmstat.nr_kernel_stack			Amount of memory allocated to kernel stacks.
vmstat.nr_unstable			The number of unstable pages in each domain of each NUMA node.
vmstat.nr_bounce			
vmstat.nr_vmscan_write			The number of dirty pages written back during a scan of LRUs.
vmstat.nr_vmscan_immediate_reclaim			
vmstat.nr_writeback_temp			
vmstat.nr_isolated_anon			The number of anonymous memory pages isolated in each domain of each NUMA node.
vmstat.nr_isolated_file			The number of file storage pages isolated in each

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			domain of each NUMA node.
vmstat.nr_shmem			The number of shared memory pages.
vmstat.nr_dirtied			The number of dirty pages in each domain of each NUMA node.
vmstat.nr_written			
vmstat.numa_hit			The number of pages that were successfully allocated to this node.
vmstat.numa_miss			The number of pages that were allocated to this node because of low memory on the intended node.
vmstat.numa_foreign			The number of pages initially intended for this node that were allocated to another node.
vmstat.numa_interleave			The number of interleave policy pages successfully allocated to this node.
vmstat.numa_local			The number of pages successfully allocated on this node by a process on this node.
vmstat.numa_other			The number of pages allocated on this node by a process on another node.
vmstat.workingset_refault			
vmstat.workingset_activate			
vmstat.workingset_nodereclaim			
vmstat.nr_anon_transparent_hugepages			
vmstat.nr_free_cma			Free continuous memory allocator pages in each domain of each NUMA.
vmstat.nr_dirty_threshold			

© 2025 ServiceNow, Inc. All rights reserved.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.nr_dirty_background_threshold			
vmstat.pgpgin			The number of pages brought in from disk.
vmstat.pgpgout			The number of pages written out to disk.
vmstat.pswpin			The number of pages brought in from swap space.
vmstat.pswpout			The number of pages swapped out into swap space.
vmstat.pgalloc_dma			
vmstat.pgalloc_dma32			
vmstat.pgalloc_normal			
vmstat.pgalloc_movable			
vmstat.pgfree			The number of pages free since the last boot.
vmstat.pgactivate			Number of page activations since the last boot.
vmstat.pgdeactivate			Number of page deactivations since the last boot.
vmstat.pgfault			Minor faults since the last boot.
vmstat.pgmajfault			Major faults since the last boot.
vmstat.pglazyfreed			
vmstat.pgrefill_dma			
vmstat.pgrefill_dma32			
vmstat.pgrefill_normal			Number of page refills since the last boot.
vmstat.pgrefill_movable			
vmstat.pgsteal_kswapd_dma			
vmstat.pgsteal_kswapd_dma32			
vmstat.pgsteal_kswapd_normal			
vmstat.pgsteal_kswapd_movable

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.thp_collapse_alloc			The number of pages collapsed into one huge page with the successful allocation of a new huge page to store the data.
vmstat.thp_collapse_alloc_failed			The number of pages collapsed into one huge page but failed allocation.
vmstat.thp_split			The number of base pages to split from a huge page.
vmstat.thp_zero_page_alloc			The number of successful allocations of huge zero pages.
vmstat.thp_zero_page_alloc_failed			The number of times the kernel failed to allocate a huge zero page and falls back to using small pages.
vmstat.balloon_inflate			
vmstat.balloon_deflate			
vmstat.balloon_migrate			

os.linux.metrics-process-status metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.<process>.VmSize			The total amount of virtual memory used by the process.
proc.<process>.VmRSS			The non-swapped physical memory used by a process.
proc.<process>.VmSwap			The total amount of swap space used.

MongoDB default checks and policies

Agent Client Collector provides the following policies for MongoDB health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

MongoDB Events

Type	Check	Description	Usage	Command	Output

Event	app.mongodb.check-mongodb-alive	Monitors whether the MongoDB server is alive and creating alerts for the MongoDB server health status.	`commoncheck check-mongodb-alive -H db_host -p db_port`
			
			Where:
			• `db_host` = Host where server is running.
			• `db_port` = Port to connect to the MongoDB server.
			
			Usage example:
			`command: commonchecks check-mongodb-alive -H 10.***.***.*** -p 27017`
				`commoncheck check-mongodb -p {{.labels.params_port}} -H {{.labels.params_host}}`	`Check mongodb Alive OK: Indicates that the server is in good health`

Event	app.mongodb.check-mongodb-metrics	Creates alerts for any of the MongoDB metrics, based on the threshold limit. To trigger the alerts for any MongoDB server metric, pass the whole metric name in the parameter.	`commoncheck check-mongodb-metrics -H Hostname -p port -w warning -c critical -d database -m MetricName` Where: • `Hostname` = Host where	`commoncheck check-mongodb-metrics -c {{.labels.params_critical}} -d {{.labels.params_database}} -w {{.labels.params_warning}} -H {{.labels.params_host}} -p {{.labels.params_port}} -m {{.labels.params_metric}}`	`Check mongodb Metrics OK: Indicates that the mongodb.connection.cu value is within the acceptable threshold`

Type	Check	Description	Usage	Command	Output
			server is running. • `port` = Port to connect to the MongoDB server. • `warning` = Warning threshold value. • `critical` = Critical threshold value. • `database` = Database name. • `MetricName` = Specific metric to monitor. Usage example: `command: commonchecks check-mongodb-alive -H 10.***.***.*** -p 27017`		

MongoDB Metrics

Type	Check	Description	Usage	Command	Output
Metric	app.mongodb.metrics-mongodb	Returns metrics of the MongoDB server and all databases. Sample metrics:	`commoncheck check-mongodb` Where: • `host` = Hostname where the MongoDB	`commoncheck metrics-mongodb -p {{.labels.params_port}} -H {{.labels.params_host}} -d {{.labels.params_database}}`	`<hostname>.mongodb.co 20632 1639498004`

MongoDB Metrics (continued)

Type	Check	Description	Usage	Command	Output
		• `mongodb.connections.totalCreated`: Incoming connections • `mongodb.locks.Database.acquireCount_IX` : Intent Exclusive lock mode • `mongodb.locks.Database.acquireCount_X` : Exclusive lock mode • `mongodb.locks.Database.acquireCount_IS` : Intent shared lock mode	server is running. • `port` = Port to connect to the MongoDB server. • `database` = Database name.		

MongoDB metrics

The following table lists the metrics that are gathered as output from MongoDB checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-mongodb metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.asserts.msg (featured metric)		count	Number of message assertions raised since the MongoDB process started. Examine the log file for more information about these messages.
mongodb.asserts.regular (featured metric)		count	Number of regular assertions raised since the MongoDB process started. Examine the log file for more information about these messages.
mongodb.asserts.rollovers		count	Number of times that the rollover counters have rolled over since the last time the

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			MongoDB process started.
mongodb.asserts.tripwire			Number of tripwire assertions raised since the MongoDB process started.
mongodb.asserts.user		count	Number of "user asserts" that occurred since the last time the MongoDB process started.
mongodb.asserts.warning (featured metric)		count	Number of warnings raised since the MongoDB process started.
mongodb.connections.available		count	Number of unused incoming connections available.
mongodb.connections.current		count	Number of incoming connections from clients to the database server.
mongodb.connections.totalCreated		count	Count of all incoming connections created to the server.
mongodb.cursor.open.noTimeout		count	Number of open cursors with the option `DBQuery.Option.noTimeout` set to prevent timeout after a period of inactivity.
mongodb.cursor.open.pinned		count	Number of "pinned" open cursors.
mongodb.cursor.open.total (featured metric)		count	Number of cursors that MongoDB is maintaining for clients. Because MongoDB exhausts unused cursors, typically this value is small or zero. However, if there is a queue, stale tailable cursors, or a large number of

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			operations, this value may increase.
mongodb.cursor.timedOut		count	Total number of cursors that have timed out since the server process started.
mongodb.databaseSizes.avgObjSize	admin	bytes	Average size of each document in bytes.
mongodb.databaseSizes.avgObjSize	config	bytes	Average size of each document in bytes.
mongodb.databaseSizes.avgObjSize	local	bytes	Average size of each document in bytes.
mongodb.databaseSizes.collections	admin	count	Number of collections in the database.
mongodb.databaseSizes.collections	config	count	Number of collections in the database.
mongodb.databaseSizes.collections	local	count	Number of collections in the database.
mongodb.databaseSizes.dataSize	admin	bytes	Total size of the uncompressed data held in the database. The *dataSize* decreases when you remove documents. For databases using the *WiredTiger* storage engine, *dataSize* may be larger than *storageSize* if compression is enabled. The *dataSize* decreases when documents shrink.
mongodb.databaseSizes.dataSize	config	bytes	Total size of the uncompressed data held in the database.
mongodb.databaseSizes.dataSize	local	bytes	Total size of the uncompressed data held in the database.
mongodb.databaseSizes.indexes	admin	count	Total number of indexes across all

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			collections in the database.
mongodb.databaseSizes.indexes	config	count	Total number of indexes across all collections in the database.
mongodb.databaseSizes.indexes	local	count	Total number of indexes across all collections in the database.
mongodb.databaseSizes.indexSize	admin	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.indexSize	config	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.indexSize	local	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.objects	admin	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.objects	config	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.objects	local	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.storageSize	admin	bytes	This value does not decrease as you remove or shrink documents. This value may be smaller than *dataSize*

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			for databases using the *WiredTiger* storage engine with compression enabled. *storageSize* does not include space allocated to indexes. See *indexSize* for the total index size.
mongodb.databaseSizes.config	config	bytes	Sum of the space allocated to all collections in the database for document storage, including free space.
mongodb.databaseSizes.local	local	bytes	Sum of the space allocated to all collections in the database for document storage, including free space.
mongodb.globalLock.activeClients.readers (featured metric)		count	Number of active client connections performing read operations.
mongodb.globalLock.activeClients.total		count	Total number of internal client connections to the database, including system threads as well as queued readers and writers. This metric will be higher than the total of *activeClients.readers* and *activeClients.writers* due to the inclusion of system threads.
mongodb.globalLock.activeClients.writers (featured metric)		count	Number of active client connections performing write operations.
mongodb.globalLock.currentQueue.readers (featured metric)		count	Number of operations that are currently queued and waiting for the read lock.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			A consistently small read queue, particularly of shorter operations, is not a cause for concern.
mongodb.globalLock.currentQueue.total		count	Total number of operations queued waiting for the lock (i.e., the sum of *globalLock.currentQueue.rea* and *globalLock.currentQueue.wri* A consistently small queue, particularly of shorter operations, is not a cause for concern. The *globalLock.activeClients* readers and writers information provides context for this data.
mongodb.globalLock.currentQueue.writers (featured metric)		count	Number of operations that are currently queued and waiting for the write lock. A consistently small write queue, particularly of shorter operations, is not a cause for concern.
mongodb.globalLock.totalTime		microseconds	Time, in microseconds, since the database last started and created the *globalLock*. This is approximately equivalent to the total server uptime.
mongodb.locks.Collection.acquireCount_r		count	Number of times the collection lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Collection.acquireCount_w		count	Number of times the collection lock was acquired in the Intent Exclusive (IX) lock mode.

© 2025 ServiceNow, Inc. All rights reserved.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.locks.Collection.acquireCount_W		count	Number of times the collection lock was acquired in the Exclusive (X) lock mode.
mongodb.locks.Database.acquireCount_r		count	Number of times the database lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Database.acquireCount_w		count	Number of times the database lock was acquired in the Intent Exclusive (IX) lock mode.
mongodb.locks.Database.acquireCount_W		count	Number of times the database lock was acquired in the Exclusive (X) lock mode.
mongodb.locks.Global.acquireCount_r		count	Number of times the global lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Global.acquireCount_w		count	Number of times the global lock was acquired in the Intent Exclusive (IX) lock mode.
mongodb.locks.Global.acquireCount_W		count	Number of times the global lock was acquired in the Exclusive (X) lock mode.
mongodb.mem.pageFaults		count	Total number of page faults. The *`extra_info.page_faults`* counter may increase dramatically during moments of poor performance and may correlate with limited memory environments and larger data sets. Limited and sporadic page faults do not

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			necessarily indicate an issue.
mongodb.mem.resident (featured metric)		mebibyte	This value is roughly equivalent to the amount of RAM, in mebibyte (MiB), currently used by the database process. During normal use, this value tends to grow. In dedicated database servers, the number tends to approach the total amount of system memory.
mongodb.mem.virtual		mebibyte	The quantity, in mebibyte (MiB), of virtual memory used by the mongod process.
mongodb.metrics.document.deleted		count	Total number of documents deleted.
mongodb.metrics.document.inserted		count	Total number of documents inserted.
mongodb.metrics.document.returned		count	Total number of documents returned by queries.
mongodb.metrics.document.updated		count	Total number of documents updated.
mongodb.metrics.getLastError.wtime_num (featured metric)		count	Total number of *`getLastError`* operations with a specified write concern (w) that wait for one or more members of a replica set to acknowledge the write operation (a w value greater than 1.)
mongodb.metrics.getLastError.wtime_totalMillis (featured metric)		miliseconds	Total amount of time in milliseconds that the mongod has spent performing *`getLastError`*

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			operations with write concern (w) that wait for one or more members of a replica set to acknowledge the write operation (a w value greater than 1.)
mongodb.metrics.getLastError.wtimeouts (featured metric)		count	Number of times that write concern operations have timed out as a result of the *`wtimeout`* threshold to *`getLastError`*. This number increments for both default and non-default write concern specifications.
mongodb.metrics.operation.scanAndOrder		count	Total number of queries that return sorted numbers that cannot perform the sort operation using an index.
mongodb.metrics.queryExecutor.scanned		count	Total number of index items scanned during queries and query-plan evaluation. This counter is the same as *`totalKeysExamined`* in the output of explain().
mongodb.metrics.queryExecutor.scannedObjects		count	Total number of documents scanned during queries and query-plan evaluation. This counter is the same as *`totalDocsExamined`* in the output of explain().
mongodb.metrics.record.moves			A document that reports on data related to record allocation in the on-disk memory files.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.metrics.repl.apply.batches_num		count	Total number of batches applied across all databases.
mongodb.metrics.repl.apply.batches_totalMillis		count	Total amount of time in milliseconds the mongod has spent applying operations from the oplog.
mongodb.metrics.repl.apply.ops		count	Total number of oplog operations applied. *`metrics.repl.apply.ops`* is incremented after each operation.
mongodb.metrics.repl.buffer.count		count	Current number of operations in the oplog buffer.
mongodb.metrics.repl.buffer.maxSizeBytes		bytes	Maximum size of the buffer. This value is a constant setting in the mongod, and is not configurable.
mongodb.metrics.repl.buffer.sizeBytes		bytes	Current size of the contents of the oplog buffer.
mongodb.metrics.repl.network.bytes		count	Total amount of data read from the replication sync source.
mongodb.metrics.repl.network.getmores_num		count	Reports the total number of *`getmore`* operations, which are operations that request an additional set of operations from the replication sync source.
mongodb.metrics.repl.network.getmores_totalMillis		count	Total amount of time required to collect data from *`getmore`* operations.
mongodb.metrics.repl.network.ops		count	Total number of operations read from the replication source.
mongodb.metrics.repl.network.readersCreated		count	Total number of oplog query processes

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			created. MongoDB creates a new oplog query any time an error occurs in the connection, including a timeout, or a network operation. Furthermore, *metrics.repl.network.reade* increments every time MongoDB selects a new source for replication.
mongodb.metrics.ttl.deletedDocuments		count	Total number of documents deleted from collections with a *ttl* index.
mongodb.metrics.ttl.passes		count	Total number of documents deleted from collections with a *ttl* index.
mongodb.network.bytesIn		count	Total number of bytes that the server has received over network connections initiated by clients.
mongodb.network.bytesOut		count	Total number of bytes that the server has sent over network connections initiated by clients.
mongodb.network.numRequests		count	Total number of distinct requests that the server has received. Use this value to provide context for the *network.bytesIn* and *network.bytesOut* values to ensure that MongoDB's network utilization is consistent with expectations and application use.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.opcounters.command		count	Total number of commands issued to the database since the mongod instance last started. *opcounters.command* counts all commands except the write commands: insert, update, and delete.
mongodb.opcounters.delete		count	Total number of delete operations since the mongod instance last started.
mongodb.opcounters.getmore		count	Total number of *getMore* operations since the mongod instance last started. This counter can be high even if the query count is low. Secondary nodes send *getMore* operations as part of the replication process.
mongodb.opcounters.insert		count	Total number of insert operations received since the mongod instance last started.
mongodb.opcounters.query		count	Total number of queries received since the mongod instance last started.
mongodb.opcounters.update		count	Total number of update operations received since the mongod instance last started.
mongodb.opcountersRepl.command		count	Total number of replicated commands issued to the database since the mongod instance last started.
mongodb.opcountersRepl.delete		count	Total number of replicated delete

			operations since the mongod instance last started.
mongodb.opcountersRepl.getmore		count	Total number of getMore operations since the mongod instance last started.
mongodb.opcountersRepl.insert (featured metric)		count	Total number of replicated insert operations since the mongod instance last started.
mongodb.opcountersRepl.query (featured metric)		count	Total number of replicated queries since the mongod instance last started.
mongodb.opcountersRepl.update		count	Total number of replicated update operations since the mongod instance last started.

MS Exchange default checks and policies

Agent Client Collector provides the following default checks and policies for MS Exchange monitoring.

Type	Check	Description	Usage and usage example	Output
Metric	app.msexchange.metrics-msexchange	Retrieves Microsoft Exchange metrics.	`winchecks metric-msexchange (options) -s scheme Replaces the host name with this parameter` Usage example: `winchecks metric-msexchange {{if .labels.params_scheme}} -s`	Metrics from MS Exchange server

Type	Check	Description	Usage and usage example	Output
			`{{if .labels.params_scheme}} {{end}}`	

MSSQL default checks and policies

The Agent Client Collector provides the following default checks and policies for MSSQL Metrics monitoring.

MSSQL Metrics

Type	Check	Description	Usage and Usage Example	Output
Metric	app.metrics-mssql-query	Generic MSSQL query class which accepts a query and dumps metrics.	winchecks metrics-mssql-query (options) -d, --database DATABASE Database schema to connect to (required) -q ,--query The query to execute, should return a list metric name and value, for example SELECT METRIC_NAME, VALUE FROM GV $SYSMETRIC -h, --host HOST Host name to connect to, defaults to localhost -r, --port PORT Port to connect to, defaults to 1433 -s, --scheme SCHEME Metric naming scheme, text to prepend to .$parent. $child, **Usage Example** `.winchecks metrics-`	Custom metrics defined in the parameters, which also contain value and timestamp.

Network ping default checks and policies

Agent Client Collector provides the following default checks and policies for Network ping monitoring. Policies and checks are available for both Windows and Linux.

Network-ping metrics policy

Check	Description	Usage	Command	Output

util.metrics-ping	Runs on the ip address discovered in the ServiceNow instance. Pings the host and collects metrics.
	
	The monitored CI type is *cmdb_ci_hardware* and is bound to the relevant server.
	
	A proxy agent is required.
		metrics-ping.rb (options)
		
		`c --count COUNT Ping count`
		
		`-h Host to ping`
		
		`-t_--timeout TIMEOUT Timeout`
		
		Example: ./metrics-ping.rb -h 10.196.121.11
				`c7inc0047383.ping.packets_transmitted 5 1675923886`
				
				`c7inc0047383.ping.packets_received 5 1675923886`

© 2025 ServiceNow, Inc. All rights reserved.

Network ping metrics

The following table lists the metrics that are gathered as output from Network ping checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

network-ping metrics

Metric type	Units	Metric type description
ping.packets_transmitted	count	Number of data packets sent to the target host during the ping test.
ping.packets_received	count	Number of data packets successfully received by the target host.
ping.packet_loss	percentage	Percentage of data packets that failed to reach the target host.
ping.time	ms	Amount of time for the data packets to travel to the destination and back.
ping.min	ms	Shortest amount of time for a series of ping requests on the data packets.
ping.avg	ms	Average amount of time for a series of ping requests on the data packets.
ping.max	ms	Longest amount of time for a series of ping requests on the data packets.
ping.mdev	ms	Mean deviation (measure of the variability or dispersion) of the round-trip time (RTT) of the packets sent during the ping test.

Network host availability check

Agent Client Collector provides the following default check for network ping monitoring. The check is available for both Windows and Linux.

util.check-ping check

Check	Description	Usage	Command	Output
util.check-ping	Checks the network host availability via ICMP (ping) requests.	`check-ping.rb -h <ip-address>` (options) `-h host`: Host to ping		`ICMP ping unsuccessful for host: 192.168.1.1`

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

util.check-ping check (continued)

Check	Description	Usage	Command	Output
	Generates an OK event if the ping success ratio exceeds the Warning threshold (-W, default 50%). Generates a Warning event if the ping success ratio is between the warning threshold (-W, default 50%) and the critical threshold (-C, default 20%). Generates a Critical event if the ping success ratio falls below the critical threshold (-C, default 20%). A proxy agent is required.	(Required). Default=<localhost> `-c count`: Number of ping requests sent to the host. Default=1 `-T timeout`: The timeout (in seconds) for each ping request. If the timeout expires before a reply is received, the ping is considered failed. Default=5 `-6 ipv6`: Enables IPv6 pinging. Ping uses IPv4 when this flag is not used. Default=False `-i interval`: Interval (in seconds) between each ping request. Default=1 `-W ratio`: The success ratio threshold for a Warning state. If the successful ping responses are below this ratio and above the -C ratio, the script returns a Warning. Default=0.5 `-C ratio`: The success ratio threshold for a Critical state. If the		`(successful: 0/5)`

util.check-ping check (continued)

Check	Description	Usage	Command	Output
		successful ping responses are below this ratio, the script returns a Critical failure. Default=0.2 `-r report`: Flag to append to the failure message of an MTR (My Trace Route) report if the ping fails. When MTR runs, a network diagnostic report generates. Default=false		

Nginx default checks and policies

Agent Client Collector provides the following policies for Nginx health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

Nginx Events policy

Check	Description	Usage	Command	Output

nginx.check-nginx-alive	Verifies whether Nginx server is alive.
	
	Note: Use basic authentication for events.
		`check-nginx-status.rb`
		-h, --host
		Nginx hostname
		-p, --port
		Nginx port
		
		Note: Use basic authentication for events.
				Successful
				`CheckNginxStatus OK: Nginx is Alive and healthy`
				
				Failure
				`CheckNginxStatus CRITICAL: Nginx is Down`

Nginx Metrics policy

Check	Description	Usage	Command	Output

nginx.metrics-nginx-server	Retrieves the following information:
	nginx.active_connections
	Total number of active connections on server.
	nginx.accepts
	The accepted connections.
	nginx.handled
	Handled connections, which normally equals the number of accepted connections.
	nginx.requests
	Total number of handled requests by the server.
	nginx.read
	Shows whether the server is reading requests.
	nginx.writing
	Shows whether the
		`metrics-nginx.rb`
		Options:
		`-u --url` Full URL to the server status page. For example: `https://yoursite.com/nginx_status`
				`ws19-INC0047517.nginx.active_connections 1 1640135552`
				`ws19-INC0047517.nginx.accepts 5746 1640135552`
				`ws19-INC0047517.nginx.handled 5746 1640135552`
				`ws19-INC0047517.nginx.requests 9603 1640135552`
				`ws19-INC0047517.nginx.reading 0 1640135552`
				`ws19-INC0047517.nginx.writing 1 1640135552`
				`ws19-INC0047517.nginx.waiting 0 1640135552`

Nginx Metrics policy (continued)

Check	Description	Usage	Command	Output
	server is writing responses to the client. **nginx.waiting** Idle connections waiting for a request. **Note:** Use basic authentication for metrics.			

Nginx metrics

The following table lists the metrics that are gathered as output from Nginx checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-nginx metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
nginx.active_connections (featured metric)	admin	count	Total number of connections opened on the server, including waiting connections (*`nginx.waiting`* value). It reflects the number of current users on the website. There can be multiple connections opened for a single user.
nginx.accepts (featured metric)	admin	count	Represents the total established connections when `https://yoursite.com/nginx_status` is triggered.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-nginx metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
nginx.handled (featured metric)	admin	count	Total number of connections handled by the Nginx server.
nginx.requests (featured metric)	admin	count	Total number of requests handled by the Nginx server.
nginx.reading (featured metric)	admin	count	Current number of connections where Nginx server is reading the request header.
nginx.writing (featured metric)	admin	count	Represents the current number of connections where the Nginx server is writing the response back to the client.
nginx.waiting (featured metric)	admin	count	Number of idle client connections waiting for a request.

PostgreSQL default checks and policies

Agent Client Collector provides the following default checks and policies for PostgreSQL health monitoring.

PostgreSQL checks

Type	Check	Description	Command
Event	postgresql.check-alive	Triggers an alert on the status of the PostgreSQL database.	`commonchecks check-postgres-alive -d {{.labels.params_database}} -p {{.labels.params_port}} -H {{.labels.params_host}}`
Event	postgresql.check-connections	Triggers an alert on the total connection load on the PostgreSQL database, based on the configured threshold.	`commonchecks check-postgres-connections -d {{.labels.params_database}} -c {{.labels.params_critical}} -p {{.labels.params_port}} -H {{.labels.params_host}}`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL checks (continued)

Type	Check	Description	Command
			`-w {{.labels.params_warning}} -a {{.labels.params_use_percer`
Metric	postgresql.metric-active-connections	Provides metrics on the total active connection on the PostgreSQL database.	`commonchecks metric-postgres-connections -p {{.labels.params_port}} -d {{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-dbsize	Provides metrics on the total size for each of the server's PostgreSQL databases.	`commonchecks metric-postgres-dbsize -d {{.labels.params_database}} -H {{.labels.params_host}} -p {{.labels.params_port}}`
Metric	postgresql.metric-locks	Provides metrics on the locks in the PostgreSQL database/tables.	`commonchecks metric-postgres-locks -p {{.labels.params_port}} -d {{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-relation-size	Provides metrics on the database table size on the server.	`commonchecks metric-postgres-relation-size -p {{.labels.params_port}} -l {{.labels.params_limit}} -H {{.labels.params_host}} -d {{.labels.params_database}}`
Metric	postgresql.metric-statsbgwriter	Provides metrics related to buffer allocations.	`commonchecks metric-postgres-statsbgwriter -p {{.labels.params_port}} -d`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL checks (continued)

Type	Check	Description	Command
			`{{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-statsdb	Provides metrics related to commits/ rollbacks/tuples transactions / deadlocks/query conflicts count.	`commonchecks metric-postgres-statsdb -d {{.labels.params_database}} -H {{.labels.params_host}} -p {{.labels.params_port}}`
Metric	postgresql.metric-statsio	Provides table based metrics related index reads/total hits to a table index.	`commonchecks metric-postgres-statsio -s {{.labels.params_scope}} -H {{.labels.params_host}} -p {{.labels.params_port}} -d {{.labels.params_database}}`
Metric	postgresql.metric-statstable	Provides metrics related to CRUD operations.	`commonchecks metric-postgres-statstable -d {{.labels.params_database}} -H {{.labels.params_host}} -s {{.labels.params_scope}} -p {{.labels.params_port}}`

PostgreSQL metrics

The following tables list and describe the metrics that are gathered as output from the specified PostgreSQL checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

postgresql.check-connections metrics

Metric	Description
pgsql.connections.active (Featured metric)	Provides metrics on the total active connections in the PostgreSQL database.
pgsql.connections.idle	Provides metrics on the total idle connections on the PostgreSQL database.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.check-connections metrics (continued)

Metric	Description
(Featured metric)	

postgresql.metric-dbsize metrics

Metric	Description
pgsql.db.size (Featured metric)	Provides metrics on the total disk size utilization for each of the PostgreSQL databases on the server.

postgresql.metric-locks metrics

Metric	Description
pgsql.locks.AccessShareLock	Provides metrics on read-lock mode acquired automatically from queried tables.
pgsql.locks.ExclusiveLock	Provides metrics on read-lock mode acquired by LOCK TABLE table for IN EXCLUSIVE MODE statements.

postgresql.metric-relation-size metrics

Metric	Description
pgsql.tables_size (Featured metric)	Provides metrics on the database table size on the server.

postgresql.metric-statsbgwriter metrics

Metric	Description
pgsql.statsbgwriter.buffers_alloc	Provides metrics related to the number of allocated buffers.
pgsql.statsbgwriter.buffers_backend	Provides metrics related to the number of buffers written directly by a backend.
pgsql.statsbgwriter.buffers_backend_fsync	Provides metrics related to the number of times a backend had to execute its own fsync call (normally the background writer handles those, even when the backend performs its own write).
pgsql.statsbgwriter.buffers_checkpoint	Provides metrics related to the number of buffers written during checkpoints.
pgsql.statsbgwriter.buffers_clean	Provides metrics related to the number of buffers written by the background writer.
pgsql.statsbgwriter.checkpoint_sync_time	Provides metrics related to the total amount of time spent in the portion of checkpoint

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsbgwriter metrics (continued)

Metric	Description
	processing where files are synchronized to disk, in milliseconds.
pgsql.statsbgwriter.checkpoint_write_time	Provides metrics related to the total amount of time spent in the portion of checkpoint processing where files are written to disk, in milliseconds.
pgsql.statsbgwriter.checkpoints_req (Featured metric)	Provides metrics related to the number of requested checkpoints that have been performed.
pgsql.statsbgwriter.checkpoints_timed (Featured metric)	Provides metrics related to the number of scheduled checkpoints that have been performed.
pgsql.statsbgwriter.maxwritten_clean	Provides metrics related to the number of times the background writer stopped a cleaning scan because it had written too many buffers.

postgresql.metric-statsdb metrics

Metric	Description
pgsql.statsdb.blk_read_time (Featured metric)	Provides metrics related to the time spent reading data file blocks by backends in this database, in milliseconds.
pgsql.statsdb.blk_write_time (Featured metric)	Provides metrics related to the time spent writing data file blocks by backends in this database, in milliseconds.
pgsql.statsdb.blks_hit (Featured metric)	Provides metrics related to the number of times disk blocks were found in the buffer cache, so that a read was not necessary. This only includes hits in the PostgreSQL buffer cache, not the operating system's file system cache.
pgsql.statsdb.blks_read	Provides metrics related to the number of disk blocks read in this database.
pgsql.statsdb.checksum_failures	Provides metrics related to the number of data page checksum failures detected in this database (or on a shared object), or 0 if data checksums are not enabled.
pgsql.statsdb.conflicts	Provides metrics related to the number of queries canceled due to conflicts with recovery in this database. Conflicts occur only on standby servers.
pgsql.statsdb.deadlocks (Featured metric)	Provides metrics related to the number of deadlocks detected in this database.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsdb metrics (continued)

Metric	Description
pgsql.statsdb.numbackends	Provides metrics related to the number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
pgsql.statsdb.temp_bytes	Provides metrics related to the total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the *log_temp_files* setting.
pgsql.statsdb.temp_files	Provides metrics related to the number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (such as sorting or hashing), and regardless of the *log_temp_files* setting.
pgsql.statsdb.tup_deleted	Provides metrics related to the number of rows deleted by queries in this database.
pgsql.statsdb.tup_fetched	Provides metrics related to the number of rows fetched by queries in this database.
pgsql.statsdb.tup_inserted	Provides metrics related to the number of rows inserted by queries in this database.
pgsql.statsdb.tup_returned	Provides metrics related to the number of rows returned by queries in this database.
pgsql.statsdb.tup_updated	Provides metrics related to the number of rows updated by queries in this database.
pgsql.statsdb.xact_commit	Provides metrics related to the number of transactions in this database that have been committed.
pgsql.statsdb.xact_rollback	Provides metrics related to the number of transactions in this database that have been rolled back.

postgresql.metric-statsio metrics

Metric	Description
pgsql.statsio.heap_blks_hit (Featured metric)	Provides metrics related to the number of buffer hits in this table.
pgsql.statsio.heap_blks_read	Provides metrics related to the number of disk blocks read from this table.
pgsql.statsio.idx_blks_hit	Provides metrics related to the number of buffer hits in all indexes in this table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsio metrics (continued)

Metric	Description
pgsql.statsio.idx_blks_read	Provides metrics related to the number of disk blocks read from all indexes in this table.
pgsql.statsio.tidx_blks_hit	Provides metrics related to the number of buffer hits in this table's TOAST table index (if any).
pgsql.statsio.tidx_blks_read	Provides metrics related to the number of disk blocks read from this table's TOAST table index.
pgsql.statsio.toast_blks_hit	Provides metrics related to the number of buffer hits in this table's TOAST table (if any).
pgsql.statsio.toast_blks_read	Provides metrics related to the number of disk blocks read from this table's TOAST table (if any).

postgresql.metric-statsio metrics

Metric	Description
pgsql.statstable.idx_scan	Provides metrics related to the number of index scans initiated on this table.
pgsql.statstable.idx_tup_fetch	Provides metrics related to the number of live rows fetched by index scans.
pgsql.statstable.n_dead_tup	Provides metrics related to the estimated number of dead rows.
pgsql.statstable.n_live_tup	Provides metrics related to the estimated number of live rows.
pgsql.statstable.n_tup_del	Provides metrics related to the number of deleted rows.
pgsql.statstable.n_tup_hot_upd	Provides metrics related to the number of rows HOT updated (that is, with no separate index update required).
pgsql.statstable.n_tup_ins	Provides metrics related to the number of inserted rows.
pgsql.statstable.n_tup_upd	Provides metrics related to the number of updated rows.
pgsql.statstable.seq_scan	Provides metrics related to the number of sequential scans initiated on this table.
pgsql.statstable.seq_tup_read	Provides metrics related to the number of live rows fetched by sequential scans.

RabbitMQ default checks and policies

Agent Client Collector provides the following default checks and policies for RabbitMQ health monitoring. You must perform RabbitMQ discovery before executing the checks. RabbitMQ checks are available only in a Windows environment.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RabbitMQ Events policy

Type	Check	Description	Command
Event	check-rabbitmq-alive	Verifies whether the RabbitMQ server is alive, using the REST API. If the server is down, an alert triggers.	`check-rabbitmq-alive.rb --host {{.labels.params_host}} --port {{.labels.params_port}} -v {{.labels.params_vhost}}`
Event	check-rabbitmq-cluster-health	Verifies whether the RabbitMQ server's cluster nodes are running. If the nodes are down, an alert triggers.	`check-rabbitmq-cluster-health.rb --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-consumers	Verifies the number of consumers on the RabbitMQ server and triggers an alert based on the configured threshold.	`check-rabbitmq-consumers.rb {{if .labels.params_warn}} --warn {{.labels.params_warn}} {{end}} {{if .labels.params_critica --critical {{.labels.params_critical}} {{end}} --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-messages	Verifies the total number of messages queued on the RabbitMQ server and triggers an alert based on the threshold.	`check-rabbitmq-messages.rb --critical {{.labels.params_critical}} --port {{.labels.params_port}} --warn {{.labels.params_warn}} --host {{.labels.params_host}}`
Event	check-rabbitmq-network-partitions	Verifies whether the RabbitMQ network partition has occurred and triggers an alert based on the threshold.	check-rabbitmq-network-partitions.rb --host {{.labels.params_host}} --port {{.labels.params_port}}
Event	check-rabbitmq-node-health	Verifies whether the RabbitMQ server node is in a running state.	`check-rabbitmq-node-health.rb --host {{.labels.params_host}} {{if .labels.`

RabbitMQ Events policy (continued)

Type	Check	Description	Command
			`{{if .labels.params_fdwarn}} --fwarn {{.labels.params_fdwarn}} {{end}} {{if .labels.params_memwarn}} mwarn {{.labels.params_memwarn}} {{end}}`
Event	check-rabbitmq-queue-drain-time	Verifies the time it will take for each queue on the RabbitMQ server to drain, based on the current message exit rate. For example, if a queue has 1,000 messages in it but only 1 message exits per second, an alert generates because the default critical level of 360 seconds has been exceeded.	`check-rabbitmq-queue-drain-time.rb --host {{.labels.params_host}} --port {{.labels.params_port}} --warn {{.labels.params_warn}} --critical {{.labels.params_critical}}`
Event	check-rabbitmq-queues-synchronised	Verifies that all mirrored queues with secondary queues are synchronised.	`check-rabbitmq-queues-synchronised.rb --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-stomp-alive	Verifies whether the RabbitMQ server is alive and responding to STOMP.	`check-rabbitmq-stomp-alive.rb --host {{.labels.params_host}} --queue {{.labels.params_queue}} --port {{.labels.params_port}}`

RabbitMQ Metrics policy

Type	Check	Description	Command
Metric	metrics-rabbitmq-overview	Provides RabbitMQ overview statistics.	`metrics-rabbitmq-`

RabbitMQ Metrics policy (continued)

Type	Check	Description	Command
			`overview.rb --port {{.labels.params_port}} --host {{.labels.params_host}}`
Metric	metrics-rabbitmq-queue	Provides RabbitMQ metrics per queue.	`metrics-rabbitmq-queue.rb --port {{.labels.params_port}} --host {{.labels.params_host}} {{if .labels.params_vhost}} --vhost {{.labels.params_vhost}} {{end}}`

RabbitMQ metrics

The following table lists the metrics that are gathered as output from RabbitMQ checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-rabbitmq-overview metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
rabbitmq.queue_totals.messages.count		count	Provides metrics on the total number of messages (ready plus unacknowledged).
rabbitmq.queue_totals.messages.rate (featured metric)		rate / sec	Provides metrics on the total number of messages (ready plus unacknowledged)
rabbitmq.queue_totals.messages_ready.count		count	Provides metrics on the number of messages ready for delivery.
rabbitmq.queue_totals.messages_ready.rate		rate / sec	Provides metrics on the number of messages ready for delivery.
rabbitmq.queue_totals.messages_unacknowledged.count		count	Provides metrics on the number of unacknowledged messages.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-rabbitmq-overview metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
rabbitmq.queue_totals.messages_unacknowledged.rate		rate / sec	Provides metrics on the number of unacknowledged messages.
rabbitmq.message_stats.deliver_get.count		count	Provides metrics on messages recently delivered to consumers.
rabbitmq.message_stats.deliver_get.rate (featured metric)		rate / sec	Provides metrics on messages recently delivered to consumers.
rabbitmq.message_stats.deliver_no_ack.count		count	Provides metrics on unacknowledged messages recently delivered to consumers.
rabbitmq.message_stats.deliver_no_ack.rate		rate / sec	Provides metrics on unacknowledged messages recently delivered to consumers.
rabbitmq.message_stats.publish.count		count	Provides metrics on recently published messages.
rabbitmq.message_stats.publish.rate		rate / sec	Provides metrics on the recently published messages.
rabbitmq.object_totals.channels.count		count	Provides metrics on the total number of channels.
rabbitmq.object_totals.connections.count (featured metric)		count	Provides metrics on the total number of connections.
rabbitmq.object_totals.consumers.count (featured metric)		count	Provides metrics on the total number of consumers.
rabbitmq.object_totals.exchanges.count		count	Provides metrics on the total number of exchanges.
rabbitmq.object_totals.queues.count (featured metric)		count	Provides metrics on the total number of queues.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-rabbitmq-queue metrics

rabbitmq.queue.{{QueueName}}.avg_egress_rate (featured metric)	Queue Name	count	Provides queue specific metrics on the rate at which unacknowledged message records enter RAM for the given queue.
rabbitmq.queue.{{QueueName}}.consumers	Queue Name	count	Provides queue specific metrics on the total consumers for the given queue.
rabbitmq.queue.{{QueueName}}.messages	Queue Name	count	Provides queue specific metrics on the total messages in the given queue.
rabbitmq.queue.{{QueueName}}.drain_time	Queue Name	count	Provides queue specific metrics on the message drain time for the given queue.

URL Monitoring default checks and policies

Agent Client Collector provides policies for URL Monitoring. Polices come with embedded checks.

URL Monitoring uses the HTTP Entry Point default policies. For details, see HTTP default checks and policies.

Varnish default checks and policies

Agent Client Collector provides the following default checks and policies for Varnish monitoring.

Varnish metrics policy

Type	Check	Description	Usage	Output

Metric	app.varnish.metrics-varnish	Collects Varnish metrics from the host.	`linuxchecks metrics-varnish (options)`
			where:
			• -t = fields List of required metrics, comma separated within ""
			• -v = varnishname The Varnish
				`hostname.MAIN_sess_conn 175 1649420020`
				`hostname.MAIN_sess_drop 0 1649420020`
				`hostname.MAIN_client_req 173 1649420020`

Varnish metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
MAIN_sess_conn (featured metric)		count	Cumulative number of accepted client connections by Varnish Cache.
MAIN_sess_drop (featured metric)		count	Number of connections dropped due to a full queue.
MAIN_client_req (featured metric)		count	Cumulative number of received client requests. Increments after a request is received, but before Varnish responds.
MAIN_cache_hit		count	Cumulative number of times a file was served from Varnish's cache.
MAIN_cache_hitpass		count	Cumulative number of hits for a "pass" file.
MAIN_cache_miss		count	Cumulative number of times a file was requested but was not in the cache, and was therefore requested from the backend.
MAIN_backend_conn		count	Cumulative number of successful TCP connections to the backend.
MAIN_backend_unhealthy (featured metric)		count	Cumulative number of backend connections which were not attempted because the backend has been marked as unhealthy.
MAIN_backend_busy		count	Cumulative number of times the maximum amount of connections to the backend has been reached.
MAIN_backend_fail (featured metric)		count	Cumulative number of failed connections to the backend.
MAIN_backend_reuse (featured metric)		count	Cumulative number of connections that were

Varnish metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			reused from the keep-alive pool.
MAIN_backend_recycle		count	Cumulative number of current backend connections which were put back to a pool of keep-alive connections and have not yet been used.
MAIN_threads (featured metric)		count	Number of threads in all pools.
MAIN_threads_limited		count	Number of times a thread needed to be created but couldn't because varnishd maxed out its configured capacity for new threads.
MAIN_threads_created		count	Number of times a thread has been created.
MAIN_threads_failed (featured metric)		count	Number of times that Varnish unsuccessfully tried to create a thread.
MAIN_thread_queue_len		count	Current queue length: number of requests waiting on worker thread to become available.
MAIN_sess_queued		count	Number of times Varnish has been out of threads and had to queue up a request.
MAIN_n_expired (featured metric)		count	Cumulative number of expired objects for example due to TTL.
MAIN_n_lru_nuked (featured metric)		count	Least Recently Used Nuked Objects: Cumulative number of cached objects that Varnish has evicted from the cache because of a lack of space.

Varnish metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
MAIN_backend_req (featured metric)		count	Number of requests to the backend.

vSphere default checks and policies

Agent Client Collector provides the following default checks and policies for vSphere monitoring.

vSphere virtualMachine metrics policy

Type	Check	Description	Usage	Output
Metric	vsphere.metric-VirtualMachine	Retrieves metrics for a vSphere virtual machine. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R VirtualMachine -v vm_id -r true -i 20` where: • -H = hostname Instance Hostname • -i = intervalId 20 for real time metrics; 300 for 5 minutes older aggregate metrics (default 300) • -r = resourceLevelMetric To enable resource level metrics (default=false)	`vsphere.VirtualMachine.c 8 1654755994`

vSphere Datastore Metrics policy

Type	Check	Description	Usage	Output
Metric	vSphere.metric-Datastore	Retrieves Metrics for vSphere Datastore. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R Datastore -v vm_id -r` where:	`vsphere.Datastore.disk.c 21474836480 1655182836`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vSphere Datastore Metrics policy (continued)

Type	Check	Description	Usage	Output
			• -H = hostname Instance Hostname • -r = resourceLevelMetric To enable resource level metrics (default=false)	

vSphere Datacenter Metrics policy

Type	Check	Description	Usage	Output

Metric	vsphere.metric-Datacenter	Retrieves metrics for the vSphere datacenter.	`commonchecks metric-vsphere -H hostname -R Datacenter -v vm_id -r`
			where:
			• -H = hostname Instance Hostname
			• -r = resourceLevelMetr To enable resource level metrics (default=false)
				`vsphere.Datacenter.vmop.numChangeDS.latest.total 217 1655194924`
				`vsphere.Datacenter.vmop.numChangeHost.latest.total 1373 1655194924`
				`vsphere.Datacenter.vmop.numChangeHostDS.latest.total 9 1655194924`
				`vsphere.Datacenter.vmop.numClone.latest.total 192 1655194924`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vSphere ESX Server Metrics policy

Type	Check	Description	Usage	Output

Metric	vsphere.metric-ESX_Server	Retrieves metrics for vSphere ESX server or HostSystem. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R HostSystem -v vm_id -r`
			where:
			• -H = hostname Instance Hostname
			• -r = resourceLevelMet To enable resource level metrics (default=false)
				`vsphere.HostSystem.net.broadcastRx.summation.total 63885 1655198166`
				`vsphere.HostSystem.net.broadcastTx.summation.total 196 1655198166`
				`vsphere.HostSystem.net.bytesRx.average.total 5924 1655198166`

vSphere metrics

The following table lists the metrics that are gathered as output from vSphere checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

vsphere.metric-VirtualMachine metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
net.broadcastRx.summation	network adapter	packets	Number of broadcast packets received.
net.broadcastTx.summation	network adapter	packets	Number of broadcast packets transmitted.
net.bytesRx.average	network adapter	KiB	Average amount of data received per second.
net.bytesTx.average	network adapter	KiB	Average amount of data transmitted per second.
net.droppedRx.summation	network adapter	packets	Number of received packets dropped.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
net.droppedTx.summation	network adapter	packets	Number of transmitted packets dropped.
net.multicastRx.summation	network adapter	packets	Number of multicast packets received.
net.multicastTx.summation	network adapter	packets	Number of multicast packets transmitted.
net.packetsRx.summation	network adapter	packets	Number of packets received.
net.packetsTx.summation	network adapter	packets	Number of packets transmitted.
net.received.average	network adapter	KiB	Average rate at which data was received during the interval. This represents the bandwidth of the network.
net.transmitted.average	network adapter	KiB	Average rate at which data was transmitted during the interval. This represents the bandwidth of the network.
net.usage.average (featured metric)	network adapter	KiB	Network utilization (combined transmit- and receive-rates).
disk.maxTotalLatency.latest (featured metric)	drive	millisecond	Highest latency value across all disks used by the host.
disk.read.average	drive	KiB	Average number of kilobytes read from the disk each second.
disk.usage.average (featured metric)	drive	KiB	Aggregated disk I/O rate.
disk.usage.maximum	drive	KiB	Maximum disk I/O rate.
disk.usage.minimum	drive	KiB	Minimum disk I/O rate.
disk.write.average	drive	KiB	Average number of kilobytes written to the disk each second.
cpu.costop.summation	cpu-core	millisecond	Time the virtual machine is ready to run, but is unable to run due

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			to co-scheduling constraints.
cpu.demand.average	cpu-core	megahertz	The amount of CPU resources a virtual machine would use if there were no CPU contention or CPU limit.
cpu.demandEntitlementRatio.latest	cpu-core	percent	CPU resource entitlement to CPU demand ratio.
cpu.entitlement.latest	cpu-core	megahertz	CPU resources devoted by the ESXi scheduler.
cpu.idle.summation	cpu-core	millisecond	Total time that the CPU spent in an idle state.
cpu.latency.average	cpu-core	percent	Percent of time the virtual machine is unable to run because it is contending for access to the physical CPU(s).
cpu.maxlimited.summation	cpu-core	millisecond	Time the virtual machine is ready to run, but is not running because it has reached its maximum CPU limit setting.
cpu.overlap.summation	cpu-core	millisecond	Time the virtual machine was interrupted to perform system services on behalf of itself or other virtual machines.
cpu.readiness.average	cpu-core	percent	Percentage of time that the virtual machine was ready, but could not get scheduled to run on the physical CPU.
cpu.ready.summation	cpu-core	millisecond	Milliseconds of CPU time spent in ready state.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.run.summation	cpu-core	millisecond	Time the virtual machine is scheduled to run.
cpu.swapwait.summation	cpu-core	millisecond	CPU time spent waiting for swap-in.
cpu.system.summation	cpu-core	millisecond	Amount of time spent on system processes on each virtual CPU in the virtual machine.
cpu.usage.average (featured metric)	cpu-core	percent	Percentage of CPU capacity being used.
cpu.usagemhz.average	cpu-core	megahertz	CPU usage, as measured in megahertz.
cpu.used.summation	cpu-core	millisecond	Time accounted to the virtual machine. If a system service runs on behalf of this virtual machine, the time spent by that service (represented by cpu.system) should be charged to this virtual machine. If not, the time spent (represented by cpu.overlap) should not be charged against this virtual machine.
cpu.wait.summation (featured metric)	cpu-core	millisecond	Total CPU time spent in wait state.The wait total includes time spent the CPU Idle, CPU Swap Wait, and CPU I/O Wait states.
cpu.usage.vcpus.average	cpu-core	percent	Percentage of vcpus capacity being used.
cpu.utilization.average	cpu-core	percent	Percentage of CPU capacity being used.
mem.active.average	memory	KiB	Amount of memory that is actively used, as estimated by VMkernel based on

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			recently touched memory pages.
mem.activewrite.average	memory	KiB	Estimate for the amount of memory actively being written to by the virtual machine.
mem.compressed.average	memory	KiB	Kilobytes of memory that have been compressed.
mem.compressionRate.average	memory	KiB	Rate of memory compression for the virtual machine.
mem.consumed.average	memory	KiB	Amount of host physical memory consumed by a virtual machine, host, or cluster.
mem.decompressionRate.average	memory	KiB	Rate of memory decompression for the virtual machine.
mem.entitlement.average	memory	KiB	Amount of host physical memory the virtual machine is entitled to, as determined by the ESX scheduler.
mem.granted.average	memory	KiB	Amount of host physical memory or physical memory that is mapped for a virtual machine or a host.
mem.latency.average	memory	KiB	Percentage of time the virtual machine is waiting to access swapped or compressed memory.
mem.llSwapInRate.average	memory	KiB	Rate at which memory is being swapped from host cache into active memory.
mem.llSwapOutRate.average	memory	KiB	Rate at which memory is being swapped from active memory to host cache.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.llSwapUsed.average	memory	KiB	Space used for caching swapped pages in the host cache.
mem.overhead.average	memory	KiB	Host physical memory consumed by the virtualization infrastructure for running the virtual machine.
mem.overheadMax.average	memory	KiB	Host physical memory reserved for use as the virtualization overhead for the virtual machine.
mem.overheadTouched.average	memory	KiB	Actively touched overhead host physical memory (KB) reserved for use as the virtualization overhead for the virtual machine.
mem.shared.average	memory	KiB	Amount of guest physical memory that is shared with other virtual machines, relative to a single virtual machine or to all powered-on virtual machines on a host.
mem.usage.average (featured metric)	memory	percent	Memory usage as percent of total configured or available memory.
mem.vmmemctl.average	memory	KiB	Amount of memory allocated by the virtual machine memory control driver.
mem.vmmemctltarget.average	memory	KiB	Target value set by VMkernal for the virtual machine's memory balloon size. In conjunction with vmmemctl metric, this metric is used by VMkernel to inflate and deflate the

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			balloon for a virtual machine.
mem.zero.average	memory	KiB	Memory that contains 0s only. Included in shared amount. Through transparent page sharing, zero memory pages can be shared among virtual machines that run the same operating system.
power.energy.summation	power	joule	Total energy (in joule) used since last stats reset.
power.power.average	power	watt	Current power usage.
sys.heartbeat.latest	system	number	Number of heartbeats issued per virtual machine.
sys.osUptime.latest	system	seconds	Total time elapsed, in seconds, since last operating system boot-up.
sys.uptime.latest	system	seconds	Total time elapsed since last system startup.
virtualDisk.read.average	virtual disk	KiB	Average number of kilobytes read from the virtual disk each second.
virtualDisk.write.average	virtual disk	KiB	Average number of kilobytes written to the virtual disk each second.
rescpu.actav1.latest	rescpu	percent	CPU active average over 1 minute.
rescpu.actav15.latest	rescpu	percent	CPU active average over 15 minutes.
rescpu.actav5.latest	rescpu	percent	CPU active average over 5 minutes.
rescpu.actpk1.latest	rescpu	percent	CPU active peak over 1 minute.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
rescpu.actpk15.latest	rescpu	percent	CPU active peak over 15 minutes.
rescpu.actpk5.latest	rescpu	percent	CPU active peak over 5 minutes.
rescpu.runav1.latest	rescpu	percent	CPU running average over 1 minute.
rescpu.runav15.latest	rescpu	percent	CPU running average over 15 minutes.
rescpu.runav5.latest	rescpu	percent	CPU running average over 5 minutes.
rescpu.runpk1.latest	rescpu	percent	CPU running peak over 1 minute.
rescpu.runpk15.latest	rescpu	percent	CPU running peak over 15 minutes.
rescpu.runpk5.latest	rescpu	percent	CPU running peak over 5 minutes.
rescpu.sampleCount.latest	rescpu	millisecond	Group CPU sample count.
rescpu.samplePeriod.latest	rescpu	millisecond	Group CPU sample period.

vsphere.metric-Datacenter metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmop.numChangeDS.latest	Virtual Machine Operations Counters	Number	Number of datastore change operations for powered-off and suspended virtual machines.
vmop.numChangeHost.latest	Virtual Machine Operations Counters	Number	Number of host change operations for powered-off and suspended virtual machines.
vmop.numChangeHostDS.latest	Virtual Machine Operations Counters	Number	Number of host and datastore change operations for powered-off and suspended virtual machines.

vsphere.metric-Datacenter metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmop.numClone.latest	Virtual Machine Operations Counters	Number	Number of virtual machine clone operations.
vmop.numCreate.latest (featured metric)	Virtual Machine Operations Counters	Number	Number of virtual machine create operations.
vmop.numDeploy.latest	Virtual Machine Operations Counters	Number	Number of virtual machine template deploy operations.
vmop.numDestroy.latest (featured metric)	Virtual Machine Operations Counters	Number	Number of virtual machine delete operations.
vmop.numPoweroff.latest	Virtual Machine Operations Counters	Number	Number of virtual machine power off operations.
vmop.numPoweron.latest	Virtual Machine Operations Counters	Number	Number of virtual machine power on operations.
vmop.numRebootGuest.latest (featured metric)	Virtual Machine Operations Counters	Number	Number of virtual machine guest reboot operations.
vmop.numReconfigure.latest	Virtual Machine Operations Counters	Number	Number of virtual machine reconfigure operations.
vmop.numRegister.latest	Virtual Machine Operations Counters	Number	Number of virtual machine register operations.
vmop.numReset.latest	Virtual Machine Operations Counters	Number	Number of virtual machine reset operations.
vmop.numSVMotion.latest	Virtual Machine Operations Counters	Number	Number of migrations with Storage vMotion (datastore change operations for powered-on VMs).
vmop.numShutdownGuest.latest	Virtual Machine Operations Counters	Number	Number of virtual machine guest shutdown operations.
vmop.numStandbyGuest.latest	Virtual Machine Operations Counters	Number	Number of virtual machine standby guest operations.

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmop.numSuspend.latest	Virtual Machine Operations Counters	Number	Number of virtual machine suspend operations.
vmop.numUnregister.latest	Virtual Machine Operations Counters	Number	Number of virtual machine unregister operations.
vmop.numVMotion.latest (featured metric)	Virtual Machine Operations Counters	Number	Number of migrations with vMotion (host change operations for powered-on VMs).
vmop.numXVMotion.latest	Virtual Machine Operations Counters	Number	Number of host and datastore change operations for powered-on and suspended virtual machines.

vsphere.metric-Datastore metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
datastore.busResets.summation	Datastore	Number	Number of SCSI-bus reset commands issued.
datastore.commandsAborted.summation	Datastore	Number	Number of SCSI commands aborted.
datastore.datastoreIops.average	Datastore	Number	Storage I/O Control aggregated IOPS.
datastore.datastoreMaxQueueDepth.latest	Datastore	Number	Storage I/O Control datastore maximum queue depth.
datastore.datastoreNormalReadLatency.latest	Datastore	millisecond	Storage DRS datastore normalized read latency.
datastore.datastoreNormalWriteLatency.latest	Datastore	millisecond	Storage DRS datastore normalized write latency.
datastore.datastoreReadBytes.latest	Datastore	millisecond	Storage DRS datastore bytes read.
datastore.datastoreReadIops.latest	Datastore	Number	Storage DRS datastore read I/O rate.

vsphere.metric-Datastore metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
datastore.datastoreReadLoadMetric.latest	Datastore	Number	Storage DRS datastore metric for read workload model.
datastore.datastoreReadOIO.latest	Datastore	Number	Storage DRS datastore outstanding read requests.
datastore.datastoreVMObservedLatency.latest	Datastore	microsecond	The average datastore latency as seen by virtual machines.
datastore.datastoreWriteBytes.latest	Datastore	millisecond	Storage DRS datastore bytes written.
datastore.datastoreWriteIops.latest	Datastore	Number	Storage DRS datastore write I/O rate.
datastore.datastoreWriteLoadMetric.latest	Datastore	Number	Storage DRS datastore metric for write workload model.
datastore.datastoreWriteOIO.latest	Datastore	Number	Storage DRS datastore outstanding write requests.
datastore.maxTotalLatency.latest	Datastore	millisecond	Highest latency value across all datastores used by the host.
datastore.numberReadAveraged.average	Datastore	Number	Average number of read commands issued per second to the datastore.
datastore.numberWriteAveraged.average	Datastore	Number	Average number of write commands issued per second to the datastore during the collection interval.
datastore.read.average (featured metric)	Datastore	KiB	Rate of reading data from the datastore.
datastore.siocActiveTimePercentage.average (featured metric)	Datastore	percent	Percentage of time Storage I/O Control actively controlled datastore latency.
datastore.sizeNormalizedDatastoreLatency.average	Datastore	microsecond	Storage I/O Control size-normalized I/O latency.

vsphere.metric-Datastore metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
datastore.throughput.contention.average	Datastore	millisecond	Average amount of time for an I/O operation to the datastore or LUN across all ESX hosts accessing it.
datastore.throughput.usage.average	Datastore	KiB	The current bandwidth usage for the datastore or LUN.
datastore.totalReadLatency.average	Datastore	millisecond	Average amount of time for a read operation from the datastore.
datastore.totalWriteLatency.average	Datastore	millisecond	Average amount of time for a write operation from the datastore.
datastore.unmapIOs.summation	Datastore	Number	Number of Unmap operations.
datastore.unmapSize.summation	Datastore	Number	Total UnMap size.
datastore.write.average (featured metric)	Datastore	KiB	Rate of writing data to the datastore.
disk.busResets.summation	disk	Number	Number of SCSI-bus reset commands issued.
disk.capacity.latest	disk	KiB	Configured size of the datastore.
disk.capacity.contention.average	disk	KiB	The amount of storage capacity overcommitment for the entity, measured in percent.
disk.capacity.provisioned.average	disk	KiB	Provisioned size of the entity.
disk.capacity.usage.average	disk	KiB	The amount of storage capacity currently being consumed by or on the entity.
disk.commands.summation	disk	Number	Number of SCSI commands issued.
disk.commandsAborted.summation	disk	Number	Number of SCSI commands aborted.

vsphere.metric-Datastore metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.commandsAveraged.latest	disk average	Number	Average number of SCSI commands issued per second.
disk.deltaused.latest	disk	KiB	Storage overhead of a virtual machine or a datastore due to delta disk backings.
disk.deviceLatency.average	disk	millisecond	Average amount of time it takes to complete an SCSI command from physical device.
disk.deviceReadLatency.latest	disk average	millisecond	Average amount of time it takes to complete read from physical device.
disk.deviceWriteLatency.latest	disk average	millisecond	Average amount of time to write from the physical device.
disk.kernelLatency.average	disk	millisecond	Average amount of time spent by VMkernel to process each SCSI command.
disk.kernelReadLatency.latest	disk average	millisecond	Average amount of time spent by VMkernel to process each SCSI read command.
disk.kernelWriteLatency.latest	disk average	millisecond	Average amount of time spent by VMkernel to process each SCSI write command.
disk.maxQueueDepth.average (featured metric)	disk average	Number	Maximum queue depth.
disk.maxTotalLatency.latest	disk	millisecond	Highest latency value across all disks used by the host.
disk.numberRead.summation	disk	Number	Number of disk reads during the collection interval.
disk.numberReadAveraged.latest	disk average	Number	Average number of read commands

			issued per second to the datastore.
disk.numberWrite.summation	disk	Number	Number of disk writes during the collection.
disk.numberWriteAveraged.average	disk	Number	Average number of write commands issued per second to the datastore.
disk.provisioned.latest	disk	KiB	Amount of storage set aside for use by a datastore or a virtual machine. Files on the datastore and the virtual machine can expand to this size but not beyond it.
disk.queueLatency.average	disk	millisecond	Average amount of time spent in VMkernel queue (per SCSI command).
disk.queueReadLatency.average (featured metric)	disk	millisecond	Average amount of time spent in the VMkernel queue per SCSI read command.
disk.queueWriteLatency.average	disk	millisecond	Average amount of time spent in the VMkernel queue per SCSI write command.
disk.read.average	disk	KiB	Average number of kilobytes read from the disk each second.
disk.scsiReservationCnflctsPct.average	disk	Number	Number of SCSI reservation conflicts for the LUN as a percent of total commands during the collection interval.
disk.scsiReservationConflicts.summation	disk	Number	Number of SCSI reservation conflicts for the LUN during the collection interval.
disk.throughput.contention.average	disk	millisecond	Average amount of time for an I/O operation to the datastore or LUN

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			across all ESX hosts accessing it.
disk.throughput.usage.average	disk	KiB	The current bandwidth usage for the datastore or LUN.
disk.totalLatency.average (featured metric)	disk	millisecond	Average amount of time taken during the collection interval to process a SCSI command issued by the guest OS to the virtual machine.
disk.totalReadLatency.average	disk	millisecond	Average amount of time taken to process a SCSI read command issued from the guest OS to the virtual machine.
disk.totalWriteLatency.average	disk	millisecond	Average amount of time taken to process a SCSI write command issued by the guest OS to the virtual machine.
disk.unshared.latest	disk	KiB	Amount of space associated exclusively with a virtual machine.
disk.usage.average (featured metric)	disk	KiB	Aggregated disk I/O rate.
disk.used.latest	disk	KiB	Amount of space actually used by the virtual machine or the datastore. May be less than the amount provisioned at any given time, depending on whether the virtual machine is powered-off, whether snapshots have been created or not, and other such factors.
disk.write.average	disk	KiB	Average number of kilobytes written to the disk each second.

vsphere.metric-ESX_Server metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.coreUtilization.average (featured metric)	cpu-core	percent	CPU utilization of the corresponding core (if hyper-threading is enabled) as a percentage.
cpu.reservedCapacity.average	cpu-core	megahertz	Total CPU capacity reserved by virtual machines.
cpu.totalCapacity.average	cpu-core	megahertz	Total CPU capacity reserved by and available for virtual machines.
datastore.maxTotalLatency.latest	datastore	millisecond	Highest latency value across all datastores used by the host.
hbr.hbrDiskReadLatency.average	host-based replication	millisecond	Average Disk read latency.
hbr.hbrDiskStallLatency.average	host-based replication	millisecond	Average Disk stall latency.
hbr.hbrNetRx.average	host-based replication	KiB	Average amount of data received per second.
hbr.hbrNetTx.average	host-based replication	KiB	Average amount of data transmitted per second.
hbr.hbrNumVms.average	host-based replication	Number	Number of powered-on virtual machines running on this host that currently have host-based replication protection enabled.
mem.heap.average	memory	KiB	VMkernel virtual address space dedicated to VMkernel main heap and related data.
mem.heapfree.average	memory	KiB	Free address space in the VMkernel main heap.Varies based on number of physical devices and configuration options.

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.llSwapIn.average	memory	KiB	Amount of memory swapped-in from host cache.
mem.llSwapOut.average	memory	KiB	Amount of memory swapped-out to host cache.
mem.lowfreethreshold.average	memory	KiB	Threshold of free host physical memory below which ESX/ESXi will begin reclaiming memory from virtual machines through ballooning and swapping.
mem.reservedCapacity.average	memory	MiB	Total amount of memory reservation used by powered-on virtual machines and vSphere services on the host.
mem.sharedcommon.average	memory	KiB	Amount of machine memory that is shared by all powered-on virtual machines and vSphere services on the host.
mem.state.latest	memory	KiB	One of four threshold levels representing the percentage of free memory on the host.
mem.swapin.average	memory	KiB	Amount of memory swapped-in from disk.
mem.swapinRate.average	memory	KiB	Rate at which memory is swapped from disk into active memory.
mem.swapout.average	memory	KiB	Amount of memory swapped-out to disk.
mem.swapoutRate.average	memory	KiB	Rate at which memory is being swapped from active memory to disk.
mem.swapused.average	memory	KiB	Amount of memory that is used by swap. Sum of memory swapped of all

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			powered on VMs and vSphere services on the host.
mem.sysUsage.average	memory	KiB	Amount of host physical memory used by VMkernel for core functionality, such as device drivers and other internal uses. Does not include memory used by virtual machines or vSphere services.
mem.totalCapacity.average	memory	KiB	Total amount of memory reservation used by and available for powered-on virtual machines and vSphere services on the host.
mem.unreserved.average	memory	KiB	Amount of memory that is unreserved. Memory reservation not used by the Service Console, VMkernel, vSphere services and other powered on VMs user-specified memory reservations and overhead memory.
mem.vmfs.pbc.capMissRatio.latest (featured metric)	memory	percent	Trailing average of the ratio of capacity misses to compulsory misses for the VMFS PB Cache.
mem.vmfs.pbc.overhead.latest	memory	KiB	Amount of VMFS heap used by the VMFS PB Cache.
mem.vmfs.pbc.size.latest	memory	MiB	Space used for holding VMFS Pointer Blocks in memory.
mem.vmfs.pbc.sizeMax.latest	memory	MiB	Maximum size the VMFS Pointer Block Cache can grow to.

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.vmfs.pbc.workingSetLatest	memory	TiB	Amount of file blocks whose addresses are cached in the VMFS PB Cache.
mem.vmfs.pbc.workingSetMax.latest	memory	TiB	Maximum amount of file blocks whose addresses are cached in the VMFS PB Cache.
net.errorsRx.summation (featured metric)	network adapter	Number	Number of packets with errors received.
net.errorsTx.summation (featured metric)	network adapter	Number	Number of packets with errors transmitted.
net.unknownProtos.summation	network adapter	KiB	Number of frames with unknown protocol received.
power.powerCap.average	power	watt	Maximum allowed power usage.
rescpu.maxLimited1.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 1 minute.
rescpu.maxLimited15.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 15 minutes.
rescpu.maxLimited5.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 5 minutes.
storageAdapter.maxTotalLatency.latest (featured metric)	storage adapter	millisecond	Highest latency value across all storage adapters used by the host.
storagePath.maxTotalLatency.latest (featured metric)	storage adapter	millisecond	Highest latency value across all storage paths used by the host.

Windows default checks and policies

Agent Client Collector provides the following default checks and policies for Windows health monitoring.

Windows event monitoring checks

Windows OS Events policy

Check	Description	Usage and Example	Output
os.windows.check-event-log	Measures the Windows event log against parameter thresholds and returns a *CRITICAL* | *WARNING* | *OK* event.	Usage: • -w warning - Triggers a WARNING event if the event log count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log count matching the pattern is above the CRITICAL parameter value specified in the check parameter. • -e event level - Specifies the severity level of the event. Possible values: Information, Verbose, Critical, Warning, Error. • -i - Unique event ID • -d - The duration of time, in hours, in which you want to retrieve events from the Windows event log. Usage example: `winchecks check-windows-event-log -w 5 -c 10 -e "Information" -l`	Check Event Log OK: The Event Log that matches the pattern is <matched count>

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		`"Application" -d 24`	
os.windows.check-event-log-count	Measures the Windows event log against parameter thresholds and returns a CRITICAL \WARNING\OK event. Provides information on the number of events that have occurred within a specified duration for a single log file and a single ID. Also indicates the filters to be applied to retrieve events for a specific single-valued windows event level and provider name. Retrieving events from multiple log files is not supported. The number of events is provided, without details of each and every event.	Usage: • -w warning - Triggers a WARNING event if the event log count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log count matching the pattern is above the CRITICAL parameter value specified in the check parameter. • -l log_file - The log file to be monitored. Name of the file is written in double quotation marks. • -r regex_pattern - The regex pattern which filters out the description in the event log. Written in double quotation marks. • -e event level - Specifies the severity level of the event. Possible values: Information, Verbose, Critical, Warning, Error. • -i id - Unique event ID • -d duration_hour - The duration of time, in hours, in which you want to retrieve events	Check Event Log OK: The Event Log that matches the pattern is <matched count>

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		from the Windows event log. Decimal points can be used; for example, 30 minutes - 0.5. • -p provider_name - Source of the event, written in double quotation marks. Usage example: `winchecks check-windows-event-log -w 5 -c 10 -e "Information" -l "Application" -d 24`	
os.windows.check-event-log-details	Collects and filters Windows Event logs based on the `duration_hour`, `event_log_level` and `log_file` values. Retrieves and filters Windows event logs according to the provided parameters. It returns details about the events with CRITICAL, WARNING, or OK status, based on the specified severity level.	Usage: • -d duration_hour - Duration (in hours) from the current time to filter events (Default: 24). • -e event_log_level - Filter the events based on the event level. Possible values are: Information, Verbose, Critical, Warning, Error. Multiple values are comma-separated (Default: Information). For example: Information, Warning • -i id - Filters events based on the specified event IDs. For multiple IDs, values are comma-separated and enclosed in double quotation marks.	Check Event Log Details WARNING: Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 1704, Message: Security policy in the Group policy objects has been applied successfully., TimeCreated: 10/14/2024 12:09:35 AM. Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 16384, Message: Successfully scheduled Software Protection service for restart at 2124-09-20T06:25:44Z. Reason: Rules Engine, TimeCreated: 10/13/2024 11:25:44 PM.

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		For example: "1257, 1001" • -l log_file - Specifies the log file name to filter events. The name of the file is written in double quotation marks. Supports creating custom files and multiple values are comma-separated. (Default: Application). For example: "Application, System" • -p provider_name - The name of the event provider, enclosed in double quotation marks. • -r regex_pattern - Filters events by matching the event message with the specified pattern. Value must be enclosed in double quotation marks. • -s servicenow_event_severity - Creates a servicenow event with the value given in this parameter. Possible values are: Critical, Warning and OK. Usage example: `winchecks check-windows-event-log-details -d 24 -l Application -e Warning -r "*" -s Warning`	Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 16394, Message: Offline downlevel migration succeeded., TimeCreated: 10/13/2024 11:24:19 PM. Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 8224, Message: The VSS service is shutting down due to idle timeout., TimeCreated: 10/13/2024 11:51:36 AM.

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
os.windows.check-disk-name	Takes the storage drive name as input and verifies if the drive is present. Returns a *CRITICAL | WARNING | OK* value based on the parameter provided.	winchecks check-windows-disk-name <options> -d : Disk name (Default = C) Usage example:`winchecks check-windows-disk-name -d C`	Windows Checks OK: Disk storage C is present.
os.windows.check-processor-queue-length	Measures the process queue length against thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the processor queue length count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the processor queue length count matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-processor-queue-length -w 5 -c 10`	Processor Queue Length OK: The Processor Queue length is 0.00
os.windows.check-system-cpu-load	Checks CPU Load by using typeperf. Measures the CPU load against configured thresholds and returns a CRITICAL \WARNING\OK event	Usage: • -w warning - Triggers a WARNING event if the CPU load count matching the pattern is above	CPU Load OK: The total CPU utilization is 26.92%

	according to the thresholds given in the accompanying parameters.	the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the CPU load count matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-cpu-load -w 85 -c 95`	
os.windows.check-system-disk	Measures the free physical memory against thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the event log percentage matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log percentage matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-disk -w 85 -c 95`	Disk Usage Check OK: The disk usage is %

Check	Description	Usage and Example	Output
os.windows.check-system-memory-percent	Collects the RAM usage. Measures the memory usage against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the memory use percentage matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the memory use percentage matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-ram -w 85 -c 95`	RAM Usage OK: The total memory utilization is 84%
os.windows.check-system-process	Query running processes to find running processes that match the given arguments (pattern, name, both pattern and name. At least one must be given). Measures the running processes against configured thresholds and filters, returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -n name - Process executable name to check the process execution. • -p pattern - Pattern (sub string) to search for in the command that invoked the process. Produces valid results only if the user running the Agent owns the queried process has view permissions for the queried process. • -w warnover - Triggers a WARNING status	Check Process OK: OK Found 1 matching running processes named explorer

Check	Description	Usage and Example	Output
		if the query returns more processes than those specified by the argument. • -W warnunder - Triggers a WARNING status if the query returns fewer processes than those specified by the argument. • -c critover - Triggers a CRITICAL event if the query returns more processes than those specified by the argument. • -C critunder - Triggers a CRITICAL event if the query returns fewer processes than those specified by the argument. Usage example: `winchecks check-windows-processes -n explorer`	
os.windows.check-directory	Verifies whether a Windows directory exists.	Usage: -d --directory Path to the relevant directory; use '\' for separation. Usage example: `winchecks check-windows-directory -d dir_path`	Check Directory OK: The directory 'C:/Users/Public' exists
os.windows.check-pagefile	Collects the *`Pagefile`* usage and compares it against the WARNING	Usage: • -w warning - Triggers a WARNING event if the *`Pagefile`*	Check Windows Page File OK: Page file usage at 31.63%

	and CRITICAL thresholds.	usage is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the *Pagefile* usage is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-pagefile -w 75 -c 85`	
os.windows.check-free-physical-memory	Measures the free physical memory against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the free physical memory is under the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the free physical memory is under the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-free-physical-memory -w 10 -c 5`	Free Physical Memory OK: The Free Physical Memory is 20.25%
os.windows.check-free-virtual-memory	Measures the free virtual memory against configured	Usage:	Free Virtual Memory OK: The Free Virtual Memory is 25.66%

	thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	• -w warning - Triggers a WARNING event if the free virtual memory is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the free virtual memory is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-free-virtual-memory -w 10 -c 5`	
os.windows.check-process-cpu	Processes CPU usage against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -p processname - Process name to collect CPU usage. • -w warning - Triggers a WARNING event if the CPU usage is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the CPU usage is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-`	Check Process CPU OK: Process CPU usage is 0.0000%

Windows metric monitoring checks

Windows OS Metrics policy

Check	Description	Usage and Example	Output
os.windows.check-processor-queue-length	Measures the processor queue length.	Usage: -s scheme - Replaces output's hostname + process with the given value (example: hostname.process) Usage example: `command: winchecks metric-windows-processor-queue-length --scheme hostname.proc`	win2019-dc-64bit.cpu.queuelength 0.00 1645371109
os.windows.check-system-cpu-load	Collects average CPU load per second.	Usage: -s scheme - Replaces output's hostname + process with the given value (example: hostname.process) Usage example: `command: winchecks metric-windows-cpu-load -scheme hostname.proc`	win2019-dc-64bit.cpu.loadavgsec 15.07 1645371561
os.windows.check-system-cpu	Collects the CPU core metric.	Usage: -s , scheme Replaces output's hostname+process with the given value (example: hostname.process) Usage example: `command: winchecks metric-windows-cpu -scheme hostname.proc`	win2019-dc-64bit.cpu.cpu0.cores 2 1645371681
os.windows.check-system-disk-usage	Collects the following disk usage metrics usage:	Usage:	win2019-dc-64bit.disk_usage.disk_C.total(GB) 99.40 1645371774

Windows metrics

The following table lists the metrics that are gathered as output from Windows checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Windows metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Process.Status			Windows process status including CPU and memory data.
Process.CpuPercent			Percentage of CPU used by the process.
Process.Memory(KB)		KB	Memory used by the given process.
cpu.queuelength (featured metric)			Processor queue length.
cpu.loadavgsec (featured metric)			Average CPU load per second.
disk.AvgDisksec/Read		seconds	Average time of a read from the disk.
disk.AvgDisksec/Write		seconds	Average time of a write to the disk.
disk.DiskReadBytes/sec		byte/sec	Rate at which bytes are transferred from the disk during read operations.
disk.DiskWriteBytes/sec		byte/sec	Rate at which bytes are transferred to the disk during write operations.
disk_usage.avail(GB)		GB	Disk available.
disk_usage.used(GB)		GB	Disk used.
disk_usage.total(GB)		GB	Disk total.
disk_usage.used_percentage (featured metric)			Disk used in percentage.
mem.free_physical_percentage			Percent of free physical memory.
mem.free_virtual_percentage			Percent of free virtual memory.
ram.usage_percentage (featured metric)			Percent of RAM used.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.free_physical(KB)		KB	Amount of free physical memory.
mem.total_physical(KB)		KB	Total physical memory.
mem.free_virtual(KB)		KB	Amount of free virtual memory.
mem.total_virtual(KB)		KB	Total virtual memory.
mem.available(KB)		KB	Total amount of virtual memory available.
mem.total_visible(KB)		KB	Total amount of physical memory accessible to the operating system.
system.uptime(Sec)		seconds	Duration that the system has been operational.
system.network.Bytes_Received/sec (featured metric)		byte/sec	Bytes received per second for active network adapters.
system.network.Bytes_Sent/sec (featured metric)		byte/sec	Bytes sent per second for active network adapters.
system.network.Bytes_Total/sec (featured metric)		byte/sec	Sum of the bytes received and sent per second.
system.network.Current_Bandwidth		bit/sec	Estimate of the network interface bandwidth.
system.network.Offloaded_Connections			Number of IPv4 and IPv6 TCP connections currently handled by the TCP chimney offload capable network adapter.
system.network.Output_Queue_Length			Length of the output packet queue.
system.network.Packets/sec			Rate that packets are sent and received on the network.
system.network.Packets_Outbound_Discarded			Number of outbound packets that were discarded.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
system.network.Packets_Outbound_Errors			Number of outbound packets that could not be sent becuase of errors.
system.network.Packets_Received/sec			Rate that packets are received.
system.network.Packets_Received_Discarded			Number of inbound packets that were discarded.
system.network.Packets_Received_Errors			Number of inbound packets that could not be sent because of errors.
system.network.Packets_Received_Non-Unicast/sec			Rate that non-unicast (subnet broadcast or subnet multicast packets) are delivered to a higher-layer protocol.
system.network.Packets_Received_Unicast/sec			Rate that unicast (subnet) packets are delivered to a higher-layer protocol.
system.network.Packets_Received_Unknown			Number of packets that were received, but discarded, because of an unknown or unsupported protocol.
system.network.Packets_Sent/sec			Rate that packets are sent.
system.network.Packets_Sent_Non-Unicast/sec			Rate that packets are requested for transmission to non-unicast (subnet broadcast or subnet multicast) addresses by higher-layer protocols. Includes packets that were discarded or not sent.
system.network.Packets_Sent_Unicast/sec			Rate that packets are requested to for transmission to subnet-unicast

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			addresses by higher-layer protocols. Includes packets that were discarded or not sent.
system.network.TCP_Active_RSC_Connections			Number of IPv4 and IPv6 TCP connections currently receiving large packets from the RSC-capable network adapter.
system.network.TCP_RSC_Average_Packet_Size		byte	Average size of received packets across all TCP connections.
system.network.TCP_RSC_Coalesced_Packets/sec			The large-packet receive rate across all TCP connections.
system.network.TCP_RSC_Exceptions/sec			The RSC exception rate for received packets across all TCP connections.

Windows log monitoring default checks and policies

Agent Client Collector provides the following policy for Windows log monitoring.

Windows log monitoring policy

Type	Check	Description	Usage and Usage Example	Output
Event	os.windows.check-log	Enables monitoring log files on a Windows server.	Usage: • -c crit N: Critical level if pattern has a group. • -f -log-file FILE: Path to log file. • -o --warn-only: Warn instead of critical on match. • -q pattern PAT: Pattern to search for. To search	Windows Log CRITICAL: Found 4 criticals, 0 warnings for pattern SEVERE|Exception|404|Errorin file C:\ProgramData\ServiceNow\agent-client-collector\log\acc.log

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows log monitoring policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			for multiple patterns, separate each pattern with a pipe (|) and put inside quotes. For example: "SEVERE|404" • -w warn N: Warning level if pattern has a group.	

Azure metrics script

When creating a new policy for Azure cloud metrics, create a .json script to determine the metrics to be monitored. The format for the script appears below, followed by a table explaining the script contents.

```
{
  "namespace": "Microsoft.Network/loadBalancers",
  "metrics": [
          "AllocatedSnatPorts",
          "ByteCount",
          "DipAvailability",
          "PacketCount",
          "SnatConnectionCount",
          "SYNCount",
          "UsedSnatPorts",
          "VipAvailability"
  ],
  "time_grain": "PT1M"
}
```

Resources and their metrics are retrievable from the Supported metrics for Azure resources page.

Header	Description
namespace	The name of the resource being monitored.
metrics	The metrics being retrieved from the monitored resource.
time_grain	The granularity of how often metrics are to be collected. Possible values are: • PT1M: Metric values are collected every minute. • PT5M: Metric values are collected every 5 minutes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header	Description
	• PT15M: Metric values are collected every 15 minutes. • PT30M: Metric values are collected every 30 minutes. • PT1H: Metric values are collected every hour. • PT1D: Metric values are collected daily.

Windows event log filter parameters

The configurable values on the Check Parameters tab of the os.windows.check-event-log check.

Check Parameters tab values

Parameter	Type	Description
provider_name	String	Name of the provider that generated the event. **Note:** If you do not specify a *log_file* value together with the *provider_name*, the system searches all available log files, which increases the time it takes to receive results.
log_file	String	The name of the Windows event log file from which you retrieve events. Possible values are: • Application • System **Note:** If you do not specify a *provider_name* value together with the *log_file*, the system searches all events from the log file, which increases the number of retrieved events.
id	Integer	The numerical id of the event. Possible values are 0-65535.
warning	Integer	Any value above the specified parameter generates a Warning event.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Parameters tab values (continued)

Parameter	Type	Description
event_level	String	The severity level of the event. Possible values: • Critical • Error • Warning • Information • Verbose
regex_pattern	String	The regex pattern to be used in searching the event logs. The value must be enclosed in double quotation marks. For example, "error".
duration_hour	Integer	The time period for which you want to retrieve events from the Windows event log. Value is specified in hours; fractions of hours are specified with decimals.
critical	Integer	Any value equal to or above the specified parameter generates a Critical event.

Parameters of MID Server distributed cluster

The following MID Server parameters support the MID Server Distributed cluster type.

You can access these parameters in the **Configuration Parameters** related list of a MID Server. To add and set any of these parameter, see Add a MID Server parameter.

Parameter	Description
mid.distributed.cluster.striped.threadpool.size	Size of striped threadpool in MID Server distributed cluster. • **Type**: integer • **Default value**: Number of cores on the virtual machine or server.
mid.distributed.cluster.log.level	Logging level for MID Server distributed cluster, which can help troubleshooting. However, logging impacts the performance of Metric Intelligence. An empty value designates no logging.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	• **Type**: integer • **Default value**: none • **Other possible values**: info, debug, trace

mid.distributed.cluster.global.timeout	Global timeout in seconds for MID Server distributed cluster.
	
	• **Type**: integer
	• **Default value**: 180
	• **Other possible values**:
	  ○ **Minimum value**: 60 (not enforced)
	  ○ **Maximum value**: 300 (not enforced)

mid.distributed.cluster.node.max.off.heap.memory	The amount of off heap memory used by Metric Intelligence to process data series per minute. The default 4 GB of space is the amount of off heap memory needed for processing 800,000 data series per minute. Adjust this value proportionally to the amount of actual data series. For example, to process 400,000 data series per minute, you can change the value to 2048. • **Type**: integer • **Default value**: 4096

Scheduled jobs included with MID Server distributed cluster

The following MID Server scheduled job is included with the MID Server Distributed cluster type.

Name	Description
Validate MID distributed cluster	Validates status of the cluster node for each MID Server in the cluster. For a MID Server that is down and its status is not stopped, updates the node status to stopped. Also, validates overall status of the cluster. During this validation, the job stops the cluster if there are multiple sub-clusters in a single cluster.

Components installed with Metric Intelligence

Several types of components are installed with activation of the Metric Intelligence (com.snc.sa.metric) plugin, including tables, scheduled jobs, and properties.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

Name	Description
Metric Intelligence — Metric Learner job	Runs daily and builds the statistical models used for anomaly detection.
Metric Intelligence — Purge old metric schemas and anomaly scores	Cleans up the *sa_metric_anomaly_score* and the *sa_metric_schema_definition* tables.
Metric Intelligence — Sync metric schema to mid	Synchronizing data from the instance to the MID Server in the metric schema table *sa_metric_schema_definition*.
Metric Intelligence — Sync tables with mid	Synchronizing data from the instance to the MID Server in tables.
Metric Intelligence — Table cleanup	Cleaning up tables related to various deletion operations.
Metric Intelligence — Observation Interval Learner job	Calculates the observation interval using collected data points for all data series.
Metric Intelligence — Process Stale Anomaly Score – Daily	Daily job that cleans stale anomaly scores, for a specified window of time, in the Metric Anomaly Score [sa_metric_anomaly_score] table. Uses the properties *sa_metric.anomaly_score_stale_interval_in_days* and *sa_metric.anomaly_score_next_stale_interval_in_days* to calculate the window of time for cleaning.
Metric Intelligence — Sync CI Anomaly Scores	Keeps anomaly scores up to date with any deletion of metrics.
Metric Intelligence — Metric configuration job	Synchronizes metric configurations from the instance to all Metric Intelligence MID Servers.
Metric Intelligence — Local level kalman filter model learner job	Builds local level kalman filter models on which to run change detection.
Metric Intelligence — Anomaly Model Test	On-demand scheduled job which runs when user clicks **Run Anomaly Test**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Metric Intelligence — Validate MID Distributed cluster	**1.** Checks the status of the cluster node. If status is **Started** and the status of the Metric Intelligence extension is not any of **Started**/**Starting**/**Warning** [warning with specific errors], then the job changes the status of the cluster node to **Stopped**. This happens when MID Server stops unexpectedly without notifying the instance that it is stopping. **2.** Checks the status of all cluster nodes on all MID Servers in the cluster. ○ If the status of all nodes is **Stopped** and the status of the cluster itself is **Started**, then the job changes the status of the cluster to **Stopped**. ○ If the status of the cluster is **Stopped** but there are MID Servers with a cluster node that is running, then the job changes the status of the cluster to **Started**. **3.** Checks the number of Cluster Leaders: If two are detected, then the job stops the entire cluster. This happens when MID Servers are not able to connect with other members of the cluster and form multiple sub-clusters.
Event Management - process metric binding events [1000-1020]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1000-1020).
Event Management - process metric binding events [1020-1040]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1020-1040).
Event Management - process metric binding events [1040-1060]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1040-1060).
Event Management - process metric binding events [1060-1080]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1060-1080).
Event Management - process metric binding events [1080-1100]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1080-1100).
Metric Intelligence - Stationary nonparametric model learner job	Learns the stationary nonparametric model.

Name	Description
Metric Intelligence - Combined Model Learner Job	Constructs all the information required for performing real time anomaly detection (calculating data frequency and building statistical models) on a subset of all series for which data is being collected.

Tables installed

Table	Description
Metric Time Series Model [sa_time_series]	Statistical models built for metric data.
Alert Anomaly [em_alert_anomaly]	Anomaly alerts that were created from anomaly events that were sent by Metric Intelligence so users can review. Anomaly alerts are kept separately from regular system alerts.
Metric Anomaly Score [sa_metric_anomaly_score]	Stores anomaly scores for the metric.
Metric To CI Mapping Deleted SysIds [sa_metric_map_deleted]	SysIds of deleted metric-to-CI mapping records.
Metric To CI Mapping [sa_metric_map]	Mappings currently in effect of metric types to CIs.
SA Metric Type Registration [sa_metric_registration]	Details about metric type registration.
Metric Type Registration Deleted SysIds [sa_metric_registration_deleted]	SysIds of records that were deleted from the SA Metric Type Registration [sa_metric_registration] table.
Metric Schema Definition [sa_metric_schema_definition]	Map of metrics being received based on CI class. It is used to optimize the metric data payload being sent from the MID Server to the instance.
Metric Type [sa_metric_type]	Metric type source.
Monitoring System Metric Type Deleted SysIds [sa_source_metric_type_deleted]	SysIds of deleted monitoring system metrics.
Monitoring System Metric Type [sa_source_metric_type]	Metric types per CI class, active/inactive status, and metric source.
Metric Settings	Default configuration settings for Metric Intelligence MID Servers.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_metric_config_setting]	
Metric Configuration Rules [sa_metric_config_rule]	Rules to override configuration settings for MID Servers.
Metric overridden configurations [sa_metric_config_rule_setting]	Maps overridden configurations to custom defined rules.
Metric Staged Configurations [sa_metric_config_staging]	Saved encoded configurations for the MID Servers.
Metric learned parameters [sa_metric_learned_param]	Parameters learned for CI/metric combinations, that will be synced to the MID Servers.
Metric To CI Mapping Deleted Details [sa_metric_map_deleted_detail]	Details about deleted entries from metric to CI mapping table. Includes CI, metric, and SysId of the deleted entry in the Metric To CI Mappings [sa_metric_map] table.
Track unique CIs created in metric map [sa_metric_ci_tracker]	All unique CIs for which metric map entry was created.
Metric Class [sa_metric_class]	Metric classes that can be associated with specific metrics to override bounds and widths learned values.
Metric Change Score [sa_metric_change_score]	Change events information.
Anomaly Test Rules [sa_metric_anomaly_test_rule]	Anomaly test rules used for anomaly model testing.
Anomaly test results [sa_metric_anomaly_test_result]	Results from anomaly model testing, such as bounds and anomaly scores.
Metric anomaly test config customized parameters [sa_metric_anomaly_test_config_custom_param]	Customized parameters for selected series in anomaly model testing.
Metric Intelligence Properties [sa_metric_property]	Metric Intelligence properties by domain.
Track host name with metric CI [sa_metric_ci_host]	CIs that are bind with node name from the binding event.
Functions supported by metric expression language	Functions supported by metric expression language.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_metric_expr_function]	
Argument types for functions supported by metric expression language [sa_metric_expr_func_arg]	Argument types for functions supported by metric expression language.
Track CI Types to metric entries valid for different sources [sa_metric_ci_type_map]	Track CI Types to metric entries that are valid for different sources.
CI Type To Resource Class [sa_ci_type_to_resource_class]	Contains mappings of CI type to resource class. Used for resource binding during resource lookups given a CI and a *resource_path* in the event. The [sa_ci_type_to_resource_class] table contains some default mapping records, and the evt_mgmt_admin role is required to manage this table.
CI Resource [ci_resource]	Parent table used for resource binding.
CI Resource Hardware [ci_resource_hardware]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Application [ci_resource_appl]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Service [ci_resource_service]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource VM [ci_resource_vm_object]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Database [ci_resource_database]	An extension of the CI Resource [ci_resource] table, used for resource binding.
Series Event History [sa_series_event_history]	Information about CIs start and end maintenance mode. Metric Intelligence stores historical information about the times CIs enter and exit maintenance mode if the system property sa.model_learner.maint_event_record_history_enabled is set to true (default). And if the system property sa_metric.maint_exclusion is also set to true (default), metrics from CIs that are in maintenance mode are excluded from model learning.

Table	Description
Metric Dashboard Metadata [sa_metric_dashboard_metadata]	Chart configurations per CI class, for the metrics that are displayed for a CI associated with an alert, in Agent Workspace.
Metric Config Anomaly Detection Staging [sa_metric_config_anomaly_detection_staging]	Internal table that is used to help calculate the action level for each entry in the Metric to CI Mapping [sa_metric_map] table.

Properties installed

Note:
To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter. To open the Metric Settings [sa_metric_config_setting] table, enter `sa_metric_config_setting.list` in the navigation filter.

Property	Usage
sa.metric.map.with.ci.expiration.sec	Length of time (in seconds) that records for mapping of CIs remains in effect if the mapping to CI is found. • **Type**: numeric • **Default value**: 432000 • **Location**: System Property [sys_properties] table • **Learn more**: Metric Intelligence
sa.metric.map.without.ci.expiration.sec	Length of time (in seconds) that records for mapping of CIs remains in effect if the mapping to CI is not found. • **Type**: numeric • **Default value**: 86400 • **Location**: System Property [sys_properties] table • **Learn more**: Metric Intelligence
sa_metric.anomaly_score_stale_interval_in_days	The starting day of the window of time that the *Opera Metrics - Process Stale Anomaly Score* scheduled job uses when checking staleness status of score. The window of time spans from today, until the past nu specified in this property. • **Type**: numeric • **Default value**: 3 • **Location**: System Property [sys_properties] table
sa_metric.anomaly_score_next_stale_interval_in_days	Number of days by which to extend the window of time *Operational Metrics - Process Stale A Score - Daily* scheduled job.

Property	Usage
	Applies if the job runs, but fails to return any data using the window of time specified by the *sa_metric.anomaly_score_stale_interva* property. • **Type**: numeric • **Default value**: 7 • **Location**: System Property [sys_properties] table

max_records_per_rest_request	Maximum number of records to download from the inst MID Server in each synchronization cycle.
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 10000
	• **Other possible values**:
	  ○ **Minimum value**: 1000
	  ○ **Maximum value**: 20000
	• **Location**: Metric Settings [sa_metric_config_setting]

normalized_metric_max_queue_size	Size of metrics queue. Anomaly detector reads through and determines for each metric whether it is anomalou
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 3000000
	• **Other possible values**:
	  ○ **Minimum value**: 1000000
	  ○ **Maximum value**: 5000000
	• **Location**: Metric Settings [sa_metric_config_setting]

normalized_metric_queue_consumer_count	Number of threads that concurrently perform anomaly
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 12
	• **Other possible values**:
	  ○ **Minimum value**: 8
	  ○ **Maximum value**: 16
	• **Location**: Metric Settings [sa_metric_config_setting]

ignite_data_streamer_thread_count	Number of threads that data streamers use to write data cache. The data streamer creates batches from individual data adds these batches to the cache.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Agent Client Collector for Visibility - Content

Agent Client Collector for Visibility - Content (ACC-VC) is a ServiceNow Agent installed on your Windows, Linux, or macOS endpoint devices to collect host data.

Agent Client Collector for Visibility - Content overview

ACC-VC deploys Ruby scripts that execute OS Query commands and OS-specific commands to gather information on your Windows, Linux, or macOS endpoint devices. You can discover data from various file systems and storage devices, TCP connections, running processes, and other information about target hosts.

Exploring Agent Client Collector for Visibility - Content

Learn how you can use Agent Client Collector for Visibility - Content (ACC-VC) to discover data on your target hosts.

Agent Client Collector for Visibility - Content overview

ACC-VC is an additional mechanism to perform Discovery. It is an alternative to horizontal IP-based Discovery for OS-related attributes including system information, network interfaces, running process, and so on. ACC-VC is suitable for on-prem servers and cloud instances. ACC-VC discovers software from different installation sources, such as Chocolatey, Click-to-Run and winget, in addition to traditional msi-based installations.

When performing MSSQL Discovery with ACC-VC, use the `summary.txt` file located at: `%ProgramFiles%\Microsoft SQL Server\<version number>\Setup Bootstrap\LOG\Summary.txt`. You must be a local system user to discover MSSQL components with the `summary.txt` file.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector for Visibility - Content supports the following modules:

- Data Collection
- Enhanced Inventory
- Serial Numbers
- Storage Devices
- File Systems
- Network Adapters
- TCP Connections
- Running Processes
- Installed Software
- Local User
- Intel vPro® platform

Note:

- Currently, Agent Client Collector for Visibility - Content does not support multi-languages. If values returned are not in English, the returned data cannot be parsed properly and the discovery will fail.
- Powershell is not being used in any of the ACC-VC modules on Microsoft Windows operating systems.

You can register and manage your target systems in the ServiceNow Configuration Management Database (CMDB) using the ACC-VC pushed-based model. There is no need to provide credentials, configure schedules, or scan IP ranges.

Agent Client Collector for Visibility - Content supports software identification (SWID) tag discovery on the agent. SWID tags gather information on the software in your environment. For details, see File-based Discovery.

Agent Client Collector for Visibility - Content workflow

The following illustration describes the high-level architecture of Agent Client Collector for Visibility - Content.

ACC-VC architecture

ACC-VC works with the following components:

- ServiceNow Instance
- ServiceNow MID Server
- Target host machines
- ServiceNow Agent Client Collector which runs on the Target host machines

Supported operating systems

ACC-VC collects the system attributes and related lists normally collected by the OS pattern. ACC-VC currently supports the following operating systems on x86_64 architecture:

- Linux
  - Red Hat Enterprise Linux (RHEL) and Oracle Linux (OL) 7, 8, 9
  - Centos 7, 8, 9
  - SLES 12, 15
  - Ubuntu 18, 20
  - Amazon Linux 2
  - Debian 9 and 10
- Microsoft Windows
  - Windows Server 2012, 2012r2, 2016, 2019, 2022
  - Windows 10 Enterprise Edition
  - Windows 11 Enterprise and Professional Editions

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- macOS (starting in ACC-VC version 1.3.0)
  - 10.15 - Catalina
  - 11 - Big Sur
  - Monterey (x86)
  - 13 - Ventura
  - macOS Ventura on ARM64 - Apple Silicon M1/M2
  - Sonoma

Related topics

How Agent Client Collector for Visibility - Content works

How Agent Client Collector for Visibility - Content works

Agent Client Collector for Visibility - Content (ACC-VC) requires installation of ServiceNow Agent Client Collector (ACC) on the target host. ACC is a derivative of Sensu-Go, an open-source software.

ACC-VC use cases

ACC-VC applies Checks and Policies to schedule and collect host data. ACC-VC is triggered in the following cases:

- Periodic scheduling: A policy-based approach where Discovery is triggered on a periodic basis.
- On CI delete: When the computer or server CI record is deleted.
- MID Server cycle: When the MID Server goes down and comes back up.
- Target host cycle: When the target host goes down and comes back up.
- Network break: When there is a break in the network link to the target.

Note:
Discovery is triggered for those agents whose hosts are already present. Agents whose hosts are not present are discovered through ACC-F.

ACC-VC checks and policies

The ACC-VC assets are stored as Agent plugins with the main entry point [acc_visibility_main] and other modules for OS families. There is one main system Discovery Check definition, called *`Enhanced Discovery`*, which is used by the *`Enhanced Discovery Policy`*. This ACC-VC policy runs off a schedule, which is defaulted to 24 hours (86,400 seconds). This policy configuration is synced to all agents as defined in the ACC-VC policy.

When the payload is returned from the MID Server to the instance, the ACC-VC Check Type, *`EnhancedDiscovery`*, delegates tasks to the EnhancedDiscoveryHandler script include provided by ACC-VC. The script contains logic to process the data from the check and handles tasks such as:

- Data transformation into an identification and reconciliation engine (IRE) compatible payload
- Non-CI data reconciliation (cmdb_running_processes, cmdb_tcp_connections, and so on)

The ACC-VC Check Definition, *`Enhanced Discovery`*, is initiated by the ServiceNow Instance. Then, an ECC Queue record with topic, MonitoringProbe, is created on the output

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

queue with relevant Check information. The MID Server then processes the check by sending a message to the ACC via WebSocket over TLS.

During this time, the MID Server also serves any relevant Assets or Plugins that the ACC requests, making sure it is relevant to the particular Operating System, platform, OS version, and architecture on which the ACC is running.

You can edit and modify all parts of the ACC-VC application including check type, policy, and check definition. See Checks and policies for more information.

Virtual machines and cloud instances

ACC-VC associates a target, discovered via Discovery, with a pre-existing virtual machine (VM) Instance CIs. ACC-VC associates the discovered CI record with any pre-existing VM Instance record or Cloud Server Instance record with appropriate CMDB relationships.

The following variants of virtualization and cloud server vendors are supported for ACC-VC:

- vCenter
- Amazon AWS Cloud
- Google (GCP)
- Microsoft Azure

Configuring Agent Client Collector for Visibility - Content

Plan and configure your Agent Client Collector for Visibility - Content (ACC-VC) implementation.

Configuration overview

ACC-VC requires installation of the ServiceNow Agent Client Collector (ACC) on the target host. ACC is a derivative of Sensu-Go, an open-source software.

Configuring Agent Client Collector for Visibility - Content requires the following:

- Discovery plugin (com.snc.discovery) must be installed and activated.
- Agent Client Collector Framework (ACC-F) must be installed on the ServiceNow instance.
- Agent must be installed on the target host.
- Ensure that you have upgraded to Quebec patch 3 or later.
- In a Linux or macOS environment, ensure that you are logged in as a servicenow user.

  In a Windows environment, ensure that you are logged in as a Local System user.
- ITOM Discovery or ITOM Visibility SKUs (SU-based licensing) is required.

You can then download and install the Agent Client Collector for Visibility - Content (ACC-VC) application from the ServiceNow Store or from the instance [sn_acc_visibility]. See Agent Client Collector Installation for details.

Note:
The ServiceNow Store regularly releases new applications and updates to applications that are created by the ServiceNow Store. If you already have the application, you can download the latest version to enhance your existing experience. Since different features are available or enhanced each time an application is released in the Store, the content and features available are indicated by version number in this document.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Agent Client Collector for Visibility - Content

When Agent Client Collector for Visibility - Content (ACC-VC) is installed on your Windows, Linux, or macOS servers, various information is collected depending on what other features or products you have installed.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Using push-based Discovery and horizontal IP-based Discovery together

Discovery performed by Agent Client Collector for Visibility - Content (ACC-VC) is compatible and can coexist with horizontal IP-based Discovery. You may have ACC installed on a given target host and still have that host as part of a horizontal IP-based Discovery schedule as well.

To avoid conflicts, ACC-VC does not perform Discovery when the target host's IP already has a CI that has been discovered by horizontal IP-based Discovery (discovery_source is ServiceNow). To override this behavior, set the system property [*sn_agent.disco_disable_ci_clobber_of_agentless_disco*] to false. This setting is ignored if horizontal IP-based Discovery was not performed over a specific time. Update the system property [*sn_agent.disco_ci_clobber_of_agentless_disco_threshold_days*] if necessary. The default is 14 days. See System properties for more details.

To enable Discovery using Agent Client Collector, enable the following Discovery properties on the Discovery properties page (**All** > **Discovery Definition** > **Properties**):

Agent Client Collector Discovery properties

Field	Description
glide.discovery.domain.name.nbt	Set OS domain name by NBT or WMI. If set to **true**, Windows domain name is set by NBT. Otherwise it's set by WMI. • **Type**: true | false • **Default value**: true
glide.discovery.enable.software_simplify	Enables cleanup for software's name and version. If set to **true**, it removes any appended version or commonly found phrases from the name and removes leading 0s in the version. If set to **false**, raw data is persisted in the table. Use with the **glide.discovery.enable.software_simplify_sccm** property to avoid software data discrepancy between Discovery and SCCM. • **Type**: true | false • **Default value**: true

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Discovery properties (continued)

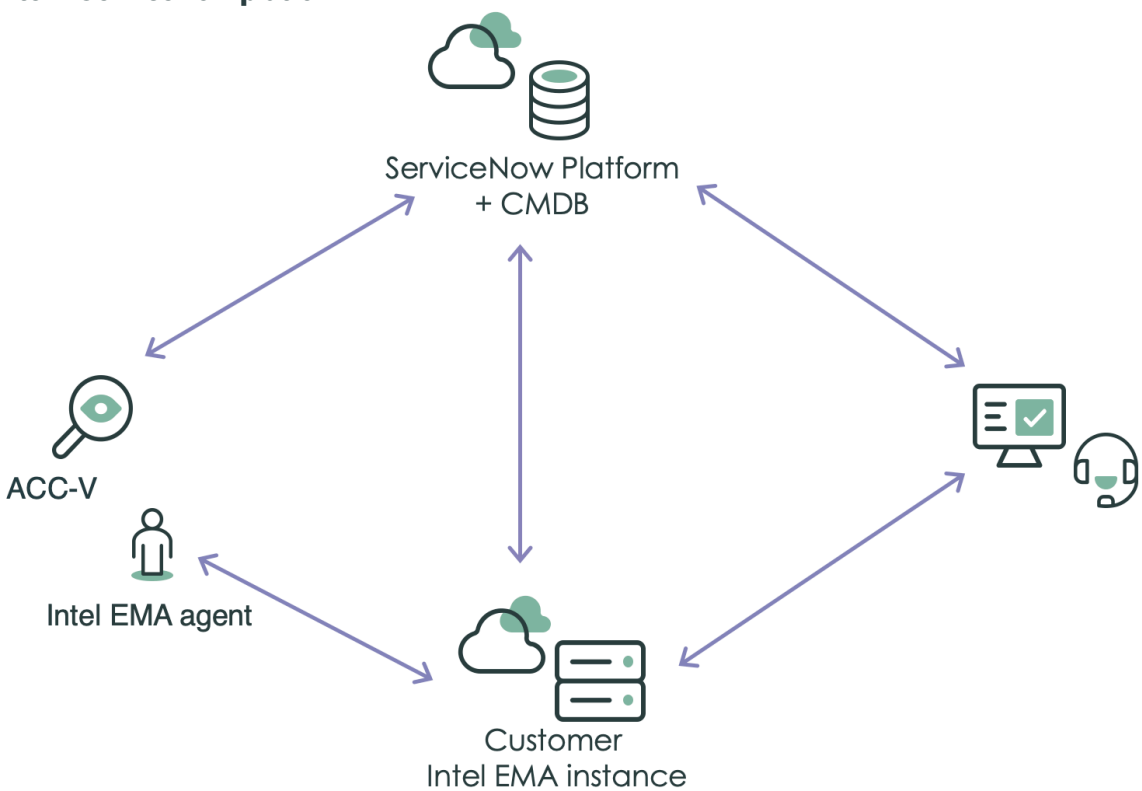
Field	Description
	Note: Once the property is set to **false**, to disable the cleanup, duplicate records are generated for a given software. Name and Version are the primary identifiers.

Using push-based Discovery and Intel Endpoint Management Assistant (EMA) together

Agent Client Collector for Visibility - Content (ACC-VC) can collect data for uses cases with the Intel vPro® platform when the Intel ® EMA application is installed on Windows endpoints. You can install the Intel EMA application from the ServiceNow store. Attributes are stored in the CMDB when enabled. Currently, data for Intel EMA can only be fetched for Windows endpoints.

The Intel EMA application enables customers to configure access to the Intel Instance from their ServiceNow instance. For example, IT Support groups can open a remote console and perform some actions like power cycle from a ServiceNow incident.

Intel + ServiceNow platform



Using push-based Discovery and SAM together

Agent Client Collector for Visibility - Content (ACC-VC) collects installed software data for use cases for Software Asset Management (SAM), when the SAM plugin is installed. Using push-based Discovery and SAM together can help optimize software data collection with SAM basic metering and SAM total usage metrics.

ACC-VC can capture the last accessed time for the software or applications that are installed on the target via push-based Discovery. This information along with the target CI reference, is added to the Software Update [samp_sw_usage] table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM Basic metering and SAM total usage metrics are supported for both Windows and macOS.

The software usage records are domain separated. The records are populated with the domain of the MID Server that is used for the agent-based Discovery for the target.

Note:
For software installations (cmdb_sam_sw_install), to avoid insertion of duplicate records, the same discovery source "ServiceNow" is being used for both push-based Discovery and horizontal IP-based Discovery.

Requirements

SAM basic metering and SAM total usage metrics

For SAM basic metering and SAM total usage metrics, the non-privileged servicenow user (which the agent service logs on as) must be configured with READ only access in the registry. This access allows for successful execution of the OSQuery against the UserAssist table to be successful. Go to regedit and allow the servicenow user to read UserAssist for a user account on the device (for example: HKEY_USERS\SID...\Software\\Microsoft\\Windows\\CurrentVersion\\Explorer\\UserAssist for every user in HKEY_USERS).

Note:
The *UserAssist* key does not inherit permissions from the *HKEY_USERS|SID...* parent key. Therefore, you must navigate to the *UserAssist* key and add permission directly on the key.

To apply SAM basic metering or SAM total usage metrics, you need the following:

- SAM plugin (com.snc.samp) enabled
- System property [*sn_acc_vis_content.persist_sam_usage_metrics*] set to true. See System properties for more details.

For details on SAM metering setup with the Agent Client Collector, see the Knowledge Base article KB1642676.

Software edition information

To retrieve software edition information, you need the SAM plugin (com.snc.samp) enabled.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM basic metering

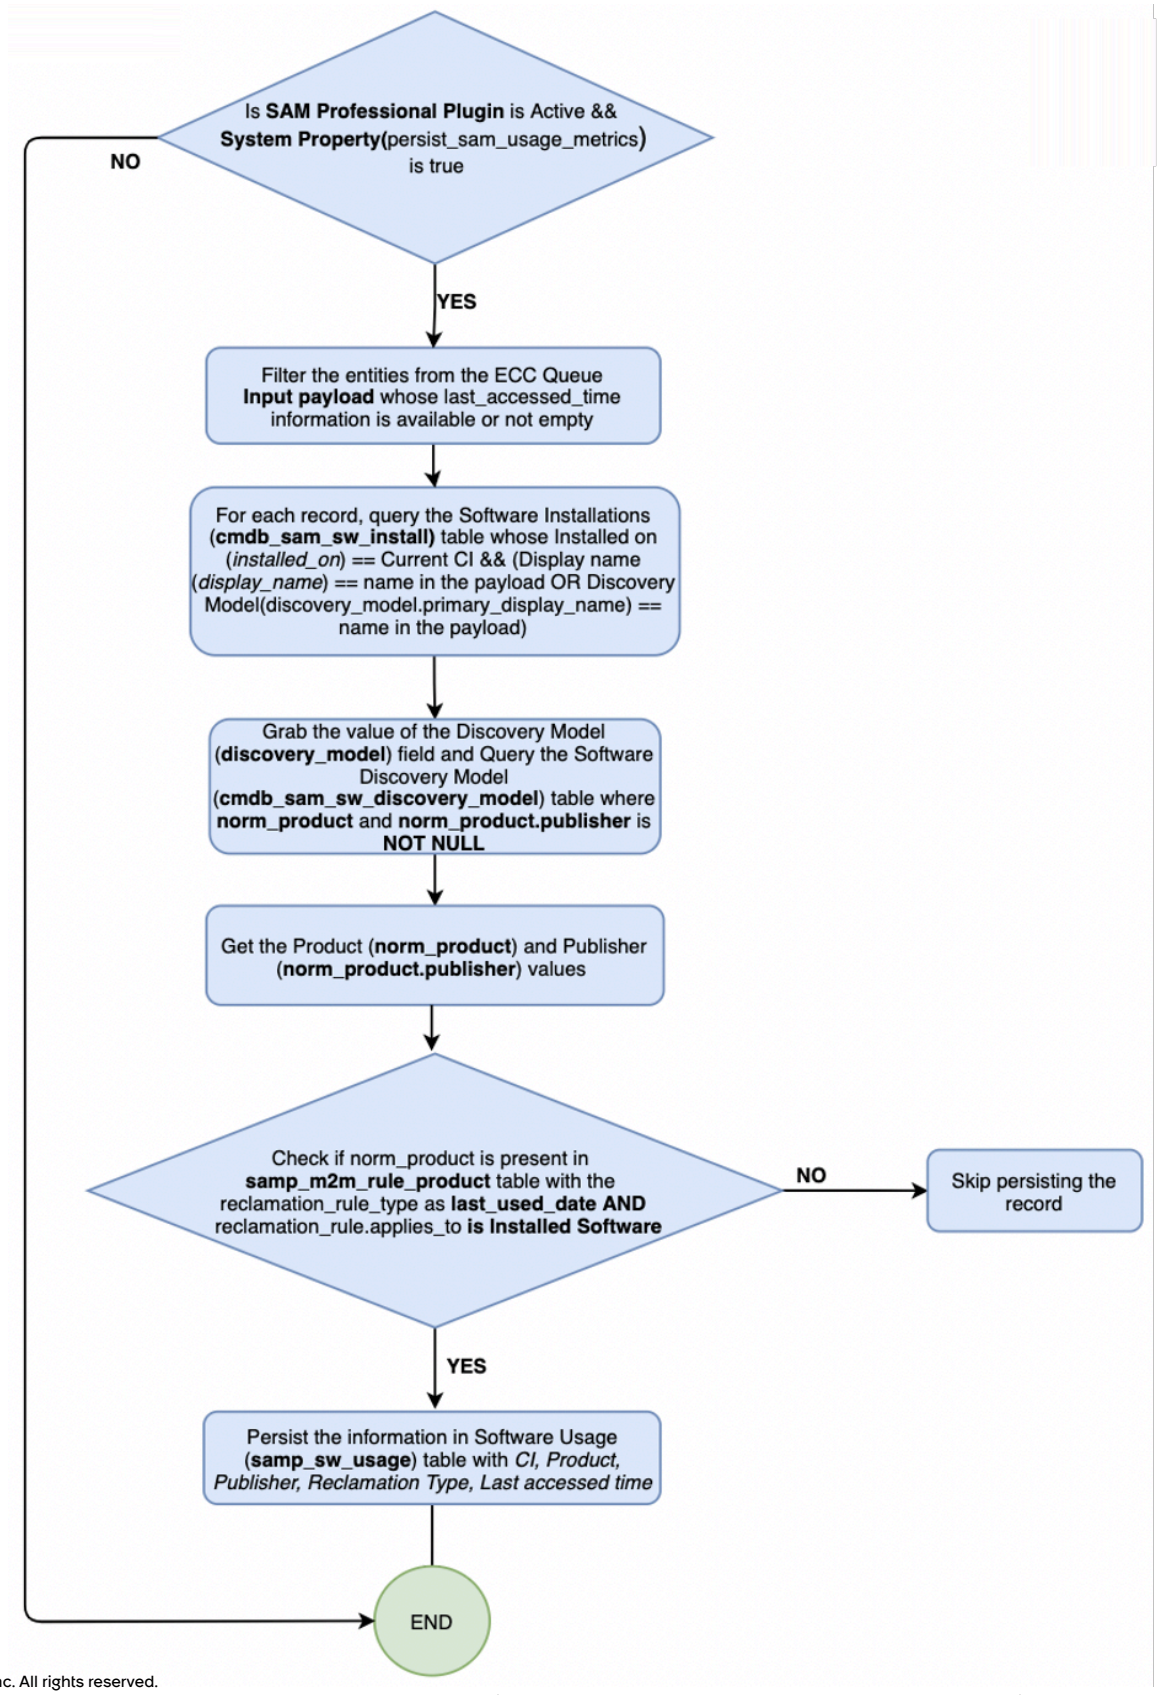
Note:
There is a configuration in the Windows operating system level that does not allow the correct detection of the data. Update the configuration so that the data can successfully be collected by the ACC-VC agent and brought to the ServiceNow platform correctly.
In the Registry Editor, create the following keys in the path: *HKEY_CURRENT_USER\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\Advanced.*

- Name: Start_TrackProgs
  - Base: Hexadecimal
  - Value:1
- Name: Start_TrackProgsBase
  - Base: Hexadecimal
  - Value:1

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM basic metering flowchart

For the list of software in the payload, query the Software Discovery Model [cmdb_sam_sw_discovery_model] table to fetch the corresponding product and publisher. Once the product is fetched, check if the reclamation rule is enabled for that product to persist the last usage information in the Software Usage [samp_sw_usage] table. See the flowchart for details.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In the target, query the last accessed time from the UserAssist table via the OSQuery by taking the application or software name as the input to the Query.

Use the *sn_acc_vis_content.disable_sam_reclamation_rules_for_licensable_softwares* property to define reclamation rules for licensable software, as follows:

- **True**: Disable invoking reclamation rules for licensable software. SAM usage continues for all licensable software and for non-licensable software with defined reclamation rules.
- **False**: Store SAM usage according to defined reclamation rules.

Common applications supported include:

- WinZip
- Google Chrome
- Sublime Text
- Notepad++
- Autodesk
- Microsoft Office 365
- Tableau

SAM total usage metrics

SAM total usage metrics allows you to measure total usage time and total usage count on any application that has a software reclamation rule enabled.

Osquery provides a daemon executable which can run as a service, called Osqueryd. Osqueryd needs to be manually deployed for SAM total usage metrics to work properly. Each Osqueryd deployment requires the osquery.conf file, optional external packs, and initialization flags (configured in osquery.flags file) provided when starting the service. In return, the daemon service runs scheduled queries on the host and logs it into a local file system.

Note:
Osquery supports filesystem-based logging by default. This configuration is provided in the osquery.conf file on any fresh Osquery installation.

Domain information can be collected during the data collection. This can help large organizations with multiple employee directories map software to the correct user. Currently, this is supported for Windows only. To map the software usage/assigned_to with the correct user in a domain separated environment, use the system property [sn_acc_vis_content.column_name_for_user_mapping] with a valid field name. By default, the value of this system property is empty which means it only validates the username and not the domain. You can use either of the following formats to validate username and domain: username@domain or domain\username.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM total usage metrics flowchart

Using the list of processes, you can perform SAM normalization to map the processes for the relevant installed software records. This provides flexibility since installed software names and processes are not usually the same. For the list of processes in the payload, query the Software Discovery Model [cmdb_sam_sw_discovery_model] table and Software Product [samp_sw_product] table to fetch the corresponding product and publisher. Once the product is fetched, check if the reclamation rule is enabled for that product to persist the total usage time in the Software Usage [samp_sw_usage] table. See the flowchart for details.

install and configure Osqueryd for Windows using the following script.

```
# Install latest osquery

$msi = "osquery-5.7.0.msi"
$url = "https://pkg.osquery.io/windows/$msi"
$dst = "$PSScriptRoot\$msi"
Invoke-WebRequest -Uri $url -OutFile $dst
# msiexec /i "$dst" /quiet /qn /norestart
Start-Process msiexec.exe -Wait "/i $dst /quiet /qn /norestart"

# Configure osqueryd service

$flags = "--logger_rotate=true
--logger_rotate_size=26214400
--logger_rotate_max_files=1
--watchdog_level=-1
--config_path=C:\Program Files\osquery\osquery-sam.conf"
Set-Content -Path 'C:\Program
 Files\osquery\osquery.flags.default' -Value "$flags"

$conf = @'
{
  "options": {
    "config_plugin": "filesystem",
    "logger_plugin": "filesystem",
    "utc": "true"
  },
  "schedule": {
    "sam_process_info": {
      "query": "SELECT name, pid, elapsed_time, start_time,
 user_time, system_time, username FROM processes p JOIN users
 u ON u.uid = p.uid WHERE p.elapsed_time != -1 AND u.type !=
 'special';",
      "snapshot" : true,
      "interval": 300
    },
    "system_info": {

Restart-Service osqueryd
```

For details on Windows and macOS see Configure Osqueryd schedule for SAM total usage metrics and Configure Osqueryd logs for SAM total usage metrics.

Collecting SAM metrics without osqueryd

Optionally, you can enhance efficiency by using non-osqueryd data collection when using push-based Discovery and Software Asset Management (SAM) together. When non-osqueryd data collection is invoked, data collection is automatically performed on all available agents, instead of invoking osqueryd on each agent individually.

To perform non-osqueryd data collection:

1. Ensure that the following permissions are configured for the relevant OS:
   - Windows: Either NT AUTHORITY\SYSTEM or admin
   - Linux and macOS: root
2. On the System Properties page (**All** > **System properties** > **All properties**), set the *sn_acc_vis_content.enable_sam_collection_without_osqueryd* property to **true**.

> **Note:**
> Enable this property only when all agents are version 4.1.0 or later.

Software edition information

Starting in ACC-VC version 2.3.0, edition information is supported for Adobe Acrobat and MS SQL server. With this feature, SAM admins can get clear visibility into the editions of their installed software. Osquery commands are used to fetch the edition information which then shows in the Software Installation [cmdb_sam_sw_install] table in the Edition Override column. For more details, see the support KB: https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB0721360

Related topics

Configure Osqueryd schedule for SAM total usage metrics

Configure Osqueryd logs for SAM total usage metrics

Configure Osqueryd schedule for SAM total usage metrics

SAM total usage metrics works by relying on the Osqueryd service running on the target host. Configure the Osqueryd service to run the required schedule Osquery on the host.

Before you begin

Role required: admin

Procedure

1. Navigate to **Osqueryd installation folder**.
2. Find and edit the osquery.conf file.
3. Add the below Osquery pack under the packs keyword.

   For Windows:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"packs": {
      "sam-metering":
 "C:\\ProgramData\\ServiceNow\\agent-client-collector\\cache\
\acc-visibility-modules\\bin\\sam-metering.conf"
  }
```

For macOS:

```
"packs": {
    "sam-metering": "/Library/Application\
 Support/servicenow/agent-client-collector/cache/acc-visibility
-modules/bin/sam-metering.conf"
  }
```

Result

You can now Configure Osquery logs for SAM total usage metrics.

Configure Osqueryd logs for SAM total usage metrics

By default, Osquery supports log rotation based on size. To enable it for SAM total usage metrics and to configure the log size and rotation, you need to add specific flags for Osqueryd service.

Before you begin

Role required: admin

Note:
SAM with Osqueryd consumes memory and CPU cycles. For example, with the Agent installed on a Windows Machine having 2 CPU core, 8 GB RAM, 1000 software installations, and 500 running processes, the following was observed:

- Average CPU usage for the Agent and Osqueryd was less than 10 % CPU and maximum of 30% CPU. This will only occur when the SAM background policy is triggered. By default, the trigger happens every 480 seconds.
- Average Memory usage for Agent and Osqueryd was less than 10 MB and maximum of 26 MB was consumed.

To store the data for a single running process for two days, the log file size on an average should be 52429 bytes. The log file size must be increased if the number of running processes on the machine is higher. For example, with 500 running processes the log size would be on average 25 MB which is 26214400 bytes.

Procedure

1. Navigate to **Osqueryd installation folder**.
2. Find and edit the osquery.flags file.
3. Add the below flags with these sizing guidelines:

   Note:
   Modification of the log file size should be done as per the Osqueryd Log file sizing guidelines.

   For Windows:

   - --logger_rotate=true
   - --logger_rotate_size=26214400

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- --logger_rotate_max_files=1
- --watchdog_level=1

For macOS:

- --logger_rotate=true
- --logger_rotate_size=26214400
- --logger_rotate_max_files=1
- --watchdog_level=1
- --logger_mode=0644

4. Save the file.

Result
Once the Osqueryd schedule and Osqueryd logs are configured the Osqueryd service can start.

The schedule runs the Osquery: Select name, pid, elapsed_time, start_time, user_time, system_time, username from processes p JOIN users u ON u.uid = p.uid where p.elapsed_time != -1 AND u.type !='special';" runs every 5 minutes (300 seconds) on the target machine. This logs the results into the log file. The log file contains snapshot entries of all the queries configured to run by the Osqueryd . This query contains all the processes attributes.

Note:

A temporary file *marker.json* is created in a temporary local folder on your machine in the directory:

For Windows : `<userprofile>\\AppData\\Local\\AgentClientCollector\\SAM`.

For macOS: `/Library/Application\ Support/servicenow/agent-client-collector`.

This file has read/write permissions and contains the marker data: *Data and Last Read Unix Time stamp*.

The Osqueryd can also be configured to write its logs to a custom directory path instead of the default directory. If you choose a custom directory, modify the check definition [samadvanced-background-log-check].

Application patterns for the Agent Client Collector

Application patterns gather details on the applications that run on the Agent Client Collector (ACC) host. Application patterns are supported only for servers, and are triggered after the Agent Client Collector host Discovery is complete.

Prerequisites for using application patterns

To enable application patterns on the Agent Client Collector, install the following:

- Agent Client Collector Framework
- Agent Client Collector for Visibility - Content
- Discovery

Set the *sn_agent.appl_classification_behavior* property to **full**, and restart any MID Servers connected to the agent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When working in a Windows environment, ensure that you are working with Powershell 3.0 or higher.

Role required (on the host device):

- In a Linux or macOS environment: servicenow user with sudoers; nopasswd enabled with regular Discovery commands.
- In a Windows environment: Local System user, SYSTEM, or a local user account where the local user account uses one of the following:
  - Logon as a service
  - Backup (SeBackupPrivilege)
  - Debug Programs privileges

Viewing supported application patterns

To view the list of patterns supported for Agent Client Collector, navigate to **All** > **Agent Client Collector** > **Agents**. Application patterns are the only pattern types supported for use with Agent Client Collector.

You can view the application patterns that were executed on a given agent.

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. Select and hold the name of the agent 
and select **View** > **Discovery**.
4. Select the **Application Pattern logs** tab on the bottom of the page.

   The list of patterns executed on the agent appears. Executed patterns are indicated with the value **true** in the Executed On Agent column.

Unsupported application pattern operations

Application patterns are not supported in the following pattern operations:

- WMI method invocation
- Change/unchange user
- All custom operations
- SNMP query
- Put file

Agent Client Collector pattern execution properties

Configure the following properties (**All** > **System Properties** > **All Properties**) to maximize the use of application patterns with Agent Client Collector:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application pattern properties

Property	Description
sn_agent.appl_classification_behavior	Set value to **full** to enable working with applications patterns and to access pattern commands in the allow-list. Default: simple **Note:** To enable application pattern execution with the allow-list, use the allow-list template for application patterns. For details, see the Pattern execution on ACC: Sample Allowlist for Pattern Content article in the Now Support Knowledge Base.

MID Server configuration parameter properties

mid.discovery.agent.command.mid.timeout	The maximum duration, in seconds, that the MID Server waits for a response from the agent before timing out. Default: 60 seconds
mid.discovery.agent.command.timeout	The maximum amount of time, in seconds, that the command is given to execute on the agent host. Default: 60 seconds

Using pattern designer debugging in ACC mode

You can debug application patterns that are configured in ACC mode.

1. Set the *sn_agent.appl_classification_behavior* property to **full**.
2. In the Pattern Designer, enable the debug option and select **Use ACC connection** in the Debug identification section.

The pattern log indicates whether the pattern was successfully executed on the agent.

You can also receive pattern details in the following logs:

- MID Server logs: Set *mid.log.level* to DEBUG for the mid agent log to display details on the pattern step, ACC check, and the pattern response.
- ACC logs: Search for the string *PatternOnTheFlyCheck* for details on pattern checks.

Oracle Global License Advisory Services (GLAS) data collection

Oracle Java process discovery works either with patterns (when using either a MID Server or Agent Client Collector), or with file-based discovery (using Agent Client Collector with file-

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

based discovery). If both the pattern and file-based discovery run the same Java installation, the pattern-collected data takes precedence.

When performing Discovery with Agent Client Collector, ensure that you have the following settings:

- All users must have the Oracle GLAS store app, starting with version 1.8.4.
- Agent Client Collector users:
  - Must have the Agent Client Collector Framework store plugin.
  - Can have the Agent Client Collector for Visibility - Content store plugin, for extra data.

For information about privileged user access, see KB1705845.

Note:
Oracle Java discovery with ACC is applicable in all server environments. However, currently, it's partially supported for different Desktop environments. For a Windows Desktop update set, see the KB article KB1705845.

For information on java installation Discovery using Agent Client Collector for Visibility - Content, see Discover java installation data using Agent Client Collector for Visibility - Content file-based discovery.

For information on the collected data, see Data collected during Agent Client Collector for Visibility - Content file-based Discovery.

Application patterns support Oracle GLAS data collection in a Linux environment. For details on using patterns, see Oracle Global License Advisory Services (GLAS) data collection using patterns.

Although Oracle GLAS supports Put file operations, the related files are deployed using Agent Client Collector plugins instead of SSH or WMI.

Related topics

Discovery patterns used by ITOM Visibility

Discover java installation data using Agent Client Collector for Visibility - Content file-based discovery

Discovering java installation data using Agent Client Collector for Visibility - Content file-based discovery enables you to discover file information in your system.

Before you begin

- Install the latest version of Agent Client Collector for Visibility - Content.
- Install file-based discovery.
- Enable the Oracle Global License Advisory Services (GLAS) hardware data collection policy.

Role required: discovery_admin

Procedure

1. Enable file-based discovery.
   a. Navigate to **All** > **Discovery Definition** > **Configuration Console**.
   b. Enable the **File Discovery** entry.
2. Enable the Java Discovery property.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Locate the *sn_acc_vis_content.file_discovery.enable_java_discovery* property on the System Properties page (**All** > **System Properties** > **All Properties**).

b. Set the property value to **true**.

3. Grant elevated permissions to the `acc` user, enabling access to your java installation directories, for example:

   - `/usr/lib/jvm/*/bin/java`
   - `/usr/lib/jvm/*/*/bin/java`

   You can add additional java directories during java installation, as needed.

   - In a Linux environment, grant elevated permissions in the `/etc/sudoers` file to enable access to the java installation directories.
   - In a Windows environment, grant elevated permissions (read and execute) via the system administrator to enable access to the java installation directories.

Result

When running Discovery for java installation, data is discovered through file-based discovery and is stored in the `ora_java_audit` table. For details on the data stored in this table, see Data collected during Agent Client Collector for Visibility - Content file-based Discovery.

Generate a Pattern allow list

Generate an allow list for a specific scope or selection of patterns.

Before you begin

Ensure that the following plugins are installed on your instance:

- Discovery (com.snc.discovery)
- Pattern Designer Enhancements (com.sn_itom_pde)

Role required: discovery_admin or agent_client_collector_admin

Procedure

1. Navigate to **All** > **Pattern Designer** > **Patterns allowlist for ACC**.
   The **Pattern Allowlist Generator** page appears.
2. Select the type of pattern selection in the **Pattern Selection** section.
   - **All patterns**: The allow list generates for all patterns on the agent.
   - **Specific patterns**: The allow list generates on the agent only for the patterns you select.

     After selecting this option, choose the patterns from which you want the allow list to be generated.
3. Select an application scope from which to choose patterns to be included in the allow list.
   - All
   - Discovery and Service Mapping Patterns
   - Global

   Note:
   Choosing an application scope is possible only when selecting **All patterns** in the **Pattern Selection** section.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Generate Allowlist**.
5. Select **Copy** to copy the generated allow list.
6. Append the copied allow list into the existing `check-allow-list.json` allow list on the agent.
   The patterns specified in the allow list are permitted to run on the agent.

Note:
The pattern allow list generator does not add an entry for commands nested under EVAL() in the pattern steps.

Discovering DNS names using push-based discovery

CMDB owners need CIs to contain all domain system names (DNS) associated with their system. Starting in Agent Client Collector for Visibility - Content (ACC-VC) version 2.3.0, ACC-VC can discover DNS name lists for Windows and Linux CIs.

When discovering DNS names associated with systems, the following occurs.

- network_adapters.rb is used to populate the DNS name for all the IP addresses using OSquery. (There is no limit.)
- Nslookupcommand is used to get the DNS name for all IP addresses.

Note:
Nslookup must be configured on the target.

This creates a relationship of *Owns::Owned by* between the CI and the DNS names.

This information is then populated into the [cmdb_ci_dns_name] table.

Detecting portable applications using push-based discovery

Portable applications are those applications that don't need to be installed on the target system. Starting in ACC-VC version 2.3.0, push-based Discovery can detect portable applications, such as Firefox, VLC, Notepad++ etc, for Windows only.

Note:
Only portable applications listed in https://portableapps.com/ are supported.

When the portable application is executed, it creates a running process. The application creates a path similar to the following for the configuration file 'appinfo.ini':

```
-\ <--- Directory with FirefoxPortable.exe
 +\App
 +\firefox
 +\Data
 +\profile
 +\settings
 +\plugins\ (optional)
```

Note:
ServiceNow users must have Local account access to get the data in order to read appinfo.ini file.

Name, Version, and Vendor attributes are fetched from the Portable software and are found in the appinfo.ini files. appinfo.ini is the mandatory file to execute any portable application. If SAM is installed, the information is displayed in Software installation [cmdb_sam_sw_install] table. If

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM is not installed, the information shows in the Software instance [cmdb_software_instance] table.

Setting exclusion lists for IPs and NICs

Agent Client Collector for Visibility - Content (ACC-VC) version 1.3.0 supports exclusion list for IPs and Network Interface Controllers (NICs) with a flexible mechanism for filtering out values for IPs and or NICs when creating or updating the host CI and related items.

The property [*sn_acc_visibility.network_adapter_exclusion_list*] contains the list of regular expressions for the names and IP addresses that are excluded in the Network Adapter and IP Address tables. The value of this property is comma-separated regular expressions. Make sure that there is no comma in the regex and nic and ip_addr should be in different lines.

Sample format of the value should be:

- nic = nameRegex1, nameRegex2, nameRegex3
- ip_addr = IPRegex1, IPRegex2

Populating Assigned To attribute in Computer CI for Agent Client Collector for Visibility - Content

To update the Assigned To attribute of the Computer CI, you need to collect information from the logged in user.

Before you begin

Role required: admin

You can automatically populate Assigned to for Windows endpoint devices and macOS devices, like workstations or employee laptops, as part of agent-based Discovery using ACC-VC with the following system properties. See Available system properties for more information.

- **sn_acc_vis_content.set_assigned_to**
- **sn_acc_vis_content.assigned_to_user_order**
- **sn_acc_vis.column_name_for_user_mapping**

Procedure

1. Create higher user privileges to fetch the logged in user details.
   Use Log on As Local System User instead of the default ServiceNow user for running the Agent Client Collector.

   These commands are executed on the Windows machine:

   - wmic COMPUTERSYSTEM GET USERNAME
   - From osquery: SELECT l.user FROM logged_in_users l JOIN users u ON l.sid = u.uuid WHERE u.type != 'special'

   This command is executed on the macOS machine: SELECT distinct(l.user) FROM logged_in_users l JOIN users u ON l.user = u.username

2. User names match is performed on the user records in the sys_user table.
   The Assigned To attribute is populated and then it creates a reference to the user. Systems logs shows a warning if no user can be found in sys_user. The user names sourced for Assigned To attribute is based on the system property: **sn_acc_vis_content.assigned_to_user_order**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Assigned_to attribute is set based on priorities.
   If assigned_to is already there, keep it as is by default. However, you can update the **sn_acc_vis_content.set_assigned_to** system property to override it. If there are any Reconciliation Rules defined, then the IRE populates the field accordingly.

Result

No new user account is created in the sys_user table. Instead, the existing user is queryied and the same is referenced as Assigned To user for a CI.

Populating users based on type for Agent Client Collector for Visibility - Content

You can persist the type of users that populate the CMDB depending on your particular interests. Currently, local and system are supported for Windows, Linux, and macOS.

You can filter the types of users by using the system property: **sn_acc_visibility.persist_os_user_type**. See Available system properties for more information.

For Windows

You need to identify if a server is domain controller or not. Since domain controller machines don't have local accounts, local user information does not persist for such machines and is not populated.

For non-domain controller Windows machines, use OSquery commands to get user information through ACC-VC: select *uid*, *username*, *directory*, *type* from users where **type=local** or **type=special**.

For Linux

The userID defines if a user is a local account or system account. This is defined by *UID_MIN* and *UID_MAX*.

Use this command to get user information through ACC-VC to get *UID_MIN* and *UID_MAX* value: `grep -E '^UID_MIN|^UID_MAX' /etc/login.defs`.

Use this command to get user names: `cat /etc/passwd | awk -F':' '{print $1,$3,$6`.

For macOS

Use OSquery commands to get user information through ACC-VC: select *uid*, *username*, *directory* from users. User names that are preceded by '_' are treated as system accounts. Others are local accounts.

Run Certificate Discovery via Agent Client Collector for Visibility - Content

Discover TLS/SSL certificates used by ports running on the agent's server. The Certificate Inventory and Management application uses this information to manage TLS/SSL certificates.

Before you begin

Verify that the latest version of Agent Client Collector for Visibility - Content (ACC-VC) is installed.

Verify that the latest version of Certificate Inventory and Management is installed.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Enable the *TLS SSL Certificate Capture* policy.
3. Navigate to **All** > **System properties** > **All properties**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To discover certificates on specific ports:

   a. Locate and select the *sn_acc_vis_content.tls_ssl_scanner_ports* property.

   b. Enter a comma-separated list of port numbers on which to scan for certificates in the **Choices** field.
   By default, the values are identical to those values configured for the *tls_ssl_certs* property.

5. To discover certificates on all available open ports:

   a. Locate and select the *sn_acc_vis_content.tls_ssl_scan_all_open_ports* property.

   b. Assign the value **true**.

6. **Optional:** To store the original certificate in the instance, set the *sn_acc_vis_content.tls_ssl_keep_original* property to **true**.

Result

The Agent Client Collector collects the data and discovers the TLS/SSL certificates. This data is the same as what is gathered by the IP-based *tls_ssl_probe* property.

The TLS/SSL certificates are populated in the following tables:

- Discovered Certificates [sn_disco_certmgmt_certificate_history]
- Unique Certificates [cmdb_ci_certificate]
- Installed Certificates [sn_disco_certmgmt_cmdb_installed_certificate]

A CI relationship is created between the discovered certificates and the corresponding Host CI (in this case, the agent's server).

Operating System family/plugin	Name of module script
acc-visibility-modules	storages_devices.rb (support for getting physical disk and corresponding disk partitions only)
	network_adapters.rb
	local_users.rb
	enhanced_inventory.rb
	cloud.rb

Note:

running_processes.rb and tcp_connections.rb are interdependent. For an efficient Discovery, keep both tcp_connections.rb and running_processes.rb together. Both the files are needed to get the complete data. If one is not there, it will not populate the other data.

To fetch information about all the running_processes on the macOS, you must provide sudo access to osquery. If this configuration is not made, then running_processes.rb will only fetch what is triggered by _servicenow user. For tcp_connections.rb, you must add 'sudo lsof' command in the sudoers file. If this is not done, tcp_connections.rb will only fetch what is triggered by _servicenow user.

Data collected

ACC-VC uses the same classification criteria as IP-based Discovery for classifying as computer or server. The subset of collected data includes the following categories:

- Basic inventory – Starting with ACC-F version 2.10.1, this will not be used.
- Data collection - Collects the necessary data for classification and identification of a host CI. This includes host name, serial numbers, and OS information.
- Installed Software – cmdb_sam_sw_install (if SAM enabled) and cmdb_software_instance (if SAM not enabled)
- File Systems – cmdb_ci_file_system
- Storage Devices – cmdb_ci_disk and cmdb_ci_storage_device
- Serial Numbers – cmdb_serial_number
- Network Adapters – cmdb_ci_network_adapter and cmdb_ci_ip_address
- TCP Connections – cmdb_tcp
- Running Processes – cmdb_running_process (ACC-VC also classifies the running processes and creates application CIs in cmdb_ci_appl, where possible)
- Local User – cmdb_os_user (Populates the local users for all the Operating Systems that ACC-VC supports by adding a new module called local_user)
- Enhanced inventory – Collects enhanced data (such CPU info, start_date, object_id) which is not necessary for identifying a unique host.

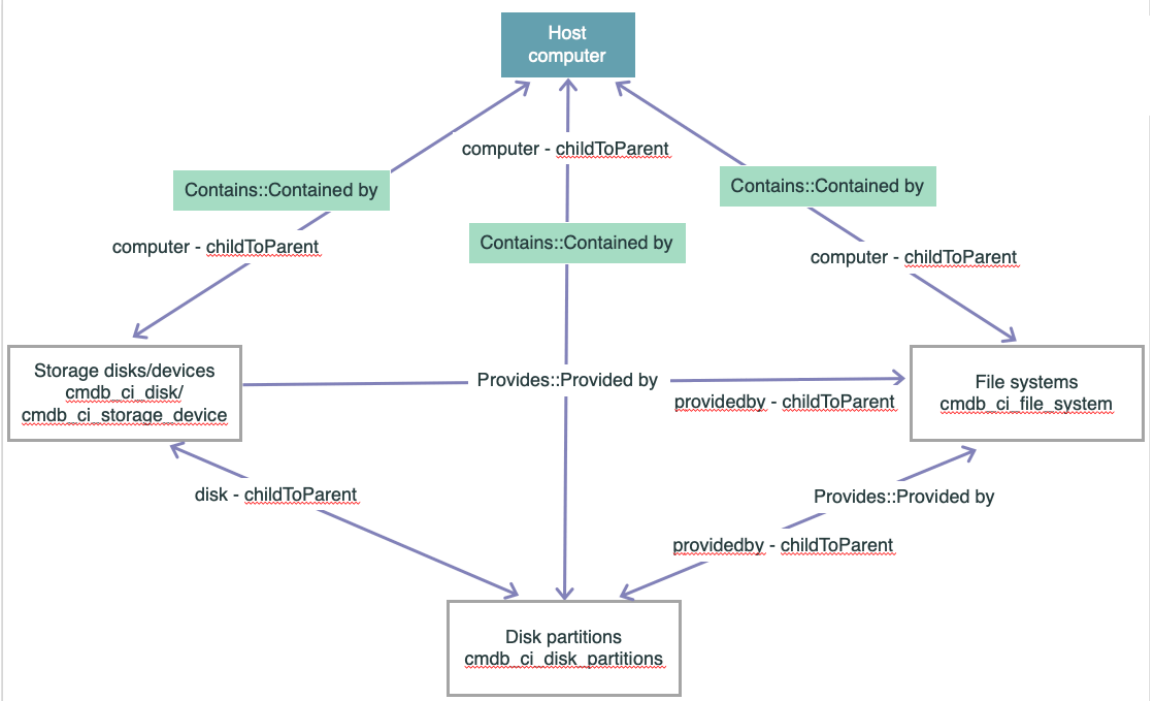
Relationships between host computer, file systems, and storage devices



Agent Client Collector terms

Agent Client Collector (ACC)

The software component installed on target hosts that communicates with the MID Server. Sometimes referred to as Agent. This component is a ServiceNow derivative of Sensu-Go.

Agent Client Collector Framework (ACC-F)

A ServiceNow base scoped application that leverages ACC and provides core capabilities (including Check Types, Check Definitions, Policies, and so on) enabling other ACC scoped applications, including ACC-M and ACC-VC.

Agent Client Collector Monitoring Monitoring (ACC-M)

A ServiceNow scoped application enabling monitoring use cases.

Agent Client Collector for Visibility - Content (ACC-VC)

A ServiceNow scoped application that implements push-based Discovery leveraging ACC and ACC-F.

Horizontal IP-based Discovery

Traditional Discovery available to customers prior to ACC-VC. It discovers data via Probes and Patterns through the MID Server, requiring the Discovery Plugin.

Modules

A subset of discovered data that is populated as part of Discovery. Examples of Modules include: Data Collection, Installed Processes, Serial Numbers, File Systems, Storage Devices, Network Adapters, Running Processes, and TCP Connections.

Push-based Discovery

Discover data via ACC, ACC-F, ACC-VC, and the MID Server with a direct push of data from the target host. Discovery does not require specific IP range configuration on a Discovery Schedule or providing Discovery Credentials for target host.

Sensu-Go agent

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Free and Open Source project which ACC is derived from.

Virtual Machine Instance

A virtual target host running inside of a hypervisor, either on-premise or within a cloud service provider like AWS, GCP, or Microsoft Azure.

Virtual Machine Image

A snapshot of a live virtual machine instance persisted to a file system or cloud storage.

Agent Client Collector for Visibility - Content default checks and policies

Agent Client Collector for Visibility - Content (ACC-VC) provides various checks and policies as well as a business rule.

Policies

Note:
ACC-VC policies execute at a frequency of once per day. The total data ingested would be approximately 572KB prior to file-based discovery, which runs once per week. This takes into consideration an average of approximately 1500 installed software applications and approximately 500 running processes other than CI data per machine.

ACC-VC policies

Name	Description	Checks definitions
Enhanced Discovery	Runs on a schedule, by default every 24 hours (86400 seconds). The policy interval can be adjusted, for example to run every 4 hours (set the interval to 14400). The ACC-VC policy configuration is synced to all agents based on the policy filter defined by ACC-VC. Update the following ACC-F system properties, if needed: • *sn_agent.disco_minimum_threshold_for_rediscovery_minu* to avoid discovering the system too frequently. • *sn_agent.disco_disable_ci_clobber_of_agentless_disco* to avoid Discovery conflicts. • *sn_agent.disco_ci_clobber_of_agentless_disco_thresho* to avoid Discovery conflicts.	Enhanced Discovery
SAM Discovery	Responsible for capturing the software installed on a Windows endpoint device, such as desktops or servers.	Software installations and usage metrics
SAM background	Enables a background job for processing the Osqueryd logs for SAM on Windows and macOS endpoint devices.	SAM background log check

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC-VC policies (continued)

Name	Description	Checks definitions
SAM background (Non OsqueryD)	Enables a background job to collect SAM information using osqueryi instead of osqueryd.	SAM Background Policy (Non OsqueryD)
Software installed	Responsible for capturing the software installed on all devices except for Windows and macOS endpoint devices. The data collected is stored in the [cmdb_sam_sw_install] table. Scheduled to run every 24 hours.	installed software
File-based Discovery background policy	Takes the config file (`AgentFBDUnixParameters.json`, `AgentFBDWindowsParameters.json`, or `WindowsWhiteList.txt`) as input from the instance to an agent. Information compiled by the configuration console gets put into the config file after running the *`Refresh FBD Config Files`* scheduled job. This policy scans the system using config file parameters and stores the output on the agent, in the location of the configuration file. Runs weekly on the agent when file-based discovery is activated on the configuration console. For details, see File-based Discovery.	File-based discovery background
File-based Discovery policy	Collects the output file from the agent's background policy. Sends the collected information to the configuration tables and deletes the file after sending. The output file cannot exceed 2MB. Runs weekly on the agent when file-based discovery is activated on the configuration console. For details, see File-based Discovery.	File-based discovery

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC-VC policies (continued)

Name	Description	Checks definitions
	Note: • During file-based discovery on a Windows system, the servicenow user does not have the necessary permissions. Therefore, manually grant the List Folder Contents permission to the folder you want to scan. • To ensure successful retrieval of the file version, run the agent as the local system account user instead of the *servicenow* user.	
VISC Get application metric	Retrieves the SaaS application metrics from the agents. For details on enabling SaaS usage monitoring with ACC-VC, see the SaaS Usage Monitoring with Agent Client Collector [KB2320193] article in the Now Support Knowledge Base.	VISC Get application metric
VISC Get browser extension device init	Initializes the DEX browser extension with the host sysID.	VISC Get browser extension device init
VISC Get browser extension init	Initializes the DEX browser extension with logged-in users.	VISC Get browser extension init

Note:
Windows endpoint devices include devices that have a Windows operating system and belong to CI class: computer.

See System properties for more details. For more details on policies, see Checks and policies.

Check type

ACC-VC has the following check types: *Enhanced Discovery*, *SAM Advanced Discovery*, and *Installed Software*.

Enhanced Discovery

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This check type is responsible for invoking the EnhancedDiscoveryHandler script include that processes the payload produced by endpoint_discovery.rb as executed by ACC.

Used by File-base Discovery.

SAM Advanced Discovery

This check type is for the SAM Discovery policy that invokes the EnhancedDiscoveryHandler script include for processing the SAM data produced by the sam_advanced.rb file.

Installed Software

This check type for the *Software installed policy* that invokes the EnhancedDiscoveryHandler script include for processing the installed software data produced by the installed_software.rb file.

Check definitions

ACC-VC check definitions

Name	Description

Enhanced Discovery	Synced to all agents based on the policy filter defined by ACC-VC. The Check definition is configured to run with certain assets and determines what gets synced between the agent and the MID Server. For more details on policies, see Checks and policies.
	
	Note:
	
	For the agent to retrieve the OS serial numbers and TCP connections along with associated running processes, sudo access for "dmidecode" and "ss" is required on Linux systems. For example, this content could be added to /etc/sudoers or to an individual file in `/etc/sudoers.d/`:
	
	`Cmnd_Alias AGENT_ACC_V = /usr/sbin/dmidecode -s baseboard-serial-number,/usr/sbin/dmidecode -s chassis-serial-number,/usr/sbin/dmidecode -s system-serial-number,/usr/sbin/dmidecode -s system-uuid,/usr/sbin/ss -tanp`
	`servicenow ALL=(root) NOPASSWD:AGENT_ACC_V`

SAM background log check	Runs every 8 minutes and performs inline aggregation of data generated from Osqueryd logs. After collecting the data, it writes all the intermediate data results into a temporary

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC-VC check definitions (continued)

Name	Description
	marker file which is reused in the next run. This reuse limits the number of log files and disk space needed on target systems. **Note:** You may notice a spike in system resource consumption, as the background aggregation check runs every interval.
Software installations and usage metrics	Collects data every 24 hours.
Installed software	Fetches installed software data for all devices other than Windows and macOS endpoint devices.
File-based discovery background	Runs a file scanning background job on the agent.
File-based discovery	Fetches the file data from the agent.

Business rule

The *Enhanced Discovery - On Host CI Delete* business rule triggers the Endpoint Discovery Check when the CI associated with a given CI is deleted from sn_agent_cmdb_ci_agent.

Agent Client Collector MID-less installation command parameters

Description of the command line parameters used during MID-less Agent Client Collector installation.

Installation command line parameters

Parameter	Description
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less Agent Client Collector installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Specify a public gateway endpoint for Agent Client Collector.
REGISTRATION_KEY	Active and valid registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registered with.
ACC_ALLOW_LIST	Optional string; to disable the allow list, set *ACC_ALLOW_LIST=0*. By default, the allow list is enabled.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installation command line parameters (continued)

Parameter	Description
	Note: Disabling the allow list compromises your system's security and is intended as a temporary measure while you're updating the allow list. After completing the update, enable the allow list by setting **ACC_ALLOW_LIST=1**.
ACC_VALIDATE_SIG	Optional string; to disable verification of the installer certification validation, set *ACC_VALIDATE_SIG=0* that you can add to disable the verification of the installer certification validation. By default, validation is enabled. **Note:** Disable the certification validation only when using non-standard signature validation tools.

Data collected during Agent Client Collector for Visibility - Content file-based Discovery

The following tables describe the data collected during Agent Client Collector for Visibility - Content file-based Discovery.

Java Audit [ora_java_audit]

Field	Description
Name	Name of the record. For example: Java@hostname
Physical Machine Name	Name of the host CI
Machine Type	Either Server(S) or Desktop(D)
Java Publisher/Runtime Vendor	Java Vendor name
Operating System	Operating system in which the java is run
Environment Type	Production or Development or QA environment
Java Release/Version/Build	Java Version
Installation Path	Absolute installation path of the java binary
Installation Date (DateTime)	The date and time of the java binary file created on the file system
Release File (Y / N)	Indicates if a *release.md* file exists in the installation
Processor Make/Model	Processor model name

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Java Audit [ora_java_audit] (continued)

Field	Description
Sockets (Integer)	Number of CPU sockets
Cores (Integer)	Number of CPU cores
V6 and earlier	Indicates if you have a 6 or earlier java version
Open Source	Indicates if you have an open-source java installation
Unlock Commercial features	Indicates if you have the commercial features (like JFR) enabled. Not collected during ACC-VC file-based discovery (FBD).
Mission Control	Indicates if the mission control plugin is enabled
AMC Agent	Indicates if the AMC agent plugin is enabled. Not collected during ACC-VC file-based discovery (FBD).
Usage Tracker	Indicates if the Usage Tracker feature is enabled
Virtual Machine Object ID	Object ID of the Virtual machine instance
PID	Running process PID
IP Address	IP address of the host/VM
First Discovered	The date of the first discovery
Most recent discovery	The date of the most recent discovery
Discovery Source	The discovery method
Application	Reference to the [cmdb_ci_appl] table
Software installation	Reference to the [cmdb_sam_sw_install] table
Java evidence	Reference to the [cmdb_ora_java_evidence] table
Host	Reference to the [cmdb_ci] table

Java Evidence [ora_java_evidence]

Field	Description
Running process	Reference to the [cmdb_running_process] table
Host CI	Reference to the [cmdb_ci_computer] table
File information	Provides a reference to the [cmdb_file_information] table. Relevant only for file-based discovery (FBD); in pattern-based discovery, this field remains empty.

Agent Client Collector Log Analytics

Agent Client Collector Log Analytics (ACC-L) enables you to stream log data from Linux and Windows hosts to a ServiceNow instance, using the Agent Client Collector.

As with Agent Client Collector Framework (ACC-F), the Agent Client Collector connects to a MID Server. A single MID Server may support multiple agents, while a single agent works with one MID Server at a time and switches to a different MID Server when necessary to provide failover protection.

Use the Agent Client Collector to stream log data to your ServiceNow® instance by means of a log shipper. The log data is mapped and structured in the ServiceNow® Health Log Analytics application. For more information, see the Health Log Analytics product documentation.

Agent Client Collector Log Analytics has a dependency on the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

The Agent Client Collector Log Analytics (ACC-L) application, Version 3.2.0, August 2022, has a dependency on the Agent Client Collector Framework (ACC-F) application, Version 2.10.1, August 2022.

To enable Agent Client Collector Log Analytics, you enable log analytics on the Agent Client Collector, as described in Set up Agent Client Collector Log Analytics without using guided setup.

Dependencies

For a list of Agent Client Collector Log Analytics plugin dependencies, see Plugins or applications installed with ITOM AIOps.

Agent Client Collector Log Analytics setup

Configure Agent Client Collector Log Analytics on your ServiceNow instance either with or without using guided setup.

Agent Client Collector Log Analytics setup using guided setup

Agent Client Collector Log Analytics guided setup provides a sequence of tasks that help you configure Agent Client Collector Log Analytics on your instance. Using guided setup ensures that you have the minimum required setup to use the application. For more information, see Set up Agent Client Collector Log Analytics using guided setup.

For more information about using the guided setup interface, see Using guided setup.

Agent Client Collector Log Analytics setup without using guided setup

If you are not using guided setup, you must perform several configuration steps manually. For more information, see Set up Agent Client Collector Log Analytics without using guided setup.

Set up Agent Client Collector Log Analytics using guided setup

Configure Agent Client Collector Log Analytics on your ServiceNow instance using guided setup.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Agent Client Collector Log Analytics has a dependency on the ServiceNow® Event Management application. Set up Event Management before you configure Agent Client Collector Log Analytics. For more information, see Event Management setup.
- ServiceNow Service Operations Workspace ITOM Apps must be installed. If it is not installed already, install it manually. For more information, see Install Service Operations Workspace for ITOM application.

Note:
Currently, the ACC data input setup only supports basic authentication with MID Server. mTLS is not supported.

Role required: agent_client_collector_admin

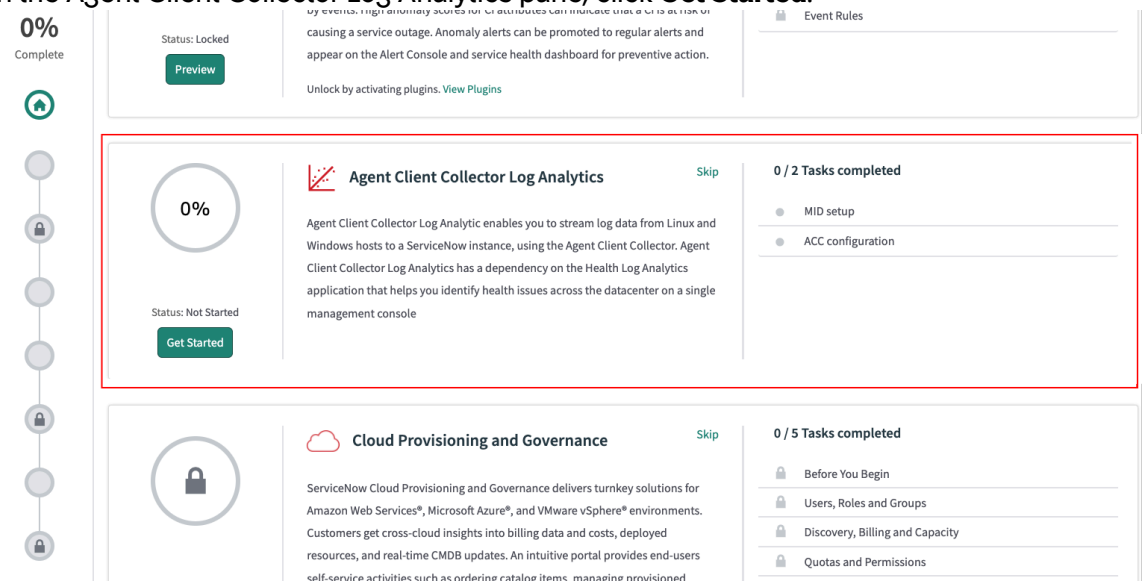
About this task

Agent Client Collector Log Analytics guided setup provides a sequence of tasks that help you configure Agent Client Collector Log Analytics. Using guided setup ensures that you have the minimum required setup to use the application.

Note:
If you are not using guided setup, you must perform several configuration steps manually. For more information, see Set up Agent Client Collector Log Analytics without using guided setup.

Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.
2. Select **Get Started**.
3. In the Agent Client Collector Log Analytics pane, click **Get Started**.



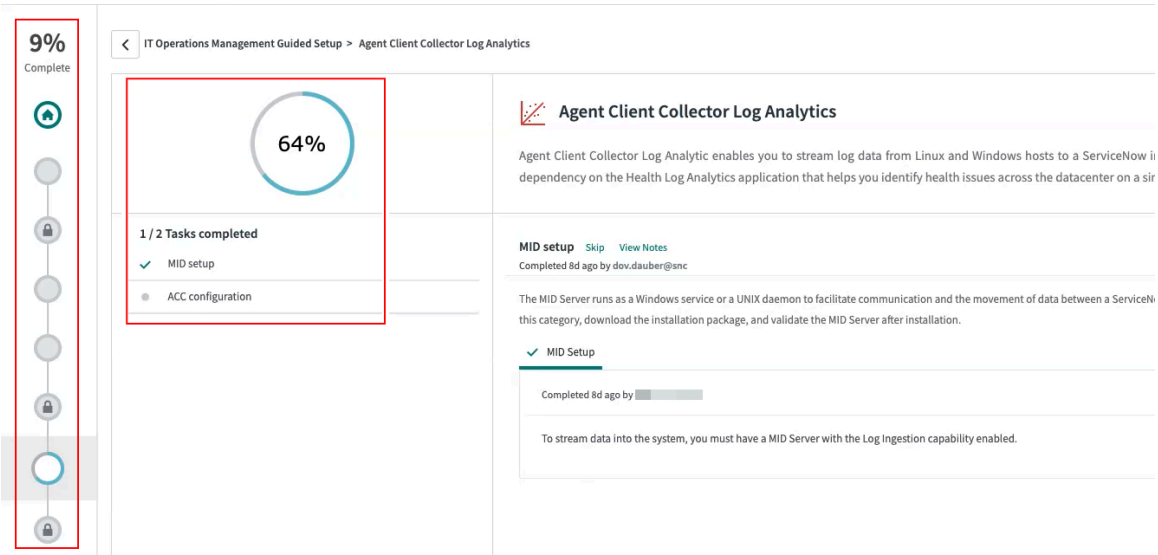
4. In the **MID setup** section, take the appropriate action:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you have already configured a MID Server, select **Mark as Complete**.
- If you have not configured a MID Server, select **Configure** and set up a MID Server, then select **Mark as Complete**. For more information, see Use MID Server guided setup.

> **Note:**
> To stream data into the system, you must have a MID Server with the Log Ingestion capability enabled.

When the MID Server is configured, the status indicator for Agent Client Collector Log Analytics guided setup shows that 64% of the configuration is complete. The progress indicator shows the completion percentage for all the IT Operations Management tasks.



5. Configure Agent Client Collector Log Analytics.

   a. In the **ACC Configuration** section, select a setup task and read the instructions in the help pane.

   b. Select **Configure** and complete the task.
   For detailed information about each setup task, consult the Agent Client Collector Log Analytics product documentation.

   c. Complete all required setup tasks in the task list.

   d. Select **Mark as Complete** to complete the Agent Client Collector Log Analytics configuration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up Agent Client Collector Log Analytics without using guided setup

Configure the Agent Client Collector to stream log data from Linux and Windows hosts to a ServiceNow instance without using guided setup.

Before you begin

Note:
You can configure Agent Client Collector Log Analytics using guided setup. The guided setup ensures that you have the minimum required setup for using the application. For more information, see Set up Agent Client Collector Log Analytics using guided setup.

- The Agent Client Collector Log Analytics (ACC-L) plugin must be installed. The plugin comes with the Agent Client Collector Framework (ACC-F) and Agent Client Collector Monitoring (ACC-M) plugins. For more information, see Agent Client Collector installation.
- ServiceNow Service Operations Workspace ITOM Apps must be installed. If it is not installed already, install it manually. For more information, see Install Service Operations Workspace for ITOM application.
- Agent Client Collector Log Analytics has a dependency on the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

  Important:
  Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- The Agent Client Collector comes with the default *`servicenow`* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *`servicenow`* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and `C:\Windows\System32` in Windows. For information about configuring permissions for the *`servicenow`* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

Note:
Currently, the ACC data input setup only supports basic authentication with MID Server. mTLS is not supported.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. On the MID Server page, select a MID Server that is validated and has a Status value of **Up**.
3. On the MID Server page for the selected server, select **Setup ACC Log Analytics** in the related links section.
   Agent Client Collector Log Analytics setup starts.

   In addition, the system automatically creates an ACC data input. When it has been created, the data input record is added to the ACC data inputs table and the data input is ready to stream logs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
It is important to configure an ACC data input for every MID Server to which Agent Client Collectors can connect. For more information, see Set up additional ACC data inputs.

The system also prompts you to set up the MID Web Server. For more information, see MID Web Server.

4. In the ACC Log Analytics Setup dialog box, configure the ports.

   a. In the **MID Web Server Port** and **ACC data input Port** fields, enter the appropriate port numbers.

   b. Select **OK**.
   The URL with the configured endpoint appears in the dialog box.

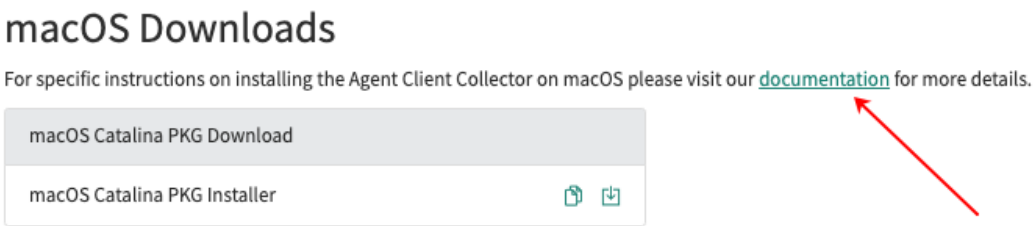
   c. Copy and save the endpoint URL for use when installing the ACC agent on the endpoint machine.

5. Navigate to **All** > **Agent Client Collector** > **MID Web Server API Key** and copy and save the MID Web Server API key for use when installing the ACC agent on the endpoint machine.
6. Install the ACC agent on the endpoint machine.

   Note:
   If you have already installed the ACC agent, proceed to Agent Client Collector log policies.

   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.

   b. Download the ACC agent for the appropriate operating system.
   For detailed instructions, select the documentation link for the operating system. For example:



Result
Agent Client Collector Log Analytics and the ACC agent are installed. You can start using the application.

What to do next
Review the Agent Client Collector log policies.

Set up additional ACC data inputs

Data inputs for streaming log messages to your ServiceNow instance using the Agent Client Collector are created automatically as part of the Agent Client Collector setup. Set up additional ACC data inputs manually as needed using the Health Log Analytics data input setup flow.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- The Agent Client Collector Log Analytics application has a dependency on the following ServiceNow applications, available from the ServiceNow Store:
  - Health Log Analytics, Version 22.0.12 - December 2021 and later releases.
  - Agent Client Collector -Framework, Version 2.7.0 - December 2021 and later releases.
- Verify that a MID Server is installed and configured. For more information, see MID Server system requirements.
- The MID Server must be configured to work with the Agent Client Collector. For more information, see Enable Agent Client Collector monitoring on the MID Server.

Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

Role required: evt_mgmt_admin

About this task

It is important to configure an ACC data input for every MID Server to which Agent Client Collectors can connect, even if no agent is currently connected to it. An agent works with one MID Server at a time, but is connected to a different MID Server when necessary to provide failover protection.

Important:
As part of the standard Health Log Analytics data input setup, you can define JavaScript functions for mapping and preprocessing raw log data. The JavaScript function must be identical for all ACC data inputs, because agents will switch to a different ACC data input when the system connects them to a different MID Server to provide failover protection. The latest published JavaScript function is provided to all existing and future ACC data inputs and replaces the previous one. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store.

Procedure

1. Set up additional ACC data inputs manually using the Health Log Analytics data input setup flow.
   For more information, see Configure ACC data inputs manually.
2. Identify and address log streaming issues to ensure that your data inputs are streaming data properly.
   For more information, see Ensure that the data input is streaming data.
3. Determine how Health Log Analytics handles raw log data that is streaming into your instance. By default, every incoming log line is auto-mapped to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function. For more information, see Map the raw data.
4. **Optional:** Modify raw log data and drop or break up log messages before they are processed. Define a JavaScript function that modifies your raw log data before Health Log Analytics maps and structures it. For more information, see Edit your raw log data before processing.
5. **Optional:** Refine the source type structure to make sure that Health Log Analytics extracts and classifies all properties correctly.
   For more information, see Refine the source type structure in Health Log Analytics.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure ACC data inputs manually

Agent Client Collector setup automatically creates an ACC data input for streaming log messages to your ServiceNow instance. You can set up additional ACC data inputs manually as needed.

Before you begin

- The Agent Client Collector Log Analytics application has a dependency on the following ServiceNow applications, available from the ServiceNow Store:
  - Health Log Analytics, Version 22.0.12 - December 2021 and later releases.
  - Agent Client Collector -Framework, Version 2.7.0 - December 2021 and later releases.
- Verify that a MID Server is installed and configured. For more information, see MID Server system requirements.
- The MID Server must be configured to work with the Agent Client Collector. For more information, see Enable Agent Client Collector monitoring on the MID Server.

Important:
Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

Note:
Currently, the ACC data input setup only supports basic authentication with MID Server. mTLS is not supported.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Data Inputs**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the fields, see ACC data input configuration fields.
4. **Optional:** Select **Advanced** to set additional configuration fields.
5. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
6. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note:
     You can only publish the data input configuration when the connection is created successfully.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

7. Select **Publish** to publish the data input to the MID Server.

Result
The new data input is ready to stream logs.

Note:
The data input record includes these related lists:

- Agents – Lists all active agents connected to the MID Server for this data input.
- Streaming Sources – Lists all sources for this data input and the MID Server that receives logs from it.

What to do next
Ensure that the data input is streaming data.

ACC data input configuration fields

Description of the fields on the ACC data input configuration form.

Basic configuration

Field	Description
MID	The MID Server to which the logs stream. **Note:** • Only one ACC data input can be defined per MID Server. You can select only MID Servers with AgentClientCollector capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. However, when 10 data inputs that are not ACC data inputs have been defined for a MID Server, one ACC data input can still be defined for it, making a total of 11 data inputs defined for that MID Server. • When you submit the form, this field becomes read-only. This field is required.
Port	The port on the MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration (continued)

Field	Description
	The port must be configured and active. It must not be occupied by another process. Make sure that your organization's security team opens the port before you assign it. **Note:** When you update the port, the system updates the Agent Client Collector with the new port configuration. Log streaming continues seamlessly without log loss after 1-3 minutes. This field is required.
Description	Description of the data input.

The fields in the following table show read-only information.

Field	Description
Name	The name of the data input: Agent Log Analytics. **Note:** All ACC data inputs have the same name. You can identify an ACC data input by the name of the MID Server that is defined for it.
Status	The status of the data input.
Transport	The protocol used to send the log data. The ACC data input sends data using a ServiceNow Agent.
Sources count	The total number of log sources originating from all ACC data inputs together. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Field	Description	Default value
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Use SSL	Option for selecting to use SSL.	true
Client inactivity timeout (sec)	The timeout, in seconds, to close an inactive channel.	15
Worker thread count	The number of threads that handle incoming data.	4
Default time zone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	false

Agent Client Collector log policies

Agent Client Collector data inputs stream log messages to your ServiceNow instance using the ServiceNow Agent Client Collector. The Agent Client Collector Log Analytics (ACC-L) application provides predefined log policies for collecting log data from the CIs monitored by the ACC.

You can work with Agent Client Collector log policies in the following ways:

- Use the system's predefined log policies.

  The default ACC-L log policies consist of the monitored CIs and the check that runs on those CIs. For a complete list of the predefined log policies and monitored CI types, see Agent Client Collector Log Analytics default policies and checks.

- Edit a predefined log policy.

  For example, you can modify a default policy if your organization always uses a specific non-default log path. For more information, see Edit a log policy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Customize a published log policy by creating a child policy from it.

  You can use an existing log policy (the parent policy) as a template to create a new log policy (the child policy). You then customize the parameters that the child policy inherits from the parent to focus on a subgroup of its CIs or services. For example, create a child policy if your organization saves a subset of IIS Server logs to a different location. For more information, see Create a child log policy.

  Note:
  The child policy is inherently more specific than its parent policy. When Agent Client Collector matches a condition defined in the child policy, it will not try to match the parent policy.

- Define a new log policy when no policy exists for the CI that you want Agent Client Collector to monitor.

  For more information, see Create an Agent Client Collector log policy. For a general explanation of Agent Client Collector policies, see Checks and policies.

Agent Client Collector Log Analytics default policies and checks

Agent Client Collector Log Analytics provides various default policies and checks.

Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

Default ACC-L policies

Name	OS	Description	Check
Apache on Linux Logs	Linux	Collects logs from Apache servers running on a Linux OS and sends them to the MID Server for further analysis.	log shipper
Apache on Windows Logs	Windows	Collects logs from Apache servers running on a Windows OS and sends them to the MID Server for further analysis.	log shipper
IIS logs	Windows	Collects logs from Microsoft IIS web servers and sends them to the MID Server for further analysis.	log shipper
JBoss/WildFly Application Server on Linux Logs	Linux	Collects logs from JBoss/WildFly application servers running on a Linux OS and sends them to the	log shipper

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	OS	Description	Check
		Note: • The log path that WebLogic uses has two environment variables, as described in the WebLogic documentation. For more information, see Environment variables. • On both Windows and Linux, Agent Client Collector Log Analytics adds a default environment variable from the WebLogic documentation to the log path. You can either use this default environment variable to get the full directory, or change it manually if you prefer to use a known direct directory. For information about customizing the environment variable, see Edit log path configurations.	
WebSphere Application Server on Linux Logs	Linux	Collects logs from WebSphere application servers running on a Linux OS and sends them to the MID Server for further analysis.	log shipper

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	OS	Description	Check
Windows OS Event Logs	Windows	Collects Windows event logs from Windows servers and sends them to the MID Server for further analysis.	log shipper for win events

Environment variables

The log path used for collecting logs from certain servers may contain environment variables. It's important to note that on Linux systems, the ACC Agent can only access environment variables that reside in the `/etc/environment` file. Add the environment variables that the agent must access to the `/etc/environment` file using the format *<NAME>='<VALUE>'*. On Windows systems, you can create environment variables in the usual manner.

Default ACC-L checks

Agent Client Collector Log Analytics (ACC-L) provides the following default **Type=Log** checks.

- The *`log shipper`* check launches a background process that sends logs from servers to an agent data input, according to the check's configured log path. When access permissions are lacking or the log path is configured incorrectly, the system sends an alert to the instance. For proper log configuration, ensure that the *`servicenow`* user has permissions to access the configured log path on the machine that is hosting the agent, and that the log path is configured correctly.
- The *`log shipper for win events`* check is similar to the *`log shipper`* check, but sends event logs from Windows OS servers to the agent data input.

> **Note:**
> To collect Security Windows event logs, *`servicenow`* users on an agent hosting machine must have admin privileges.

Create an Agent Client Collector log policy

Create a new ACC log policy when no default policy exists for the CI that you want Agent Client Collector to monitor.

Before you begin

- The Agent Client Collector Log Analytics (ACC-L) application, available from the ServiceNow Store, must be installed. For more information, see Agent Client Collector installation.
- The Agent Client Collector comes with the default *`servicenow`* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *`servicenow`* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and `C:\Windows\System32` in Windows. For information about configuring permissions for the *`servicenow`* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
   The **Policies** page displays all Log Analytics policies. For a list of the policies that come with the base system, see Agent Client Collector Log Analytics default policies and checks.
2. Click **New**.

   Note:
   For general information about creating an ACC policy, see Create a new Agent Client Collector policy.

3. On the form, fill in the fields.

   Policy Definition Form

Field	Description
Name	A descriptive name for the policy.
Description	Description of the policy.
Publish status	Hard coded as **Draft**, which means that the policy has not yet been published. You cannot edit this field.
Hierarchy	Hard coded as **None**. When a child policy is added to the policy, the value changes to **Parent**. Child policies have a value of **Child**.

4. On the **Checks** tab, associate the log policy with the relevant log shipper check.
   - For Linux and Windows, except for Windows event logs, select the *`log shipper`* check definition.
   - For Windows event logs only, select the *`log shipper for win events`* check definition.
5. On the **Monitored CIs** tab, specify the CIs to which the policy applies.

   a. Choose the CI type to be monitored.
   - **Monitored CI type by filter**: Select the monitored CI type. You can narrow down the CIs that will be monitored by using filter conditions.
   - **Monitored CI type by script**: Specify the monitored CIs by using a script.
   - **Monitored CI type by CMDB Group**: Specify the monitored CIs by using CMDB group queries.

   For more information about choosing monitored CI types, see Create a new Agent Client Collector policy.

   b. **Optional:** Monitor only CIs that are associated with an Application Service by selecting **Filter Monitored CIs by Application Service**.
   You can specify the Application Services to be monitored by using filter conditions. Agent Client Collector will only retrieve the logs of CIs that are associated with these Application Services.

6. Save the log policy.
   In the Check instances related list, a check instance record is created.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Open the relevant check instance record and then select **Edit in Sandbox**.
8. Select the Log path configurations related list.
9. Add a log path for the check instance.

> **Note:**
> A check must have at least one log path configured for it to enable streaming logs. For more information about checks, see Checks and policies.

a. Select **New**.

b. On the form, fill in the fields.

New path configuration form

Field	Description
Path	The full path from where the logs are streamed. You can use a wildcard. This field is required.
Component	The device type or stack layer that provides a context for the logs, used for anomaly detection and correlation. For example: Tomcat.
Source Type	Defines how Health Log Analytics handles a specific log type and parses the log data. For example: Tomcat Catalina.

c. **Optional:** For shipping multiline logs using Filebeat, configure the following properties.

(Optional) These parameters control how Agent Client Collector Log Analytics (ACC-L) handles messages that span multiple lines of text.

For more information, see Manage multiline messages in the Elastic documentation.

Field	Description
multiline.pattern (regex)	The regular expression to match. **Note:** You must define this property before you can configure the multiline.match and multiline.negate properties.
multiline.match	How ACC-L combines matching lines into a single log line. (Optional) The available options are None, Before, and After. Default is None.
multiline.negate	Option for determining whether the pattern identified in the log lines is negated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	(Optional) The available options are None, True, and False. Default is None.

d. **Optional:** Define the following properties that control the Filebeat YML configuration.

Field	Description
Fields	Field that enables you to include and exclude information in the output. For example, you can add a field for filtering the log data. (Optional) Add more Field rows by selecting the plus icon next to the Value field: ⊕. Remove a Field row by selecting the minus icon: ⊖. For more information, see the Log input Fields description in the Elastic documentation.
Configuration Options	Field that enables you to add configuration options to the log lines. For example, you can add the encoding to use. **Note:** Define only configuration options that are supported by Filebeat. For more information, see the Log input Configuration options description in the Elastic documentation.

e. Select **OK**.
The log path is created.

10. Select **Return to Policy**.
11. On the policy form, select **Publish**.
The policy's Publish status changes to **Published**.
12. **Optional:** Activate the policy by selecting **Activate**.

What to do next
Ensure that the data input is streaming data.

Create a child log policy

Refine an existing log policy to focus on a subset of CIs or services by creating a child policy.

Before you begin
Role required: agent_client_collector_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A published log policy (the parent policy) can be used as a template for creating a new log policy (the child policy). You can customize the parameters that the child policy inherits from the parent to focus on a subgroup of its CIs or services.

The child policy inherits parameters from its parent policy that are modified after the child policy's creation, unless you disable this option in the child policy. You can choose to review these modified parameters in draft mode in each child policy before accepting them.

Note:
The child policy is inherently more specific than its parent policy. When Agent Client Collector matches a condition defined in the child policy, it will not try to match the parent policy.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. On the **Policies** page, select a published policy with a Hierarchy value of either **None** or **Parent**.
3. Select **Create Child**.
   A new policy opens with the same parameters as the published policy. The name of the new policy is *<Policy name><date and time created>*.

   For example, MySQL DB on Linux Logs 2022-02-13 04:44:12.

   The following fields are read-only:

   Child policy fields

Field	Value
Publish status	Draft
Hierarchy	Child
Parent	<Name of the parent policy>

   The **Order** field value indicates the priority by which the agent attaches itself to the child policy in relation to its sibling policies. A lower number indicates a relatively higher priority for this child policy. By default, each new child policy takes on a higher value (and hence, a lower priority) than the one preceding it. You can modify the order value as needed.
4. Customize the child policy's parameters.
   For a description of the parameters, see Create an Agent Client Collector log policy.
5. Select **Save** to create the child policy.
6. **Optional:** Select **Disable inherit option** to disable automatically inheriting modified parameters from the parent policy.
7. Select **Publish** to publish the child policy.

Result

The child policy is published and appears on the **Child Policies** tab of the parent policy.

Edit a log policy

You can edit published Agent Client Collector log policies. For example, modify a default log policy if your organization always uses a specific non-default log path.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. Select a policy for which the **Publish status** is **Published**.
3. Select **Edit in Sandbox**.
   The policy is now in **Draft view**, and its fields and check instances are editable.

   Note:
   Although the policy is in **Draft view**, its publish status remains **Published**.

4. On the **Monitored CIs** tab, edit the CIs to which the policy applies as needed.

   a. Choose the CI type to be monitored.

   - **Monitored CI type by filter**: Select the monitored CI type. You can narrow down the CIs that will be monitored by using filter conditions.
   - **Monitored CI type by script**: Specify the monitored CIs by using a script.
   - **Monitored CI type by CMDB Group**: Specify the monitored CIs by using CMDB group queries.

   For more information about choosing monitored CI types, see Create a new Agent Client Collector policy.

   b. **Optional:** Monitor only CIs that are associated with an Application Service by selecting **Filter Monitored CIs by Application Service**.
   You can specify the Application Services to be monitored by using filter conditions. Agent Client Collector will only retrieve the logs of CIs that are associated with these Application Services.

5. **Optional:** In the **Check Instances** table, select the log shipper check instance record and edit it.
   For more information, see Edit log path configurations.
6. Select **Save** to save the changes you entered into the Sandbox policy fields.
   The policy remains in **Draft view**, and the **Publish status** is **Published***. The asterisk (*) indicates that the current published version is not the most up to date one, because it contains saved changes that have not yet been published.
7. Select **Republish** to publish the updates.
   The policy returns to **Published** state and opens as the published policy.

   Note:
   This option appears only after entering updates into the policy fields, for a policy whose **Publish status** is **Published***.

8. Determine the active status of the policy by selecting either **Activate** or **Deactivate**.
9. **Optional:** Select **Delete** to delete both the Published and the draft policies.

Edit log path configurations

Modify a log path configuration in the log shipper check instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. Select a policy record.
3. In the Check instances related list, select the log shipper check instance record.
4. Select **Edit in Sandbox** to enable editing the record.
5. On the Log path configuration related list, edit a log path configuration.

   a. Select the log path configuration that you want to edit.

   b. Edit the configuration.

   - You can add custom fields, allowing you to include additional information in the output.
   - You can add extra configuration options, such as `encoding`, `include_lines`, and `exclude_lines`, to filter your log data. For information about discovering file encoding, see the How to Detect File Encoding on Windows, Linux and Mac [KB1702770] article in the Now Support Knowledge Base.

     These configuration options impact all the files that the data input streams to your instance.

     Note:
     Define only configuration options that are supported by Filebeat. For more information, see the Log input Configuration options description in the Elastic documentation.

   c. Select **Update** to save your edits.

6. **Optional:** Add an environment variable or edit an existing one in the **Path** field.
   Use the relevant format for its name:
   - On Linux, capitalize the name and precede it with a dollar sign: $. For example: `$HOME`. The name is case sensitive.
   - On Windows, surround the name with percentage signs: %. For example: `%HOMEPATH%`. The name is not case sensitive.

   Important:
   The servicenow user and ACC agent must have access to the environment variable. On Linux systems, only environment variables that reside in the `/etc/environment` file are accessible. Add the environment variable to this file using the format *<NAME>='<VALUE>'*.

7. **Optional:** Delete a log path.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Check the box next to the log path configuration that you want to delete.

> **Note:**
> You can select multiple log path configurations, but a check must have at least one log path configured for it to enable streaming logs. For more information about checks, see Checks and policies.

b. Select **Delete**.

8. Select **Return to policy** to go back to the log policy record.
9. Select **Republish** and then confirm to publish the policy again with the updated log path configurations.
   The changes take effect in a few minutes.

Identify and resolve log streaming issues

Make sure that your ACC data inputs are streaming data properly by identifying and resolving log streaming issues.

Before you begin

Role required: agent_client_collector_admin

About this task

In the ACC data input record, the Streaming Sources related list shows the streaming data of that data input's sources. This data enables you to identify streaming issues and their possible cause.

For example, if the last event time for a data input's endpoint server is yesterday, the server might be down or configured incorrectly. A streaming issue might also be caused by the data input configuration file not being installed on the endpoint.

> **Note:**
> You can view the streaming data of all data inputs and the MID Servers that receive logs from them in the Streaming Sources page. For more information, see Identify and resolve a log streaming issue in Health Log Analytics in the ServiceNow Health Log Analytics application documentation.

Procedure

1. Navigate to **All** > **ACC Data Inputs** and select a data input record.
2. On the data input form, select the Streaming Sources related list.
3. Review the streaming data of that data input's sources.
   For a description of the filters, see ACC data input streaming sources.
4. Resolve any data streaming issues.
   a. Navigate to **All** > **ACC Log Analytics** > **ACC Log Alerts**.
   b. Open alerts and address the specified issues.

What to do next

Proceed to the next step in the Health Log Analytics data input setup flow. For more information, see Set up additional ACC data inputs.

ACC data input streaming sources

In the ACC data input record, the Streaming Sources related list shows the streaming data of that data input's sources.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Streaming Sources related list

Filter	Description
Status	The status of the source. A red bullet indicates that this source has not streamed data in the last hour.
Last event time	The last recorded time an event arrived at the MID Server in the last one-minute interval. Health Log Analytics continuously updates the last event time. If the last event time is not up to date, data is not streaming.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Preprocessed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

View log shipper alerts

View all log shipper check alerts for Agent Client Collector Log Analytics (ACC-L) agents.

Before you begin

Role required: agent_client_collector_admin

About this task

In the ACC Alerts list, you can see at a glance if any issues are preventing the log shipper from collecting data. The list shows all log shipper-related alerts in one place and provides information to help you resolve the issues.

The ACC Alerts list only includes alerts about the success or failure of log shipper execution on a CI on a specific agent. These alerts are a subset of the alerts shown in the Event Management Alerts list, which includes alerts of all types. For more information about the Event Management Alerts list, see View alert information.

Log shipper alerts are generated from log shipper events with a severity of Major or Critical. These alerts are typically related to log path issues or a lack of permissions.

Note:
If an **OK** event on the log shipper is received on a CI where an open log shipper alert exists, the open log shipper alert on that CI is closed.

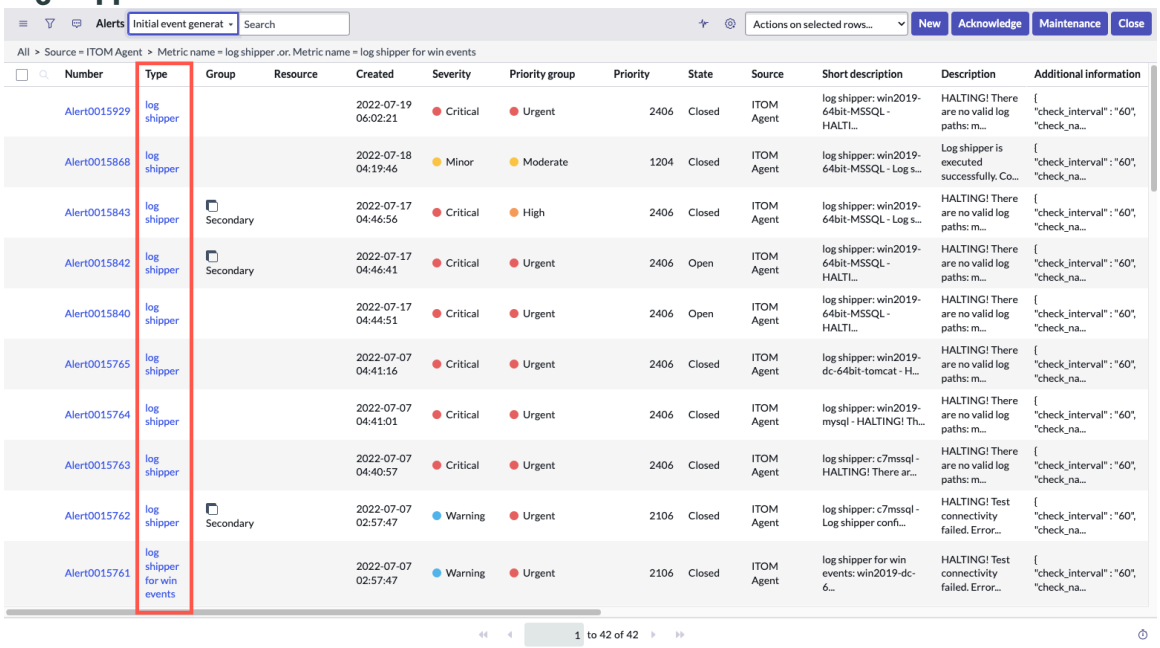
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log shipper Alerts list



Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Alerts**.
2. Review the information provided in the Alerts list.
   For details and a description of the columns, see Monitor incoming alerts.

Related topics

View log shipper events

View log shipper events

View all log shipper events with all severity levels for Agent Client Collector Log Analytics (ACC-L) agents.

Before you begin

Role required: agent_client_collector_admin

About this task

The ACC Events list shows all log shipper-related events in one place. The list only includes events about the success or failure of log shipper execution on a CI on a specific agent. These events are a subset of the events shown in the Event Management Events list, which includes events of all types.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Events**.
2. Review the information provided in the Events list.
   For details and a description of the columns, see View events.

CI association to a dynamic CI Group in Agent Client Collector Log Analytics

When the Agent Client Collector Log Analytics (ACC-L) application discovers a CI that is not associated to an application service, the application creates a dynamic CI Group and associates the CI to it.

A dynamic CI Group is a group of CIs that are organized by attribute, such as the CI type. By default, Agent Client Collector log policy checks monitor only CIs that are associated to an application service. The Agent Client Collector Log Analytics application inspects the CIs that the Agent Client Collector discovers. When it discovers a CI that is not associated to an application service, the application creates a dynamic CI Group and associates the CI to it.

If the CI is later associated to an actual application service, its association to the dynamic CI Group is automatically deleted. The baseline for the CI is lost in this process. While the system is establishing the new baseline, it doesn't issue alerts for the application service to which the CI is now associated.

You can choose to disable the association of unassociated CIs to a dynamic CI group by changing the default setting of the relevant system property, *sn_accl.dynamic_service.creation.enabled*, to false. The Agent Client Collector Log Analytics application will then not associate unassociated CIs to dynamic CI Groups. In this case, logs are not streamed for CIs that are not associated to an application service.

Agent Client Collector Security Incident Response

Agent Client Collector Security Incident Response (ACC-SIR) enables you to automate security incident enrichment data collection and response actions using the Agent Client Collector. This functionality is measured by the Security Operations Security Incident Response (SIR).

Note:
Agent Client Collector Security Incident Response is no longer supported. For details on replacement options, see the Deprecation guidance for Agent Client Collector Security Incident Response [KB2249776] article in the Now Support Knowledge Base.

Select from a list of actions (capabilities) that come with the base system, to run on security incidents. The Agent Client Collector Security Incident Response functionality uses the `util.command.agent` and `util.osquery.agent` check definitions (run by Agent Client Collector Spoke) to run commands and OS queries on security incidents. Capabilities are part of existing system subflows in the Agent Client Collector Security Incident Response integration app. You can also add customized commands and OSquery sql queries to run on the security incidents.

For details on the plugins installed with Security Incident Response, see Plugins or applications installed with ITOM AIOps.

Agent Client Collector Security Incident Response capabilities

Agent Client Collector Security Incident Response capabilities that come with the base system are listed on the ACC Capabilities page (**Agent Client Collector SIR Integration** > **ACC Integration Capabilities**). These capabilities run on security incidents to gather information about the incident.

You select a capability from the **Agent Client Collector Capabilities** option in the Related Links section of the security incident. Capabilities are part of existing system flows, which are referenced on the ACC Capabilities page.

Agent Client Collector Security Incident Response capabilities

Capability Name	Description	Flow
Get Logged on Users	Gathers data of logged on users and relates it to the security incident.	ACC SIR - Get Logged on Users
Get Network Statistics	Gathers network statistics for the CI associated with the security incident.	ACC SIR - Get Network Statistics
Get Processes	Gathers process data and relates it to the security incident.	ACC SIR - Get Processes
Get Services	Gathers service data and relates it to the security incident.	ACC SIR - Get Services
Get System Details	Gathers system details for the CI associated with the security incident.	ACC SIR - System Details
Run Command on Agent	Runs a custom command on the Agent Client Collector and sends results to the security incident.	ACC SIR - Run Command from Security Incident
Run OSQuery on Agent	Runs a custom OSQuery on the Agent Client Collector and sends results to the security incident.	ACC SIR - Run OSQuery from Security Incident

Perform an action on a security incident

Run an Agent Client Collector Security Incident Response action to gather more information on a security incident. Actions are referred to in the system as **capabilities**, and are configured with the base system.

Before you begin

Add the following JSON script to your Agent Client Collector allow list, to enable running the actions that come with the base system.

```
{
  "args": [
    "--logger_min_status 1",
    "--json",
    "SELECT p.name, p.state, p.pid, p.parent as ppid, p.path,
 p.total_size, p.start_time, p.elapsed_time as run_time,
 p.cmdline, p.uid, p.username, u.type as owner_domain, u.uuid
 FROM processes as p LEFT JOIN users as u ON u.uid = p.uid",
    "select name, process_open_sockets.pid, parent as ppid,
 processes.path, process_open_sockets.state, total_size,
 process_open_sockets.protocol, local_address, local_port,
 remote_address, remote_port from process_open_sockets,
 processes where process_open_sockets.pid = processes.pid",
    "select * from services order by service_type",
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "select computer_name, hardware_serial, hostname, name
 as os, build, version, mac, address from system_info,
 os_version, interface_details, interface_addresses where
 address like '%:%' and interface_addresses.type='manual' or
 interface_addresses.type ='dhcp' limit 1",
    "select * from logged_in_users order by time"
  ],
  "exec": "osqueryi",
  "skip_arguments": false
}
```

Role required: sn_si.admin or sn_si.basic

About this task

For details on the capabilities that come with the base system, see Agent Client Collector Security Incident Response capabilities.

Procedure

1. Navigate to **All** > **Security Incident** > **Incidents** > **Show All Incidents**.
2. Select an incident.
3. In the Related Links section, select **Agent Client Collector Capabilities**.
   The **Agent Client Collector Capabilities** dialog box opens.
4. Select the capability you want to run.

Agent Client Collector Capabilities

Field	Description
ACC Integration Capabilities	The ACC Integration Capabilities. If the selected the capability you want is “Run OSQuery on Agent” then the data will be tabular formatted within the work notes.
ACC Integration OSQuery	The ACC Integration OSQuery. For example, Selected system info columns.
Transpose Data check box	Transpose the data. When selected,the information is displayed with vertical columns.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	When clear, the information is displayed horizontally. 
5. Select **Submit**.
   The selected capability runs on the security incident's CI.

Related topics

Generate an Agent Client Collector allow list

Create an Agent Client Collector Security Incident Response command

Define a command or command string to be executed on a machine referenced by a security incident. Commands are listed by operating system. For example, a *ps* command on a Windows OS retrieves the status of active Windows OS processes in the system.

Before you begin

Role required: sn_si.admin

Procedure

1. Navigate to **All** > **Agent Client Collector SIR Integration** > **ACC Integration Commands**.
2. Select **New**.
   The **ACC Integration Commands - New Record** page appears.
3. Configure the fields on the page.

ACC Integration Commands

Field	Description
Name	A descriptive name for the command.
Operating System	The CI's operating system supported by the Agent Client Collector.
Command	The actual command or command string to be executed.

4. To validate that the command you are writing works, select **Test Command**.
   The **Test Command** page appears.

Test Command

Field	Description
Agent	The specific end-point where the command is run.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Enter the specific end-point Agent where the result of the test is displayed.
   - If it was successful
   - too large of an output
   - or an Error occurred with the error message displayed to the sn_si.admin.
6. Select **Submit**

Run an Agent Client Collector Security Incident Response command

Run a specified command, on a machine referenced by an incident, to retrieve information on the incident's CI. For example, if you run a *ps* command on an incident, the command retrieves the status of active processes in the system. Commands are listed according to the CI operating system associated with the security incident.

Before you begin

Role required: sn_si.admin or sn_si.basic

Procedure

1. Navigate to **All** > **Security Incident** > **Incidents** > **Show All Incidents**.
2. Select an incident.
3. In the Related Links section, select **Agent Client Collector Capabilities**.
   The **Agent Client Collector Capabilities** dialog box opens.
4. Select **Run Command on Agent**.
5. In the **ACC Integration Capabilities** field, select **Run Command on agent**.
   The **ACC Integration Command** field appears.
6. Select the command you want to run.
   The available commands are those configured on the ACC Integration Commands page, as described in Create an Agent Client Collector Security Incident Response command.
7. Select **Submit**.
   The command runs on the security incident's CI, according to the OS specified in the command.

Create an Agent Client Collector Security Incident Response OSQuery

Define an OSQuery to gather information on a security incident's CI. OSQuery provides an SQL layer on top of OS tables, and is bundled together with the Agent Client Collector as part of the base system.

Before you begin

Role required: sn_si.admin

Procedure

1. Navigate to **All** > **Agent Client Collector SIR Integration** > **ACC Integration OSQuery**.
2. Select **New**.
   The **ACC Integration OSQuery - New Record** page appears.
3. Configure the fields on the page.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Integration OSQuery

Field	Description
Name	A descriptive name for the query.
Query	The query string.

4. To validate that the Query you are writing works, select **Test OSQuery**.
   The **Test OSQuery** page appears.

Test OSQuery

Field	Description
Agent	The specific end-point where the Query is run.

5. Enter the specific end-point Agent where the result of the test is displayed.

- If it was successful
- too large of an output
- or an Error occurred with the error message displayed to the sn_si.admin.

6. Select **Submit**.
   OSQueries gather information on the target machine, where the incident commands are listed by operating system. For example, a query defined as `select * from system_info` gathers all information from the OSQuery `system_info` table.

Run an Agent Client Collector Security Incident Response OSQuery

Run an OSQuery on a machine referenced by an incident to retrieve information on each incident's CI. For example, if you run a `select * from system_info` query on an incident, the query gathers all information from the OSQuery `system_info` table.

Before you begin

Role required: sn_si.admin or sn_si.basic

Procedure

1. Navigate to **All** > **Security Incident** > **Incidents** > **Show All Incidents**.
2. Select an incident.
3. In the Related Links section, go to the **Configuration Items** list and select each incident's CIs that you want to retrieve the information.
4. From the right-click menu, select **Run ACC OSQuery**
   The **OSQuery to run** dialog box opens.
5. Select the name of the query you want to run.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The available queries are those configured on the ACC Integration OSQuery page, as described in Create an Agent Client Collector Security Incident Response OSQuery. Options are selectable according to their Name value.

6. Select **Submit**.
   The query runs on each of the selected security incident's CIs.

View live CI data with Agent Client Collector

View live data for incident-related CIs through Agent Client Collector for information that can help resolve the incidents.

Before you begin

- Collecting running processes for a macOS system requires `sudo` privileges. If `sudo` privileges aren't granted, only processes run by the Agent Client Collector are collected.

  To enable `sudo` privileges for osqueryi, add the following strings to either the `/etc/sudoers` file or to an individual file in the `/etc/sudoers.d` directory:

  - `Cmnd_Alias LIVE_CI_VIEW = /Library/Application\ Support/servicenow/agent-client-collector/osquery/bin/osqueryi`
  - `_servicenow ALL=(ALL) NOPASSWD:LIVE_CI_VIEW`
- To enable the OSQuery executable to retrieve information on logged-in users in a Windows environment, the agent must run as a local SYSTEM account.

Verify that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ).
3. Select **Incidents** > **All**.
4. Select an incident from the list.
5. On the <name of incident> form, select the **Live CI Data** tab.
   The CI data is displayed in the cards described in the following table.

Live CI Data tab cards

Card	Description
Device details	General details about the CI.
Memory Usage	Amount of memory being used by the CI.
Top 5 running processes by CPU usage	The five CI processes using the most CPU.
Top 5 running processes by memory usage	The five CI processes using the most memory.
Disk Usage %	Percentage of disk space in use on the CI.
Logged-in users	Users logged in to the CI. Whether this data is visible depends on your OS privileges.

View live CI data logs

Assign a problematic CI to its incident to view live CI data

View live CI data logs

View CI logs to receive additional details on an incident when viewing live CI data. For example, viewing log information for a process with high CPU usage can help you pinpoint when the usage went up, helping you determine the root cause of the issue.

Before you begin

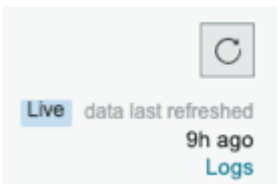
Ensure that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ).
3. Select **Incidents** > **All**.
4. Select an incident from the list.
5. Select the **Live CI Data** tab.
6. Select the **Logs** link on the right side of the pane.

Logs link



Note:
The **data last refreshed** value follows the instance time zone and not your local system time zone. Therefore, ensure that your local system time zone matches the instance time zone.

The logs appear on the **Log** page.

Assign a problematic CI to its incident to view live CI data

Retrieve live CI data to help troubleshoot the issues that caused an incident by assigning the problematic CI to its incident. An incident typically is associated with the CI that caused the incident, but if this was omitted during the incident creation, you can assign the CI manually.

Before you begin

Ensure that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ) icon.
3. Select **Incidents** > **All**.
4. Select an incident with a value of **Configuration item = (empty)**.
5. Select the **Live CI Data** tab.
6. Enter the first several characters of the CI that caused the incident in the **Primary configuration item** field.
   A list of CIs matching the string appears.
7. Select the relevant CI from the list.
   The name of the CI appears in the **Primary configuration item** field, and the CI's live data appears on the **Live CI Data** tab.

Metric Intelligence

ServiceNow® Metric Intelligence provides the ability to capture, and then explore and analyze operational metrics data, identifying and indicating anomalies. Metric Intelligence generates anomaly alerts that can be promoted to IT alerts and appear on the Service Operations Workspace and service health dashboard. You can leverage this analysis to prevent potential service outages.

Understanding Metric Intelligence

Use Metric Intelligence to identify and prevent potential service outages. Metric Intelligence, based on historical metric data, indicates anomalous behavior of CIs which events might not capture. Anomaly alerts can be promoted to regular IT alerts and appear on the Service Operations Workspace and service health dashboard for preventive actions.

Anomaly detection

Metric data is collected by various data sources such as SCOM, SolarWinds monitoring system, or Nagios XI server (some partially configured for metric collection by default). These monitoring systems collect metric data from the source environment regularly. Metric Intelligence captures the raw data from these monitoring systems, and uses event rules and the CMDB identification engine to map data to existing CIs and their resources. The data is then analyzed to detect anomalies and to provide other statistical scores.

Metric Intelligence uses historical metric data to build statistical models. These models facilitate projection of expected metric values along with upper and lower bounds. Metric Intelligence then uses these projections to detect statistical outliers and to calculate anomaly scores. Anomalies are scored on a range of 0-10. High anomaly scores for CI metrics can indicate that a CI is at risk of causing a service outage.

After processing, the Insights Explorer shows metric statistics and charts, and the Anomaly Map shows correlated scores for CIs with the highest anomaly scores, across a timeline.

You may want to disable anomaly detection during system maintenance, as anomalies may be irrelevant when detected while maintenance is in progress. To do so, set the *`mid.mi.anomaly_detection.disable`* property to **true**.

To customize displaying anomalies for metrics classified as near-constant, contact customer support.

Metric Intelligence is available when you activate the Metric Intelligence (com.snc.sa.metric) plugin.

Terms used with Metric Intelligence

Source metric type

A metric such as '% Free Space' or 'Current Bandwidth' that can be measured by a data source for a CI. For each data source, you can choose which of all possible source metric types are processed. For example, there are about 380 source metric types that are active by default for the SCOM data source.

Anomaly

Data that is outside the control bounds is considered a statistical outlier. These outliers are used to compute an anomaly score, which is a value between 0–10 that indicates the degree to which the metric appears unlikely. When an anomaly score is above a threshold, an anomaly alert is generated. Anomaly alerts are reported separately from regular IT alerts.

Resource

A component of a CI that consists of multiple individual components of similar type, where each subcomponent can be monitored separately. For example, individual Web pages, or specific disks such as 'Disk C:' and 'Disk D:'.

Time series

A series of values (such as metric values) over a time range, associated with a CI and a metric type. Because an anomaly score is evaluated for each metric, the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

series of anomaly scores over a period of time are also a time series. Time series are computed by the statistical model built for a metric data series, and are used with metric data values, anomaly scores, and upper and lower control bounds.

Statistical models

Metric Intelligence jobs learn from past metric data (up to 32 days old). A model training process analyzes historical data to construct a model that projects future values. Typically, models are in effect until the next time the model learning process runs. These models are used to calculate upper and lower bounds. Incoming values that are beyond those bounds, and that deviate with statistical significance from expected values, generate anomalies. Each model is uniquely patterned and is labeled with a classifier that illustrates the general behavior of the model. This classification determines if anomaly detection can be applied. For most models, it is possible to project which future values deviate from expected values. Such models are associated with control bounds and anomaly detection can be applied (if enabled).

However, for some models, there is insufficient data to determine which values are anomalous and anomaly detection cannot be applied without additional information (even if anomaly detection is enabled).

The learned data models are stored in the Metric Time Series Models [sa_time_series] table.

The following statistical models and classifiers are used in anomaly detection:

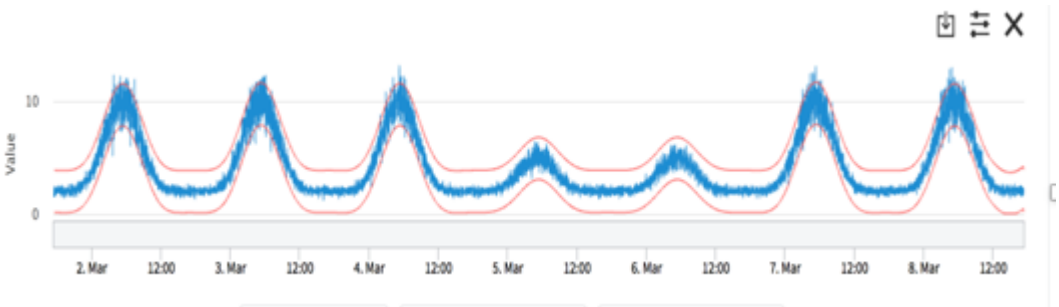
Time Series statistical model

After it is established, a time series model does not adjust to changes in the incoming metric data. Therefore, if the pattern of incoming data changes, those changes are likely to be identified as anomalous. Upper and lower control bounds, after they are learned, persist until the next time the learning process runs (data is learned every day).

Weekly

Data with a pattern that repeats itself over weekly intervals (seasonal model).

Requires a minimum of 15 days of data in the series, as set by the weekly_model_min_days configuration setting.



Daily

Data with a pattern that repeats itself over a daily interval (seasonal model).

Requires a minimum of 3 days of data in the series, as set by the daily_model_min_days configuration setting.

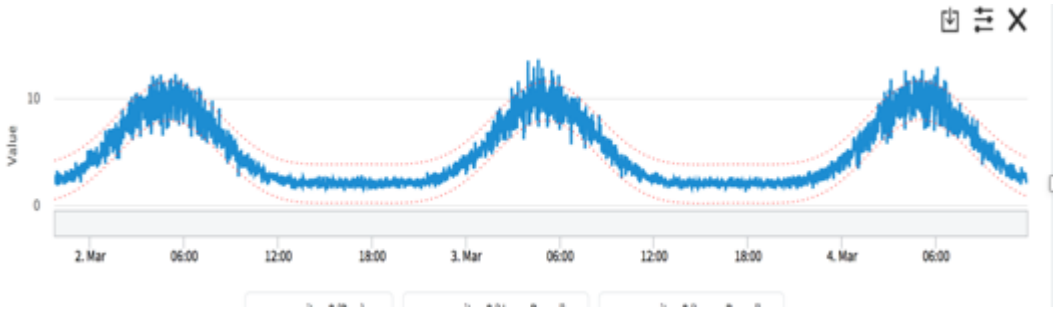
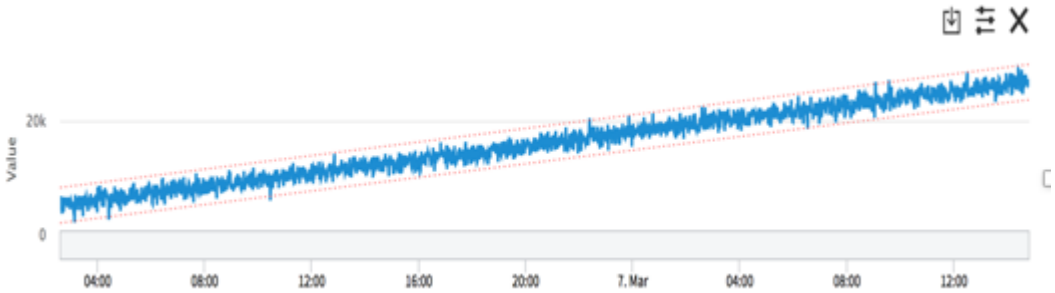
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Trendy

Data that has a linear trend with some slope and with some noise.

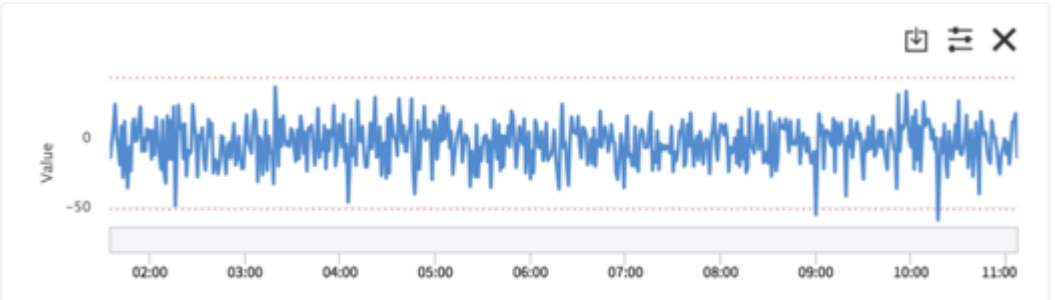
Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Noisy

Typical noisy data that is a basic pattern classification in a data model. The pattern cannot be identified with a specific trend or seasonality.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Positive clipped noisy

Similar to the noisy classifier other than the lower bound that is fixed on 0.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Centered noisy

Noisy data that typically spreads symmetrically between user-specified upper and lower bounds. The formula that is used to set bounds and width values, ignores the statistical data, and the lower and the upper widths have an identical value.

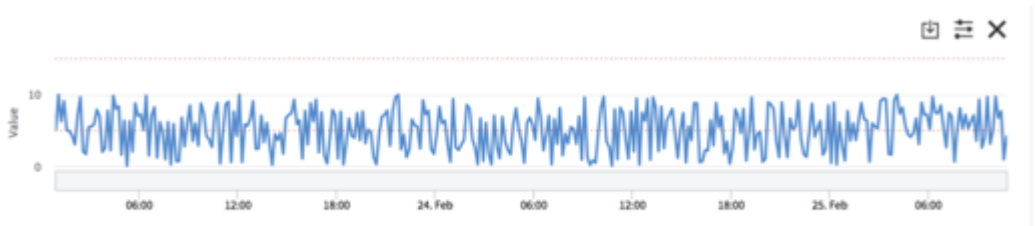
Requires that the number of data points in the series is zero.

To retrieve alerts for metrics with this model, create metric rules for static bounds definitions. For details, see Create metric rules.

Skewed noisy

Noisy data that is not evenly spread between user-specified upper and lower bounds, but instead tends to concentrate closer to one of the bounds. The median of the data is used to separately compute an upper width and a lower width.

Requires a minimum of one data point in the series.



To retrieve alerts for metrics with this model, create metric rules for static bounds definitions. For details, see Create metric rules.

Skewed noisy - Generalized Extreme Value (GEV) Distribution

Noisy data that is spread unevenly between user-specified upper and lower bounds, and concentrates closer to one of the bounds. In addition, the data distribution demonstrates a long or heavy tail. The median of data derived from the tail of the distribution is used to

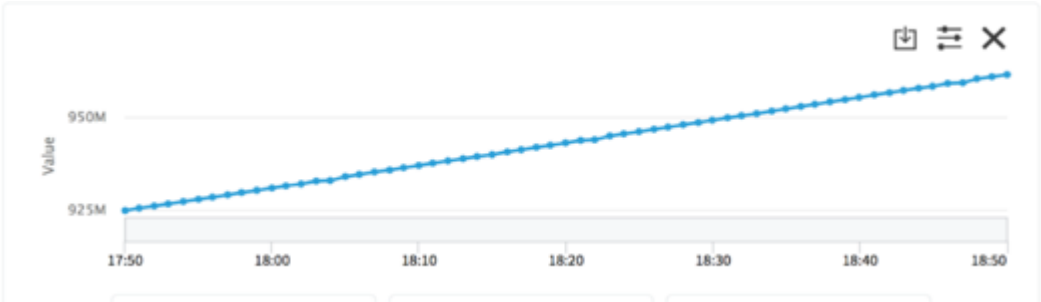
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

separately compute an upper width and a lower width. There must be at least one data point in the series.

Accumulator

Data pattern similar to the trendy classifier but with a monotonous increase and without noise. For this classifier, there is no data model and no anomaly detection.

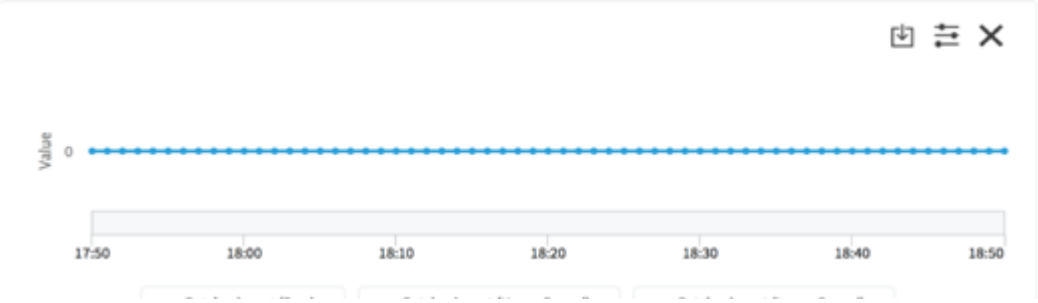
Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Near Constant

Nearly constant data, in which most values are a specific constant value. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Detected Constant

Enables checking near-constant metrics for anomalies. To do so, you must move the metrics to the detected-constant model, via a system token. To add tokens to the token list and enable more metrics to be measured for anomalies, contact customer support.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

Enabled when the `metric_name_analysis.add_detected_constant_candidate` system property is set to **true**. To overwrite the value of this property for a specific metric type, update the **Detected Constant Candidate** field in the Metric Types table by doing the following:

1. Enter `sa_metric_type.list` in the instance navigation field.
2. In the **Detected Constant Candidate** column, select the relevant value for the entry you want to update.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

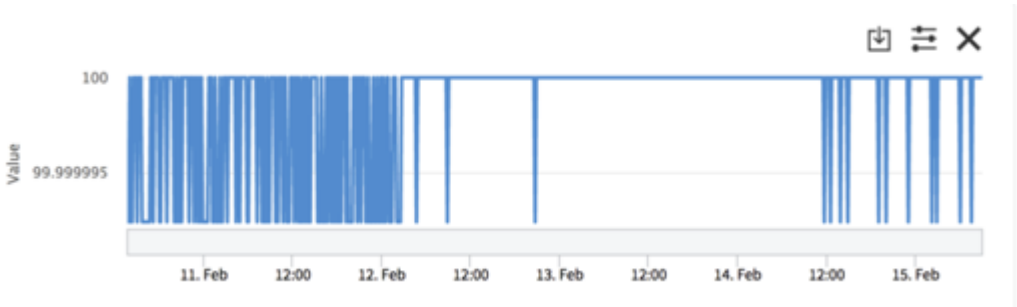
Detected Constant Candidate values

Value	Description
<empty>	An algorithm automatically decided whether the metric is to be considered for the detected constant model. This is the default value.
Yes	The metric is considered for the detected constant model.
No	The metric is not considered for the detected constant model.

Multinomial

Data pattern in which all values are one of a relatively small number of values. For example, values are always 100 or 99.9. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 400 data points in the series, calculated as 10 times the value of the multinomial_count_threshold configuration setting.



Corrupt

Data has insufficient data points to identify a pattern. For this classifier, there is no data model and no anomaly detection.

Requires that the number of data points in the series is less than the value of the corrupt_data_count_threshold configuration setting (30 by default).

Kalman Filter statistical model

Add on to the time series statistical model and applicable only to the noisy and positive noisy classifiers. This model is a general method of estimating model parameters from a stream of data where level is the only parameter in the model. The Kalman Filter model can adjust to new values in incoming metric data. When there are no clear patterns in the noise or if there is too much noise, the Kalman Filter model is not used.

Local level

When incoming data clusters around a new value according to the current control bounds, the Learner adjusts the data model to accommodate a permanent change. This clustering is detected as a new value in the data model so that most incoming data is again within

© 2025 ServiceNow, Inc. All rights reserved.

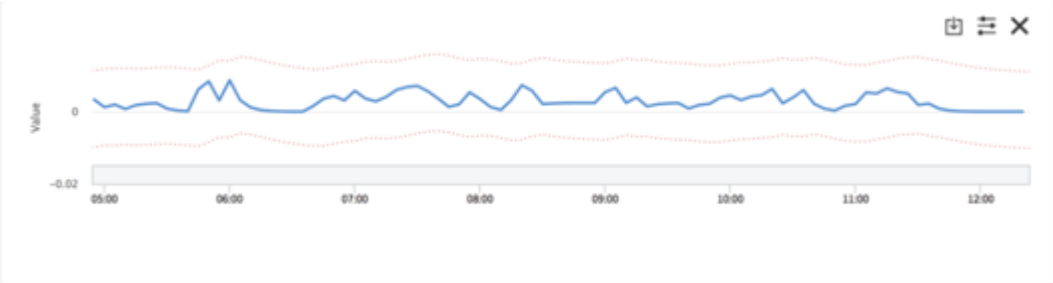
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the control bounds rather than anomalous. Such change detection is useful when for example, cores or memory are added to a server, which impact the baselines.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Unrecognized

When data does not fit the local level classifier, time series classifiers are used. This happens when it is not possible to adjust the variance ratio in a learned local level model to reasonable values.

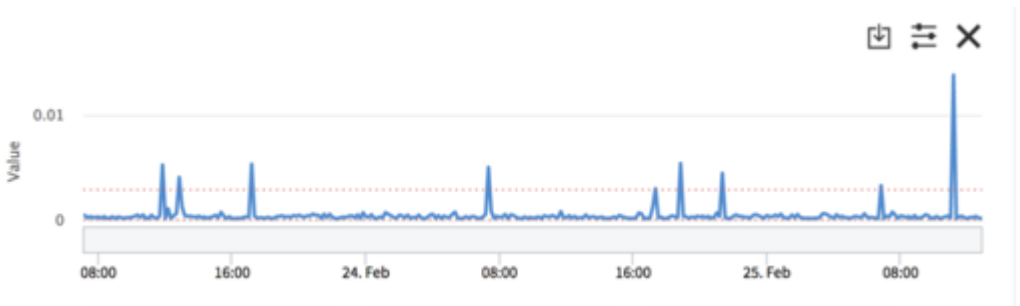
Non-Parametric statistical model

Add on to the positive noisy classifier. In the nonparametric model, noise distribution is not symmetrical and does not fit any seasonal pattern. The nonparametric model creates control bounds that better fit the actual data, and once learned, the control bounds persist until the next learning cycle. This model does not adjust itself to changes in the data, and it takes longer for a deviation to be identified as an anomaly.

Stationary Non-Parametric

Data that is not time-dependent meaning that there is no significant shift in parameters such as mean and variance when shifting data in time.

Requires a minimum of 5000 data points in the series, as set by the snpm_minimum_data_count configuration setting.



Unrecognized

When data does not fit the stationary classifier, time series classifiers are used.

Median Absolute Deviation (MAD) statistical model

An add-on to the skewed noisy classifier. In this type of data, noise distribution is not symmetrical and does not fit any seasonal pattern. In addition, data reflects a heavy or long-tailed distribution. The MAD statistical model creates control bounds that better fit the data, and once learned, the control bounds persist until the next

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

learning cycle. Using this model enhances the deciphering of data collection with approximately 30% greater efficiency.

MID Server and MID Server distributed cluster for Metric Intelligence

Using Metric Intelligence requires at least one MID Server distributed cluster which contains a single MID Server that is configured for Metric Intelligence.

When using a single Metric Intelligence MID Server, that server must be added to a MID Server distributed cluster.

To support the specified throughput, create a distributed cluster with a single MID Server that meets the Metric Intelligence MID Server requirements. When using a virtual machine (VM), only a single MID Server can run that supports Metric Intelligence. When working with Agent Client Collector, a MID Server can also be connected to multiple agents (ACC-M and ACC-L).

A MID Server supporting Discovery can also be used with other applications.

For details on setting up Metric Intelligence, see Get started with Metric Intelligence.

MID Server distributed clusters

Activating Metric Intelligence (com.snc.sa.metric), automatically activates MID Server distributed cluster (com.snc.agent.distributed.cluster). A MID Server distributed cluster supports the Distributed MID Server cluster type which is used exclusively with Metric Intelligence.

If automatic creation of a MID Server distributed cluster fails, you can configure the cluster manually. For details, contact Customer Support.

Metric Intelligence MID Server

The Metric Intelligence MID Server supports the Metric Intelligence feature by processing data and detecting anomalies. The MID Server transmits batches of processed data to the instance. If an anomaly is detected, then information about the anomaly along with the raw data is sent immediately to the instance.

Each Metric Intelligence MID Server must be configured with the following settings:

- Metric Intelligence as a supported application
- The Metrics capability
- Running the Metric Intelligence Metrics extension

Note:
The Metric Intelligence MID Server does not support IPv6.

The Metric Intelligence application that the Metric Intelligence MID Server is configured with enables you to add additional supported applications to the same MID Server. By default, Metric Intelligence is included in the definition of the MID Server ALL option. For information about modifying the behavior of the ALL option when selecting supported applications, see Configure applications included in ALL Applications.

If Domain Support - Domain Extensions Installer is activated, then you can configure a MID Server with the Metrics capability, per domain. In this case, metrics for a business service are processed on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

Ensure that the MID Server that you want to configure for Metric Intelligence:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Is validated. For more information, see Validate a MID Server
- Is in running state
- Meets all software, hardware, and configuration requirements

Hardware requirements for the virtual machine/host on which the MID Server runs (scaled for 5000 CIs with 100 metrics per CI)

Requirement	
One MID Server with: • Memory: 12 GB • Processor: 4 cores	Supports approximately up to a total of 1.2 million metrics (12,000 CIs with 100 metrics per CI).
One MID Server with: • Memory: 24 GB • Processor: 8 cores	Supports approximately up to a total of 1.7 million metrics (17,000 CIs with 100 metrics per CI).

Software requirements

Software	Supported versions	Additional requirements
Windows	32-bit and 64-bit versions: • Windows 2008 R2 • Windows Server 2012 R2 • Windows Server 2019	32-bit or 64-bit version of the MID Server
Linux	• Red Hat Enterprise Edition Linux 6.6 or later • CentOS Linux 6.6 or later	32-bit or 64-bit version of the MID Server

Configuration requirements

Configuration	Requirement
MID Server service logon user (required only for pulling)	Must be set to a user with read access to the SCOM database (OperationsManagerDW). **1.** On the MID Server, open the MID Server **Properties** dialog box. **2.** Click the **Log On** tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration requirements (continued)

Configuration	Requirement
	3. Select **This account**, and enter credentials for a user with the required access. 4. Click **Apply**.

MID Server throttling mechanism

The MID Server throttling mechanism protects against data bursts to the instance. Data burst protection prevents overloading the instance, while ensuring that you do not lose any data.

The MID Server throttling mechanism is enabled by default. You may want to disable this mechanism when troubleshooting, to ensure that the mechanism is not causing system malfunction.

- To disable this feature for metrics, set the mid.oi.metric_token_bucket_enabled parameter to **false**.
- To disable this feature for anomalies, set the mid.oi.anomaly_token_bucket_enabled parameter to **false**.

Configuration Override

Update the `wrapper-override.conf` file in folder `../agent/conf`:

- Add the following code at the bottom of the file:

```
# GC
wrapper.java.additional.5=-XX:+AlwaysPreTouch
wrapper.java.additional.6=-XX:+UseG1GC
wrapper.java.additional.7=-XX:+ScavengeBeforeFullGC
wrapper.java.additional.8=-XX:+DisableExplicitGC

# IP4
wrapper.java.additional.9=-DpreferIPv4Stack=true
```

- Ensure that `wrapper.java.initmemory=1024` (or higher) and `wrapper.java.maxmemory=4096` (or higher) for Metric Intelligence to run properly.
- Optionally, if a server has additional RAM available, for example 16 GB RAM, you can replace 4096 with 8192 in: `wrapper.java.maxmemory=4096`.

Metric Configuration Rules

Metric configuration rules enable you to determine how incoming metrics from the Agent Client Collector are to be processed.

When a new metric arrives from an Agent Client Collector, a new record is created in the Metric to CI Mappings table, with the value, **Anomaly Detection Action Level = Bounds**.

To trigger execution of a metric configuration rule, navigate to the Metric Configuration Rules table (**Event Management** > **Anomaly Detection** > **Metric Config Rules**) and select the **Sync to MID** button at the top of the page. This also synchronizes all MID Servers connected to the instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When executing the rule, the anomaly detection action level defined in the rule (set by the *anomaly_detection_action_level* parameter) retroactively overrides the anomaly detection action level configured for the metric in the Metric to CI Mappings table.

If you do not trigger the rule execution, retroactive overriding of the *Anomaly detection action level* parameter is performed during execution of the hourly scheduled **Metric Intelligence - Metric configuration** job.

When configuring a metric configuration rule, rules with a filter run before rules with no filter. When multiple rules have the same priority, the most recently configured rule runs first.

For details on creating configuration settings rules, see Create a configuration settings rule.

For details on the available anomaly detection action levels, see Configure the action level for anomaly detection.

Metric bounds sensitivity

When measuring metrics in Insights Explorer, metric bounds may be overly sensitive, creating an abnormally large number of anomalies. When this happens, the system adjusts itself to ensure that fewer anomalies are created.

If 95% of a CI's metric values fall within 2 standard deviations (STDs) of the mean metric values, those are considered *sensitive bounds*. Sensitive bounds generate a large number of anomalies, some of which may be irrelevant. When sensitive bounds are detected, the system adjusts to measure metric values within 5 STDs, to generate fewer anomalies. If sensitive bounds are not detected, (that is, 95% of metrics do not fall within 2 STDs of the mean metric value), the system measures metric values within 3 STDs. Any metric values falling outside the configured bounds become anomalies.

The previous values are set by default. For details on customizing these values, see Sensitivity bounds properties for Insights Explorer metrics.

Metric collection sources

When setting up Metric Intelligence, you must configure a source for metric collection. Metric collection can be performed either by the Agent Client Collector, or by metric connectors.

The metric collection source determines where Metric Intelligence gathers metrics from. For details on gathering metrics using Agent Client Collector, see Configuring Agent Client Collector Monitoring.

When gathering metrics with connectors, use either a SCOM or Dynatrace connector. For details on connecting metrics using a SCOM connector, see Configure the SCOM connector instance.

For details on connecting metrics using a Dynatrace connector, see Configure the Dynatrace metrics connector instance.

Metric binding

After metric data is collected, Metric Intelligence identifies the CIs and the resources to bind the data to.

The data that is collected on the MID Server is raw and does not relate to any specific CI or resource in the CMDB. To be useful, the data goes through a **normalization** process that uses CMDB identification rules and event rules to uniquely identify CIs, and to map and bind them to the raw data. Raw data can also be mapped and bound to resources, if binding to a CI is successful and if resource binding is configured.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Records for mapping raw data to CIs are automatically generated and remain in effect for a specified length of time determined by the properties:

- *sa.metric.map.with.ci.expiration.sec*: If the mapping to the CI was found. Set by default to be valid for five days.
- *sa.metric.map.without.ci.expiration.sec*: If mapping to the CI was not found. Set by default to be valid for 24 hours.

When similar metric data arrives within that time period, the existing mapping is used to match the data to CIs. At the end of the time period, metric-to-CI records expire. Also, a change in the event rules triggers an immediate expiration of the respective metric-to-CI records. Next time that raw metric data arrives, it will be normalized again. When Discovery adds or removes CIs, mappings are adjusted to reflect these changes at the next cycle.

All the information about the recent existing mapping is saved under metric-to-CI records in the sa_metric_map table, as shown below. You can access the Metric to CI table by navigating to **All > Event Management > Metrics > Metric to CI**.

Metric to CI table

Metric binding to resources

Bind metrics to resources to simplify metric events binding by enabling binding to resources such as specific disks or web pages, in addition to binding to CIs.

Metric Intelligence models metric series in either of the following methods:

- Binding a metric series to a CI and to the metric being monitored for that CI using a 'CI/Metric' format. For example, 'win_server_001/response_time_mean'.
- Binding a metric series to a CI, a resource within that CI, and the metric being monitored for that resource, using a 'CI/Resource/Metric' format. For example, 'win_server_001/Disk — C/disk_usage'. This method is referred to as *resource binding*.

The first method enables modeling, storing, aggregating, and querying data at the CI level. However, resource binding creates resource records for specific monitored entities, such as an individual web page or a disk. Therefore, resource binding is more efficient when there are multiple resources of similar types within a CI, and metrics applicable to a category of these resources are mapped to these resources.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases:

- Common examples are disks, processors, and network interfaces. In cases in which these entities are being monitored but do not exist in the CMDB, using resources for metric binding is useful.
- Some monitoring solutions capture metric data within services such as KPIs for individual web pages in an application. In such cases where the entity being monitored is not a configuration item, metric binding to resources can be helpful.

In those situations, using resource binding results in more meaningful aggregations across similar metrics (such as: avg disk_usage for a host across all disks).

Resource binding process

The MID Server generates metric binding events that are processed by the instance. When processing a metric binding event, there is an attempt to identify the CI to which this metric binding event belongs. If this attempt is successful, then the metric binding event is bound to the identified CI and binding to a resource is attempted. The following steps describe the attempt to bind a metric binding event to a resource:

1. Identify the CI class of the CI that was bound to the metric binding event.
2. Locate the resource class which is mapped to that CI class (using the CI Type To Resource Class [sa_ci_type_to_resource_class] table).
3. Read the *resource_path* attribute value in the **additional_information** field in the metric binding event.
4. Check if a resource record exists in the resource class table, in which *name* is equal to *resource_path* and *cmdb_ci* is equal to the CI that was bound to the metric binding event.
5. If such resource record exists, then the metric binding event is bound to that resource. Otherwise, a new resource record is created with the preceding values and the metric binding event is bound to the newly created resource.

Configure resource binding

- Ensure that the sa.metric.use.resource.binding system property is set to true (default).
- For series intended to be bound to resources, ensure that the *resource_path* attribute is populated by doing either step:
  - Use an event rule to add the *resource_path* attribute to the **Additional information** field in events. For more information, see Creating an event rule to map metrics to specific CIs.
  - Populate the *resource_path* attribute as a part of the respective CI identifier when data is sent to the MID Server for processing.
- Review the default mappings in the CI Type To Resource Class [sa_ci_type_to_resource_class] table and adjust as needed. It is critical that mappings are set as desired prior to data processing.

  Managing the CI Type To Resource Class table requires the evt_mgmt_admin role.

Resource tables

Resource binding uses an underlying hierarchy structure of resources which is a subset of the [cmdb_ci] hierarchy. Metric Intelligence installs the following resource tables:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CI Resource [ci_resource] (parent table):
- Tables that extend CI Resource [ci_resource]:
  - ci_resource_hardware
  - ci_resource_appl
  - ci_resource_service
  - ci_resource_vm_object
  - ci_resource_database

Mapping CIs to resources

Mappings of CI classes to resource classes are stored in the CI Type To Resource Class [sa_ci_type_to_resource_class] table. This table is installed with Metric Intelligence, and is used during metric binding to resources.

Mappings in the CI Type To Resource Class table (default)

CI class	Resource class
cmdb_ci_hardware	ci_resource_hardware
cmdb_ci_appl	ci_resource_appl
cmdb_ci_service	ci_resource_service
cmdb_ci_database	ci_resource_database
cmdb_ci_vm_object	ci_resource_vm_object

Creating an event rule to map metrics to specific CIs

Create event rules to map incoming raw metric data to specific CIs, to optionally modify metric names, and to populate the *`resource_path`* attribute for resource binding.

The system generates events for every new raw metric data for which there are no CI binding specifications. You can create event rules that filter those events to map the incoming metric data to specific CIs. In such event rules, you can for example define a filter that is based on the monitoring object (such as SCOM).

To use resource binding, the *`resource_path`* attribute of events must be populated. You can configure an event rule to ensure that the *`resource_path`* attribute is included in the **Additional information** field in events. For more information about configuring and using resource binding, see resource binding.

For example, in the Event Rule designer you can update the event rule **SCOM IIS Web Server** as follows:

- On the **Event Filter** tab, define filter to match only IIS Web Servers.
- On the **Binding** tab, set **Class** to `Microsoft IIS Web Server`.

Get started with Metric Intelligence

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIs in maintenance mode

Configure anomaly detection to exclude metrics for CIs that are in maintenance mode from model learning.

You can change the settings of system properties to include or exclude metric data for CIs while they are in maintenance mode.

When the system property sa.model_learner.maint_event_record_history_enabled is set to true (default), Metric Intelligence stores historical information about the times CIs enter and exit maintenance mode. When the system property sa_metric.maint_exclusion is set to true (default), metrics from CIs that are in maintenance mode are excluded from model learning.

Anomaly model testing

Use anomaly model testing to apply and evaluate anomaly detection for a small set of CIs and metrics, using actual metric data. Compare test results to expected results, then fine-tune the anomaly detection model before enabling anomaly detection for the tested CIs and metrics in the production environment.

For example, before enabling anomaly detection for Linux Servers, you can use anomaly model testing with actual metric data collected for those Linux Servers. Existing alerts might indicate an anomaly for a specific metric and CI. You can create an anomaly test rule to test anomaly detection for those CIs and metrics, and then check if the expected anomaly is detected. You can also examine the bounds calculated by the anomaly model to see if they match expected bounds. After you fine-tune the test model, you can enable anomaly detection for Linux Servers.

Anomaly model testing supports up to 20 time series, which can include 20 metric types for the same CI, the same metric type for 20 different CIs, or any combination of those options.

View test results in the Insights Explorer

Upon completion of a test run, a URL to an Insights Explorer becomes available. The anomaly model testing results appear in this trimmed-down version of the Insights Explorer. This Insights Explorer is pre-loaded with the charts and scores for the metric series specified in the anomaly test rule. You cannot add any CMDB groups or application services to this Insights Explorer.

Each chart in the Insights Explorer, contains the Anomaly Test Statistics section in its **Chart Settings**. This section is specific to anomaly model testing and provides the following options:

- **Show Bounds**: Displays a computed upper and lower bound for the metric in an anomaly model testing, based on learning of past metric values. The upper and lower bounds always appear together.
- **Show Anomaly Scores**: Displays anomaly scores on a virtual axis of 0-10, for an anomaly model test. Color code is based on the score thresholds that are defined in the Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map] table.

Use test results to fine-tune anomaly detection

Anomaly model testing uses the upper and lower bounds configured for selected series in the anomaly test rule. The anomaly model test results show how many anomaly alerts would have been generated based on the specified settings, if anomaly detection was enabled for the tested CIs and metrics. You can then decide if this result is acceptable. Fine-tune the bounds so that the number of anomaly alerts that are generated is not excessive, but sufficient to accurately indicate an out of bounds score.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Promotion Engine

You can create a definition for the Advanced Promotion Engine so that you can define the conditions for promoting the anomaly alerts to the All Alerts table. By promoting the alerts that meet the conditions, only the most relevant anomaly alerts move to the table.

The Advanced Promotion Engine moves the most relevant alerts from the list of anomaly alerts to the All Alerts table. When a group of anomaly alerts on a configuration item (CI) meets the conditions that you set in the definition that you created for the Advanced Promotion Engine, the grouping mechanism groups the promoted alerts in the All Alerts table. For example, you can create a condition indicating that only the anomaly alerts that belong to a specific CI class with a minimum severity of Major are to be promoted to the All Alerts table.

The All Alerts table is the table that contains the issues that need your immediate attention. The anomaly alerts on the different metrics within a CI in a specific time period indicate an issue that needs to be promoted to the All Alerts table.

Anomaly alerts indicate a deviation from projected metric values for monitored CIs. For details, see View anomaly alerts.

The Advanced Promotion Engine is activated automatically as part of the Metric Intelligence application.

You can use the Advanced Promotion Engine definitions that come with the base system (for the Linux server and for the Windows server), or you can create definitions on the different CI classes. The base system definitions indicate that the CIs on the Linux and Windows servers are operational, and those CIs that have a minimum severity of Major are to be promoted to the All Alerts table.

All Advanced Promotion Engine tasks require the evt_mgmt_admin role. The evt_mgmt_user role enables you to view definitions and properties only.

Metric Explorer

Metric Explorer provides an easy-to-navigate interface where service agents can view the health of a CI associated with an alert. Health details for a CI include various metric charts with control bounds, and aggregations in a time period.

The set of metric charts that appear for a CI class in Metric Explorer is determined by metric chart configurations in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table. The Metric Dashboard Metadata table is initially populated with configurations for common classes and important metrics for those classes. A user with the admin or evt_mgmt_admin role can update the default metric chart configurations in the Metric Dashboard Metadata table.

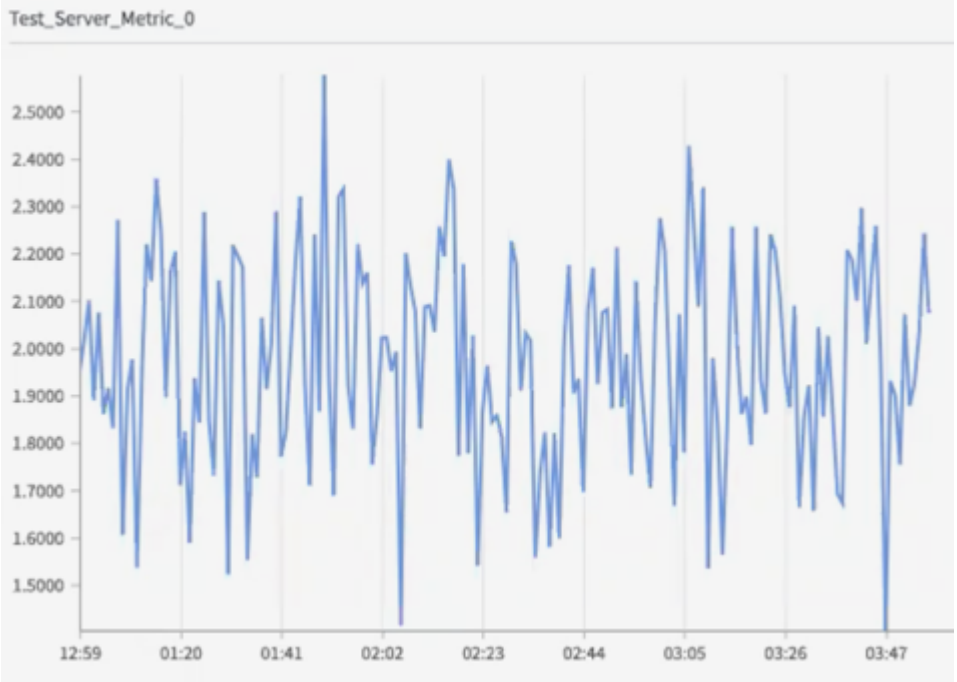
There can be up to 10 active metric charts configured for a class at any point.

Chart types

A metric chart that appears in the metric charts form in Metric Explorer can be a **time-series** chart or a **single-score** chart.

Time-series chart

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The time-series chart type is a graph of all data points in the specified time range, for the metrics of the CI associated with the chart. Time-series charts are similar to charts in Insights Explorer, and depending on settings, show lower and upper bounds.

Single-score chart

The single-score chart type shows a single number which is an aggregation of the data points in the time series for the metric and CI of the chart. The aggregation is an average of the data points, or the maximum, minimum, or last data point in the time series.

Templates

The ITOM Service Operations Workspace Metric Explorer template enables metric chart drill-down from Digital Analytics (DA) dashboards to Metric Explorer. For details, see Express list overview on the ServiceNow® Developer portal.

Self-health monitoring for Metric Intelligence

Use Event Management self-health monitors to monitor the health of Metric Intelligence infrastructure components and processes, and to alert about potential issues. Self-health monitoring allows you to proactively remediate issues and minimize data loss.

Metric Intelligence is pre-configured to use Event Management self-health monitors to ensure that essential components and processes are functioning properly. If a monitor detects a failure, then the Event Management self-health monitoring system creates an event for the issue. These events are then converted into an Event Management alert or get appended to a previous alert. Metric Intelligence self-health monitors run every 60 seconds.

For example, if an Metric Intelligence MID Server distributed cluster experiences an issue, an event is generated with the status of **Major**. Then, this event is converted into an alert. Later, when the issue is resolved, a new event is generated with the status of **Info** and the original alert is closed.

Monitored components and processes

Component/Process Check	Error Condition
Metric Intelligence extension is running properly	Monitor checks the *status* field of the *ecc_agent_ext_context_metric* table to detect a state of **Error** or **Warning**.
Metric Intelligence MID Server distributed cluster is running properly	Monitor checks the *status* field of the *ecc_agent_cluster* table to detect a state of **Error**, **Segmented**, or**Stopped**. **Note:** For a state of **Stopped**, an event is created only if the *error_message* field is not empty.
Metrics are collected by active connectors that are configured for metrics collection	For each connector with the *Metrics collection* flag set to **true**: Monitor checks the status of the *last_kpi_status* field in the *em_connector_instance* table to detect a status of **Error**.
Essential Metric Intelligence scheduled jobs are active	Monitor checks the following essential scheduled jobs, to detect if any is inactive: • Metric Intelligence — Metric configuration job • Metric Intelligence — Sync tables with mid • Metric Intelligence — Validate MID Distributed cluster

For more information about enabling or disabling an Metric Intelligence self-health monitor, see Configure a self-health monitor.

Domain separation and Metric Intelligence

Domain separation is supported in Metric Intelligence. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Metric Intelligence

When domains are separated in Metric Intelligence, users can view and manage alerts and events only in their own (tenant) domain. After the binding process has finished, the domain of the configuration item (CI) is used so that users within that domain can explore metric data. A domain column is present for Metric Intelligence tables that are provided in the base system. The domain column shows the name of the domain to which the CI belongs.

Note:

If the domain column does not appear in the list, click (Personalize List) and add the required column. In addition, you can add a column that displays the domain path.

The following Metric Intelligence features have limited domain separation support.

Feature	Support
Metric types	Supported at global level. The instance owner can control the metric types for all domains.
Metric type registration	Supported at global level. The instance owner can control the metric type registration for all domains.
Metric class	Supported at global level.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Support
	The instance owner can control the metric classes that are used for all domains.
Configuration settings rules	Supported at global level. The instance owner can control the configuration settings rules for all domains

Domain separation for service providers

Configuring Metric Intelligence

Plan and configure your Metric Intelligence implementation.

Configuration overview

Metric Intelligence configuration typically follows these steps:

1. Install the AIOps Experience plugin [sn_sow_aiops].
2. Manually configure a MID Server for Metric Intelligence.
3. Activate Metric Intelligence.
4. Stream metrics to the instance, via the relevant data source or connector.
5. Choose and configure metrics to monitor.
6. Ensure that metrics are properly bound to CIs.
7. Configure the action level for anomaly detection.
8. Define an advanced promotion rule, to determine the conditions for promoting an anomaly alert to an IT alert.

Get started with Metric Intelligence

Complete the following setup and initial configuration steps to start using Metric Intelligence.

Before you begin

Activate the Metric Intelligence plugin (com.snc.sa.metric).

Role required: evt_mgmt_admin

About this task

Metrics have an expiration date. You can continue receiving data without interruption when a metric's expiration date arrives by pushing ahead the expiration date. For details, contact customer support.

Metric Intelligence guided setup provides a sequence of tasks that help you configure Metric Intelligence on your ServiceNow instance. To open Metric Intelligence guided setup, navigate to **Guided Setup** > **ITOM Guided Setup**, and click **Continue**. Then scroll to **Metric Intelligence**, and click **Continue**. For more information about using the guided setup interface, see Using guided setup.

Alternatively, you can complete the following procedure.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configure a MID Server for Metric Intelligence.
   For details, see MID Server and MID Server distributed cluster for Metric Intelligence.
2. Use the Automated Metric Intelligence setup.
3. Choose a source for collecting metrics.
4. Choose and configure metrics to monitor.
5. Create event rules to map raw metric data to specific CIs and Create an event rule to bind metric events to host CIs.
6. About 10 minutes after the Metric Intelligence Metrics extension has started, run the quick start tests for Metric Intelligence to verify functionality.

Activating Metric Intelligence

Metric Intelligence enables you to capture, explore and analyze operational metrics data, identifying and indicating anomalies. This analysis can prevent potential service outages.

View and work with Metric Intelligence data in the Insight Explorer, Agent Workspace, and Service Operations Workspace interfaces.

For details on the plugins activated with Metric Intelligence, see Plugins or applications installed with ITOM AIOps.

Automated Metric Intelligence setup

When you initially set up Metric Intelligence, you can automate many of the setup steps. For example, the automated setup configures a MID Server for Metric Intelligence and creates a MID Server distributed cluster which contains that MID Server.

Before you begin

Role required: evt_mgmt_admin

About this task

When the following conditions are met, the related link **Setup Metric Intelligence** appears on the MID Server form, enabling automated setup:

- The MID Server has been validated.
- The MID Server is in a running state.
- The property *sa.metric.display.mid.setup.action* is set to true (default value).

The Metric Intelligence automated setup performs the following setup tasks:

1. Configures the MID Server with the *Operation Intelligence* application
2. Adds the *Metrics* capability to the MID Server
3. Creates a new MID Server cluster of type 'distributed' set with a default port of 47100 for Apache Ignite
4. Adds the MID Server to the new MID Server distributed cluster
5. Creates a Metric Intelligence Metrics Extension and starts it
6. Opens the Metric Intelligence Metrics Context form. On this form, you can click the **Setup REST Listener** UI action to create the MID Web Server extension configured with the 'Enable REST Listener' option and default port 8097

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If automatic setup fails, you can create a MID Server distributed cluster manually, as described in the Use the **Setup Metric Intelligence** link only to create the first MID Server distributed cluster that contains a single MID Server, with default values. After the automated setup completes, you have to manually create any additional MID Server distributed clusters or add Metric Intelligence MID Servers.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Select the MID Server that you want to configure as a Metric Intelligence MID Server.
3. On the MID Server form, select **Setup Metric Intelligence** in the Related Links section.
4. In the newly created Metric Intelligence Metrics Extension form:
   a. Wait for the Status value to be **Started**.
   b. If configuring the MID Server for pushing, select the UI action **Setup REST Listener**.
   A notification appears about the MID Server extension being created. The **MID Web Server Extension** field appears and **Enable REST Listener** is checked. You can preview the MID Server Extension record to verify that its Status value is **Started**.

Related topics

MID Server and MID Server distributed cluster for Metric Intelligence

Manually configure a MID Server for Metric Intelligence

To use Metric Intelligence, configure at least one MID Server with Metric Intelligence as a supported application, with the Metrics capability, and which runs the Metric Intelligence Metrics extension. Then, add that Metric Intelligence MID Server as a member to a MID Server distributed cluster.

Before you begin

Ensure that the MID Server meets all software, hardware, and configuration requirements to be configured for Metric Intelligence.

Role required: To access the MID Server - mid_server. To configure a MID Server in an instance (for example, to add a supported application), refer to the MID Server documentation.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Click the MID Server that you want to configure for Metric Intelligence.
3. Add the Metric Intelligence application:
   a. At the center of the MID Server form, click **Supported Applications**.
   b. In the **Supported Applications** section, click **Edit**.
   c. In the slushbucket, select **OperationalIntelligence** and click the **>** add button.
   d. Click **Save**.
4. Add the Metrics capability:
   a. At the center of the MID Server form, click **Capabilities**.
   b. In the **Capabilities** section, click **Edit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the slushbucket, select **Metrics** and click the '>' add button.

d. Click **Save**.

5. Click **Update**.

What to do next

Create a MID Server distributed cluster, and add the Metric Intelligence MID Server as a member to that cluster.

Manually configure the Metric Intelligence extension

Configure the MID Server Metric Intelligence extension to enable the MID Server to pull raw metrics from external systems, to detect anomalies and report anomalies to the instance along with raw data. This MID Server Metric Intelligence extension is required and must be running in order for your system to be able to collect Metric Intelligence data.

Before you begin

See Get started with Metric Intelligence for the high level steps of setting up Metric Intelligence.

Role required: evt_mgmt_admin

About this task

The MID Server Metric Intelligence extension normalizes the raw data and then transmits the data to the instance. If the extension detected any anomalies above a specified threshold, they are sent to the instance. The extension runs for as long as it is enabled. This provides a persistent connection to the MID Server to constantly listen for raw Metric Intelligence data from external systems.

The MID Server Metric Intelligence extension:

- Receives raw metric data, batches them and sends them to the instance at specified intervals.
- Detects anomalies and sends a report to the instance.
- The information that is sent to the ServiceNow instance is relevant for Metric Intelligence, so data processing is efficient.

The MID Server Metric Intelligence extension does not provide any API calls. However, when the **Enable REST Listener** option is selected, the extension adds a handler for the supported REST APIs.

Note:

- Only upon configuring the Metric Intelligence extension, the Metric Intelligence MID Servers actually join the distributed cluster for Metric Intelligence.
- After the initial configuration, the first metric is not included in the metrics data.
- There is a delay of one minute in receiving metric information from the synchronization of the instance with the MID Server.

Procedure

1. Navigate to **All** > **MID Server** > **Profiles and Deployments** > **Metric Intelligence**.
2. In the Metric Intelligence Metrics Contexts list, click **New**.
3. Fill in the fields, as appropriate.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for this extension for easy identification.
Short description	A description of this extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: ○ **Started**: The extension is running. ○ **Stopped**: The extension is not running. ○ **Offline**: The MID Server is down. ○ **Error**: The extension failed with an error (the error message is displayed in **Error Message**). ○ **Warning**: A run-time exception has occurred. The extension continues to work.
Error Message	Message describing any error that causes a command, such as **Start** or **Stop**, to fail. This field appears when the value in the **Status** field is **Error** and also when the value in the **Status** field is **Warning**.
Execute on	Location for running this extension. When configuring this option for use with Metric Intelligence, set to **Specific MID Server**. Then specify the MID Server with *`Operationalintelligence`* as a supported application and the *`Metrics`* capability.
MID Server	The name of the designated MID Server, which is configured with *`Operationalintelligence`* as a supported application and the *`Metrics`* capability.
Executing on	[Read-Only] The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If the user stops the extension, this field is empty.

4. When using the Push method for collecting Metric Intelligence data, the MID Server Metric Intelligence extension must be configured with the **Enable REST Listener** enabled. This option enables a listener so that a REST endpoint can receive raw metric data. The raw metric data is then placed in the regular data flow where the data is sent to the instance and the anomaly detector looks for anomalies. When selected, it adds a handler to the web server to listen for any metrics that are pushed to the MID Server. When this option is selected, the Web Server

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

extension, which starts a Web Server on the MID Server, must also be configured. For more information, see Configure the MID Web Server extension.

5. Right-click the form heading and select **Save**.
6. Under **Related Links** click **Start** to save the Metric Intelligence data in this extension and start the extension.

Commands available in the MID Server Metric Intelligence extension

Related Link	Description
Start	Starts the extension on the configured MID Server if it is currently not running.
Stop	Stops the running extension on the configured MID Server. No action is taken if the extension is not running.
Restart	Stops, then starts the extension on the configured MID Server.
Test	The test is not relevant to Metric Intelligence. Parameters are not tested or validated when **Test** is run.
Update parameters	Sends the latest saved parameters to the extension.

Activate the Advanced Promotion Engine

Before you can use the Advanced Promotion Engine feature, you must activate it from the list of plugins.

Before you begin

Role required: evt_mgmt_admin

About this task

To activate the *var.adv-promo-eng*, you also need to install a plugin for ACC-M, which includes Metric Intelligence plugin, as described in Exploring Agent Client Collector Monitoring.

If you don't plan to use ACC-M, install Metrics Intelligence plugin only, as described in Get started with Metric Intelligence.

Procedure

1. Navigate to **System Definition** > **Plugins**.
2. Locate **Advanced Promotion Engine** (id: sn_metric_promote).
3. Select the entry and review the app details on the **Store Application Advanced Promotion Engine** form.
4. Select **Activate/Upgrade** in the Related Links section.
5. Select **Activate**.

Configure domain separation for Metric Intelligence

Configure Metric Intelligence for domain separation to create logically defined domains that limit unauthorized access to data.

Before you begin

Role required: evt_mgmt_admin and evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate the Domain Support – Domain Extension Installer plug-in.
2. Configure the MID Server for Operational Intelligence as a user that belongs to the desired domain with the role 'mid_server' assigned to it.
3. Configure a MID Server distributed cluster in the domain you desire and add Operational Intelligence MID Servers that belong to the same domain.
   For more information about setting up MID Servers for Metric Intelligence , see MID Server and MID Server distributed cluster for Metric Intelligence.

Note:
The Event Management's binding events are configured using the domain of the logged-in MID Server user. Once the process has finished, the record's domain is updated to use the domain from the CI so that any user within that domain can see the metric data.

Optimizing Metric Intelligence

You can perform a variety of tasks to optimize your use of Metric Intelligence.

Create an anomaly test rule

To use the anomaly model testing, create an anomaly test rule in which you specify up to 20 metric series to test anomaly detection for. Run the anomaly test, and after it completes, use the provided URL to open the Insights Explorer which is pre-loaded with the model testing results.

Before you begin

Role required: evt_mgmt_user

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Anomaly Model Testing**.
2. Select an existing anomaly test rule to edit and run again, or click **New** and fill out the Anomaly Test Rules form.

Field	Description
Name	Name for the model test rule.
Applies to	The table from which to select CI/metric pairs for the model test rule. The table used is Metric To CI Mapping [sa_metric_map].
Rule	Filter conditions to specify pairs of CIs/metrics for the anomaly model testing. If the rule yields more than 20 pairs of CIs/metrics, then the list is truncated to 20.
Start date/End data	The time period for which to apply the anomaly detection testing. The time period must be within the past 7 days.
Status	Status of the test, automatically updated by the system during a test run. Status is initially Scheduled and eventually changes to Complete.

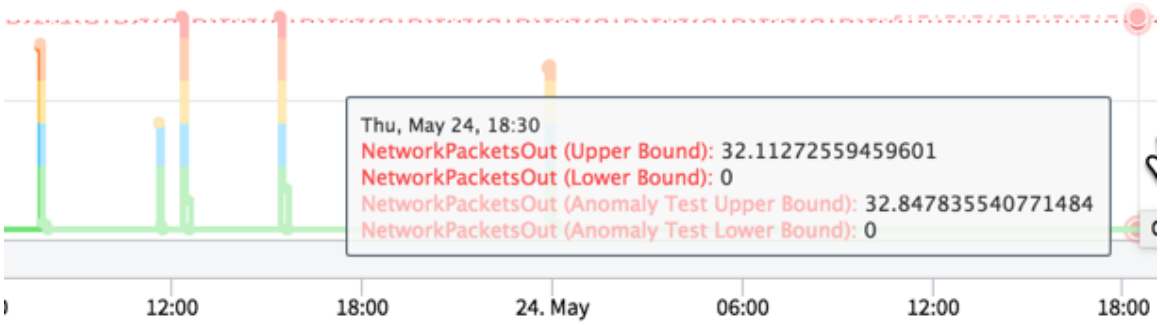
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL	URL to the Insights Explorer in which the anomaly model test results are pre-loaded.
Notes	Logging summary, automatically updated by the system with details of each test run of the anomaly test rule.

3. Click **Run Anomaly Test**.
   During the test run, the **Status**, **URL**, and **Notes** fields are automatically updated to reflect the progression of the job.
4. After **Status** changes to Complete, click the **URL** link to open the Insights Explorer to see the results of the test.

Result

The bounds and the chart for the anomaly model test, appear in faint colors in Insights Explorer. Also, the upper and lower bounds that are calculated by the test, use a line pattern that is different than line pattern used for actual anomaly detection results. These differences let you distinguish between actual anomaly detection and anomaly model test results, if both are selected in the chart settings.



What to do next

- Modify the date range for the test or choose different time series, and click **Run Anomaly Test** again to continue and fine-tune the model.
- Click the **Chart Settings** icon for a chart to toggle the display of statistics and aggregations on the chart. Select **Show Bounds** and **Show Anomaly Scores** in the Anomaly Test Statistics and in the Anomaly Statistics sections, to display test results next to actual anomaly detection results.

  Note:
  Anomaly Model Testing results might be very similar to actual anomaly detection results. If you configure the chart to display both at the same time, as you move the mouse over the chart, it might be difficult to identify points of differences.

- When you are satisfied with the anomaly test results, enable anomaly detection in the production environment, for the metrics and CIs specified in the test. See Choose and configure metrics to monitor for more details.

View metric values in the Insights Explorer

Specify custom upper and lower metric bounds

Use the Bounds Settings wizard to override learned control bounds by specifying custom upper and lower bounds for an Metric Intelligence metric.

Before you begin

Role required: evt_mgmt_admin

About this task

Metric Intelligence calculates upper and lower **control bounds** for metrics using statistical models learned from historical metric data. Upper and lower bounds are then used in the analysis for detecting anomalous CIs or resources, affecting anomaly scores. Based on historical data, some CIs, resources, or metrics might have values that you specifically want or do not want to be notified about, despite the calculated ranges. For example, trying to meet an SLA without allowing a metric to exceed or be below a certain value for too long without being notified. When concrete upper or lower bound values are known for a metric, you can configure that metric with custom bounds to override the calculated bounds. For example, a CPU metric which does not exceed 85%.

Use the Bounds Settings wizard to specify custom static bounds or ranges of bounds, and to preview anomaly analysis of actual data based on the custom settings. The metric class and the configuration setting rule that custom bounds must be associated with, are both automatically generated by the Bounds Settings wizard.

In the Bounds Settings wizard, you can choose one of the following options for custom control bounds:

Static upper and lower bounds

Custom static upper and lower bound values are used as the control bounds in effect, completely overriding the learned values for upper and lower bounds for the metric. The median of the metric data must be within the specified static bounds range, otherwise the static bounds are not applied.

Ranges for upper and lower bounds

Custom upper and lower bounds, each expressed as a range of values. The bounds in effect are a combination of the custom minimum and maximum values that define the bound range, and the learned upper and lower bounds:

- If a learned bound value for a point in time is within the custom range of upper or lower bound, then the learned bound value is in effect.
- If a learned bound value for a point in time is outside the custom range, then the **Max** or the **Min** values of the custom range are in effect respectively. If the learned value exceeds the custom range, then the custom **Max** value is in effect, and if below then the **Min** custom value is in effect.

When a metric value is outside a control bound, the deviation from the control bound is normalized by a **width** value that the system calculates from data. Lower and upper width values determine how much a metric value needs to exceed the control bounds to be anomalous. Changing a width for the control bounds affects the speed of reaching a high anomaly score and being notified about the anomaly. In addition to setting custom control bounds, you can override width values by specifying custom deviation and time values that the system uses to calculate custom widths values.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system stores custom control bounds and custom widths for a metric in a **metric class**. Custom values in a metric class override the learned bounds and widths for the metric, and are then used in subsequent anomaly analysis.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Bounds Settings**.
2. In the Bounds Settings list view, click **Add** to open the Bounds Settings wizard.
3. On the **Select Scope** tab, configure the following settings and then click **Next**.

Field	Description
Source Metric Type(s)	Source metric type that this bounds setting applies to. Select an item from the drop-down list, and then click the Add Source Metric Type icon (**+**) to add the selected item to **Selected Source Metric Types**.
Scope	Scope of CIs or resources that this bounds setting applies to. You can set the scope to **All CIs**, **Specific CI or class**, or **Specific Resource or Resource class**. Depending on the setting, you can then further filter the scope.

4. On the **Apply Bounds Settings** tab, configure the following settings and then click **Next**.

Field	Description
Bounds setting name	Unique name for this bounds setting.
Bounds type	Method for specifying the custom static bounds: ○ Set static upper and lower bounds ○ Set ranges for upper and lower bounds
Show advanced settings	The following fields appear: ○ **If lower bound is** and **And metric value is below lower bound by** ○ **If upper bound is** and **And metric value is above upper bound by** ○ **Send critical alert after duration (min.)** Specify the deviation for anomalous values (in absolute values), and the duration for sending an anomaly alert. These values are used internally to calculate the width value for the metric.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ If the metric class specified for the bounds setting, is configured with width override values from an upgraded release, you cannot set advanced settings. To set advanced settings, accept the notification that appears, agreeing that those width override values be deleted. ○ All fields must contain values. If you do not want to set a metric value, you must enter 0 in either the **And metric value is below lower bound by** or in the **And metric value is above upper bound by** field. ○ The minimum number of minutes you can enter is 2.
Lower bound	Static lower bound value that replaces the learned lower bound for the metric. Applies to the `Static upper and lower bounds` setting.
Upper bound	Static upper bound value that overrides the learned upper bound for the metric. Applies to the `Static upper and lower bounds` setting. Value must be greater than **Lower Bound**.
Lower Bound Range	**Min** and **Max** of the custom lower bound range. Applies to the `Set ranges for upper and lower bounds` setting.
Upper Bound Range	**Min** and **Max** of the custom upper bound range Applies to the `Set ranges for upper and lower bounds` setting.

5. On the **Preview and Confirm** tab:

   a. Select a **Source Metric Type**.

   b. **Optional:** Select a **Metric Type** for the preview.

   c. **Optional:** Enter a **CI Name** and a **Resource Name** that you want to include in the preview. If you specify a CI or a resource, it must be within the scope that was previously specified.

   d. Click **Preview** to perform anomaly detection for the specified metric and CI, using the newly specified custom bounds.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Examine the preview results and if the results are as expected, click **Finish**.
Otherwise, go back to the previous **Apply Bounds Settings** tab, adjust settings, and then preview again. The preview results are a stripped-down version of anomaly model testing. For more details about the results, and changing chart settings, see Anomaly model testing.

Create a configuration settings rule

View metric to CI and resource binding

View the metric to CI and resource binding results, including details for failed bindings which you can use to mitigate the failure. If Metric Intelligence cannot map and bind a metric to a CI or to a resource, then that CI or resource is not included in anomaly detection until it is properly mapped.

Before you begin

Role required: evt_mgmt_admin

If resource binding is not enabled, then no resource binding results appear.

About this task

Metric Intelligence uses event rules to map metric data with the specific CI or resource that is associated with the metric event. The results of these mappings are stored in the Metric to CI Mappings [sa_metric_map] table. If mapping fails, then the binding status for the metric indicates the general reason for the failure and further details about the failure are provided. Examine the details for a mapping failure and mitigate the problem to improve accurate and effective metric data processing.

- If mapping to a CI is successful, then the mapped CI appears in the **Configuration Item** column. If resource binding was attempted but failed, then the mapped CI does not appear, even if the mapping to a CI was successful. Missing or duplicate CIs can cause CI mapping to fail.
- If mapping to a resource is successful, then the mapped resource appears in the **Resource** column. Missing a resource table that is mapped to the CI type to which the event is bound, or a missing *`resource_path`* attribute in the event, cause resource binding to fail.

Records in the CI Mappings [sa_metric_map] table remain in effect for 24 hours (by default, if mapping to the CI is not successful), or for 5 days (by default, if mapping to the CI is successful). Later, if within that time period raw data arrives for a metric/CI pair that already has a record, the existing mapping is used to match the data to an existing CI. After Metric to CI Mappings records expire, incoming new raw data requires remapping. These records expire when:

- The 24-hour or 5-day cycle ends.
- An event rule has changed — Triggering an immediate expiration of the respective mapping record.

Adjusting mappings to reflect the addition or removal of CIs by Discovery, takes effect only upon the beginning of the next cycle.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric to CI**.
The **Metrics to CI Mappings** page appears.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Source	Data source for the metric.
Metric Type Id	Metric that is measured for the CI, such as disk% and cpu%.
Metric Identifier	A string in the form of CI/resource/metric that uniquely identifies a CI and a metric.
Configuration Item	The CI in the CMDB that is mapped to a metric. A missing value indicates that: ○ The mapping of the metric to a CI was unsuccessful. ○ Resource binding is enabled, but has failed. **Configuration Item** is missing even though binding to a CI was successful.
Resource	The resource that is mapped to a metric. If resource binding is enabled, then a missing value indicates that the mapping of the metric to a resource was unsuccessful.
Expiration Date	Record expiration date.
Anomaly Detection Action Level	The level of anomaly detection processing and analysis applied to CIs and metrics. The available options are: ○ **Metrics Only**: Only gather metrics from the data source without any further processing. ○ **Bounds**: Includes the Metrics Only processing level, and also creates a statistical model and shows bounds in Insights Explorer. ○ **Anomaly Scores**: Includes the Bounds processing level, and also calculates and displays anomaly scores. ○ **Anomaly Alerts**: Includes the Anomaly Scores processing level, and also creates anomaly alerts, as applicable. ○ **IT Alerts**: Includes the Anomaly Alerts processing level, and also creates IT alerts which are based on anomaly alerts, as applicable.
Binding Status	Status of the mapping of the metric to a CI or resource. A **CI Found** status indicates that the mapping was successful, in which case the mapped CI appears in the **Configuration Item** column. Any other status indicates that the mapping failed, and a general reason for the failure is provided. Further details about the failure

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	are provided in the **Binding Failure Reason** column.
Binding Failure Reason	Specific details about the mapping that failed, such as class and host names, and the queries that were used. Click the respective **Event** link to see further details in the **Processing Notes** field.

2. Examine the **Binding Status** and **Binding Failure Reason** as appropriate.
Use the details provided to remediate the problem:

Binding Status	Remediation
Host CI Missing	Run Discovery or use any other method to populate the CMDB with the missing host CI.
Non-Host CI Missing	Run Discovery or use any other method to populate the CMDB with the missing non-host CI.
Non-Host CI Duplicate	Use the Duplicate CI Remediator to remediate the duplication.
Dependent CI Duplicate	Use the Duplicate CI Remediator to remediate the duplication.
Dependent CI Missing	Run Discovery or use any other method to populate the CMDB with the missing dependent CI.
Duplicate Metric Map Entry Exists	Check **Binding Failure Reason** and compare the metric identifiers associated with the duplicate metric map entries. If metric identifiers have changed (for example, an identifier was added), set the entry for this series in the CI Mappings [sa_metric_map] table to expire or delete the entry. Also check the associated event rule and ensure that it extracts the attributes correctly and that it does not extract the same CI for two different metric identifiers. This error might appear when 2 different metric identifiers map to the same CI/metric.
Resource ID Not Found	Verify that the CI Type To Resource Class [sa_ci_type_to_resource_class] table contains a mapping record for the respective CI type, or for one of its parents. Then ensure that a table with the name of resource class for this record, exists.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Group **Binding Failure Reason** by **Binding Status** to create a summary report with the number of records per failure category. Use this report to efficiently remediate the problems.

Related topics

Creating an event rule to map metrics to specific CIs

Disable a metric for a CI

Metric Intelligence can be configured to collect significant amounts of data, some of which might not be necessary. To improve performance, you can disable a specific metric for a specific CI to stop processing data related to the specified metric and CI.

Before you begin

Role required: evt_mgmt_admin

About this task

Note:
The *Active* setting (true or false) for a source metric in the Monitoring System Metric Types [sa_source_metric_type] table takes precedence over the setting for the corresponding metric in the Metric To CI Mappings [sa_metric_map] table. If a source metric type in the Monitoring System Metric Types [sa_source_metric_type] table is disabled, all records related to the corresponding metrics are removed from the Metric To CI Mappings [sa_metric_map] table.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric to CI**.
2. Locate the record for the metric/CI that you want to disable, and set its **Active** column to **false**.

Disable event collection

For performance reasons, you might want to disable the collection of events from a data source from which metric data is also collected. You can disable event collection for data sources such as Nagios XI server, SolarWinds monitoring system, and Zabbix server.

Before you begin

Role required: evt_mgmt_admin

Note:
To restart event collection after it has been disabled, you will need to restore the connector's original script.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Select a connector instance for the data source for which to disable event collection.
   For example, select a connector instance for Nagios, SolarWinds, or Zabbix.
3. Set **Event collection schedule (seconds)** to a large value such as 20,000,000.
   Such setting avoids unnecessary communication with the MID Server, optimizing performance.
4. Click **Update**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Navigate to **MID Server** > **Script Includes** and extend the connector's script (such as *NagiosMetrics_JS*, *SolarWindsJS*, or *ZabbixJS*) by overriding the *execute* method.
   Add a code snippet such as the following, and then click **Update**:

Example: Snippet for Nagios

```
var NagiosJSCustom = Class.create();

// Extending Nagios default script
NagiosJSCustom.prototype = Object.extendsObject(NagiosJS, {

// Override execute method
                    execute: function() {
        var retVal = {};
        retVal['status'] = SUCCESS.toString();
       retVal['error_message'] = "Disabled by custom Class,
 'Last event collection status' will be 'error' and this is
 normal. To achieve success status, enable event pull in custom
 class(NagiosJSCustom)";

        return retVal;
    });
```

For the SolarWinds connector use:

```
var SolarWindsJSCustom = Class.create();

// Extending solarwinds default script
SolarWindsJSCustom.prototype =
 Object.extendsObject(SolarWindsJS, {
```

For the Zabbix connector use:

```
var ZabbixJSCustom = Class.create();

// Extending zabbix default script
ZabbixJSCustom.prototype = Object.extendsObject(ZabbixJS, {
```

Configure anomaly score thresholds

Metric Intelligence scores anomalies on a range 0-10. This range is broken down to the five levels of event severities, each represented by a different color in the Insights Explorer and in the Anomaly Map. You can configure the anomaly score threshold for each level of severity.

Before you begin

Role required: evt_mgmt_admin

About this task

Anomaly score thresholds are defined in the table Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map]. For example, by default, anomaly scores from 8 through 9 are severity 2 (Major), and are displayed by dark orange color in the Insights Explorer and in the Anomaly Map.

For information on the event severities that each number corresponds to, see Event severities.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Anomaly Score to Severity Mapping**.
2. In the **Metric Anomaly Score to Event Severity Maps** list view, double-click the event severity that you want to modify.
3. Modify the range of anomaly scores that map to the respective event severity.
4. Click **Update**.

View anomaly alerts

Anomaly alerts indicate deviation from projected metric values for monitored CIs. Anomaly alerts are separate from the regular IT alerts, and are not displayed in the Service Operations Workspace. You can define an anomaly alert promotion rule to generate an IT alert that is based on anomaly alerts.

Before you begin

Role required: evt_mgmt_user

About this task

The statistical model is used to calculate standard deviations, upper and lower bounds, and statistical outliers which are then used to detect anomalies. An anomaly occurs when metric values are out of the projected values according to the statistical model. The system monitors the frequency and persistence of statistical outliers across time to compute a score between 0-10 that indicates how abnormal a deviation is.

Metric Intelligence constantly generates anomaly alerts whenever the anomaly score is above zero. If there is a score that is above four and which has changed from the previous score, then it is sent to the instance. On the instance, the entire sequence of anomaly scores over time can then be displayed in the Insights Explorer.

Metric Intelligence monitors historical data to ensure that metric bounds are accurate and that the alerts close when the anomalous behavior stops. Metric Intelligence also ignores irrelevant anomalies based on the metric's labels. For example, if the available CPU increases from its upper bound of 50% to 60%, the *`available`* label is identified as an indicator that the behavior should not register as an anomaly. This is because the increase in available CPU represents a favorable outcome, even though the metric of 60% would otherwise represent an anomaly.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Anomaly Alerts**.
2. In the **Alerts Anomalies** list view, double-click an alert that you want to view.
   Information about an anomaly alert includes details such as the metric value, promotion parameter, events relevant to the alert (which appear in the alert's work notes), and upper and lower bounds (lower bounds cannot be less than 0). Description includes details about why the anomaly alert was generated, and other details such as the metric name and the anomaly score.

What to do next

Create an Advanced Promotion Engine Definition, to define the conditions which must be met to promote anomaly alerts to IT alerts. For details, see Create a definition for the Advanced Promotion Engine.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View metric values in the Insights Explorer

Metric Intelligence calculates statistics for CI metric data. Insights Explorer displays these metric values as metric charts for the CIs in the CMDB. Insights Explorer lets you overlap any metrics for any CIs in a single chart to create a multi-layered view of metric values across a time range.

Before you begin

Role required: evt_mgmt_user

About this task

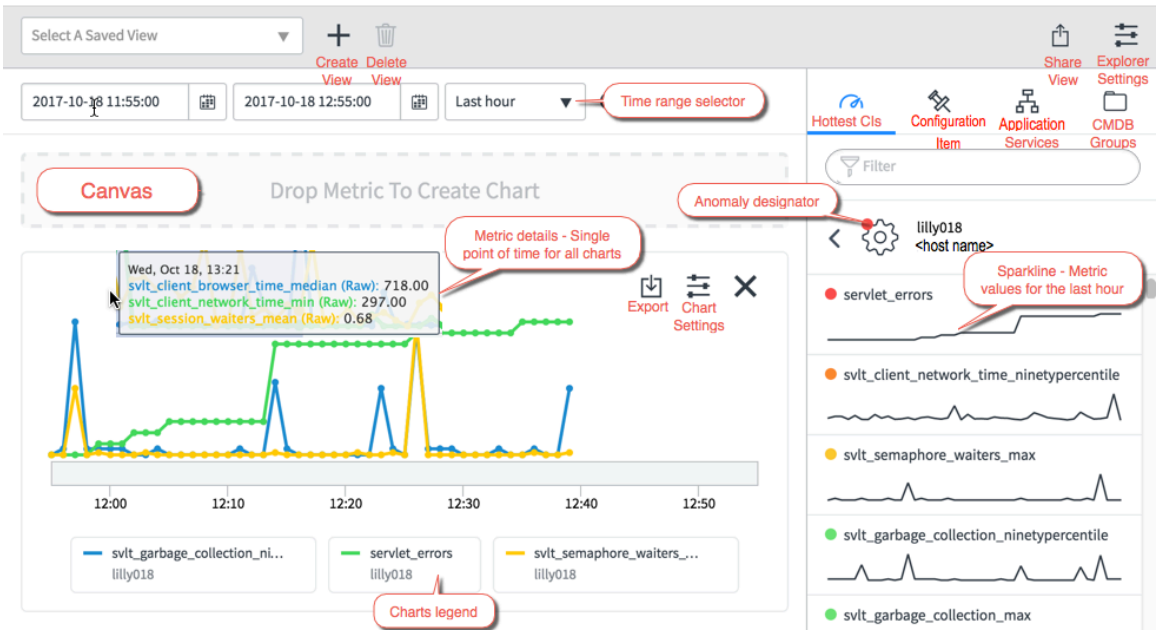
The Insights Explorer provides a canvas to which you can drag various metrics for CIs and create charts. You can place a single metric on the canvas, for an individual metric for a CI. For a more comprehensive chart, you can layer several metrics for a single CI or for different CIs to create a multi-metric chart. In such layered chart, each metric is distinguished by a unique color, which lets you compare metric values across CIs within a specific time range.

Insights Explorer displays metric boundaries according to the most recently configured model. Therefore, legacy anomalies from a previous build may still appear as anomalies, even though according to the current boundaries, the alert does not qualify as an anomaly.

You can also access the Insights Explorer from the following maps:

- View metrics in a Dependency Views map
- View metrics from a business service map

Insights Explorer



If the host name of the CI is available, it appears underneath the CI name. Host name is populated by retrieving the node information from the generated binding event as part of metric binding.

To navigate to a CI for which to display metrics:

- Use Hottest Configuration Items ( ) to quickly access the 10 most anomalous CIs.
- Use Configuration Items ( ) to create a separate custom list of any CIs from the CMDB and then add the metrics for these CIs to the canvas.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use Application services ( ) to create a custom list of application services that let you drill into the CIs of these services. You can then add metrics for these CIs to the canvas.
- Use CMDB Groups ( ) to create a custom list of CMDB Groups that let you drill into the CIs of these groups. You can then add metrics for these CIs to the canvas.

The following colors, which are based on color settings for alert severities, indicate anomaly severities:

Red

Critical severity (highest severity).

Orange

Major severity.

Yellow

Minor severity.

Blue

Warning severity (lowest severity).

Green

Informational. No severity.

The dots at the upper left on the CI icons indicate general anomaly tracking status:

- Grey: Metrics are being tracked for the CI, but none of those metrics have ever had an anomaly.
- Green: Metric for CI had at least one anomaly in the past, but anomaly score is currently 0.
- Colored: Corresponds to the last recorded severity level according to the configuration of the color band ranges.
- No dot: There are no metrics for the CI and there is no data to drill into.

> **Note:**
> **Configuration Items** and **Application Services** are likely to include CIs for which there is no metric data.

Metric Intelligence does not track changes to an anomaly score if it is within the green band range.

As you create charts, a legend for each series chart automatically appears underneath the chart. For a single-metric chart, the legend has entries for the aggregations in the chart. For a multi-metric chart, the legend has entries for the metrics in the chart.

Modifications in the Insights Explorer remain during the session, and once the Insights Explorer is refreshed it returns to its initial state.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Insights Explorer**.
2. Click a CI to drill down to its associated list of metrics, ordered by their most recent anomaly scores.

   For each metric, a sparkline displays metric values for the CI for the last hour. Point to the sparkline to display the metric value at each point of time.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If resource binding is enabled, then the list of series being monitored for a CI also contains series that belong to a resource and metric. The naming convention for such series is '<resource name>/<metric name>'. For a series that is only bound to a CI, the naming convention is '<metric name>'.

3. Drag a metric to the **Drop Metric To Create Chart** area on the canvas and point to the chart to display the exact metric value at each point of time.
   The metric chart displays data for the specified time period, according to the chart settings. By default, raw data is displayed. If the time period is longer than a week or earlier than the last week, then average data is displayed. Drag subsequent metric to the canvas as follows:
   - In the **Drop Metric To Create Chart** area, so it is displayed individually in a new chart.
   - Onto an existing chart, in the **Replace Chart** highlighted block to overwrite the existing chart.
   - Onto an existing chart, in the **Add Metric** highlighted block to overlap it with the existing metrics in the chart.

     When you display multiple metrics in a single chart, the same aggregation selection applies to all the metrics, and statistics settings are not available. For example, if **Average** is selected in the **Chart Settings**, then averaged values are displayed for all the metrics in the chart.

4. Use the **Search** box to search and filter for specific configuration items, application services, or CMDB groups that are not listed by default.
   In the SEARCH RESULTS section, click the + icon next to an item that you want to add to the ADDED ITEMS section. Or, use advanced search:
   - Select and then click **Add Configuration Item** to add any specific CIs. In the Add Configuration Items dialog box, select a **CI Class Type** such as Linux Server.
   - Select and then click **Add Application Service** to add all CIs included in a specified application services. In the Add Application Services dialog box, select `Discovered Service` or `Manual Service` as the **CI Class Type** and then specify filter conditions to narrow down the search.

     Note:
     You can add an application services only if its *`Operational Status`* is 'operational'.

   - Select and then click **Add CMDB Group** to add all CIs included in a specified CMDB group. In the CMDB Groups dialog box specify filter conditions such as **[GroupName] [starts with] [d]**, to narrow down the search.

   After selecting the items that you want to add, click **Add**.

5. Add related CIs:

   a. Click the **Add related CIs** ( ) icon next to a CI.
   The Add Related Configuration Items dialog box appears, displaying all relationships in which the selected CI is a parent or a child.

   b. To further filter the list, you can define specific conditions that must be met.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the relationships from which you want to add the parent or the child CI, whichever is not the selected CI.

d. Click **Add**.

The CIs from the selected relationships, which are not the selected CI, are added to the list of CIs in the Insights Explorer.

6. Point to a legend item and click its '**X**' icon to remove the corresponding metric from the chart, or to disable the corresponding series from the **Chart Settings**.
7. Click the cog **Settings** icon to open application settings:
   - Enable, disable, or set the frequency for refreshing anomaly data on the Insights Explorer.
   - Activate or deactivate the display of related lists such as All Alerts, Incidents, and Problems. For more information, see Create or modify map indicators.
8. Click the **Chart Settings** icon to toggle the display of statistics and aggregations on the chart. Enabling or disabling an item to add or to remove metrics from a chart, also updates the legend of the chart to reflect the change.

Chart Setting	Description
Show Bounds	Displays a computed upper and lower bound for the metric, based on learning of past values. The upper and lower bounds always display together.
Show Anomaly Scores	Displays anomaly scores on a virtual axis of 0-10. Color code is based on the score thresholds that are defined in the Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map] table.
Average	Displays aggregated average metric values calculated in one hour intervals. Aggregated averages are displayed as follows: ○ For data that is up to 8 days old: Displays 10-minute aggregation windows. ○ For data that is up to 94 days old: Displays 10-minutes aggregation windows. ○ For older data: Displays 1-hour aggregation windows.
Minimum	Displays aggregated minimum metric values calculated per one hour time periods. For data that is up to 8 days old: Displays 10-minute aggregation windows.
Maximum	Displays aggregated maximum metric values calculated for one hour time periods.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart Setting	Description
	For data that is up to 8 days old: Displays 10-minute aggregation windows.
Raw	Displays the raw, unaggregated metric values. These values are kept only for the last 8 days.

What to do next

- Point to the icon of a CI in the right-hand side bar to display the CI type.
- Zoom in or out by changing the default **Last Hour** time range selection. Select one of the preset time periods to display anomaly scores for the last **6 Hours** for example, or specify a custom time period for up to 90 days back.

  To zoom in, highlight a section of a chart by pointing to the upper left corner of the section and dragging the mouse device to the lower right corner of the section. The time range of the chart changes accordingly. If there are other charts on the canvas, they are all automatically synchronized to display data for the same time range. The time range in the title bar automatically updates to reflect the new time range.
- Right-click on a CI in the right-hand side bar and select **View Form** to open its CI form.
- Click the map icon next to an application service listed in the **Application Services** tab, to open its application service map.
- Click Remove ( ) next to a CI to remove it from the Insights Explorer.
- Click the Export icon in a chart to download it as a .png or .svg image, or as a .pdf document.

Related topics

Create an Insights Explorer view

Create an Insights Explorer view

You can create a custom view in the Insights Explorer that saves any metric charts that were added to the canvas, and any added configuration items. After you create a view, you can share a link to the view.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Insights Explorer**.
2. Click **Create View** ( ), and enter a **Name** in the Create New View dialog box.
   If you are already creating a view, then you can choose **Create With Existing** to load an existing view to work with rather than starting with a blank canvas.
3. Click **Create**.
4. Add items to be included in the view:
   a. Drag metrics and create charts on the canvas.
   b. Add configuration items.
   While modifying a view, it is automatically saved every time you update it. The time settings are not saved in views, and when a saved view is loaded, its time period is always set to **Last hour** displaying current information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Share a view: Click **Share View** ( ), and then in the Share dialog box, click **Copy Link**. Send or paste the link to make it accessible to whoever you want to share the view with. A shared link captures the time range of the view, the charts that were added to the canvas, and any added configuration items.
- Display a saved view: Open the **Select a Saved View** drop down list, and select a previously saved view that you want to display.

View metric charts in Agent Workspace

Agent Workspace for Metric Intelligence provides easy access to metric charts for a CI. On an alert form, you can drill down to important metric charts for the CI that is associated with the alert.

Before you begin

- The CI that you want to view metric charts for, must be associated with an alert.
- The Metric Dashboard Metadata [sa_metric_dashboard_metadata] table must contain active chart configurations for the CI class for which you want to view metric charts.

Role required: workspace_user and itil

About this task

The set of metric charts, chart types, and other chart characteristics, is determined by the chart configurations in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table, for the CI class.

Procedure

1. Navigate to **Agent Workspace** and click **Agent Workspace Home**.
2. In Agent Workspace, click **List** and in the **Lists** panel, select one of the **Alerts** categorized lists such as **All Alerts** or **Top Priority**.
3. In the alerts list view, open an alert.
   The alert must have a **Configuration item** associated with it.
4. In the **Details** tab of the alert form, click **Metrics**.

Result

All metric charts that are configured for the CI associated with the alert, and that are active, appear on the metric charts form in the **Metrics** tab. The calculation of the default time range for the charts is based on the times that the first and last events that generated the alert, occurred.

What to do next

- Modify the time range for the charts by changing **Start Time** and **End Time**. When you modify the time range, all charts are updated to reflect the new time range.
- Click the cog wheel **Open settings** icon and change the settings for all charts:
  - **Show bounds**: Show the bounds in the chart. Even if enabled, there are no bounds in a chart for aggregated resources.
  - **Show legend**: Show chart legend.
- Click **Insights Explorer** to open the Insights Explorer in a new browser tab. That Insights Explorer opens with the current CI pre-selected and with the current time range settings in Agent Workspace.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure metric charts for Agent Workspace

Configure the set of Metric Intelligence metric charts, chart types, and other chart characteristics, that appear in Agent Workspace.

Before you begin

Role required: admin or evt_mgmt_admin

About this task

Up to 10 metric charts for a class can be configured to appear in the Metric Intelligence metric charts form in Agent Workspace. Metric chart configurations are stored in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table, determining which metric charts appear for a CI that is associated with an alert. By default, the Metric Dashboard Metadata contains pre-configured metric charts for several classes.

If resource binding is enabled and you specify a **Resource Type** in the metric chart configuration, then all the resources for the CI are included in the chart. The class table for the resource class (such as *ci_resource_metric_extension*) that you specify is used for retrieving all the resources for the CI. Then, for each point in time in the data series, the values of resources are aggregated into a single data point which is the average of the metric values of all resources for that point of time.

Chart aggregation

Aggregation is applied differently, depending on the setting of **Chart Type***, and on whether resources are included in the chart as indicated by the setting of* **Resource Type***:*

Chart type	Resources	Aggregation
Time_Series	No	No aggregation
Time_Series	Yes	Resources are averaged per data point.
Single_Score	No	Data points are aggregated according to the **Chart Aggregate** setting.
Single_Score	Yes	Resources are averaged per data point and then data points are aggregated according to the **Chart Aggregate** setting.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Metrics View Configuration**.
2. In the Metric Dashboard Metadatas (Dashboard Metadata) list view, select an existing configuration or click **New**.
3. Fill out the Metric Dashboard Metadata form.

Field	Description
Active	Include the chart on the Metric Intelligence charts form in Agent Workspace.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Resource Type	Resource class associated with the CI and for which to retrieve and aggregate all resources.
Configuration Item Type	CI class that the chart applies to such as *cmdb_ci_metric_extension*.
Chart Aggregate	Type of aggregation that is applied for single-score charts. Aggregation can be the average of the data points in the time series. Or, the minimum, maximum, or the last data point in the time series.
Source Metric Type	Metric such as '% Free Space' that is being monitored for the CI type.
Order	Order in which the metric chart appears within all metric charts specified for the class. For proper appearance and alignment, all single-score charts always appear after any time-series charts, regardless of order settings.
Chart Type	○ Time_Series: Charts all the data points in the time series for the metric and CI of the chart. ○ Single_Score: A single number which is the aggregation of all data points in the time series for the metric and CI of the chart. Aggregation is determined by the setting of **Chart Aggregate**.

View self-health monitoring statistics for Metric Intelligence

Monitor the status of components and processes of Metric Intelligence. Use the XMLStats page to view statistics and diagnostic details that can help with troubleshooting issues with Metric Intelligence.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Open a browser and enter the URL to the instance.
   Type in: `http://<instance name>.service-now.com`
2. Append the following text to the instance URL: `xmlstats.do?include=XMLStatsOI`.
   The complete URL format is: `http://<instance name>.service-now.com/xmlstats.do?include=XMLStatsOI`
3. Hit Enter.

Result

Details are separated between two sections, instance level statistics and node level statistics. Details in the node section are specific to the node in the URL.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node section

Entry	Description
batches_recieved	Number of batches of metrics that the node received from the MID Server.
batches_processed	Number of batches of metrics processed on the node.

Details in the instance section are for the entire instance, showing the status of the self-health monitors.

Instance section

Entry	Description
scheduled_jobs_monitor	Status of the self-health monitor that checks if the essential Metric Intelligence scheduled jobs are active.
distributed_cluster_monitor	Status of the self-health monitor that checks if the Metric Intelligence MID Server distributed cluster is running properly.
oi_extension_monitor	Status of the self-health monitor that checks if the Metric Intelligence extension is running properly.
metrics_collection_monitor	Status of the self-health monitor that checks if metrics are being collected by active connectors that are configured for metrics collection.

Verify that the definitions for the Advanced Promotion Engine are active

Verify that the Advanced Promotion Engine definitions that come with the base system are active.

Before you begin

Role required: evt_mgmt_admin

About this task

The active definitions promote a group of anomaly alerts to the All Alerts table when all of the definition's conditions are met.

You can't modify the conditions of the definitions that come with the base system. For information on creating customized definitions, see Create a definition for the Advanced Promotion Engine.

Procedure

1. Navigate to **All** > **Advanced Promotion Engine** > **Advanced Promotion Definitions**.
2. Select the Advanced Promotion Engine definition that you want to be active:
   - Windows Server
   - Linux Server
3. Verify that the **Active** check box is selected.
4. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a definition for the Advanced Promotion Engine

Create a definition for the Advanced Promotion Engine so that you can define the conditions for promoting the anomaly alerts to IT alerts. By promoting the alerts that meet the conditions, only the most relevant alerts move to the table.

About this task

IT Alerts appear in the Express List and are addressed by an operator.

Only metrics that are associated with a metric configuration rule that has **Anomaly score level = Anomaly alerts** are considered for promotion to IT alerts. For details on metric configuration rules, see Metric Configuration Rules.

Before you begin

Ensure that the Metric Intelligence plugin (com.snc.sa.metric) is installed.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Advanced Promotion Engine** > **Advanced Promotion Definitions**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the definition.
4. In the **Order** field, set the execution order for the definition.
   The definitions with a lower order are executed first.
5. Activate the definition by selecting the **Active** check box.
6. On the **CIs** tab, fill in the fields for the CI alerts that you want to consider for promotion.

CIs tab fields

Field	Description
CI class	CI class alerts to be promoted to the All Alerts table.
Filter	Filter to restrict which CIs that the definition applies to. Select **New Criteria** to configure the conditions that the definition applies to. You can add more conditions by selecting either **OR** or **AND**.
Skip CIs that were created less than this number of days ago	Number of days in the past that any CI created during that time is ignored. For example, a value of 7 indicates that any CIs created less than 7 days ago are not considered for promotion to the All Alerts table.

7. On the **Severity** tab, enter the minimum severity of alerts to be considered for promotion.
   Alerts with the indicated severity level and higher levels are considered for promotion.
8. On the **Number of Alerts** tab, in the **Number of alerts on CI** field, enter the minimum number of a CI's alerts with an identical severity level (or higher) to be considered for promotion.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, a value of 3 indicates that at least three alerts with the indicated severity (or higher) must exist on a CI for the alert to be considered for promotion.

9. On the **Time Window** tab:
   - In the **Consider alerts updated at least this number of minutes ago** field, enter the minimum number of minutes old for an alert to be considered for promotion.

     For example, if the value of the field is 5, only alerts that are updated at least five minutes ago are considered for promotion.
   - In the blue box, select the number of minutes link to modify the amount of minutes during which alerts are to be considered for promotion.

     The **Properties** page opens and you modify the value in the **The width of the time...** field.

     Default = 30.

   For example:
   - The current time is 10:05.
   - In the **The width of the time...** field, you entered a value of 30.
   - In the **Consider alerts updated at least this number of minutes ago** field, you entered 5.

   Alerts that occur between 9:30-10:00 are considered for promotion.

What to do next
Ensure that the a metric configuration rule exists which includes metrics you want to be promoted to an IT alert, and that the anomaly score level of the rule is **Anomaly alerts**. For details on configuring a metric configuration rule, see Create a configuration settings rule.

View the promoted events

View the anomaly alerts that the Advanced Promotion Engine promoted to IT events. Viewing IT events enables you to track the source of the event.

Before you begin
Role required: evt_mgmt_user

About this task
The system generates an IT event when an anomaly alert is promoted. Those events then become IT alerts. For details, see View the promoted anomaly alerts.

Procedure
1. Navigate to **All** > **Advanced Promotion Events**.
2. On the Events page, view the IT events that are created from the anomaly alerts by the Advanced Promotion Engine.

View the promoted anomaly alerts

View the anomaly alerts that the Advanced Promotion Engine promoted to events, which are then processed as alerts in the All Alerts table. Viewing alerts in the All Alerts table enables you to track the source of the alert.

Before you begin
Role required: evt_mgmt_user

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The Event Management alert grouping feature takes the anomaly alerts that are promoted to the IT events and groups them into new IT alerts.

The Alerts table displays all of the relevant issues in the system.

Procedure
1. Navigate to **All** > **Advanced Promotion Engine** > **Anomaly Alerts**.
2. In the Is Advanced Promoted column header, view the alerts with a value of **true**.
   The IT alert that is created from the anomaly alert appears in the IT Alert column.
3. **Optional:** Select an alert to receive more information about the alert.
   For details on the displayed additional information, see Alerts in Service Operations Workspace.

Create metric rules

Create a metric rule to determine the metric, the threshold values and ranges, and the severity level of generated events. You can add a filter that determines the Configuration Items (CI) types or resources for which you receive alerts. For example, you can configure a filter to receive alerts only for Windows servers.

Before you begin
Role required: evt_mgmt_admin

About this task
When a metric crosses or falls within the range of a configured threshold, the system creates a single event, which is eventually processed into an IT alert. The severity of the event (and alert) is determined by a defined threshold, and the event is bound to a CI.

Procedure
1. Navigate to **All** > **Event Management** > **Metrics** > **Metric Rules**.
2. Select **New Metric Rule**.
   The **CI selection** page opens.
3. Select the CI class on which to run the rule in the **CI Class** field.
   Only CIs containing metrics are available for selection.
4. **Optional:** Apply a filter within the selected CI class.
   For example, if you selected a CI class of **Linux Server**, you can apply a filter to indicate that the rule applies only to those servers with a host name that starts with a specified string.
5. Select **Next**.
   The **Alert criteria** page opens.
6. Select the metric and criteria to create an alert.

   a. Select the alert severity that you want to configure in the **Alert severity** field.
      Choose from the following:
      - Critical
      - Major
      - Minor
      - Warning

   b. Select the metric for the alert severity to apply to in the **Metric** field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the comparison operator (equals, is greater than, is greater than or equals, and so forth) in the **Comparison operator** field.

d. Enter a value in the **Value** field.

For example, you can configure criteria to indicate that when the metric **node_rx_packets** is greater than 10, a Critical alert is generated.

To define additional alert severities, select **Add another alert severity** and repeat this step.

7. Select when to generate the alert in the **Alert when** section.
Choose from the following:
   - **All sampled values must breach the criteria in the following time period**.

     Select the time period, in minutes.
   - **Average of sampled values in the following time period must breach the criteria**.

     Select the time period, in minutes.
   - **Any time the sampled values breach the criteria**.
8. Select **Next**.
The **Name and activation** page opens.
9. Verify the name and details of the metric rule.

   To activate the rule, ensure that the **Active** toggle switch

is activated.
10. Select **Finish**.

Create an event rule to bind metric events to host CIs

Create event rules to explicitly allow binding of metric events to host CIs.

Before you begin

Role required: evt_mgmt_admin

About this task

Starting with the London release, Metric Intelligence no longer relies on the default Event Management binding workflow which binds nodes to host CIs. Event Management is configured to apply the default host binding algorithm when an event rule cannot find a CI to bind to, based on event data. In Metric Intelligence, with a given event rule and two different events, there can be a situation where one event binds to the correct CI and another event cannot bind. In this case, the same metric types would be created for the selected CI and for the host level CI, causing confusion.

For example: With an event rule that binds the disk percentage metric to a storage disk, one event can find a disk CI and another event cannot. This results in the disk percentage metric being created for a disk CI and for a host CI.

To avoid this confusion, Event Management default host binding is disabled for metric events in the base system. To allow host binding for metric events, explicitly create the following event rule in the Event Management event rule designer. The underlying binding functionality of the event rule designer is used to map metrics to CIs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules** to open the event rule designer.
2. Click **New** and ensure that the **Active** toggle switch is set to the right (Active).
3. On the **Event Rule Info** tab:
   a. Set **Source** to the data source that this rule applies to.
   b. **Optional:** Enter a **Description** such as `Bind metrics at host level`.
4. On the **Event Filter** tab, set a filter condition to indicate that **Classification** is **Metric**.
5. Click **Save**.

Metric Intelligence reference

Reference topics provide additional information about Metric Intelligence settings and properties.

Insights Explorer settings

You can configure Insights Explorer settings to control for example, the refresh frequency or the display of related records.

Click the cog **Settings** icon to open the Application settings dialog box.

Setting	Description
Refresh interval	Enable and set the frequency for refreshing metrics data on the Insights Explorer.
Indicators	Enable any indicator to display related records such as incidents or problems for CIs. The respective icon displays on the timeline in the metric chart, indicating the number of records for the CI. A toggle is available only if the **Active in Metrics** field is selected on the Map Indicator form for the respective table. For example, the **Incident** toggle is available only if **Active in Metrics** is selected on the Map Indicator form for the incident [Incident] table.

Sensitive Bounds Properties

Property Name	Description
sa_metric.sensitive_bounds_calculation_enabled	Enable/disable sensitive bounds calculation. Default: True
sa_metric.sensitive_bounds_percentile	Percentile value of sensitivity bounds calculation. If the configured percentage of metric values falls within the number of standard deviations (STDs) indicated in the *sa_metric.sensitive_bounds_sensitivity_fact* property, sensitive bounds are detected and sensitivity calculation changes to the value specified in the *sa_metric.sensitive_bounds_control_factor* property. Default: 95%
sa_metric.sensitive_bounds_control_factor	The number of standard deviations (STDs) from the mean metric value by which metric bounds are measured after the system detects sensitive bounds. Default: 5.0
sa_metric.sensitive_bounds_sensitivity_factor	The number of standard deviations (STDs) from the mean metric value by which the system tests for sensitive bounds. Default: 2.0

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Important:
Don't use Now Assist for ITOM for critical security alerts.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring Now Assist for IT Operations Management (ITOM)

Exploring Now Assist for IT Operations Management (ITOM)

The Now Assist for IT Operations Management (ITOM) application uses generative AI to provide alert analyses. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Alert analysis is a crucial feature that completely transforms the alert triage process and can help achieve faster, seamless alert management. Powered by generative AI, it uses a large language model (LLM) to generate human-readable alert titles and detailed descriptions based on enriched and actionable alert data. The AI-generated alert information facilitates quick alert triage and effective analysis for your team, which can lead to a substantial reduction in resolution time.

Alert analysis enhances the efficiency and effectiveness of alert management.

Key features include:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Automatic generation of clear, easy-to-understand alert descriptions.
- Availability of the analysis in the Alert form and Express List.
- Ability to refresh and regenerate data using card refresh.

Note:
Alert analyses are provided in English, irrespective of the language used in the alert description.

Note:
Currently, Now Assist for ITOM only analyzes tag-based, CMDB, Log Analytics, Mixed, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Configuring Now Assist for IT Operations Management (ITOM)

Enable Event Management users to view alert analyses that Now Assist for ITOM creates using generative AI.

Install the Now Assist for IT Operations Management (ITOM) plugin

Install the ITOM plugin in the ServiceNow® Now Assist feature.

Before you begin

Install the AIOps Experience [sn_sow_aiops] application from the ServiceNow Store. See Install Service Operations Workspace for ITOM application for more information.

Role required: admin

About this task

Install Now Assist plugins to enable generative AI and agentic AI on your instance.

Procedure

1. Go to the ServiceNow Store website.
2. In the search bar, enter `Now Assist for ITOM` and then select **Search**.
3. Select the Now Assist for ITOM widget and then select **Get** to make this application available for installation on your instance(s).
4. Install the Now Assist for ITOM application.
   a. Navigate to **All** > **System Definition** > **Plugins**.
   b. Search for Now Assist for IT Operations Management (ITOM).
   c. Select **Install**.

View an alert analysis by Now Assist in Express List

Activate Now Assist AI agents for IT Operations Management (ITOM)

Activate Now Assist AI agents associated with the Triage and analyze alerts agentic workflow, to enable the agentic AI experience.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Before activating the Now Assist AI agents, you must install the Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

To get started with AI agents, you must have:

- An instance on Yokohama patch 3 and above.
- A ServiceNow Pro Plus or Enterprise Plus license.
- AI Search enabled on your instance.

Role required: admin

Procedure

1. Activate the Triage and analyze alert agentic workflow in AI Agent Studio.
   a. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
   b. In the table, select **Triage and analyze alerts**.

   The Triage and analyze alerts page in AI Agent Studio lets you manage the agentic workflow, including options for Describe and connect, Define trigger, and Select display.

2. Make the Triage and analyze alerts agentic workflow visible in the Now Assist panel.
   a. Navigate to **Select display**.
   b. Next to **Now Assist panel** select the **Display** toggle to turn on the display.
   c. Select **Save and test**.
   d. Navigate to **All** > **Virtual Agent** > **Designer**.
   e. From the **Select assistant** drop-down list, select **Now Assist Panel - Platform(default).**
   f. Search for **Triage and analyze alerts**.
   g. Select the row Actions icon ( ), and select **Promoted**.

What to do next

To access AI agents in the Now Assist panel, you must enable the panel. For more information, see Turn on the Now Assist panel .

Activate Now Assist skills in Now Assist for IT Operations Management (ITOM)

You can activate the Now Assist skills for use in Now Assist for IT Operations Management (ITOM).

Before you begin

Before activating the Now Assist skills, you must install the Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

Role required: admin

About this task

Activate the Now Assist skills in the Now Assist for IT Operations Management (ITOM) plugin to enable generative AI on your instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Skills**.

   If you're already in the Now Assist Admin console, select the **Now Assist Skills** tab.

2. On the navigation panel, select **Technology** > **ITOM** to review the skill set.

   Toggle between the list and grid layouts for optimum viewing experience.

3. Select **Activate skill**.

   After configuring a step, select **Save and continue** to go to the next step. Return to a previous step by selecting **Back**.

4. Choose where to display Now Assist skills.

   You can choose where to display Now Assist skills. It is recommended to enable both **In-product desktop** and **Now Assist panel**. For every display option, you can select the roles to whom the Now Assist skills will be displayed.

   a. Navigate to **Select display**.

   b. Select where you'd like to display the skill by selecting the **Display** toggle to turn on the display.

   c. Select **Save and test**.

Configuring AI agents for Now Assist for ITOM

Configure AI agents for the analyze alert impact agentic workflow. Once configured, the AI agents gather information to help you investigate alerts.

Configure the Dynatrace analysis AI agent

Connect the Dynatrace analysis AI agent to your Dynatrace instance to use it in the analyze alert impact agentic workflow. Once connected, the AI agent gathers information to help you investigate alerts.

Before you begin

Before configuring the Dynatrace analysis AI agent, you must do the following:

- Install Now Assist for IT Operations Management (ITOM).
- Integrate Dynatrace platform events with Event Management.
- Copy your Dynatrace connection URL and Dynatrace access token or personal access token.

  The Dynatrace access token or personal access token must have the `problems.read` scope.

Role required: connection_admin and credential_admin

Procedure

1. Navigate to **All** > **sys_alias.LIST**.
2. Search for and select *Dynatrace* **analysis AI agent**.
3. Select **Create New Connection & Credential**.
4. On the form, fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Create**.
   Your connection appears in the **Connections** tab.

What to do next
Activate the Dynatrace analysis AI agent to use it in the analyze alert impact agentic workflow. In AI Agent Studio, navigate to Create and manage, find the Dynatrace analysis AI agent, and turn on the agent in the Define key requirements screen.

> **Note:**
> While working in AI Agent Studio, make sure that the Alert information retrieval AI agent is active. It's also required for the analyze alert impact agentic workflow.

To learn more about using the Dynatrace analysis AI agent in the analyze alert impact agentic workflow, see Use the analyze alert impact agentic workflow.

Configure the Kentik analysis AI agent

Connect the Kentik analysis AI agent to your Kentik instance to use it in the analyze alert impact agentic workflow. Once connected, the AI agent gathers information to help you investigate alerts.

Before you begin
Before configuring the Kentik analysis AI agent, you must do the following:

- Install Now Assist for IT Operations Management (ITOM).
- Integrate Kentik alerts with Event Management.
- Copy your Kentik connection URL, API token, and the email address associated with the API token.

  The Kentik API token requires this permission: Can view devices.

Role required: connection_admin and credential_admin

Procedure
1. Navigate to **All** > **sys_alias.LIST**.
2. Search for and select **Kentik analysis AI agent**.
3. Select **Create New Connection & Credential**.
4. On the form, fill in the fields.

5. Select **Create**.
   Your connection appears in the **Connections** tab.

What to do next
Activate the Kentik analysis AI agent to use it in the analyze alert impact agentic workflow. In AI Agent Studio, navigate to Create and manage, find the Kentik analysis AI agent, and turn on the agent in theDefine key requirements screen.

> **Note:**
> While working in AI Agent Studio, make sure that the Alert information retrieval AI agent is active. It's also required for the analyze alert impact agentic workflow.

To learn more about using the Kentik analysis AI agent in the analyze alert impact agentic workflow, see Use the analyze alert impact agentic workflow.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the New Relic analysis AI agent

Connect the New Relic analysis AI agent to your New Relic instance to use it in the analyze alert impact agentic workflow. Once connected, the AI agent gathers information to help you investigate alerts.

Before you begin

Before configuring the New Relic analysis AI agent, you must do the following:

- Install Now Assist for IT Operations Management (ITOM).
- Integrate New Relic with Event Management.
- Copy your New Relic API key.

  The New Relic API key must be a user key, also known as a personal API key.

Role required: connection_admin and credential_admin

Procedure

1. Navigate to **All** > **sys_alias.LIST**.
2. Search for and select *New Relic* **analysis AI agent**.
3. Select **Create New Connection & Credential**.
4. On the form, fill in the fields.
5. Select **Create**.
   Your connection appears in the **Connections** tab.

What to do next

Activate the New Relic analysis AI agent to use it in the analyze alert impact agentic workflow. In AI Agent Studio, navigate to Create and manage, find the New Relic analysis AI agent, and turn on the agent in the Define key requirements screen.

Note:
While working in AI Agent Studio, make sure that the Alert information retrieval AI agent is active. It's also required for the analyze alert impact agentic workflow.

To learn more about using the New Relic analysis AI agent in the analyze alert impact agentic workflow, see Use the analyze alert impact agentic workflow.

Using Now Assist for IT Operations Management (ITOM)

Use the ServiceNow® Now Assist for ITOM application to view alert or incident analyses that Now Assist creates using generative AI.

Alert analyses include human-readable briefs of the alert and additional technical information to help you investigate the alert more effectively. The analyses are provided in English, irrespective of the language used in the alert description.

For more information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application, see Now Assist for IT Operations Management (ITOM).

Domain separation and generative AI

By default, all skills exist in the global domain. When you use Now Assist in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the summarization skill, Now Assist only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the Now Assist Admin console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

Documentation in this section

See the following documentation to learn more about using Now Assist for ITOM skills.

View an alert analysis by Now Assist in Service Operations Workspace

View an alert analysis by Now Assist for an alert on the alert's Overview tab in the Service Operations Workspace. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note:
Currently, Now Assist for ITOM only analyzes tag-based, CMDB, Log Analytics, Mixed, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_user, evt_mgmt_operator

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ).
3. In the Alerts list, select **All Alerts**.
4. Select an alert.
   The alert opens in a separate tab, displaying the **Overview** subtab.
5. In the **Analysis** section, select **Analyze alert**.
6. Review the information provided in the alert analysis.

Note:
Alert analyses are provided in English, irrespective of the language used in the alert description.

View an alert analysis by Now Assist in Express List

View an alert analysis created by Now Assist using generative AI. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note:
Currently, Now Assist for ITOM only analyzes tag-based, CMDB, Log Analytics, Mixed, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) next to the alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.

Note:
Alert analyses are provided in English, irrespective of the language used in the alert description.

6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

View an alert group analysis by Now Assist in Express List

View an alert group analysis created by ServiceNow® Now Assist using generative AI. The analysis offers a simplified, human-readable description of the alert group and technical information to help you investigate it more efficiently.

Before you begin

Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

View important information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Role required: evt_mgmt_operator

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the left navigation bar.
3. In the Active alerts list, select the information icon ( ) to the left of an alert group to display the preview panel.
4. On the preview panel Info tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.

> **Note:**
> Alert analyses are provided in English, irrespective of the language used in the alert descriptions.

6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Related topics

Viewing an alert group analysis by Now Assist in Express List

View an error analysis by Now Assist in Agent Client Collector

View an error analysis created by Now Assist using generative AI. Error analyses enable asking questions on a specific agent's error or error code.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select the **Agent Client Collector (ACC) Diagnostic** entry.
3. Locate the **Add AI agents that can perform these steps widget** and select the **Agent Client Collector (ACC) Diagnostic** entry.
4. Enable the **Now Assist** option by sliding the **Display** toggle switch to the right.

Display toggle bar

Now Assist retrieves information on errors within agents.

Save the alert analysis summary by Now Assist as alert group description in Express List

Save the human-readable summary generated by Now Assist in the Alert analysis as the description of an alert group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the left navigation bar.
3. In the Active alerts list, select the information icon ( ) to the left of an alert.
4. On the preview panel Info tab, select **Analyze** in Alert analysis by Now Assist.
5. Review the human-readable, AI-generated Alert analysis summary.

   Note:
   Alert analyses are provided in English, irrespective of the language used in the alert description.

6. **Optional:** Edit the summary content.
7. Select **Save description** to save the summary content as the description of the alert group. The AI-generated summary content replaces the original description of the alert group.

Generate an alert group description in Express List using Now Assist

Use Now Assist to generate a meaningful description of an alert group in Express List that encompasses all the alerts within the group. The generated description replaces the original description of the group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the navigation bar.
3. In the Active alerts list, select the information icon ( ) for an alert.
4. Below the displayed alert group description, select **Update description**.
   Now Assist generates a comprehensive new description of the alert group, which encompasses all the alerts within the group. If you select **Update**, the generated description replaces the original description of the alert group taken from the earliest, most severe secondary alert in the group.
5. **Optional:** Restore the original alert group description by selecting the revert icon ( ) next to **Update description** and then choosing **Restore**.

Launch an alert analysis from the Now Assist panel

Initiate an alert analysis from the Now Assist panel. The alert analysis displays directly in the Now Assist panel for convenient review.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

For comprehensive information about the Now Assist panel, see Now Assist panel.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ) in the navigation bar.
3. Select **Lists** > **Alerts** > **All Alerts**.
4. Initiate an alert analysis from the Now Assist panel using one of the available methods.
5. **Optional:** Enter follow-up questions or requests.
   For example: `Summarize the analysis` or `Show alert severity`.

Create an incident from an alert with Now Assist in Express List

Create an incident with a human-readable, AI-generated description from the Express List pane by using Now Assist.

Before you begin

Currently, this feature is available for CMDB, Log Analytics, tag-based, and component-based alerts.

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

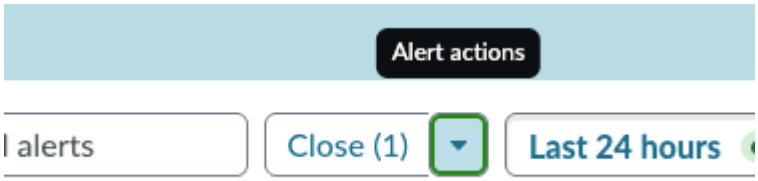
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express List icon .
3. Create an incident from a selected alert.
   a. In the Express List pane, select the check box for the desired alert.

      Note:

      To display the individual alerts inside a group, select the chevron icon ( ) at the beginning of the alert group row.

   b. Select the **Alert actions** drop-down list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Under **Response actions**, select **Create Incident with Now Assist**.

An incident with a human-readable, AI-generated description is created from the selected alert and a confirmation message is displayed.

Speed up alert resolution with a Now Assist analysis of past related incidents

Use Now Assist to investigate relevant past incidents and present effective strategies used to resolve them.

Now Assist queries historical records to find past incidents and analyzes their frequency, criticality, work notes, and resolution. It presents a summary of the most relevant related incidents in the Now Assist panel. The summary includes resolution strategies used, as well as contact details for individuals or teams who resolved the incidents and could assist with the current alert. The information provided helps you better understand the context and significance of the current alert and work more efficiently toward resolving it.

Note:
An additional Large Language Model (LLM) validation layer is added to the AI search capability to improve the accuracy of results returned by AI skills.

Generate a Now Assist summary of past related incidents

View a Now Assist summary of past incidents on the same or related Configuration Items (CIs) and strategies used to resolve them.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- Ensure that the Alert investigation skill is active. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

For comprehensive information about the Now Assist panel, see Now Assist panel.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ) in the navigation bar.
3. Select **Lists** > **Alerts** > **All Alerts**.
4. Open an alert.
5. Select the Now Assist panel icon ( ).
   The Now Assist panel displays.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Request a Now Assist past incidents investigation by selecting **Analyze related incidents**.
   An additional Large Language Model (LLM) validation layer is added to the AI search capability to improve the accuracy of results returned by AI skills.
   A summary of the most relevant related incidents displays in the panel.
7. **Optional:** Inspect the details of a related incident by selecting the relevant link under Related Incidents.
   The incident page opens, showing the Overview tab.

Using agentic workflows in Now Assist for IT Operations Management (ITOM)

Use the IT Operations Management (ITOM) agentic workflows to complete tasks autonomously.

Available agentic workflows for ITOM AI agent collection

Agentic workflow name	Description	Available AI agents
Triage and analyze alerts	Triages alerts by updating assignments, analyzing alerts, detecting recurring patterns, and differentiating between noise and real alerts.	• Alert handling AI Agent • Alert analysis AI agent • Alert history analysis AI agent • Related incidents analysis AI agent • Alert verification AI agent
Agent Client Collector (ACC) Diagnostic Workflow	Displays error analysis created by Now Assist using generative AI. Error analyses enable asking questions on a specific agent's error or error code.	Agent Client Collector (ACC) Diagnostic
Analyze alert impact	Investigates an alert and gives you the context that you need to respond efficiently.	• Alert information retrieval AI agent • Alert impact verification AI agent • Business and technology management service impact analysis AI agent • Dynatrace analysis AI agent • Kentik analysis AI agent • New Relic analysis AI agent

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available agentic workflows for ITOM AI agent collection (continued)

Agentic workflow name	Description	Available AI agents
		• Service instance impact analysis AI agent • User impact analysis AI agent
Analyze potential impact	Analyzes the potential impact of a change request on relevant servers and suggested services.	Analyze Potential Impact
TLS Certificate renewal	View all certificates about to expire and renew then automatically all at once.	

Important:
By default, all agentic workflows and AI agent records are read only.

AI model providers

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the Now Assist Admin console. For more information, see Large language models on the ServiceNow AI Platform®.

Security

Enable security settings to run AI agents and agentic workflows using Access Control Lists (ACLs) and user identities. You can configure and manage the ACLs in AI Agent Studio. See Implement access control in Now Assist AI agents for more information.

Installed agents

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Visit the following links to learn about the Now Assist for ITOM agentic workflows.

Triage and analyze alerts agentic workflow

Use the triage and analyze alerts agentic workflow to complete preliminary alert tasks and analysis for alerts.

Triage and analyze alerts agentic workflow overview

The triage and analyze alerts agentic workflow uses AI agents to support alert triage, investigation, and analysis. AI agents can perform the following functions:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Acknowledge alerts.
- Assign alerts to individual users and assignment groups.
- Summarize alert and alert group data to create a human-readable description and add technical analysis.
- Investigate relevant past incidents to analyze the significance of the alert and present options for resolution.

Note:
These functions can also be used for the origin alert of an incident when the workflow is accessed from the incident form or Express List using the Now Assist panel.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Use the information on this page to learn about the agents related to the triage and analyze alerts agentic workflow. To modify the triage and analyze alerts agentic workflow, you must duplicate it and adjust the settings according to your requirements. For more information, see Duplicate an agentic workflow.

Important:
When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Triage and analyze alerts agentic workflow

Acknowledge, assign, and investigate current and past alerts to determine significance and possible resolutions.

To access the agentic workflow, use the Now Assist panel. For more information about using the agentic workflow in the Now Assist panel, see Now Assist panel.

AI agents used in the triage and analyze alerts agentic workflow

The triage and analyze alerts agentic workflow uses a team of AI agents to perform preliminary tasks and support alert resolution.

AI agents used in the triage and analyze alerts agentic workflow

AI agent	AI agent role
Alert handling AI agent	Assign, acknowledge, and maintain an up-to-date alert record.
Alert analysis AI agent	Perform alert analysis, and update alert description, when applicable.
Alert history analysis AI agent	Analyze past occurrences, assess its significance, and close the alert when applicable.
Related incidents analysis AI agent	Analyze past incidents and provide insights on common assignments and summarized resolution notes.
Alert verification AI agent	Assess data completeness and determine whether the alert is suitable for analysis.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Analyze alert impact agentic workflow

Use the analyze alert impact agentic workflow to investigate an alert and get the context that you need to respond efficiently.

Analyze alert impact agentic workflow overview

The analyze alert impact agentic workflow uses AI agents to interact with observability tools, such as Dynatrace, Kentik, and New Relic. It also includes AIOps AI agents that analyze service, users, and business impact. Together, the agents surface information to help you do the following:

- Understand the severity and impact of alerts.
- Find potential root causes using insights, such as recent deployments.
- Identify ownership by surfacing relevant services and responsible teams.
- Support stakeholder communication with clear, actionable information.

Use the information on this page to learn about the agents related to the analyze alert impact agentic workflow. To modify the analyze alert impact agentic workflow, duplicate it and adjust the settings.

Important:
When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Analyze alert impact agentic workflow

Investigate an alert and get insights into its severity, business and service impact, ownership, and root causes.

To access the agentic workflow in AI Agent Studio:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Analyze alert impact**.

The Analyze alert impact page lets you manage the agentic workflow, including defining key requirements, adding a preferred trigger, and selecting a UI display. Navigate to Select a UI display to turn on the agentic workflow in the Now Assist panel.

AI agents used in the analyze alert impact agentic workflow

The analyze alert impact agentic workflow uses AIOps and observability AI agents to gather information from alerts and request insights. Only the observability AI agents require additional configuration. For more information, see Configuring Now Assist for IT Operations Management (ITOM).

Important:
Before using the analyze alert impact agentic workflow, activate its AI agents. In AI Agent Studio, find the AI agents in Create and manage, and turn on the AI agents in the Define key requirements screen.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents and their roles

AI agent	AI agent role
Alert impact verification AI agent	Validates your question and extracts a single alert to analyze.
Alert information retrieval AI agent	Gathers key observability details for a specific alert.
Business and technology management service impact analysis AI agent	Analyzes impact by mapping application services to business and technical services using Service Portfolio data.
Dynatrace analysis AI agent	Gathers insights from Dynatrace about possible root causes, impacted entities, and impacted environments.
Kentik analysis AI agent	Gathers insights from Kentik about service network performance, connectivity, DDOS attacks, and anomalies.
New Relic analysis AI agent	Gathers insights from New Relic about alert impact, including service and user impact, root cause theories, and responsible teams.
Service instance impact analysis AI agent	Analyzes how the alert affects the associated service instance.
User impact analysis AI agent	Identifies issues linked to the affected services and presents a summarized overview to the user.

Generating the alert analysis

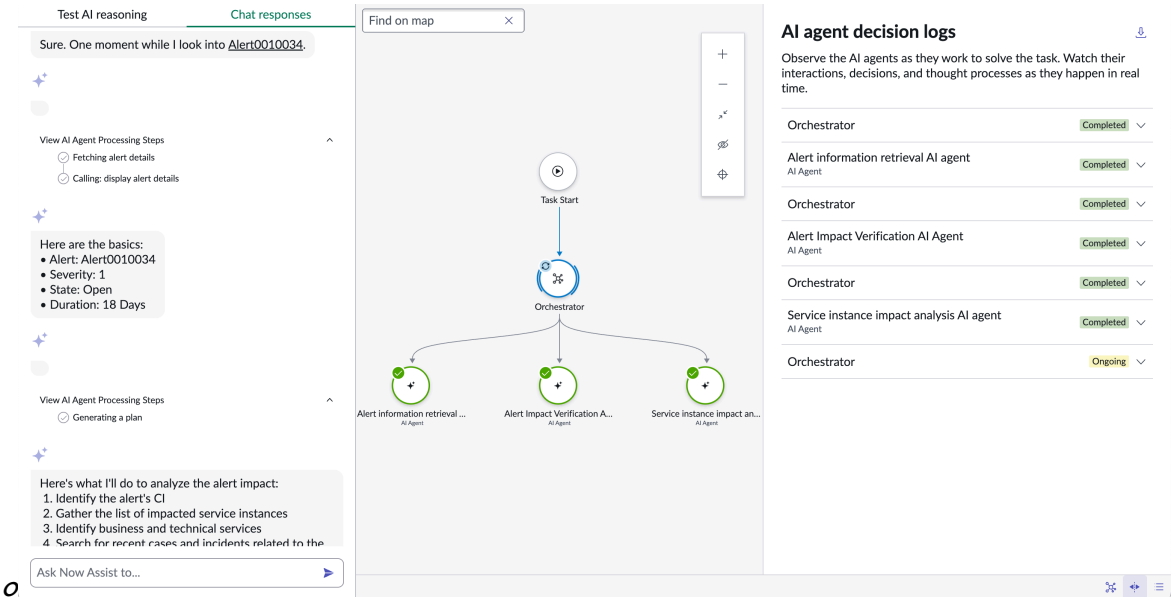
In the agentic workflow record:

1. Review the information in the Describe key requirements screen and Add a preferred trigger screen, make the necessary updates, and then select **Continue**.
2. In the Select a UI display screen:
   a. Turn on the Now Assist panel display.
   b. Select **Save and test**.
3. Test the agentic workflow by asking a question, for example, `What is the impact of Alert0010007?`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Start test**.

Example of an analyze alert impact agentic workflow output in the *ServiceNow AI Agent Studio*



In the *AI Agent Studio*, you get notified when the analysis is generated. You can then act on the information or ask more questions about the alert. For more information about using the agentic workflow in the Now Assist panel, see Use the analyze alert impact agentic workflow.

Use the analyze alert impact agentic workflow

Learn how to use the analyze alert impact agentic workflow in the Now Assist panel. The agentic workflow helps you investigate an alert and get the context that you need to respond efficiently.

Before you begin

Before using the analyze alert impact agentic workflow, you must have the following:

- Now Assist for IT Operations Management (ITOM) installed on your instance. See Install Now Assist plugins.
- The analyze alert impact agentic workflow turned on in the Now Assist panel. See Analyze alert impact agentic workflow.
- AI agents configured and activated for the observability tools integrated with Event Management, such as Dynatrace, Kentik, or New Relic. See Configuring AI agents for Now Assist for ITOM.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon ( ).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select an alert.
4. Open the panel by selecting the Now Assist icon ( ).
5. Ask Now Assist a question about the alert.

   Now Assist uses the relevant AI agents to analyze your question and respond with a summary or insight. The first response for an alert might take several seconds to appear.

What to do next

Use the information that you received to understand the alert impact and respond accordingly. You can also ask more questions about the alert.

Note:
Your conversation in the Now Assist panel is specific to the alert that you selected in Step 3. To ask about a different alert, open that alert and select the Now Assist icon ( ) to start a new conversation.

Agent Client Collector diagnostic workflow

Enable and use AI agents to examine agent behavior through the Agent Client Collector (ACC) diagnostic workflow.

Before you begin

Role required: now_assist_panel_user and either agent_client_collector_user or agent_client_collector_admin

Procedure

1. In a ServiceNow instance, select the Now Assist icon ( ).
2. In the Now Assist panel, enter prompts to invoke the ACC diagnostic workflow and perform remediation actions on the agent.
   Possible prompts include:
   - Diagnose issues with ACC agent <agent name>
   - Multiple errors on <agent name>, diagnose them
   - Provide suggestions to remediate ACC error code <error code number>

Result

An error report is generated, based on the activity logged by the Agent Client Collector Framework.

Analyze potential impact agentic workflow

The analyze potential impact agentic workflow analyzes how a change request might impact servers and suggested services. This analysis helps you make informed decisions about the next steps regarding the change request.

Analyze potential impact agentic workflow overview

Using the analyze potential impact agentic workflow, the analyze potential impact AI agent produces an analysis of potentially impacted relevant servers and suggested services.

Note:
Relevant servers refer to those servers that are currently operational and in use, excluding any non-operational or retired servers.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent used in the analyze potential impact agentic workflow

AI Agent and its role

AI Agent	AI Agent role
Analyze potential impact AI agent	Uses the change request to analyze the potential impact of the change on relevant servers and suggested services.

Generating the impact analysis

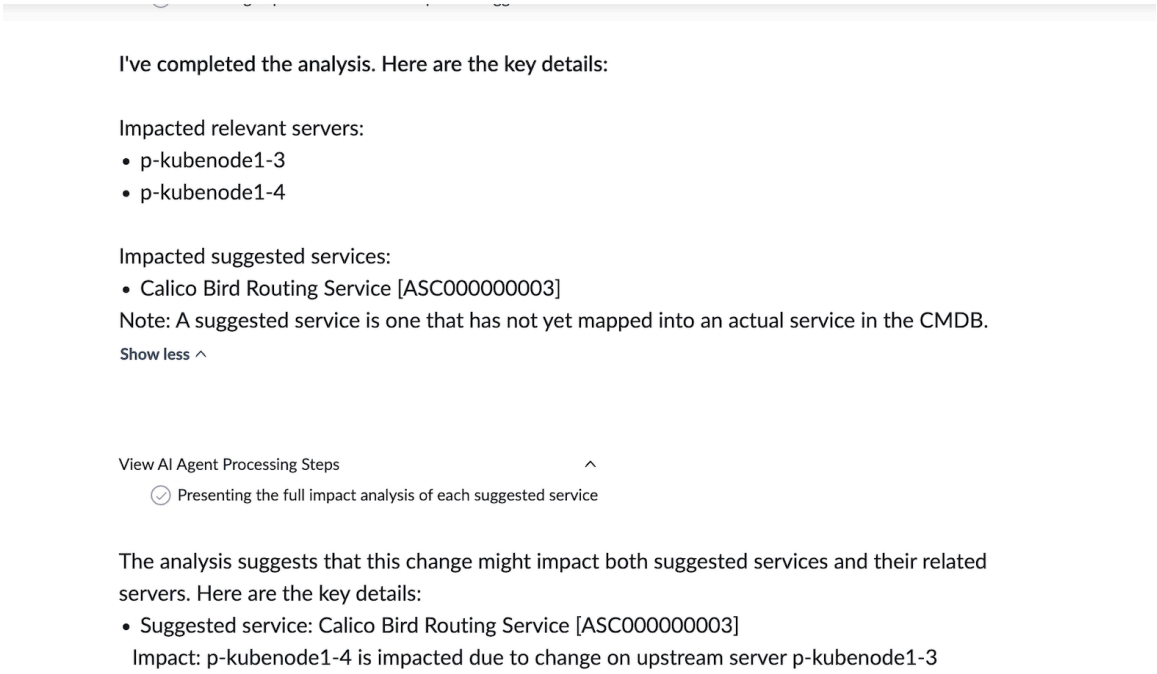
The analyze potential impact agentic workflow in Now Assist uses a single agent to evaluate the potential impact of a change request. When you select the analyze potential impact AI agent in the Now Assist panel, it initiates the workflow as follows:

- **Prerequisite verification** - The agent first verifies that all prerequisites have been met.
- **Change request identification** - If you have a change request open, the agent retrieves the change request number from the current active page. Otherwise, it prompts you to provide the change request number.
- **Server selection**- The agent selects up to 10 affected servers from the affected configuration items (CIs) in the change request.
- **Match identification** - The agent identifies matches between servers and suggested services.
- **Impact analysis** - Eventually, the agent prioritizes and displays up to 10 impacted relevant servers, giving priority to servers that are part of suggested services, and up to 3 impacted suggested services. Additionally, the agent provides you with a summary about each suggested service and how it might be impacted by related servers. This information is displayed in the Now Assist panel.
- **Saving the impact analysis** - The analysis generated by the Analyze potential impact agentic workflow is saved to the change request work notes.

To learn more about using the workflow, see Use the Analyze potential impact agentic workflow to assess a change request.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Analyze potential impact agentic workflow sample



report

Domain separation

Currently, the analyze potential impact agentic workflow doesn't support instances with domain separation. For optimal results, conduct all conversations in English.

Use the Analyze potential impact agentic workflow to assess a change request

Use the Analyze potential impact agentic workflow to assess the effects of a change request. This workflow highlights the potential impacted servers and suggested services to help you identify risks, benefits, and make any necessary adjustments.

Before you begin

Using the Analyze potential impact agentic workflow requires the installation of the following:

- Service Mapping Plus version 1.16.3.
- Now Assist for IT Operations Management (ITOM) version 2.3.0.
- Now Assist for IT Service Management (ITSM) version 11.1.3.

Role required: sn_change_write

Role masking

Required role:

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The agent verifies the prerequisites at the beginning of the agentic workflow. If any prerequisites aren't met, the workflow stops, and you're informed so that you can acquire the prerequisites. For more information about the agentic workflow, see Analyze potential impact agentic workflow.

Procedure

Either initiate the Analyze potential impact agentic workflow using a change request number or from an open change request.
The Analyze potential impact agentic workflow is initiated and the agent starts with the verification of the prerequisites.

Result

In the Now Assist panel, the Analyze potential impact agentic workflow generates an analysis of the potentially impacted relevant servers and suggested services.

Now Assist certificate renewal AI agent

Using the Now Assist certificate renewal AI agent, see which certificates are about to expire and renew them. Choose a specific certificate and renew it on the spot.

Use the Now Assist certificate renewal AI agent to automatically renew certificates before they expire. You can perform the following with the Now Assist certificate renewal AI agent:

- Renew a single certificate
- Find all certificates that are about to expire
- Renew all certificates that are about to expire in a single prompt

You must first configure your system for automatic renewal. Configuring requires the following steps:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

AI agents use role masking to determine which users can access them and what data they have access to. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Discover and renew certificates about to expire using Now Assist

Use Now Assist to find out which certificates expire on a certain date or within a certain date range. Now Assist produces a Unique Certificates list of these certificates and prompts you to renew them in a single click.

Before you begin

Complete the following steps to configure your system for the Now Assist certificate renewal AI agent:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents use role masking to determine which users can access them and what data they have access to. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Role required: sn_disco_certmgmt.pki_admin

Procedure

1. Navigate to **All** > **Unique Certificates**.
2. Select the Now Assist icon.
3. Enter `Fetch the certificates expiring between 1 May 2026 and 1 August 2026.`

   Note:
   You can choose any date range that you need.

4. Select the **Certificates** link that Now Assist returns.

Result

Now Assist directs you to a list of certificates that expire between 1 May 2026 and 1 August 2026. Now Assist then asks you if you want to renew these certificates. Renew them all at once by selecting **yes**.

Automatically renew a certificate using the Now Assist certificate renewal AI agent

Automatically renew a single certificate using the Now Assist certificate renewal AI agent.

Before you begin

Complete the following steps to configure your system for the Now Assist certificate renewal AI agent:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

AI agents use role masking to determine which users can access them and what data they have access to. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Role required: sn_disco_certmgmt.pki_admin

About this task

Navigate to the certificate that you want to renew and use the Now Assist certificate renewal AI agent to renew the certificate.

Procedure

1. Navigate to **All** > **Unique Certificates**.
2. Select the certificate that you want to renew.
3. Select the Now Assist icon.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Warning:**
> Make sure that you are on the unique certificate page of the certificate that you want to renew.

4. Enter the prompt `Renew this certificate`
5. Answer the questions that Now Assist asks you.

Result
Now Assist updates you on its progress in renewing your certificate. The certificate renewal AI agent gives you a link to the task record that displays the status of the renewed certificate.

Use Now Assist to renew a certificate set to renew manually

Use the Now Assist certificate renewal AI agent to immediately renew certificates set to renew manually.

Before you begin
Complete the following steps to configure your system for the Now Assist certificate renewal AI agent:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

AI agents use role masking to determine which users can access them and what data they have access to. Ones installed with Now Assist applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Role required: sn_disco_certmgmt.pki_admin

About this task
Find tasks that require you to renew your certificates manually and renew them immediately using the Now Assist AI certificate renewal agent.

Procedure
1. Navigate to **Workspaces** > **Certificate Management**.
2. Select **Tasks**.
3. In the **Renewal Tasks** space, select the number of renewal tasks.
4. Select the number of the renewal task that you want to auto-renew.
5. In the **Unique Certificate** field, select the search icon .

> **Note:**
> Selecting the icon opens the certificate record.

6. Select your Now Assist AI tool.
7. In the prompt field of Now Assist, enter `Renew this certificate`.
8. Answer the questions that Now Assist asks you.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The certificate is renewed by the Now Assist AI certificate renewal agent.

Now Assist for IT Operations Management (ITOM) reference

Reference topics provide additional information for configuring and using the Now Assist for ITOM application.

Applications installed with Now Assist for ITOM

Table that lists applications installed with the Now Assist for IT Operations Management (ITOM) application. When you update your application, any newly required application dependencies are installed.

Applications installed with Now Assist for ITOM (sn_itom_gen_ai)

Application name	Description
Now Assist for Platform (sn_genai_platform)	Enables Now Assist skills and Features across various BU applications.
AI agents for AIOps (sn_aiops_ai_agents)	Enables IT operations with AI Agents that can help autonomously triage alerts, assess business and technical impact, investigate root causes, and recommend or execute remediation steps. These agents operate within coordinated agentic workflows.
AI agents for Observability (sn_obs_aia)	Helps IT operators assess business and application service impact, and formulate probable cause theories. Helps prioritize investigations by analyzing data from ServiceNow and collaborating with third-party AI agents from leading APM and observability vendors.
AI agents for Agent Client Collector (ACC) (sn_acc_aia)	Helps IT operators assess ACC agent errors, and provide suggestions on how to remediate issues.
AIOps LEAP (sn_itom_leap)	AIOps LEAP (Learning-Enhanced Automation Playbook) leverages AI-driven insights to mine historical incident data, dynamically prioritize tasks, and generate actionable resolution playbooks.

Questions for the analyze alert impact agentic workflow

Questions to ask about alerts in the Now Assist for IT Operations Management (ITOM) analyze alert impact agentic workflow.

Questions organized by alert source

Ask the following questions about alerts from specific observability tools in the Now Assist panel. For more information about using the analyze alert impact agentic workflow, see Use the analyze alert impact agentic workflow.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert source	What to ask
Dynatrace	• What is the impact of this alert? • What is the root cause entity? • What is the root cause theory? • Which entities are impacted by this alert? • Which environments are impacted by this alert?
Kentik	• Are there network anomalies between the impacted services for this alert? • Is there a DDOS attack in progress at the moment on the impacted services for this alert? • Is there connectivity between the impacted services for this alert?
New Relic	• Have there been recent deployments for this alert? • What are the root cause theories for this alert? • What else is impacted by this alert? • What is the user impact for this alert? • Which engineering teams should I pull in to investigate this alert? • Who owns the impacted entity for this alert?

- Contact Customer Service and Support

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about scripts (and associated script records) in which Now Assist for code generation is called. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

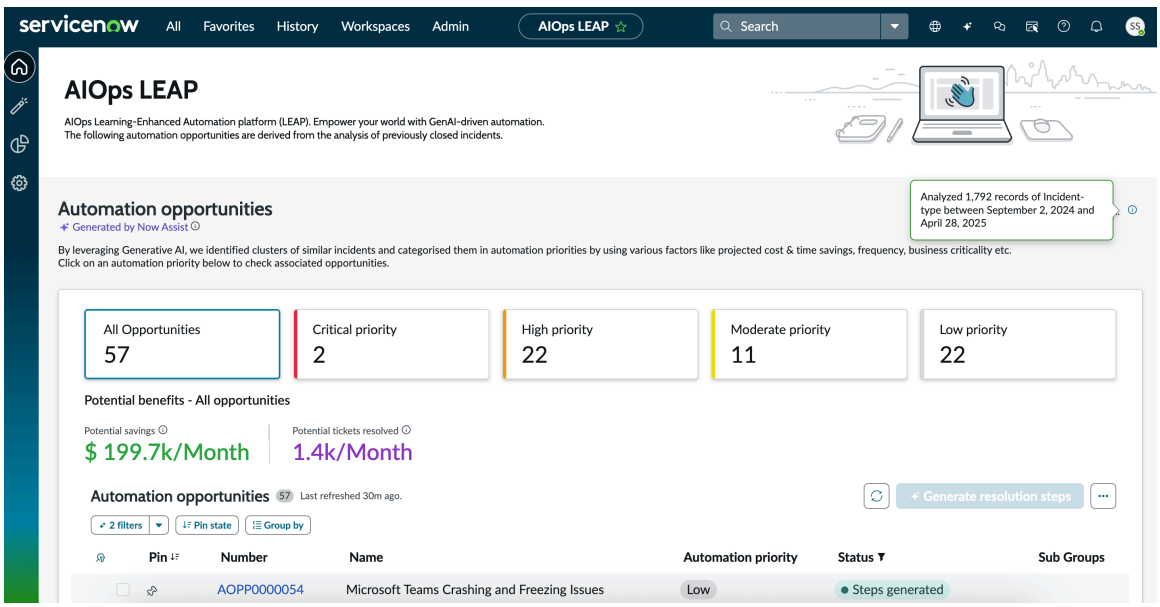
For more information, see the Now Assist documentation.

Exploring AIOps LEAP

AIOps LEAP categorizes similar incidents into groups, performs incident analysis using AI, and creates standard, dynamic resolution playbooks to promote fast incident resolution.

AIOps LEAP overview

AIOps LEAP helps you manage incidents and operational tasks efficiently. It uses AI to gather information from existing incidents and generates resolutions that can be automated. The AIOps LEAP automation provides tools to manage incidents early, speed up resolution, use prebuilt automation, and follow clear steps to handle issues. These tools help support smooth operations.



AIOps LEAP users

User roles

Role	Description
AIOps LEAP admin	You have full control over AIOps LEAP capabilities, including the following: • Turn features on and off • Execute scheduled jobs • Manage AIOps LEAP tables and the AIOps LEAP Workspace • Generate and update resolution steps • Create and view problems and AIOps LEAP playbooks from automation opportunities (AO)

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles (continued)

Role	Description
AIOps LEAP viewer	You can access and view data related to AIOps LEAP, including tables, the workspace, and problems originating from AOs.
AIOps LEAP agent	You can access the AIOps LEAP menu from the Service Operations Workspace (SOW) and trigger AIOps LEAP executions directly from within SOW.

These roles work together to create a streamlined and secure approach for managing automation, resolving incidents, and sharing knowledge across teams.

AIOps LEAP benefits

Promotes automation culture

Uses comprehensive insights from incidents to address automation adoption gaps enabling automation scaling.

Drives incident resolution

Provides guided steps for L1 operators to improve productivity, resolve common issues quickly, and improve overall efficiency.

Targets Outcomes for L1 Operators

Equips L1 operators with structured, data-driven questions for recurring incidents that help address frequent issues and minimize escalations to L2

Improves MTTR

Reduces Mean Time to Resolution (MTTR) through optimized processes and reduced delays.

Optimize Resource Allocation

Facilitates better workload distribution and promotes better usage of resources.

Analyzed data context and filters

The AIOps LEAP landing page displays information about the number of record analyzed and the time period that was considered for analysis.

What to explore next

To learn more about configuring and using AIOps LEAP, see:

- Configuring AIOps LEAP
- Using AIOps LEAP
- AIOps LEAP reference

AIOps LEAP features

AIOps LEAP includes features such as grouping incidents, creating problem records, and generating playbooks.

Identify and prioritize high impact areas

AIOps LEAP uses data-driven analytics to help users identify critical issues and prioritize high-impact automation opportunities. This ensures that resources are

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

prioritized for the areas that deliver the highest operational efficiency and business value.

Measure and enhance performance

AIOps LEAP helps improve Mean Time to Repair (MTTR) and operational efficiency by using advanced analytics and AI-driven insights to continuously monitor and optimize IT processes.

Interpret data and automate records

AIOps LEAP automatically generates problem records and executes automated playbooks by analyzing historical data patterns, enabling faster root cause identification and reducing manual intervention across complex IT environments.

Personas in AIOps LEAP

AIOps LEAP supports different personas who can have different roles assigned to enhance IT Operations Management.

AIOps LEAP personas

Persona	Description	Responsibility
Automation architect	An automation architect is a senior technical expert who designs and develops automation solutions, scaling them when required. They're a bridge between IT operations, business needs, and automation strategy. The automation architect streamlines manual, repetitive, and error-prone tasks.	• Identifies high-impact areas for automation • Develops automation scripts, integrate AI-driven insights, and maintain scalable automation frameworks • Extracts patterns from historical ticket data to optimize future resolutions • Refines automation solutions based on feedback and evolving business needs. • Collaborates with different business units to align automation with enterprise objectives.
IT operator	An IT operator includes all L1 and L2 incident handlers who support day-to-day IT operations.	• Uses AI-generated playbooks to resolve incidents • Accesses the Knowledge Base

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AIOps LEAP personas (continued)

Persona	Description	Responsibility
Buyer, Business goal owner	A buyer or a business goal owner gains strategic and operational advantages using AIOps LEAP.	• Uses AIOps LEAP to improve IT operations • Optimizes resource allocation • Automates recurring issue resolution

An automation architect can use AIOps LEAP to gather feedback and refine solutions. In a similar manner, IT operators will use AIOps LEAP to detects recurring issues and displays suggestions for preventive automation. This enables faster resolution and operators can resolve more incidents independently leading to improved efficiency and service quality.

AIOps LEAP prioritization logic and cost savings calculation

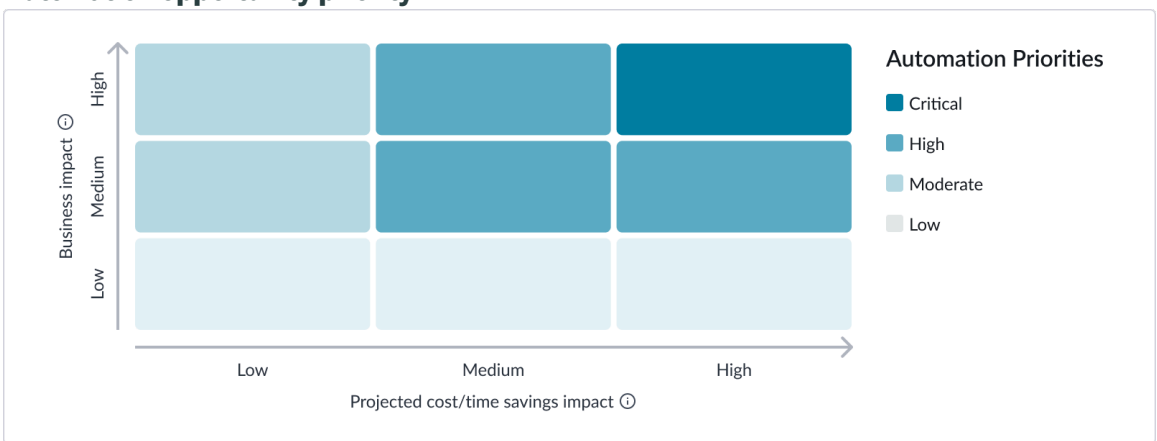
AIOps LEAP uses built-in prioritization logic to identify the highest-impact automation opportunities. This logic helps you focus on the most valuable automation tasks. The calculations provide an estimate of potential cost and time savings. It's best to validate these values in a non-production environment before implementing them in production.

The automation priority is calculated by combining the following key factors:

- Business impact
- Projected cost/time savings

The priority for an automation opportunity is determined using the following chart.

Automation opportunity priority



The key factors are evaluated for each group of related incidents, called#automation opportunities, and the results help teams focus on high-value areas.

Business impact

Each automation opportunity is a cluster of tickets. Every ticket is scored based on the following factors:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business criticality
- Major incident status
- Impact level

These factors are given values. Example values for criticality:

- Most Critical = 100%
- Somewhat Critical = 75%
- Less Critical = 50%
- Not Critical = 25%

Properties table

Key	Default value	Description
ohf_p4	0.8	Overhead factor for P4 records.
ohf_p5	0.4	Overhead factor for P5 records.
ohf_p1	1.8	Overhead factor for P1 records.
ohf_p2	1.4	Overhead factor for P2 records.
cost_per_entry	20	Cost in dollars associated with adding a work note entry to a record.
ohf_p3	1.1	Overhead factor for P3 records.
time_per_entry	0.5	Time in hours associated with adding a work note entry to a record.
first_run_group_limit	0	Total number of groups for which resolution steps are generated in the initial run.
gaf_mapping_min_threshold	0.2	Minimum ratio of incidents pointing to an active group that is considered for remapping after clustering.
group_prioritization_trigger_delay	{"minutes":10}	Delay in seconds before the group prioritization logic is triggered.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You can modify the values in the properties table. However, if you change the values, the calculations will differ.
- You should modify the values in the properties table before activating AIOps LEAP.
- If you modify any values in the Properties table, you must deactivate and reactivate the AIOps LEAP skill

Each factor is weighted. For example, say that Criticality = 0.8, Major Incident = 0.2, and Impact = 0.4.

```
Ticket Score = (Criticality × 0.8 + Major Incident × 0.2 +
 Impact × 0.4) ÷ 3
```

The average of all ticket scores in the group becomes the Business Impact Score. Based on this score, automation opportunities are labeled as high impact (the top 33%), medium impact (next 33%), and low impact (remaining 33%).

Projected cost or time savings impact

AIOps LEAP estimates how much time and cost can be saved by automating a group of incidents with historical ticket data.

The key inputs for cost and time savings are the following:

- Frequency of Incidents (FOI): Average number of similar incidents per month
- Average Manual Work Notes Count (AWNC)
- Overhead Factor (OHF): varies by incident priority based on the priorities table

AIOps LEAP uses the following formulas to calculate the projected cost or time savings:

- `Projected Cost Savings = Σ (FOI × OHF) × AWNC × Cost per Work Note`
- `Projected Time Savings = Σ (FOI × OHF) × AWNC × Agent Time per Entry`

Each ticket's projected savings is calculated. The average for the group becomes the Projected Cost/Time Savings Score, which is also categorized as High, Medium, or Low. The automation opportunities are sorted in descending order based on the projected cost or time savings.

Determining overall priority

After calculating the values for the business impact and the projected cost/time savings, AIOps LEAP assigns a priority level to each automation opportunity using this matrix:

Automation priority matrix

Business impact	Projected cost/time savings	Automation priority
High	High	Very High
Medium	High	High
High	Medium	High
Medium	Medium	Medium
Medium	Low	Low

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation priority matrix (continued)

Business impact	Projected cost/time savings	Automation priority
Low	Medium	Low
Low	Low	Very Low

These prioritized automation opportunities are displayed on the AIOps LEAP home page.

Tracking the actual cost and time savings

After automation is implemented, AIOps LEAP tracks actual cost and time savings and displays them on the LEAP Value Dashboard, helping you measure impact and make decisions.

Key metrics:

- Additional Work Notes (AWN): Manual entries after playbook execution
- Overhead Factor (OHF) by Priority: For example, P1 = 1.8x

Formulas:

- `Saved Work Notes (SWNs) = AWNC – AWN`
- `AWN= SWN × OHF`
- `Actual Cost Savings= AWN × Cost per Work Note`
- `Actual Time Savings= AWN × Agent Time per Entry`

Example projected cost and time savings calculations

A cluster has 20 AWNC and is mapped to a P2 incident with 6 AWN. The cost per work note is $20, and the agent time per entry is 0.5 hours.

According to the formulas, the SWN count is `(20 - 6) = 14`. According to the properties tables, the OHF = 1.4.

`SWN x OHF = AWN` so `14 x 1.4 = 19.6`

This value can be rounded off to 20 AWN. Each AWN entry represents $20 of savings.

The actual cost savings post automation = `AWN x Cost per Work Note` = `20 x 20 =` $400.

So, if you use automation, then the projected cost savings can be up to $400. Thus, the calculation provides actionable insights for ongoing process improvement and resource allocation.

Resolution steps for automation opportunity

Resolution steps suggest actions needed to resolve issues identified by an automation opportunity. These steps are generated using Now Assist and are accessible from the details page of an automation opportunity. To generate resolution steps for the first time, select the **Generate resolution steps** button.

Modifying resolution steps

Resolution steps can be updated as required. To manually modify resolution steps, select the edit icon.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the **Regenerate** button to refresh the AI-generated content. You can regenerate steps multiple times or manually edit them to suit specific requirements.

To manually modify resolution steps, select the edit icon.

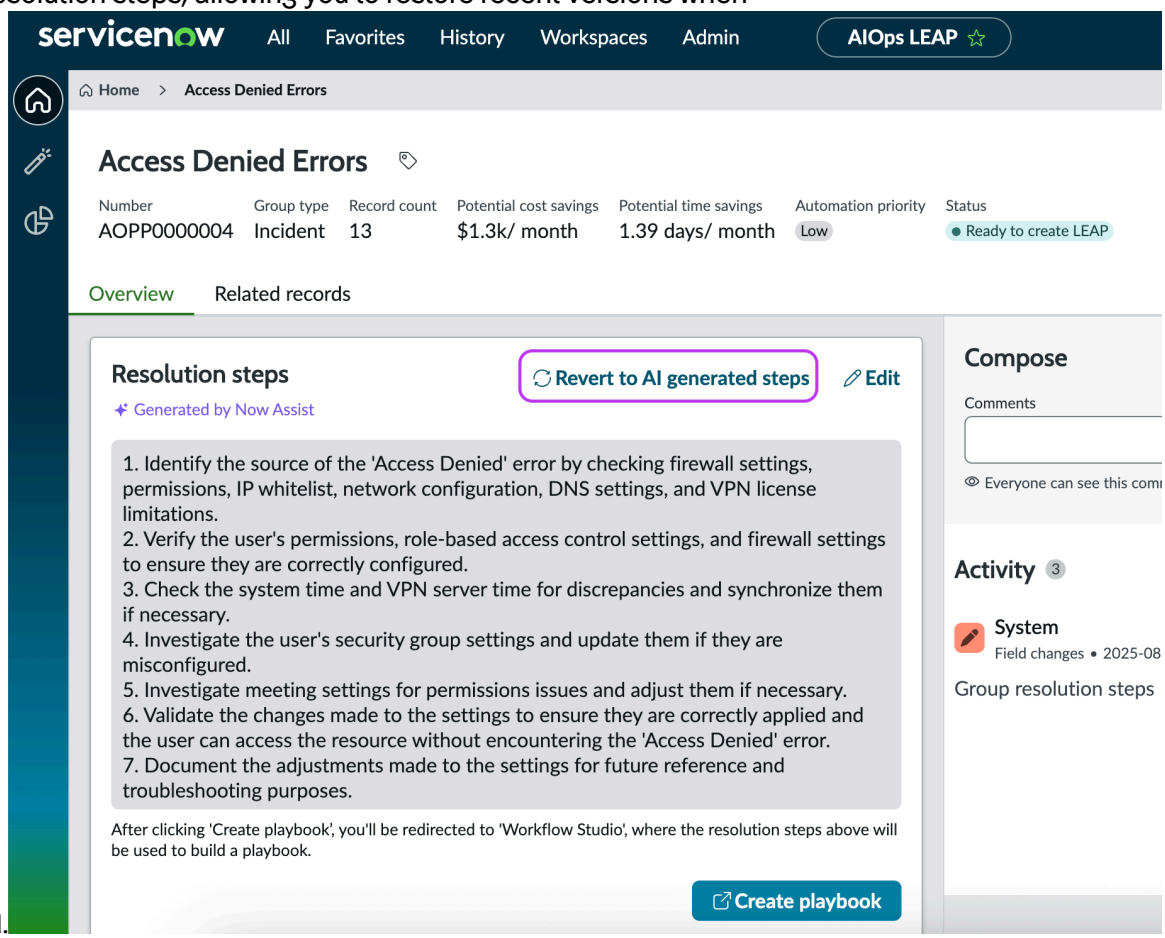
Note:
The Regenerate button is disabled while manual editing is in progress.

Tracking changes to resolution steps

Each update to the resolution steps is recorded in the LEAP Outcome Snapshots table. This table provides traceability and context for how the steps were generated or modified.

Reverting to previous resolution steps

AIOps LEAP supports reverting to a previously generated set of AI-based resolution steps, allowing you to restore recent versions when required.



Hierarchical clustering of automation opportunities

Hierarchical clustering feature in AIOps LEAP is designed to refine automation opportunities. It takes large groups of similar incidents, initially identified and included in a single automation opportunity, and breaks them down into smaller, more granular subcategories.

The primary goal of hierarchical clustering is to improve the accuracy and relevance of resolution steps. When an automation opportunity contains a very high number of incidents, the suggested resolutions might be too broad. By creating smaller, more closely related sub-groups, LEAP can provide more precise and effective resolution steps, leading to better issue resolution and overall automation efficiency. Create sub-groups for automation opportunities

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enhanced resolution analysis

AIOps LEAP has enhanced it capabilities by utilizing AI features into its analysis for automation opportunities.

There are three different enhancement options that can be used for analyzing and grouping of automation opportunities.

- AI search

  Utilizes AI agents to find relevant resolution steps from previous cases enhancing the accuracy and relevance of the steps provided.

- Web search

  Enables querying external sources (such as Perplexity and Gemini) to find comprehensive solutions, broadening the scope of potential resolutions.

- Knowledge base search

  Scans multiple internal articles to suggest more effective resolution steps, ensuring that the solutions are informed by the organization's existing knowledge.

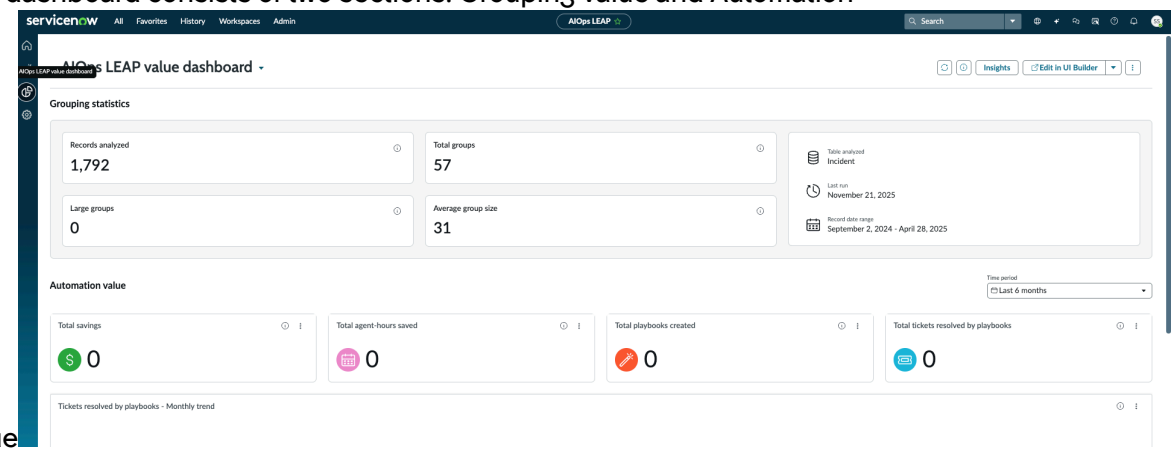
Enabling search enhancements

A LEAP administrator has the capability to enable the enhancements. Users with agent or viewer access will need to contact their administrator to activate these features. Once enabled, LEAP expands its search capabilities to deliver more comprehensive and effective resolution steps.

Understanding AIOps LEAP value dashboard

The AIOps LEAP dashboard provides a quick and comprehensive overview of the records that have been analyzed and grouped into automation opportunities. This dashboard helps organizations understand the estimated time and cost savings that can be achieved with automation.

The dashboard consists of two sections: Grouping value and Automation value



Grouping value

This section shows the total number of records analyzed, the number of groups created, and the average group size. Groups with more automation opportunities than the designated threshold are labeled as large groups. The dashboard also displays the analysis table and the start and end dates of the records used.

Automation value

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This section predicts the cost and time savings that can be achieved by using automation. The dashboard shows the number of playbooks created and number of tickets that were resolved.

The dashboard can be used to understand how automation helps in achieving cost and time savings. If required, a system administrator can modify the LEAP settings page to achieve required savings based on their organizational requirements.

Configuring AIOps LEAP

You can download and install AIOps LEAP application from the ServiceNow® Store to manage your IT operations efficiently.

Configuration overview

1. Install AIOps LEAP

   Install AIOps LEAP if you have the admin role.

2. Activate AIOps LEAP

   Activate AIOps LEAP to enable grouping of incidents, create problem records, and generate resolution playbooks.

Install AIOps LEAP

You can install the AIOps LEAP application using Now Assist for IT Operations Management (ITOM) (sn_itom_gen_ai) if you have the admin role. The application installs related ServiceNow® Store applications and plug-ins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the AIOps LEAP application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: System admin

About this task

The following items are installed with AIOps LEAP:

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with AIOps LEAP.

Procedure

1. Go to the ServiceNow Store website.
2. In the search bar, enter `Now Assist for ITOM` and then select **Search**.
3. Select the Now Assist for ITOM widget and then select **Get** to make this application available for installation on your instances.
4. Install the Now Assist for ITOM application.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **System Definition** > **Plugins**.

b. Search for Now Assist for IT Operations Management (ITOM).

c. Select **Install**.

Setup AIOps LEAP properties

Configure AIOps LEAP properties to estimate cost and time savings calculations for your organization.

Before you begin

Role required: admin

About this task

If you are a first-time user of AIOps LEAP, then use the default values to get an understanding of how each of these values are used for estimation. You can later modify these values to suit your organization requirements.

Procedure

1. Click **Configure settings**.
2. On the settings page, choose one of the following options:
   - Fresh Install
     a. Select **Configure settings**.
     b. Review the default values for each property.
     c. Select **Save**.

     Note:
     AIOps LEAP recommends using default values initially to view and understand the cost and time savings estimates.

   - Upgrade
     a. Select **Configure settings**.
     b. Review the default values for each property.
     c. Modify values as needed.
     d. Select **Save**.

   You are redirected to the AIOps LEAP landing page. For details on each field, see AIOps LEAP settings fields
3. Activate AIOps LEAP.

Activate AIOps LEAP

Activate the AIOps LEAP skill after installing the application to assemble and categorize incidents.

Before you begin

Role required: System admin or AIOps LEAP admin

Procedure

1. Activate *AIOps LEAP* with one of the following options.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In the LEAP installer input section of *LEAP installer*,enter the details for AIOps LEAP to run scans on existing records, and select **Save and continue**.
   For details on installer fields, see LEAP Installer fields
3. In the Define access section, select the role to whom you want to provide access to LEAP skills.
4. In the Select display section of *LEAP installer*, select the required display and select **Save and continue**.
5. In the Review and activate section of *LEAP installer*,review the selections, and select **Activate**.
6. Select **Return to ITOM** on the success message.

Change AIOps LEAP large language model (LLM)

AIOps LEAP allows you to change the default LLM provider from the Now LLM to your required LLM.

Before you begin

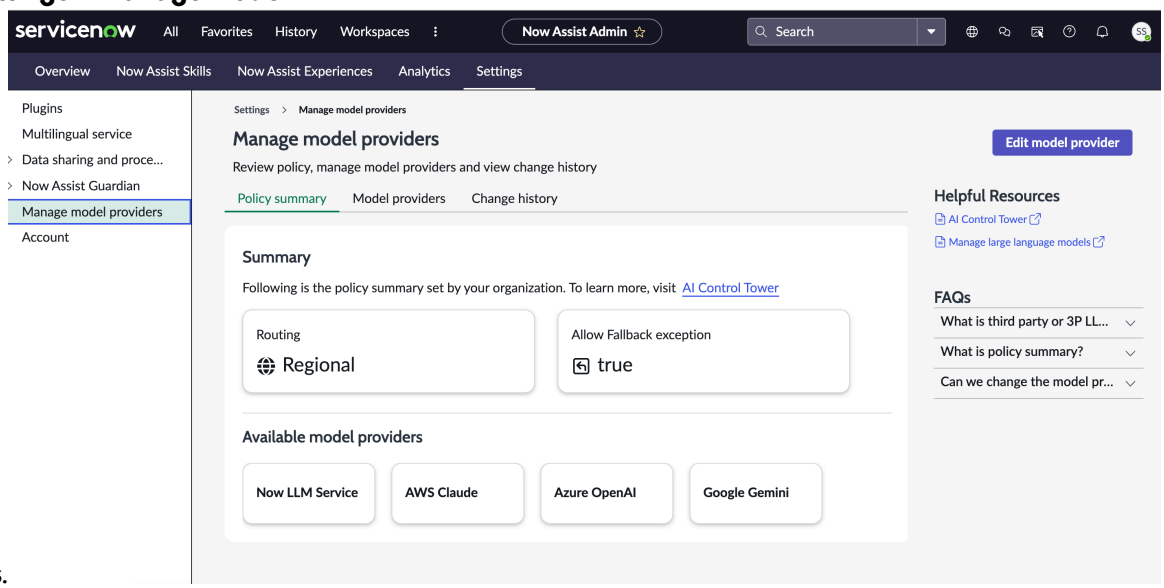
Role required: admin

About this task

If you change the LLM model, the AIOps LEAP skills should be reapplied to the selected model. The reason is AIOps LEAP skills are not applied automatically to an instance.

Procedure

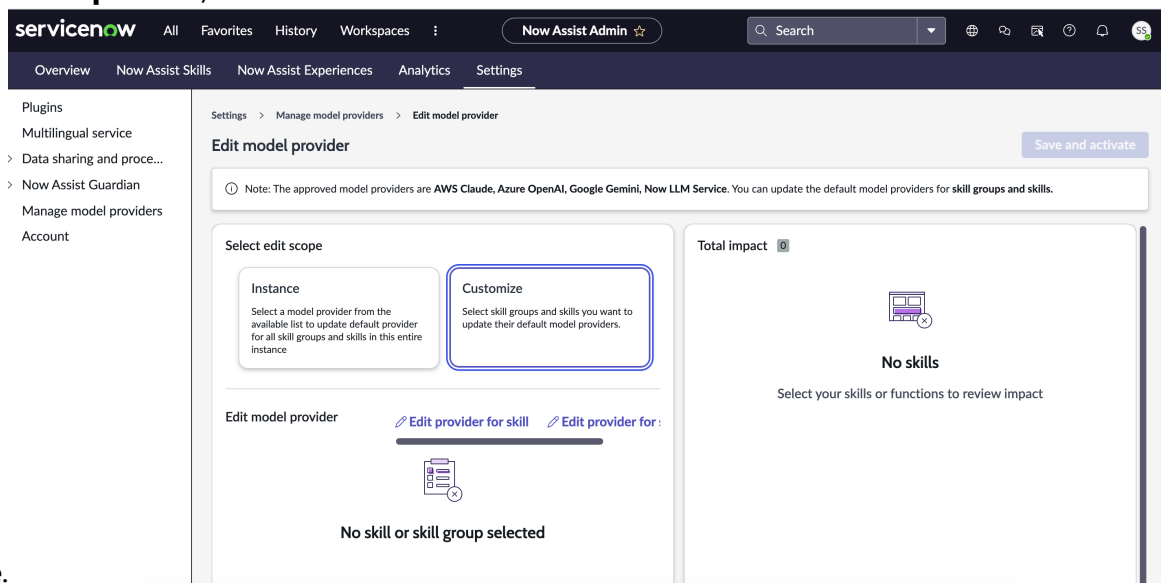
1. Access Now Assist Admin in your workspace.
2. Select **Settings** > **Manage model providers**.



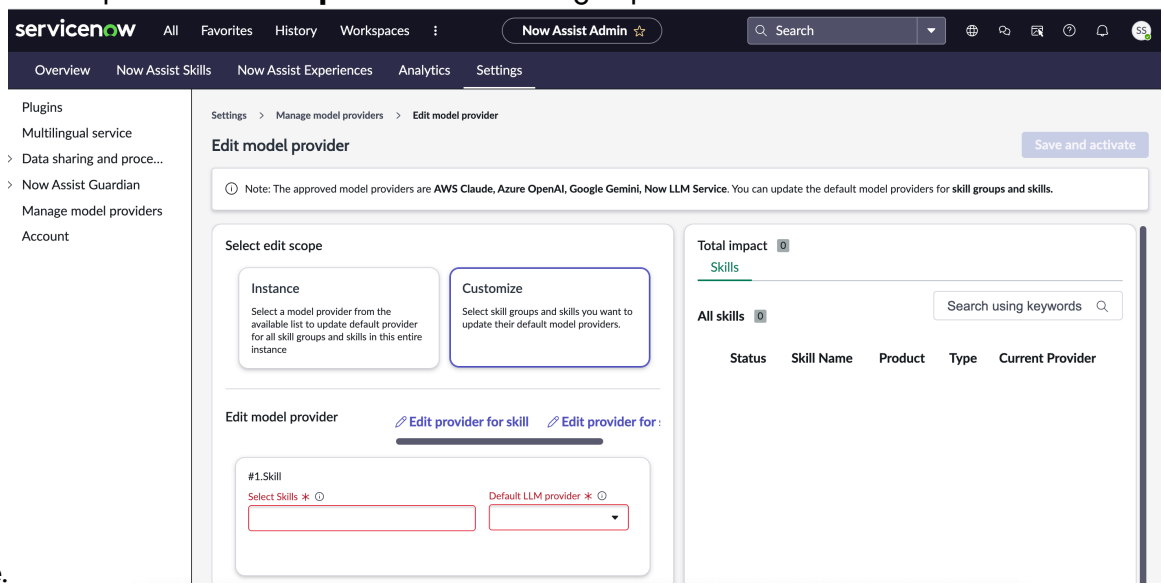
providers.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Edit model provider**, and then select **Customize**.



4. In the *`Edit provider`* section for skill groups, select the required LLM provider and **AIOps LEAP** as the Skill group name.



Using AIOps LEAP

AIOps LEAP gathers incidents or issues and groups them into items called automation opportunities (AOs).

AIOps LEAP tasks

AOs are categorized depending on how critical the services are, number of hand offs, and incident information:

- Critical
- High
- Moderate
- Low

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prioritizing AOs helps IT Operations Management personas address the most critical issues or the issues that are hindering performance. AIOps LEAP provides tasks that help perform research on the incidents to analyze the root cause and derive resolutions. Playbooks help IT operators access resolution steps to improve the overall performance of IT operations.

1. Create AIOps LEAP problem records

   Create a problem record using the resolution steps of an AO. The problem record helps you perform an in-depth analysis to find the root cause of the incident.

2. Generate AIOps LEAP playbooks

   Generate automated playbooks that use the resolution steps to efficiently solve similar incidents in the future.

Create AIOps LEAP problem records

Create problem records for AIOps LEAP from available incident clusters, also known as automation opportunities, for further analysis.

Before you begin

Role required: AIOps LEAP admin

About this task

The problem record creation process automatically transfers critical information from incidents to problem records. When a problem record is created, AIOps LEAP includes all relevant information. This information includes:

- incident group description
- incident group link
- resolution steps

The automated data transfer is characterized with:

Root cause documentation

AIOps LEAP populates the cause notes section of the problem record with the same details as available in existing incident records.

Incident attachment

All incidents associated with the group are automatically linked to the problem record for comprehensive tracking.

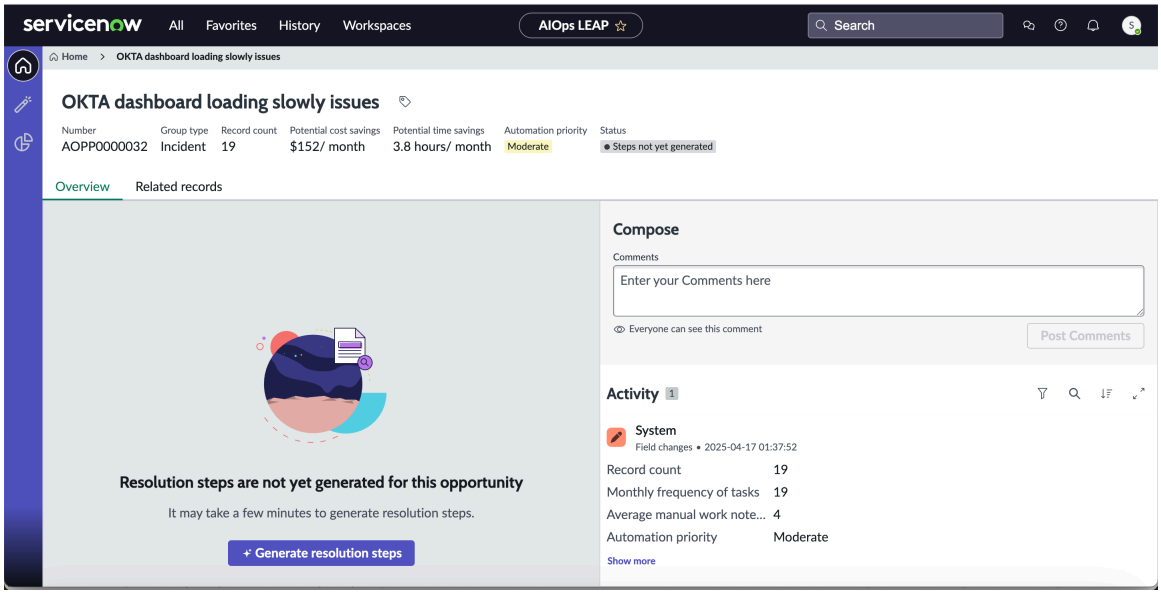
Async processing

Problem records are generated efficiently without manual intervention even during high-volume scenarios.

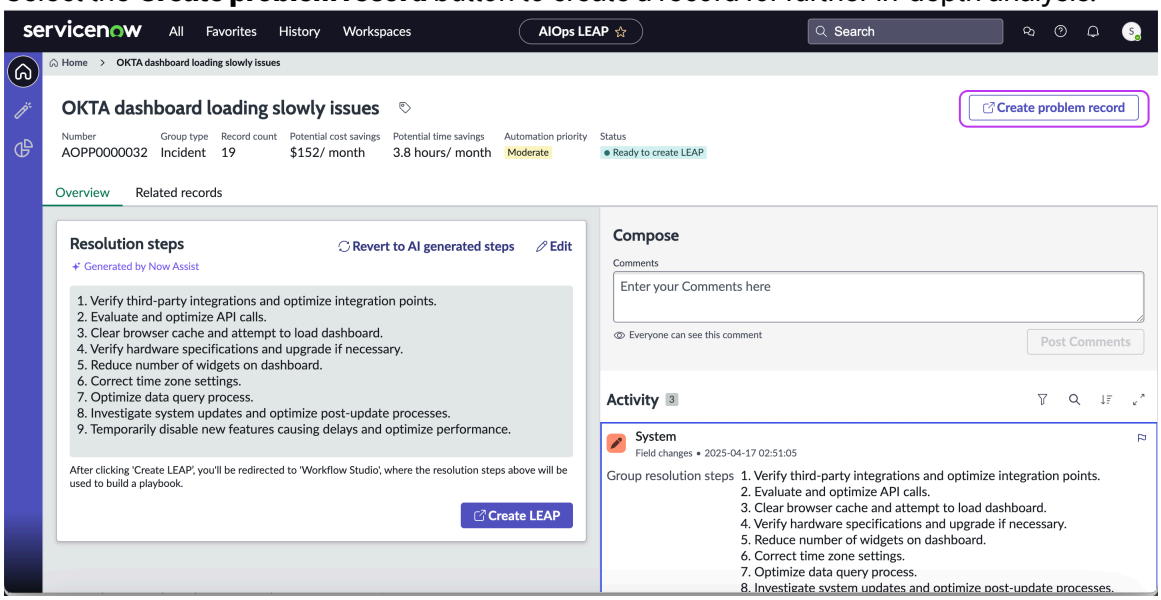
Procedure

1. Select **Workspaces** > **AIOps LEAP**.
2. On the AIOps LEAP landing page, select an automation opportunity.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. If resolution steps don't appear in the Overview section, select **Generate resolution steps**.
4. Select the **Create problem record** button to create a record for further in-depth analysis.



Generate AIOps LEAP playbooks

Create standard, dynamic, and automated playbooks using AIOps LEAP to promote fast incident resolution and response time.

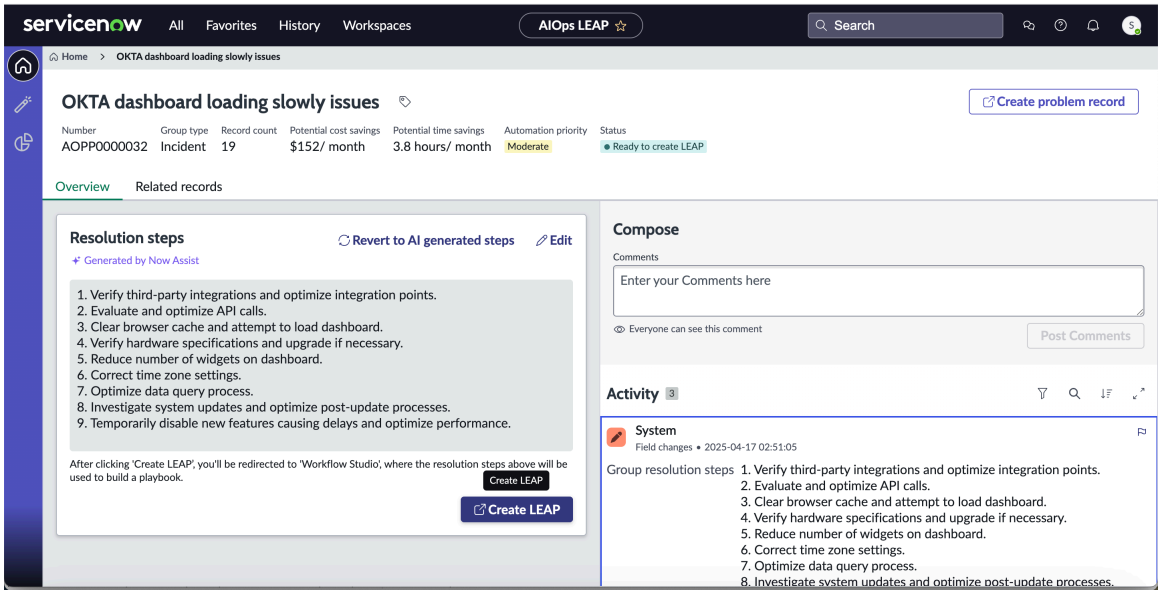
Before you begin

Role required: AIOps LEAP admin

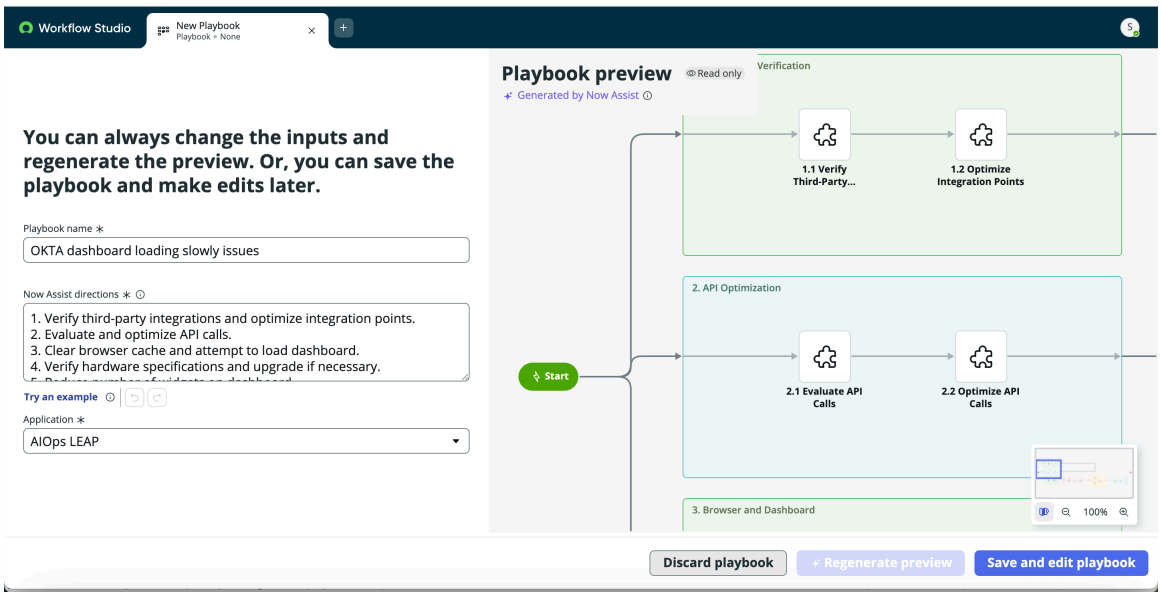
Procedure

1. Select **Workspaces** > **AIOps LEAP**.
2. On the AIOps LEAP landing page, select the required automation opportunity to create a playbook.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Create LEAP**.
   Workflow Studio opens and the playbook generation process starts. The **Playbook name** and **Now Assist directions** fields are prefilled with the problem record title and the generated resolution steps.



Generate AIOps LEAP knowledge base

Resolution steps from automation opportunities are used to create knowledge base articles, enabling quicker resolution to similar issues in future.

Before you begin

Role required: admin

About this task

AIOps LEAP automates the generation of knowledge base articles using the **Actions** or **Explore** button. These articles streamline incident resolution by providing quick access to relevant information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **AIOps LEAP**.
2. On the AIOps LEAP landing page, select the required automation opportunity.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps**. The resolution steps will be generated and you create knowledge base articles.
4. Click **Actions** > **Create KB**.

   The page to create a knowledge base article appears.
5. Enter the details you want to enter in the knowledge base page and select **Save**. Alternatively, you can use the **Explore** button and use the workflow menu to create a knowledge base article.

Create sub-groups for automation opportunities

Large automation opportunities in AIOps LEAP are broken into smaller, more manageable sub-groups to achieve more granular and accurate incident resolution.

Before you begin

Role required: admin

Procedure

1. Navigate to AIOps LEAP landing page, and select the automation opportunity that you want to refine.
   The *Action Insights* panel recommends to create sub-groups for the selected automation opportunity.
2. On the details page, click on **Related records**.
3. Click **Create Sub Groups**.
4. Click the **Sub Groups** tab to view the sub-groups created.
   Each child sub-group has it own ID and you can generate focused resolution steps.

AIOps LEAP reference

These topics provide detailed field description information required during AIOps LEAP installation.

LEAP Installer fields

Description of the field values that you configure while installing AIOps LEAP.

AIOps LEAP skills

Skill	Description
Run frequency	Frequency to run AIOps LEAP on the required table.
Group records from this table *	Table name to run AIOps LEAP query to filter records for grouping.
Use this column for grouping *	Column name from the above table used to read records for grouping. Default value is 'short_description'.
Use this filter	Filter details used to read records for grouping.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AIOps LEAP skills (continued)

Skill	Description
	Note: This field can be modified by customers. By default, the incidents are grouped and filtered for the last 6 months.
Use this column for topic generation *	Record columns used to create the titles for the created groups. **Note:** This field can be modified by customers. Only a single column of the grouping table should be selected for generating topics.

Components installed with AIOps LEAP

Several types of components are installed with activation of the plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role title [name]	Description
AIOps LEAP admin [sn_itom_leap.leap_admin]	You have full control over AIOps LEAP capabilities, including the following: • Turn features on and off • Execute scheduled jobs • Manage AIOps LEAP tables and the AIOps LEAP Workspace • Generate and update resolution steps • Create and view problems and generate AIOps LEAP playbooks from automation opportunities (AO)
AIOps LEAP viewer [sn_itom_leap.leap_viewer]	You can access and view data related to AIOps LEAP, including tables, the workspace, and problems originating from AOs.
AIOps LEAP agent [sn_itom_leap.leap_agent]	You can access the AIOps LEAP menu from the Service Operations Workspace (SOW) and trigger AIOps LEAP executions directly from within SOW.

Scheduled jobs installed

Scheduled job	Description
Populate Record Metrics Aggregate Records	Runs once per day to populate the LEAP aggregate metrics table by time periods.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Update Record Metrics Table with Calculated Metrics	Runs daily to calculate and update the records in the LEAP Record Metrics table for all the records where the metrics haven't been calculated yet.
GAF- Run Offline Flow	Runs monthly to group the tasks using the task data provided in the skill configuration while activating the LEAP skill.

Tables installed

Table	Description
LEAP aggregate metrics	Contains metrics, like cost savings, time savings, and record count, for each time period. This data is used in the LEAP report page in the workspace.
LEAP feedback	Stores the feedback given by the agent to the playbooks that are run to fix the tasks.
LEAP GAF mapping	Maintains a map between the GAF groups and the published LEAPs to retain information in the subsequent GAF clustering runs.
LEAP group	Stores the LEAP group details, like group description, resolution steps, and whether the LEAP is automated or not.
LEAP group ranking	Maintains data, like business impact, projected cost savings, problem record, and status, that is used in the Automation Opportunities page of the workspace.
LEAP properties	Sets custom values to the properties that are used in AIOps LEAP.
LEAP record metrics	Maintains data that's used in Published LEAP page in the workspace. It contains calculated data, like time saved, tickets resolved, and rating trend.

AIOps LEAP settings fields

AIOps LEAP settings page field values helps estimate cost and time savings when automation is used. The default values can be modified as per your organizational requirement for savings calculations.

LEAP settings fields

LEAP fields

Field name	Description
Cost per work note ($)	This value represents the cost for each work note that also includes labor and operational expenses for every incident.
Time per work note (hrs)	This value is the average time spent on each work note entry used to estimate the total time impact across incidents.
Overhead factor for P1 records	Overhead factors are multipliers that are used for high-priority incidents and represent hidden costs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP fields (continued)

Field name	Description
	Priority 1 incidents often require more coordination, communication, and escalation—beyond just the direct work notes. For P1 incidents, the base cost is multiplied by 1.8 to reflect the additional impact.
Overhead factor for P2 records	Overhead factors are multipliers that are used for high-priority incidents and represent hidden costs. For priority 2 incidents, the base cost is multiplied by 1.4 to reflect the additional impact.
Overhead factor for P3 records	Overhead factors are multipliers that are used for high-priority incidents and represent hidden costs. For priority 3 incidents, the base cost is multiplied by 1.1 to reflect the additional impact.
Overhead factor for P4 records	Overhead factors are multipliers that are used for high-priority incidents and represent hidden costs. For priority 4, the base cost is multiplied by 0.8 to reflect the additional impact.
Overhead factor for P5 records	Overhead factors are multipliers that are used for high-priority incidents and represent hidden costs. For priority 5, the base cost is multiplied by 0.4 to reflect the additional impact.
Large group size	Groups that have incidents more than the threshold set are marked as large groups. The default value set is 200 incidents.
Number of pinned groups	This value specifies the number of groups that can be pinned for tracking.
Groups with resolution steps in initial run	This value specifies the number of groups for which resolution steps are generated in the first run of AIOps LEAP.
Minimum incident-to-group ratio for remapping eligibility	AIOps LEAP can remap incidents to better groups when improved patterns are observed. This ratio determines the minimum incident-to-group size needed for remapping eligibility. Higher values means more selective remapping.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access to cloud environments for ITOM products

If your organization deploys IT assets on the cloud, ITOM products must access your cloud environment to collect information about the IT infrastructure.

Related topics

Discovery for cloud environment

Cloud resource discovery references

Install and configure MID Servers to access cloud environments

Install and configure the MID Servers correctly to enable ITOM products to access to the cloud resources.

Before you begin

Role required: discovery_admin or sn_cmp.cloud_admin (for Cloud Provisioning and Governance)

About this task

Procedure

1. For IP-based discovery, Installing the MID Server on a server inside the cloud environment, inside a Virtual Private Cloud (VPC).

   Example
   For example, if you are configuring access to AWS service accounts using IAM roles, install the MID Server at the Amazon EC2 instance.

   Important:
   If you configure AWS credentials at ServiceNow AI Platform, the location of the MID Server doesn't matter.

   If your organization has multiple VPC segments, deploy the MID Servers in a manage-mentor transit VPC.
2. Activate IP-based discovery jobs to access the compute layer using agentless credentials.
3. Configure the MID Server with the capabilities necessary for the cloud environment you are planning to discover.

   You can select the `ALL` capability or configure specific capabilities for tighter security.

   Add Cloud Management in **supported application** in MID Server for Cloud Provisioning and Governance requests to be processed.

Cloud environment	MID Server capability required by Cloud Discovery	MID Server capability required by Cloud Provisioning and Governance
Amazon AWS Cloud	`AWS` or `Cloud Management` or `ALL`	`AWS` or `Cloud Management`
Microsoft Azure Cloud	`Azure` or `Cloud Management` or `ALL`	`Azure` or `Cloud Management`
Google Cloud	`Google` or `Cloud Management` or `ALL`	`Google` or `Cloud Management`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud environment	MID Server capability required by Cloud Discovery	MID Server capability required by Cloud Provisioning and Governance
IBM Cloud Platform	`IBM` or `Cloud Management` or `ALL`	N/A
Oracle Cloud Infrastructure (OCI)	`OCI` or `Cloud Management` or `ALL`	N/A
OpenStack	`OpenStack` or `Cloud Management` or `ALL`	N/A
Red Hat Virtualization (RHV)	`RHV` or `Cloud Management` or `ALL`	N/A

4. If the MID Servers must go through an unauthenticated proxy server to access cloud resources, modify the `agent\conf\wrapper-override.conf` file, as follows:

```
wrapper.java.additional.1=-Dhttp.proxySet=true
        wrapper.java.additional.2=-Dhttp.proxyHost=<proxyHost>
        wrapper.java.additional.3=-Dhttp.proxyPort=<proxyPort>
        wrapper.java.additional.4=-DuseProxy=true
```

5. If you're using an authenticated proxy server, configure the MID Server parameters in the `config.xml` file.

   For a description of the parameter values, see the **Proxy server parameters** section in MID Server parameters.

Related topics

Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance

Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance

You can configure the MID Server for Cloud Provisioning and Governance to use a proxy server. Using a proxy server supports all cloud-based activities such as running Discovery, billing downloads, provisioning virtual machines, and running life-cycle operations on virtual machines.

Proxy server limitations

- VMware Cloud is not supported.
- Windows or Linux platforms only are supported.
- The Google Cloud Console integration does not support downloading billing data.
- Remote PowerShell scripts cannot be executed.
- Custom APIs may not work.

Note:

SSH calls should not be routed through a proxy server, when using a private cloud environment that is on the same side of the proxy as the MID Server.

Set *`mid.capi.skip_proxy_for_ssh`* to true to skip it. See MID Server properties used by Service Mapping for more information.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

mid.capi.skip_proxy_for_ssh:

- Determines whether the MID Server skips the proxy server when routing SSH calls.
- Type: true | false
- Default value: false

Supported proxy server authentication for Cloud Provisioning and Governance

Proxy Server type	Authentication type
HTTP/HTTPS	No authentication
SOCKS5	No authentication
HTTP/HTTPS	Basic authentication
SOCKS5	Basic authentication
HTTP/HTTPS	NTLM

Supported proxy server configurations for Cloud Provisioning and Governance

Supported configuration settings

Configuration	Operating system	Proxy server	Authentication mode
Configuration 1	Linux	None	Not Applicable
Configuration 2	Windows	Squid (HTTPS)	None
Configuration 3	Linux	Squid (HTTPS)	Local
Configuration 4	Windows	Squid (HTTPS)	Active Directory

Cloud Request Retry Configuration

If a request is throttled by a cloud provider during Discovery, Cloud Request Retry Configuration provides a customizable method to retry requests. Discovery and Service Mapping Patterns includes a retry configuration for AWS and Azure. You can customize the included configuration or create your own.

Discovery admins and Cloud admins can access the request retry configuration at **All** > **Discovery** > **Cloud Request Retry Configuration**. You can create one configuration for each provider.

When a request is throttled, the retry framework uses retry configuration defined for the provider to handle retries before returning the final response to the ApiCommand classes:

- AwsApiCommand
- AzureApiCommand

The retry configurations are synced with the MID Servers through the MID Server property, *`mid.cloud.discovery.retry.configuration`*.

There are the following retry strategies:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Exponential backoff
- Response header backoff
- Custom backoff

Exponential backoff

For the following example configuration:

Setting	Value
Max retries	3
Response codes	429
Base delay in ms	1000
Max delay in ms	10000
Additional delay window in ms	1500

The Exponential backoff retry strategy works as follows:

- 1st retry—the backoff multiplier is randomly selected between 0 and 1. The max delay value is 400 ms (400 * 1).
- 2nd retry—the backoff multiplier is randomly selected between 0 and 3. The max delay value is 1200 ms (400 * 3).
- 3rd retry—the backoff multiplier is randomly selected between 0 and 7. The max delay value is 2800 ms (400 * 7).

On subsequent retries, if the delay exceeds 10000 (the max delay), 10000 will be used as initial delay.

Once the initial delay is generated, jitter is added to the delay. The jitter window is defined by the **Additional delay window in ms** field. The system selects a random value between 0 and 1500 and adds it to the initial delay.

If the initial delay is 500, the final delay (with jitter) can be a value between 500 and 2000 ms.

Response header backoff

For the following example configuration:

Setting	Value
Max retries	3
Response codes	429
Response header	Retry-After
Response header delay unit	Seconds
Additional delay window in ms	1500

The Response header backoff strategy works as follows:

- Fetch the value of header *`Retry-After`* from the server response.
- Convert the *`Retry-After`* to milliseconds by multiplying by 1000.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once the initial delay is generated, jitter is added to the delay. The jitter window is defined by the **Additional delay window in ms** field. The system selects a random value between 0 and 1500 and adds it to the initial delay.

If the initial delay is 2000, the final delay (with jitter) can be a value between 2000 and 3500 ms.

Custom backoff

With a custom backoff retry strategy, you define the **Max retries** and **Response codes** and create your own **Mid script include** that defines how requests are retried using the *`getDelay()`* function. For more information, see Script includes.

Set up a cloud service account

Create and configure ServiceNow cloud accounts at ServiceNow AI Platform for the corresponding Cloud vendor service accounts.

Cloud Discovery service account form reference

Set up Oracle Cloud infrastructure (OCI) service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Oracle Cloud Infrastructure (OCI) service accounts.

OCI service account is a type of identity used to authenticate and authorize access to OCI resources and services. It provides a way for applications, services, and users to securely interact with OCI resources. Service accounts are often used for automated processes, applications, or services running within OCI, allowing them to access resources according to the defined permissions and policies.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

OCI access and permission using policies

Oracle Cloud Infrastructure (OCI) access and permission using policies provide privileges for secure cloud resource utilization and management in OCI.

For information on OCI permissions, go to the Oracle Help Center and search for the "Managing Access to Resources" article.

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Create Oracle API credentials

Create Oracle API credentials on the ServiceNow AI Platform to enable access to your Oracle resources during Oracle discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Verify that your OCI user has at least read-only access to all Oracle services. For information on access permissions, consult your system administrator.

Retrieve the following properties from the Oracle Cloud Console:

- Tenancy Oracle Cloud Identifier (Tenancy OCID)
- User OCID
- Key fingerprint
- Private key

For instructions on retrieving these properties, go to the Oracle Help Center and search for the "Required Keys and OCIDs" article.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Credentials**.
2. Select **New**.
3. Select **Oracle API Credentials**.
4. On the form, fill in the fields with the property values you retrieved.

Oracle API Credentials form

Field	Value
Name	Unique and descriptive name for the Oracle credentials.
Active	Option to select to use the credential.
Tenancy Id	Oracle Cloud Identifier (OCID) for your tenancy.
User Id	OCID of the OCI user.
Key Fingerprint	Fingerprint of the public key.
Private Key	RSA private key that is used for API signing authentication.

5. Select **Submit**.

What to do next

Create OCI service accounts. For more information, see Create OCI service accounts.

Create OCI service accounts

Create Oracle Cloud Infrastructure (OCI) service accounts on the ServiceNow AI Platform to access your Oracle account during Oracle discovery.

Before you begin

Verify that Oracle API credentials have been created. For more information, see Create Oracle API credentials.

Retrieve the Compartment ID, which can be found under **Identity & Security** > **Compartments** in the Oracle Cloud Console.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For GovCloud accounts, confirm that Discovery and Service Mapping Patterns is using at least version 1.29.0.

Role required: discovery_admin

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. In the **Discovery Credentials field**, begin to enter the credential name and select it from the list.
4. On the form, fill in the remaining fields.

Cloud Service Account form

Field	Description
Name	A unique name for the OCI service account.
Account ID	Compartment ID, which is the Oracle Cloud Identifier (OCID) of the compartment associated with this service account.
Datacenter URL	URL of the datacenter. Example URLs: ○ For commercial cloud: `https://{service}.ap-mumbai-1.oraclecloud.com` ○ For GovCloud: `https://{service}.us-gov-ashburn-1.oraclegovcloud.com`
Datacenter Type	Type of the datacenter where the account is hosted, which should be OCI Datacenter [cmdb_ci_oci_datacenter].

5. Select **Submit**.

What to do next

Schedule an OCI cloud discovery. For more information, see Create a discovery schedule in Cloud Discovery Workspace.

Setting up AWS service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Amazon Web Services (AWS) service accounts.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Ensure that you are familiar with the hierarchy of AWS service accounts in your environment. For example, if there are AWS Organizations, set up the management and member accounts at ServiceNow AI Platform to reflect that hierarchy. You can set up the AWS service accounts of the following types:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Discrete account**: Standalone account, with no management account.
- **Management account**: Management account that may or may not contain member accounts (subaccounts).

  Note:
  Some ServiceNow UI screens may refer to management accounts as master accounts.

- **Member account**: Subaccount that belongs with the (management) account.

Access setup for AWS service accounts

Cloud Discovery and Cloud Provisioning and Governance need access to resources in the Amazon Web Services (AWS) service accounts. Learn about different methods of configuring such access.

Cloud Discovery and Cloud Provisioning and Governance access resources in AWS service accounts through MID Servers. You must authorize inbound traffic to Amazon EC2 instances from the MID Server for setting up initial communication. For more information, see Configure security group inbound rules using the AWS Management Console.

Types of AWS credentials

There are permanent and temporary AWS credentials that you can use for configuring access to AWS service accounts.

Permanent

The permanent credentials are the actual AWS credentials for the service account that you add to the Connections and Credentials module of ServiceNow AI Platform. While it might be time consuming to manage credentials on ServiceNow AI Platform, you avoid the complex configurations involved in using temporary credentials.

Temporary

The temporary credentials are generated by the AWS Security Token Service (AWS STS) for IAM roles. After you configure IAM roles for AWS accounts, the MID Server accesses AWS resources with these temporary credentials. You can use the default IAM role, *`OrganizationAccountAccessRole`*, or create custom IAM roles.

Assuming IAM roles in a large AWS organization is more convenient and offers better security than using large numbers of permanent credentials for all AWS accounts. Temporary credentials are only acquired on behalf of a service account when there's no permanent credential specified for that service account in the Service Accounts [cmdb_ci_cloud_service_account] table.

The MID Server uses the AssumeRole action in the AWS Security Token Service API to assume a member account role. Parameters passed to this API determine which additional security restrictions are applied to the role when it accesses the AWS resources.

By default, the MID Server is configured to assume the *`OrganizationAccountAccessRole`*, which grants temporary credentials to all the members of a primary account. This action occurs automatically if no permanent credentials exist for the member accounts. This configuration doesn't apply any additional security or restrict access to any resources in member accounts.

By default, the ServiceNow instance caches temporary credentials for member accounts for 60 minutes. This interval enables the horizontal discovery process

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to run multiple times without generating new credentials during each discovery. You can avoid credential caching or modify the caching period using MID Server properties.

IAM roles and permissions

To enhance security provided by the default AWS `OrganizationAccountAccessRole` role, you can customize the AWS roles that MID Servers can assume to receive temporary credentials for member accounts. You can configure additional permissions to improve security and customize the way that the member account's role is assumed when discovering cloud resources.

Methods of granting access

For the purposes of configuring access for AWS accounts, the following terms are used:

Trusting accounts

The trusting accounts don't have permanent AWS credentials. You configure the trust relationship for IAM roles in these accounts to rely on other accounts for access.

Trusted accounts

The trusted accounts are used by the trusting accounts for access. The ServiceNow UI refers to the trusted accounts as accessor accounts.

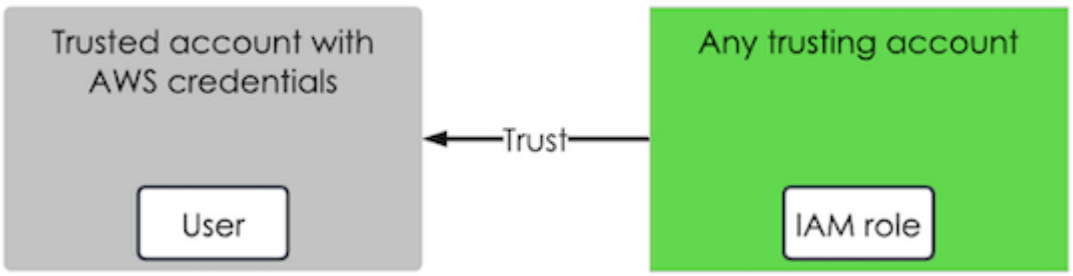
Typically, you set up access to the AWS accounts in your organization using the following methods:

Configuring access for a single account

- Configure AWS credentials on the ServiceNow AI Platform to avoid the complexity of creating and setting up IAM roles. For more information, see Configure access to the AWS accounts using permanent AWS credentials.
- Create an AWS service account on the ServiceNow AI Platform. For more information, see Create AWS service accounts.

Configuring access for an account that trusts an accessor account with AWS credentials

Setting up any AWS account to rely on a trusted account with AWS credentials



- Configure any type of account—discrete (independent), management, or member—to rely on a trusted account with AWS credentials for access.
- Configuring an IAM role belonging to the trusting accounts to trust the user of the trusted account enables using only one set of AWS credentials for providing access to multiple AWS accounts.

- Configure access using temporary credentials based on trusted AWS accounts with AWS credentials.
- Configure access using temporary credentials based on trusted AWS accounts without AWS credentials.

How Cloud Discovery determines which credentials to use

Member account trusts management account

Cloud Discovery uses the following logic to determine which credentials to use to discover AWS cloud resources in member accounts:

1. If permanent credentials are defined for the member account in the Cloud Service Account [cmdb_ci_cloud_service_account] table, Discovery uses those credentials. The Cloud Service Accounts [cmdb_ci_cloud_service_account] table contains the information on the service account types, like management or member, and their credentials.
2. If no permanent credentials are defined for the member account, Discovery checks the Cloud Service Account AWS Org Assume Role Params [cloud_service_account_aws_org_assume_role_params] table for any special parameters associated with the member account. If parameters exist in that table, Discovery uses the temporary credentials acquired from specifying a role and its parameters in the AWS Security Token Service API AssumeRole action.
3. If no special parameters are associated with the member account in the [cloud_service_account_aws_org_assume_role_params] table, Discovery checks that table for parameters associated with the management account. If parameters exist that define a role for the management account, Discovery uses the temporary credentials provided by that role.
4. If no special parameters are present in the [cloud_service_account_aws_org_assume_role_params] table for either management or member accounts, Discovery uses the defaults defined for the `OrganizationAccountAccessRole` role.

Member or management account trusts accessor account

1. If permanent credentials are defined for the member or management account in the Cloud Service Account [cmdb_ci_cloud_service_account] table, Discovery uses those credentials. The Cloud Service Accounts [cmdb_ci_cloud_service_account] table contains the information on the service account types, like management or member, and their credentials.
2. If no permanent credentials are defined for the account, Discovery checks the Cloud Service Account AWS Cross Assume Role Params [cloud_service_account_aws_cross_assume_role_params] table for any special parameters associated with the account. If parameters exist in that table, Discovery uses the temporary credentials acquired from specifying a role and its parameters in the AWS Security Token Service API AssumeRole action.

Related topics

KB2184482: Step-by-Step Guide to Configure AWS Cloud Discovery in ServiceNow Using Patterns

Configure access to the AWS accounts using permanent AWS credentials

To securely access data on your provider account, the Discovery process must present appropriate credentials. To make the credentials available to Discovery and Cloud Provisioning

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and Governance, you first create a user with programmatic access in the AWS Management Console. You then securely store the credentials in a service account at ServiceNow AI Platform.

Before you begin

Roles required:

- AWS Management Console administrator
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

Cloud providers often use different names for accounts, regions, and credential settings. Because the ServiceNow application supports several cloud providers, the app uses general-purpose names for the settings.

Procedure

1. **Optional:** To create a user for Cloud Provisioning and Governance (for programmatic access to your AWS resource and billing data), perform the following steps.

   a. On the AWS Management Console, navigate to **Identity and Access Managements (IAM)** > **Access Management** > **Users**.

   b. On the IAM Resources portal, select **Users**.

   c. Select **Add user**.

   d. On the Details page, configure the user settings, and then select **Next**.

   Details page

Field	Description
User name	Name for the programmatic user. For example, `servicenowcloud`.
Access type	Select **Programmatic access**.

   e. On the Permissions page, attach the user to a policy.
   Configure the following settings and then select **Next**.

Field	Description
Set permissions for <user name>	Select **Attach existing policies directly**.
Attach one or more policies ...	Select the appropriate policy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The **AdministratorAccess** policy has the most powerful permission level, including permission to provision cloud resources. The policy enables the same access that would be granted to the instance if you were not using IAM and used your AWS account Access Key ID and Secret Access Key. You might instead prefer to create a policy or combine multiple policies to grant the appropriate permission level. See Control AWS access and permissions using policies for details.

f. On the Review page, verify your selections and then select **Create user**.

g. On the Security Credentials page, copy the secret access key and the access key ID.

Important:
Do not leave the page until you have completed both steps. The **Secret access key** value does not appear again. You need to paste the values that you generate in these steps into a Cloud Provisioning and Governance form.

i. Select **Show** to display the Secret access key. Copy the value.

ii. Select **Download .csv** to save the CSV-format file that contains the user name, Access key ID, and the Secret access key value. You create the file as a backup in the case that you lose the values. Verify that the file was created and then store the file securely.

2. In the ServiceNow instance, navigate to **Discovery** > **Credentials**.
3. Select **New**, select **AWS Credentials**, enter a unique and meaningful **Name** (for example, `Cloud Provisioning Account`), and then fill in the form.

AWS Credentials form fields

Field	Input value
Name	Unique and descriptive name for the AWS credentials.
Active	Option to use the credential.
Access Key ID	The **Access key ID** that you generated on the AWS Management Console, such as: APIAIOSFODNN7EXAMPLE.
Secret access key	The **Secret access key** that you generated on the AWS Management Console, such as: wPalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY.

4. Select **Update** or **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Create an AWS service account on the ServiceNow AI Platform. For more information, see Create AWS service accounts.

Create AWS service accounts

Create AWS service accounts on the ServiceNow AI Platform to access your AWS account during AWS discovery.

Before you begin

- Retrieve the user account number, which can be found in the AWS Management Console by expanding the list under the AWS account name.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

Role required: discovery_admin

About this task
A service account is a secure record on your instance that stores the credential and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account is the logical representation in cloud management of all or part of your managed cloud infrastructure. A cloud account can include multiple service accounts—even service accounts from different providers. For each service account, you specify which datacenter to include in the cloud account.

Procedure

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Cloud Service Account form

Field	Description
Name	The unique and meaningful name for this service account.
Account ID	12-digit user account number. Expand the list under the AWS account name on the AWS Management Console to view the number. **Important:** In the **Account ID** field, remove the hyphen characters (-) from the number.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	IAM user account number Discovery credentials	The credentials needed for ServiceNow applications to access this account. You may configure this field at a later stage, while configuring access to AWS accounts. ○ If you configured AWS credentials at ServiceNow AI Platform , select the magnifying glass icon, and then select the name of the relevant AWS credential. ○ To use other AWS accounts to access this account, leave the field blank. For example, you don't need to specify the AWS credentials for accounts assuming IAM roles or member accounts using their management account for access.
Datacenter URL	URL of the datacenter. This field is required for AWS China region and AWS GovCloud (US) accounts. For example: ○ AWS China region: `https://organizations.cn-northwest-1.amazonaws.com.cn` ○ AWS GovCloud (US): `https://ec2.us-gov-west-1.amazonaws.com`
Datacenter type	Type of the datacenter where the account is hosted. Select **AWS datacenter**.
Datacenter discovery status	Auto-generated value: Status and timestamp of the last execution of Discovery on the datacenter.
Parent account	Name of the management account that represents the organization in AWS that this member account belongs to.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	It appears when you select **AWS datacenter**. Leave the field empty if this account is not part of an AWS organization.
Is master account	Management account flag. It appears when you select **AWS datacenter** from the Datacenter Type drop-down. Select the check box to associate the AWS service account with the management account. Select this check box only for accounts that you previously configured in the AWS Management Console as management accounts with some member accounts belonging to them. See the AWS documentation for information on AWS Organizations. **Note:** You will need to setup the correct permission in AWS or the Organization role for a standard credential. For more information, see Control AWS access and permissions using policies.
Accessor account	Name of the trusted account. Configure this field only for accounts that don't use permanent AWS credentials and rely on IAM roles for access.

4. Select **Submit**.

Configure access using temporary credentials based on trusted AWS accounts with AWS credentials

Configure the trusting account whose resources need to be accessed, to rely on the trusted account using the Identity and Access Management (IAM) role.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Decide which AWS account is going to be the trusted account. You use the trusted account to configure temporary credentials for Cloud Discovery using IAM roles. The trusted account that you use to access other accounts using IAM roles is referred to as an accessor account.
- If you're setting up a trust chain where a member account trusts a management account, and the management account trusts an accessor account, verify that you've configured the member account to trust the management account. For more information, see Configure access using temporary credentials for trusting AWS member accounts in management-accessor trust chain.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

Role required:

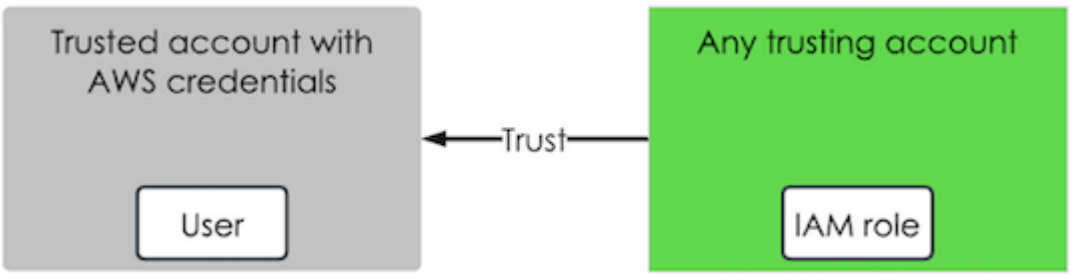
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

During this configuration, you create an IAM role for the trusting account, and then configure the trusted service account for the trusting account at ServiceNow AI Platform. Finally, you associate the IAM role you created for the trusting account with the trusting account itself.

Setting up any AWS account to rely on a trusted account with AWS credentials



Procedure

1. Create an IAM role for the trusting account and configure the trust relationship between the user assuming this role and the trusted (accessor) account.

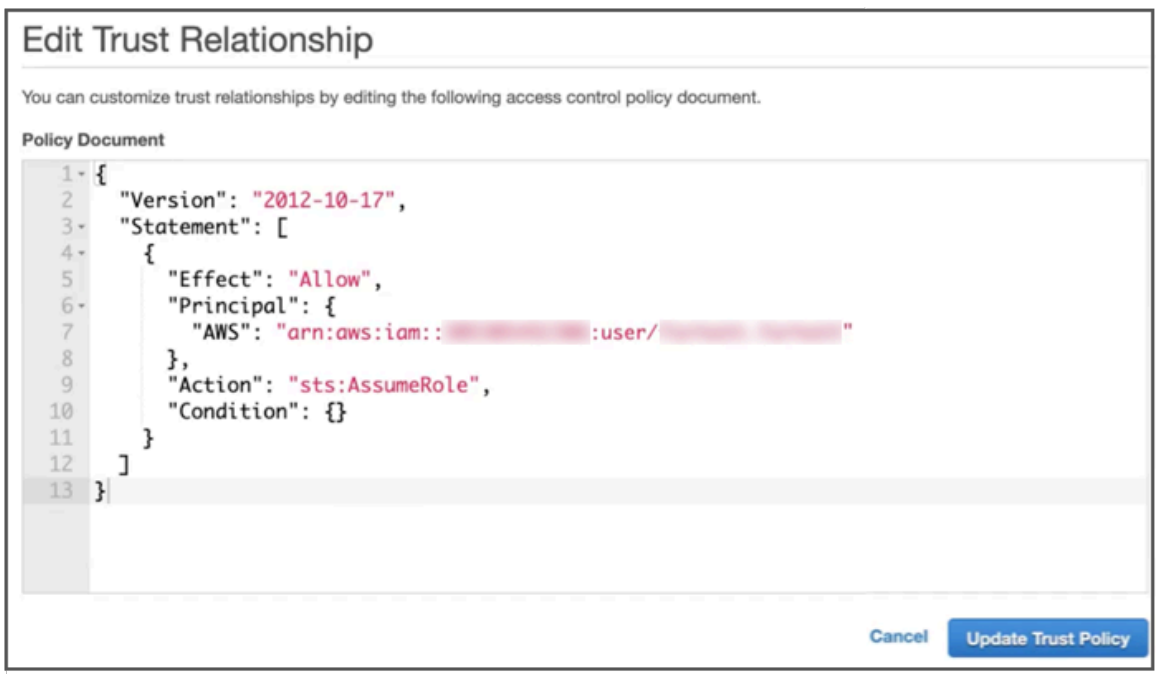
   a. Log in to the trusting account on the AWS Management Console.

   b. Create and configure the IAM role specifying the trusted (accessor) account ID in the **Account ID** field.
   For information on creating AWS roles, see the Amazon documentation.

   c. On the Summary page for the IAM role, select the **Trust Relationships** tab.

   d. Select **Edit trust relationship**.
   The Edit Trust Relationship page opens showing the policy document.

   e. Set the *AWS* parameter to the full user ARN of the trusted (accessor) account.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Verify that the *Action* value is set to *sts:AssumeRole*.

g. Select **Update Trust Policy**.

2. On the ServiceNow AI Platform, configure the trusted service account.

a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.

b. Selelct **New**.

c. On the form, fill in the fields.
For a description of the field values, see Create AWS service accounts.

d. Select **Submit**.

3. On the ServiceNow AI Platform, configure the trusting service account.

a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.

b. Select **New**.

c. In the **Accessor account** field, enter the name of the trusted account.

d. On the form, fill in the remaining fields.
For a description of the field values, see Create AWS service accounts.

e. Select **Submit**.

4. On the ServiceNow AI Platform, assign the AWS IAM role to the trusting account, using the relevant form, based on the relationship to the trusted account.

What to do next

Verify that ServiceNow applications can access the trusting service account using the IAM role:

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select the trusting AWS service account.
3. Under **Related Links**, select **Create Discovery Schedule**.
4. In the Discovery Manager Cloud Discovery page, select **Test Account**.
   - If the connection is successful, a message displays indicating the account validation is successful.
   - If the connection isn't successful, an error message displays indicating the cause of failure.

Configure access using temporary credentials based on trusted AWS accounts without AWS credentials

Set up a trusted credential-less account that other AWS accounts can rely on for access.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Decide which AWS account is going to be the trusted account. You use the trusted account to configure temporary credentials for Cloud Discovery using IAM roles. The trusted account that you use to access other accounts using IAM roles is referred to as an accessor account.
- If you're setting up a trust chain where a member account trusts a management account, and the management account trusts an accessor account, verify that you've configured the member account to trust the management account. For more information, see Configure access using temporary credentials for trusting AWS member accounts in management-accessor trust chain.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery > Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

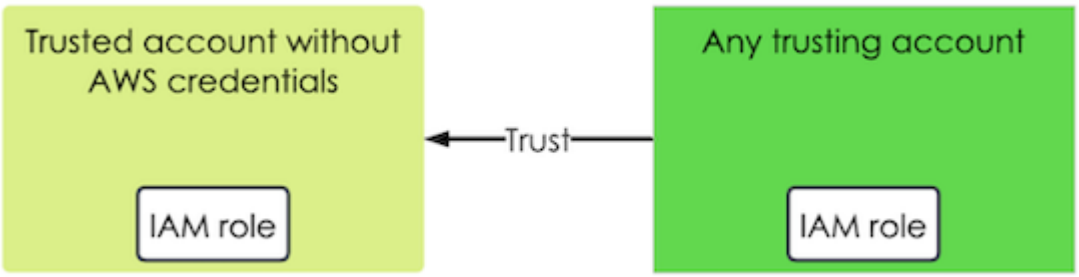
Role required:

- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

To use an account without AWS credentials, you must first configure that account with an IAM role and permissions to access the trusting service account. Then, you set up the IAM role of the trusting account to grant access to the IAM role of the trusted account.

Setting up any AWS account to rely on a trusted account without AWS credentials



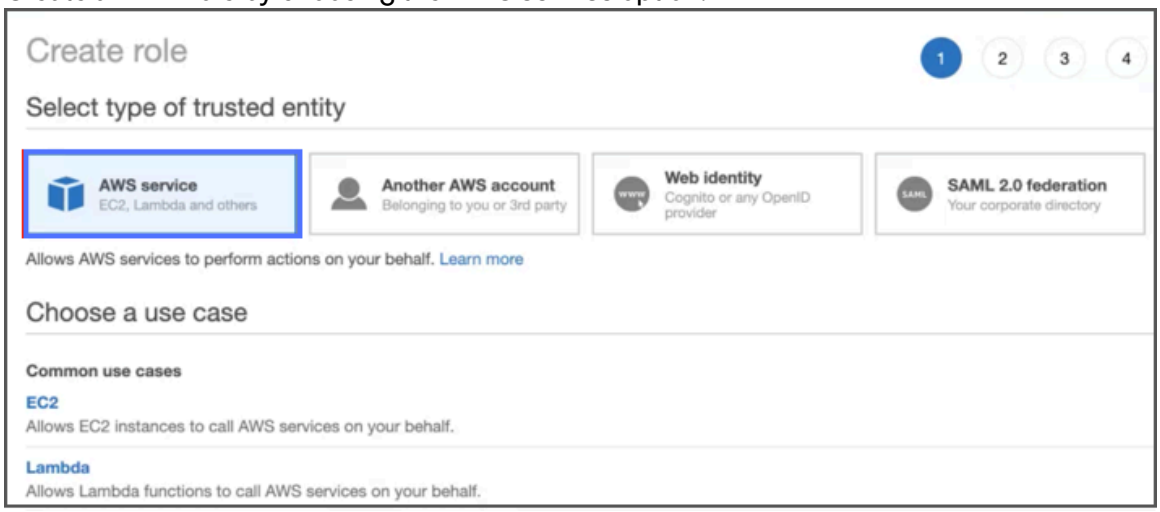
Procedure

1. Configure an IAM role for the trusting account.
   a. Log into the trusting account on the AWS Management Console.
   b. Create an IAM role for this account.
      Use the account ID of the trusted account while creating this IAM role. For operational information about working with AWS roles, refer to the Amazon documentation.
   c. Create a ReadOnlyAccess policy and attach it to the newly created IAM role.
2. Configure the IAM role for the trusted account.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Log into the AWS Management Console using the credentials of the account that you want to set up as a trusted account.

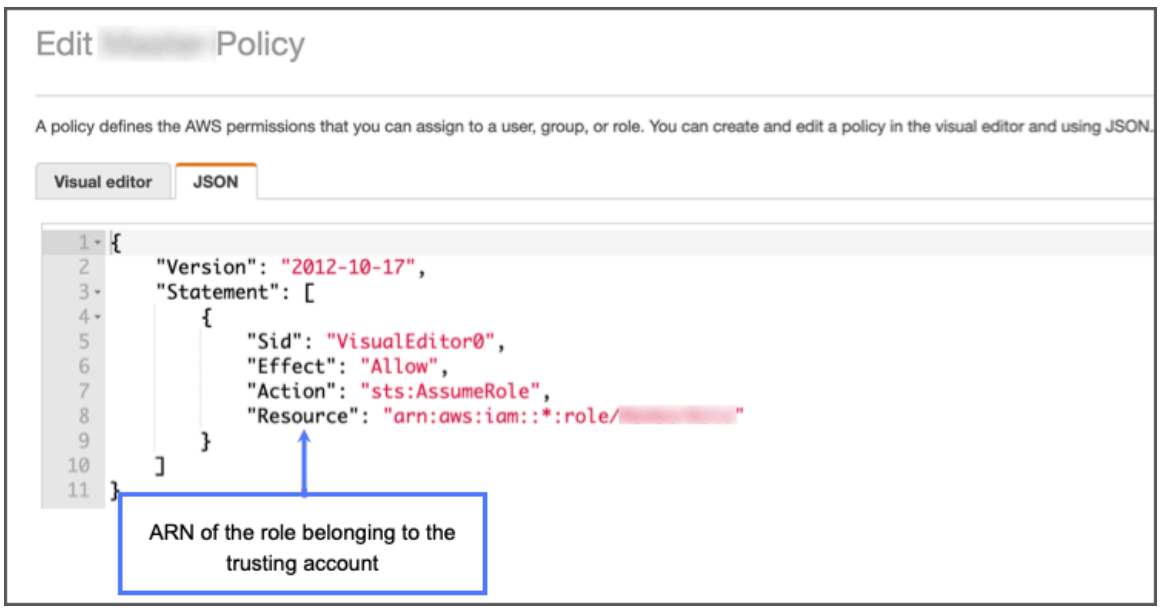
b. Create an IAM role by choosing the **AWS service** option.



c. Create a ReadOnlyAccess policy for the trusted account IAM role.

d. Create an additional policy to grant this IAM role access to resources in trusting accounts:

- Set the *`Action`* parameter to `sts:AssumeRole`
- Set the *`Resource`* parameter to the ARN of the trusting account role that you created in 1.b.



e. Attach the newly created role to the relevant Amazon EC2 instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, when you attach an IAM role to an EC2 instance, it creates a trust relationship between this role and the EC2 instance.

3. Configure the trusting service account to grant access to the IAM role belonging to the trusted account.

   a. Log into the trusting account on the AWS Management Console.

   b. Navigate to the IAM role you created for this account as described in 1.b.

   c. Edit the Trust Relationship for this IAM role as follows:

   - Set the *Action* parameter to `sts:AssumeRole`.
   - Set the *AWS* parameter to the ARN of the trusted account role that you created in 2.b.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure the MID Server for AWS IAM roles.
5. On the ServiceNow AI Platform, configure the trusted service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Selelct **New**.
   c. On the form, fill in the fields.
      For a description of the field values, see Create AWS service accounts.
   d. Select **Submit**.
6. On the ServiceNow AI Platform, configure the trusting service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Select **New**.
   c. In the **Accessor account** field, enter the name of the trusted account.
   d. On the form, fill in the remaining fields.
      For a description of the field values, see Create AWS service accounts.
   e. Select **Submit**.
7. On the ServiceNow AI Platform, assign the AWS IAM role to the trusting account, using the relevant form, based on the relationship to the trusted account.

What to do next

Verify that ServiceNow applications can access the trusting service account using the IAM role:

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select the trusting AWS service account.
3. Under **Related Links**, select **Create Discovery Schedule**.
4. In the Discovery Manager Cloud Discovery page, select **Test Account**.
   - If the connection is successful, a message displays indicating the account validation is successful.
   - If the connection isn't successful, an error message displays indicating the cause of failure.

Configure access using temporary credentials for trusting AWS member accounts in management-accessor trust chain

Configure access for AWS member accounts by using a trust chain from the accessor through the management account.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Ensure that you know which AWS member accounts are assigned to the same management account. You use the management account for configuring temporary credentials for cloud discovery using IAM roles.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery > Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

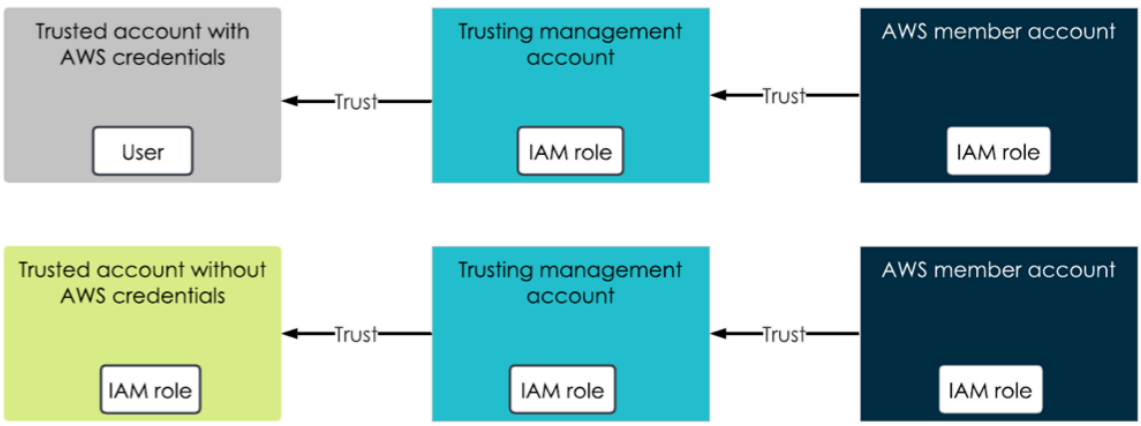
Role required:

- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

You can configure access for AWS member accounts by using a trust chain from the accessor through the management account. The accessor account either has AWS credentials or uses a credential-free method.

Configuring member accounts to use their management account for access



Procedure

1. Create an IAM role for the member account and configure the trust relationship between the user assuming this role and the trusted management account.

   a. Log into the AWS Management Console using the credentials of the member account for which you are configuring access.

   b. Create and configure the IAM role specifying the management account ID in the **Account ID** field.
   For operational information about creating AWS roles, refer to the Amazon documentation.

   c. On the **Summary** page for the IAM role, click the **Trust Relationships** tab.

   d. Click **Edit trust relationship**.
   The Edit Trust Relationship page opens showing the policy document.

   e. Edit the trust relationship as follows:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set the *Action* parameter to `sts:AssumeRole`
- Set the `AWS` parameter to the full role ARN of the management account.

f. Click **Update Trust Policy**.

2. On the ServiceNow AI Platform, configure the trusting member's service account.

a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.

b. Select **New**.

c. In the **Parent account** field, enter the name of the management account.

d. On the form, fill in the remaining fields.
For a description of the field values, see Create AWS service accounts.

e. Select **Submit**.

3. On the ServiceNow AI Platform, assign the AWS IAM role to the member account.

> **Important:**
> Perform this step only if you created custom IAM roles. By default, the OrganizationAccountAccessRole role is assigned to the member's trusting management account and you don't need to assign the OrganizationAccountAccessRole role to a service account.

a. Navigate to **All** > **Cloud Provisioning and Governance** > **Organization Access Parameters** > **AWS Org Assume Role Parameters**.

b. Select **New**.

c. On the form, configure only the following fields for the trusting member account:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Service Account AWS Org Assume Role Params form

Field	Definition
Access role name	Name of the IAM role created for the trusting account. ▪ If IAM roles are the same across all member accounts: Enter the full ARN using an asterisk (*) as a wildcard for the account ID in the format: `arn:aws:iam::*:role/MemberRoleName`. For example: `arn:aws:iam::*:role/SN_MEMBER_ACCOUNT_ROLE`. ▪ If IAM roles are different across member accounts: Enter the full ARN of the specific IAM role for each member account in a separate entry.
Cloud service account	Name of the trusting account for which you are providing access using the IAM role. ▪ If IAM roles are the same across all member accounts: Enter the management account name. ▪ If IAM roles are different across member accounts: Enter each member account in a separate entry.

d. Select **Submit**.

What to do next

Configure the trusting management account and the trusted accessor account.

- For information on configuring accessor accounts with AWS credentials, see Configure access using temporary credentials based on trusted AWS accounts with AWS credentials.
- For information on configuring accessor accounts without AWS credentials, see Configure access using temporary credentials based on trusted AWS accounts without AWS credentials.

Configure the MID Server for AWS IAM roles

Configure the MID Server to retrieve the temporary security credentials associated with an IAM role.

Before you begin

Role required: discovery_admin or sn_cmp.cloud_admin (for Cloud Provisioning and Governance)

Procedure

1. Navigate to **All** > **Discovery** > **MID Servers**.
2. Select a MID Server installed on an Amazon EC2 instance within the relevant AWS service account.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Open the **Configuration Parameters** related list.
4. Click **New**.
5. In the configuration parameter form, select *mid.aws.instance_profile_name* in the **Parameter name** field.
6. Enter the name of the IAM role attached to the EC2 Instance in the **Value** field.

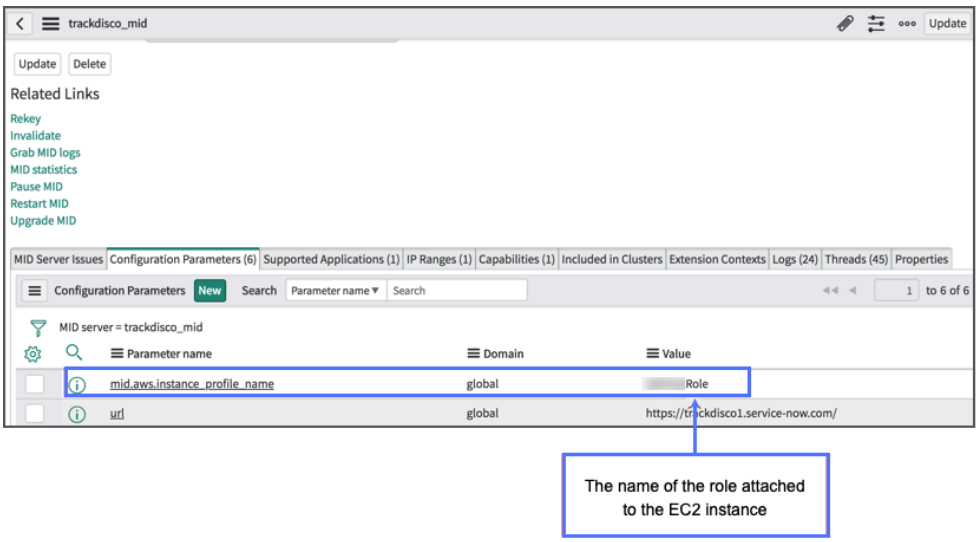
Note:
AWS Cloud Discovery for "mid.aws.instance_profile_name" accepts both "role name" and "full ARN" as valid parameter values. For example, both of the following values are acceptable:

- arn:partition:service:region:account-id:resource-type/resource-id
- resource-id

The MID Server uses the same IAM role that is set up for the corresponding AWS service account. For more information, see Configure access using temporary credentials based on trusted AWS accounts with AWS credentials.

For operational information about creating AWS roles, refer to the Amazon documentation on Creating a role to delegate permissions to an IAM user.

7. Click **Submit**.
The new parameter is listed in the MID Server record.



Control AWS access and permissions using policies

Configure policies with the necessary level of permissions to provide access to the AWS resources for Cloud Discovery and Cloud Provisioning and Governance.

Before you begin

Familiarize yourself with creating IAM users and user policies. Refer to the AWS documentation.

Identify the level of permissions required for discovering the resources using Cloud Discovery and managing the resources with Cloud Provisioning and Governance. For example:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Additional S3 permissions are needed as AWS uses an S3 bucket to store and run the cloud formation templates to deploy stacks using CloudFormation. These permissions are needed even if you run the same CloudFormation template from the AWS console.
- Read-only access is required to do pattern discovery with the custom policy.

AWS CloudFormation provisions and configures resources by making calls to the AWS services that are described in your template. For more information, see How does CloudFormation work?

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Roles required:

- AWS Management Console administrator
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

The policy you configure defines the AWS permissions that you can assign to a user, group, or a role. Depending on the AWS services you use, specify actions for the service to perform discovery and provisioning and life-cycle actions using Cloud Provisioning and Governance.

Procedure

1. Log in to the AWS Management Console using the credentials of the relevant service account. If you used an IAM user or an IAM role to provide access using temporary credentials, log in using the same IAM user or IAM role.
2. Open the user record in the instance for the relevant user.
3. Define a user policy in AWS Management Console using either of the following methods:
   - Grant administrator access to the instance. This method gives the same level of access as using the Access Key ID and Secret Access Key gives. Attach the `AdministratorAccess` policy to the user profile.

     Note:
     To create a user policy that supports only Cloud Discovery rather than the provisioning of cloud resources, attach the `ReadOnlyAccess` policy instead.

   - Create a custom policy with a descriptive name. In the Policy Document field, write the code that includes the APIs that this policy allows running.

     Note:
     The following JSON sample is a partial example showing permissions for Cloud Discovery. It isn't a complete list of all required permissions.

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Sid":"PermissionsNeededForDiscovery",
         "Effect":"Allow",

Set up Azure service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Microsoft Azure accounts.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Before you begin

Ensure the configuration of Azure credentials

For more information, see Create Azure cloud credentials and Configuration steps for Azure Service Principal User and Credentials (KB2202765)

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure that you are familiar with the hierarchy of the Azure service accounts in your environment.

Set up the service accounts at ServiceNow AI Platform to reflect the hierarchy of your environment. You can set up the Azure service accounts for the following Azure account types:

- Management group.
- Subscription.

Role required: discovery_admin

About this task

A service account is a secure record on your instance that stores the credentials and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account is the logical representation in cloud management of all or part of your managed cloud infrastructure. A cloud account can include multiple service accounts—even service accounts from different providers. For each service account, you specify which datacenter to include in the cloud account.

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. Fill in the fields by the following order:
   a. Select the datacenter.
   b. Select the check box of the **Is management account** if your are creating a service account for a management group.
   c. Select **Should pull events** to preform event-based discovery. For more information, see Microsoft Azure Alert driven discovery

Cloud Service Account form

Field	Description
Name	The unique and meaningful name for this service account.
Account ID	If you are creating a service account for a management group, fill in the Azure management group ID that belongs to the management group. If you are creating a service account for a subscription, fill in the Azure subscription ID.
Discovery credentials	The credentials needed for ServiceNow applications to access this account.
Datacenter URL	URL of the datacenter. Configuring this field is required for Azure Gov Cloud (US) accounts. For example, https://management.usgovcloudapi.net/.
Datacenter type	Type of the datacenter where the account is hosted. Select **Azure datacenter**.
Datacenter discovery status	Auto-generated value: Status and timestamp of the last execution of discovery on the datacenter.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent account	When setting up a service account for an Azure subscription, fill in the management group ID. When the **Is management account** check box is selected, the **Parent account** field is not applicable
Accessor account	Not applicable for Azure service accounts.

4. Select **Submit**.

Related topics

Discovery for Microsoft Azure Cloud

Set up Google Cloud Platform service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Google Cloud Platform (GCP) service accounts.

GCP service account is a unique account typically used by an application or compute workload, such as a Compute Engine instance, rather than a user. A service account is identified by its email address, which is unique to the account. It's used to authenticate and authorize interactions between your application and various GCP services.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Configure the Google API credentials for Cloud Discovery

Create Google API credentials to allow Cloud Discovery to access the data on your Google account securely.

Before you begin

Ensure that the latest versions of the following applications are installed:

- Discovery and Service Mapping Patterns
- Visibility Content
- CMDB CI Class Models

Role required: discovery_admin

Procedure

Configure the GCP credentials either by importing a JSON file or by filing in the record manually.

Google API Credentials Form

Fill in the Google API Credentials form to configure the credentials.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Set a unique name for the Google Cloud API credentials.
Active	Option for enabling this credential for discovery. Select this check box to enable discovery.
Applies to	MID Server to which you apply the credentials. Select **All MID servers**.
Order	Order in which the platform runs this credential as it attempts to log in to devices. A smaller number indicates that the credential appears higher in the list. Establish the credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number, or none, the instance tries the credentials in a random order. The default value is 100.
Email	Your GCP email address.
Secret Key	Secret key that you generated on the Google Cloud Console.
Credential alias	A credential alias that is used by the credentials to authorize actions.

Create GCP service accounts

Create Google Cloud Platform (GCP) service accounts on the ServiceNow AI Platform to access your GCP account during GCP discovery.

Before you begin

Verify that Google API credentials have been created. For more information, see Configure the Google API credentials for Cloud Discovery.

Retrieve the **project_id** value from the JSON key file that is associated with the service account.

Role required: discovery_admin

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. In the **Discovery Credentials field**, begin to enter the credential name and select it from the list.
4. On the form, fill in the remaining fields.

Cloud Service Account form

Field	Description
Name	A unique name for the GCP service account.
Account Id	GCP project ID.

Field	Description
Datacenter URL	URL of the datacenter, which should remain empty.
Datacenter Type	Type of the datacenter where the account is hosted, which should be Google Datacenter [cmdb_ci_google_datacenter].

5. Select **Submit**.

What to do next

Schedule a GCP cloud discovery. For more information, see Create a discovery schedule in Cloud Discovery Workspace.

GCP access and permission using policies

Google Cloud Platform (GCP) access and permission using policies provide privileges for secure cloud resource utilization and management in GCP.

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.
